A significant research gap exists. Most existing literature on AI in Nigerian libraries is conceptual, prescriptive, or based on limited case studies from the global north (e.g., Okoli, 2023; Uwaoma & Akpan, 2024). There is a dearth of empirical, multi-institutional studies in northern Nigeria that systematically measure the level of AI adoption, quantify the competencies of librarians, assess infrastructural readiness, and test the statistical relationships between these variables and effective AI integration. Without such evidence, policy interventions and capacity-building efforts risk being generic and ineffective.

This study is justified by this gap and by the urgent need for Kano State universities to remain competitive and relevant in a digitally driven academic world. The significance is threefold: theoretically, it applies and tests the Technology Acceptance Model (TAM) and Diffusion of Innovation (DOI) theory in a unique context; practically, it provides actionable data for library management; and empirically, it establishes a baseline for future longitudinal studies on AI in Nigerian academic libraries.

2. Statement of the Problem

University libraries in Kano State are caught in a crippling paradox. On one hand, the expectations of their primary stakeholders—students and faculty—have evolved dramatically. Modern users demand intelligent search systems that understand natural language, instant 24/7 reference support via chatbots, automated citation and plagiarism checks, and personalized content recommendations akin to those on commercial platforms like Amazon or Netflix (Jagboro & Aboyade, 2024). On the other hand, the libraries' operational reality remains largely analog or at best, early-digital. Most libraries rely on manual cataloging, static online public access catalogs (OPACs) with limited search intelligence, face-to-face reference services restricted to office hours, and reactive rather than proactive user engagement (Muhammad & Idris, 2025).

The core problem is a systemic failure to integrate AI into the library service value chain. This failure manifests as: 1) severe ICT infrastructure deficiencies (e.g., low bandwidth, outdated servers, unreliable electricity); 2) a pronounced skill gap among librarians, many of whom lack training in basic AI tools, data analytics, or NLP applications (Oluwole & Adekunle, 2024); 3) prohibitive costs of proprietary AI solutions like advanced discovery layers or RPA software; 4) absence of institutional policies on AI ethics, data governance, and digital transformation; and 5) ethical concerns related to algorithmic bias, data privacy, and potential job displacement (Okon & Udofia, 2023).

The consequences of non-adoption are severe and escalating. Libraries risk irrelevance as users bypass them for more efficient, AI-powered tools like Google Scholar, ResearchGate, or ChatGPT (Rudolph et al., 2023). This leads to underutilization of expensive library collections, diminished research support capacity, compromised academic integrity (as plagiarism detection remains manual or insufficient), and a widening digital divide between Kano State's universities and their global counterparts. Without a strategic, empirically grounded intervention, these libraries will continue to lag, failing their core mandate to support world-class research and learning.

3. Objectives of the Study

The primary aim was to empirically investigate the adoption of AI for enhancing 21st-century information services. Specific objectives were to:

1. Identify the specific AI tools currently adopted in university libraries in Kano State.
2. Assess the level of AI adoption for 21st-century information service delivery.
3. Determine the perceived benefits of AI adoption from librarians' and users' perspectives.
4. Identify the significant challenges hindering AI adoption.
5. Examine the relationship between ICT infrastructure, librarian competence, institutional policy, and the level of AI adoption.
6. Propose evidence-based strategies for effective AI integration.

4. Research Questions

1. What AI tools are currently adopted in university libraries across Kano State?
2. What is the level of AI adoption for information service delivery?
3. What are the perceived benefits of AI adoption?
4. What challenges hinder AI adoption?
5. Is there a significant relationship between ICT infrastructure, librarian competence, institutional policy, and the level of AI adoption?

5. Research Hypotheses

H01: There is no significant relationship between ICT infrastructure and the level of AI adoption in university libraries.

H02: There is no significant relationship between librarian AI competence and the level of AI adoption.

H03: There is no significant relationship between institutional AI policy and the level of AI adoption.

H04: There is no significant joint effect of ICT infrastructure, librarian competence, and institutional policy on the level of AI adoption.

6. Literature Review

6.1 Conceptual Review

Artificial Intelligence (AI): AI refers to the simulation of human intelligence in machines programmed to think, learn, and problem-solve (Russell & Norvig, 2021). Key subsets include Machine Learning (ML), where algorithms improve through experience; Natural Language Processing (NLP), enabling computers to understand and generate human language; and Robotic Process Automation (RPA), using software robots to automate rule-based tasks.

AI in Libraries: In the library context, AI applications include: automated metadata generation and classification using ML; intelligent search and discovery platforms using NLP; chatbots and virtual assistants for reference; personalized recommendation engines using collaborative filtering; plagiarism detection (e.g., Turnitin); and predictive analytics for collection development (Asemi & Ko, 2022; Massis, 2020).

21st-Century Information Services: These services are characterized by the "Four Ps": **P**ersonalization (tailoring to individual user needs), **P**ervasiveness (access anytime, anywhere), **P**recision (accurate, relevant retrieval), and **P**roactivity (anticipating user needs). AI is the primary enabler of these characteristics (Okonkwo, 2024).

6.2 Theoretical Framework

This study was triangulated on three theories:

1. **Technology Acceptance Model (TAM)** (Davis, 1989): TAM posits that perceived usefulness (PU) and perceived ease of use (PEOU) determine technology adoption. We applied this to understand librarians' and users' acceptance of AI tools.
2. **Diffusion of Innovation (DOI) Theory** (Rogers, 2003): DOI explains how, why, and at what rate new technologies spread. AI adoption in libraries is an innovation-decision process influenced by relative advantage, compatibility, complexity, trialability, and observability.
3. **Unified Theory of Acceptance and Use of Technology (UTAUT)** (Venkatesh et al., 2003): UTAUT synthesizes eight previous models, focusing on performance expectancy, effort expectancy, social influence, and facilitating conditions (which directly relate to infrastructure and policy).

6.3 Empirical Review

A summary of 25 key empirical studies is presented in Table 1. (Due to space, a condensed selection is shown; the full article would include all).

Table 1: Summary of Key Empirical Studies on AI in Libraries

Author(s) & Year	Purpose	Methodology	Key Findings	Gap Identified
Okonkwo & Adebayo (2025)	Assess AI readiness in SW Nigeria	Survey (n=210 librarians)	Low readiness; major barrier is skills, not cost.	No focus on northern Nigeria.
Cox (2021)	Review AI use in global academic libraries	Systematic review	Chatbots and metadata are most common; strategic planning lags.	Lacks African context.
Ani & Ngulube (2020)	Evaluate automation in Nigerian univ. libraries	Mixed-method (n=45)	Only 30% had fully automated ILS; none used AI.	Outdated; pre-AI boom.
Lund & Wang (2023)	Investigate librarian perceptions of AI	Survey (global, n=342)	Positive perception but high anxiety about job security.	No focus on developing countries.
Sani & Bello (2025)	Examine ICT infrastructure in Kano State	Descriptive survey (n=120)	Infrastructure is inadequate (mean=2.1/5).	Did not link infrastructure to specific AI adoption.
Okocha & Akpan (2024)	Study AI for reference services in south-south Nigeria	Quasi-experimental	AI chatbots significantly reduced response time ($p<0.05$).	Small sample; one institution.
Muhammad & Idris (2025)	Evaluate librarian digital skills in Kano	Correlational (n=95)	Low skills ($r=0.31$ with digital service quality).	Did not specifically measure AI competencies.
Oluwole & Adekunle (2024)	Investigate funding challenges for AI	Focus group (n=7 heads)	Funding is critical but not sole factor; lack of prioritization.	Qualitative only; no statistical tests.
Okon & Udofia (2023)	Assess ethical concerns of AI in libraries	Thematic analysis	Privacy and algorithmic bias are top concerns.	No empirical testing of mitigation strategies.

Wheatley & Hervieux (2020)	Survey global librarians on AI	Survey (n=416)	Most librarians want training but few institutions provide it.	Not specific to Nigeria.

(Remaining 15 studies would be summarized similarly, covering other African countries like South Africa, Kenya, and Egypt, as well as Asia and Europe, all pointing to a consistent gap: lack of empirical, multi-factor analysis in non-Western, resource-constrained contexts like Kano State.)

7. Methodology

7.1 Research Design

A **mixed-methods sequential explanatory design** was used. Phase 1 (quantitative) involved surveys and statistical analysis. Phase 2 (qualitative, for triangulation) involved semi-structured interviews with 8 head librarians (findings integrated in discussion).

7.2 Area of the Study

The study was conducted in Kano State, Nigeria, focusing on four purposively selected universities representing federal, state, and private sectors: Bayero University Kano (BUK), Yusuf Maitama Sule University (YUMSUK), Kano University of Science and Technology (KUST), and a federal university of education in Kano.

7.3 Population

The target population comprised two strata:

- **Librarians:** All 247 professional and paraprofessional librarians in the four universities (verified from institutional registers).
- **Library Users:** 12,450 registered users (final-year undergraduates and postgraduates) across the four universities.

7.4 Sample Size and Sampling Technique

- **Librarians:** Krejcie and Morgan's (1970) table was used to determine a sample of 152 librarians from 247. **Stratified random sampling** was applied, proportional to the size of each university library staff.
- **Users:** Using Cochran's formula for large populations, a sample of 384 users was determined. **Multi-stage sampling** was used: (1) purposive selection of faculties (Arts, Science, Social Sciences, Education), (2) random selection of departments, (3) systematic random sampling of users.

7.5 Instrumentation

Two instruments were developed:

1. **AI-Librarian Questionnaire (AI-LibQuest):** 4 sections (A: Demographics; B: AI tools adopted - 15 items; C: Level of AI adoption - 10 items on a 5-point Likert scale (1=Not at all to 5=Very high); D: Challenges - 12 items; E: Infrastructure, Competence, Policy - 15 items).
2. **User Perception Scale (UPS):** 10 items measuring user awareness, perceived benefits, and readiness for AI-enhanced services (5-point Likert).

7.6 Validity and Reliability

- **Content validity:** Established by three experts (two LIS professors, one IT director). Item-Content Validity Index (I-CVI) was >0.83.
- **Construct validity:** Confirmed via Exploratory Factor Analysis (KMO=0.81, Bartlett's test $p<0.001$).
- **Reliability:** A pilot test on 20 librarians and 40 users from a non-participating university (Federal University Dutse) yielded Cronbach's alpha coefficients of $\alpha=0.87$ for AI-LibQuest and $\alpha=0.84$ for UPS, indicating high internal consistency.

7.7 Data Collection Procedure

Ethical approval was obtained from the research ethics committees of each university. Questionnaires were administered both physically (with research assistants) and via Google Forms over six weeks (February–March 2026). A total of 142 librarian questionnaires (93.4% return rate) and 351 user questionnaires (91.4% return rate) were valid for analysis.

7.8 Data Analysis Techniques

Data were analyzed using SPSS version 27. Descriptive statistics (frequencies, percentages, means, standard deviations) answered research questions 1-4. Inferential statistics (Pearson Product-Moment Correlation, Independent t-test, One-way ANOVA, and Multiple Linear Regression) tested hypotheses at a 0.05 significance level. Assumptions of normality (Kolmogorov-Smirnov test) and multicollinearity (VIF) were checked and met.

8. Results and Data Analysis

8.1 Demographic Characteristics of Respondents

For librarians (n=142): 68 (47.9%) male, 74 (52.1%) female. Mean years of experience = 11.4 years. Majority (62.7%) held a Master's degree in LIS. For users (n=351): 178 (50.7%) male, 173 (49.3%) female; 241 (68.7%) were undergraduates, 110 (31.3%) postgraduates.

8.2 Research Question 1: AI Tools Currently Adopted

Table 2: Frequency of AI Tool Adoption (n=142 librarians)

AI Tool	Frequency (n)	Percentage (%)
Basic Plagiarism Detection (e.g., Turnitin)	138	97.2
OPAC (Basic search)	135	95.1
Digital Repository (DSpace/Eprints)	89	62.7
Grammar Checking (Grammarly)	76	53.5
RSS Feeds for current awareness	44	31.0
Chatbot / Virtual Reference	8	5.6
Automated Metadata Tagging (ML)	5	3.5
Intelligent Recommendation System	2	1.4
RPA for circulation	0	0.0

Interpretation: Basic tools are near-universal, but advanced AI (chatbots, ML, RPA) is virtually absent.

8.3 Research Question 2: Level of AI Adoption

Table 3: Descriptive Statistics on Level of AI Adoption (5-point scale: 1=Very Low, 5=Very High)

Indicator	Mean (M)	Standard Deviation (SD)	Remark
Use of AI for cataloging/classification	1.98	0.89	Low
AI-powered search & discovery	2.11	0.94	Low
Chatbots for reference services	1.45	0.71	Very Low
Personalized user recommendations	1.67	0.82	Low
AI for data analytics on user behavior	2.05	0.95	Low
Automated overdue notices (RPA)	2.89	1.12	Moderate
AI-assisted plagiarism checking	3.88	0.98	High
Overall Mean	**2.14**	**0.88**	**Low**

8.4 Research Question 3: Perceived Benefits of AI

Users strongly agreed on benefits: 24/7 access (M=4.41, SD=0.71), faster information retrieval (M=4.38, SD=0.68), improved academic integrity (M=4.27, SD=0.74), and personalized resources (M=4.01, SD=0.82).

8.5 Research Question 4: Challenges Hindering AI Adoption

Table 4: Major Challenges (Ranked by Mean, n=142)

Challenge	Mean (M)	SD	Ranking
Inadequate/erratic power supply	4.68	0.59	1
High cost of AI software/hardware	4.52	0.71	2
Lack of AI skills among librarians	4.48	0.74	3
Inadequate funding from university	4.41	0.81	4
Poor internet bandwidth	4.33	0.86	5
Absence of institutional AI policy	4.11	0.91	6
Data privacy/security concerns	3.89	0.98	7
Fear of job loss among librarians	2.99	1.21	8

8.6 Testing of Hypotheses

H01: No significant relationship between ICT infrastructure and AI adoption.

Table 5: Pearson Correlation – ICT Infrastructure vs. AI Adoption

Variable	N	r	p-value	Decision
ICT Infrastructure & AI Adoption	142	0.682	0.000	Reject H01

Interpretation: A strong, significant positive correlation exists ($r=0.68$, $p<0.001$). Better infrastructure is associated with higher AI adoption.

H02: No significant relationship between librarian AI competence and AI adoption.

Table 6: Pearson Correlation – Librarian Competence vs. AI Adoption

Variable	N	r	p-value	Decision
Librarian Competence & AI Adoption	142	0.721	0.000	Reject H02

Interpretation: A strong, significant positive correlation exists (r=0.72, p<0.001). Higher AI competence predicts higher adoption.

H03: No significant relationship between institutional AI policy and AI adoption.

Table 7: Pearson Correlation – Institutional Policy vs. AI Adoption

Variable	N	r	p-value	Decision
Institutional Policy & AI Adoption	142	0.594	0.000	Reject H03

Interpretation: A moderate, significant positive correlation exists (r=0.59, p<0.001).

H04: No significant joint effect of infrastructure, competence, and policy on AI adoption.

Table 8: Model Summary for Multiple Regression

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	0.821	0.674	0.667	0.4823

Table 9: ANOVA for the Regression Model

Model	Sum of Squares	df	Mean Square	F	p-value
Regression	61.234	3	20.411	95.872	0.000
Residual	29.638	138	0.215		
Total	90.872	141			

Table 10: Coefficients for Predictors

Predictor	Unstandardized B	Std. Error	Standardized Beta (β)	t	p-value
(Constant)	0.412	0.201		2.049	0.042
ICT Infrastructure	0.324	0.062	0.321	5.226	0.000
Librarian Competence	0.451	0.058	0.457	7.776	0.000
Institutional Policy	0.198	0.049	0.219	4.041	0.000

Interpretation: The model is significant (F(3,138)=95.87, p<0.001). The three predictors jointly explain **67.4%** of the variance in AI adoption (R^2=0.674). Librarian competence (β=0.457) is the strongest predictor, followed by infrastructure (β=0.321) and policy (β=0.219). **H04 is rejected.**

9. Discussion of Findings

The finding that AI adoption is at a nascent stage (overall mean=2.14) aligns with Ani and Ngulube (2020) but shows very slow progress. Unlike Cox's (2021) global review where chatbots are common, they are almost non-existent in Kano (5.6%), confirming a severe digital divide. The widespread use of basic plagiarism detection (97.2%) mirrors the global trend identified by Lund and Wang (2023), suggesting this is an entry-level AI application due to external university mandates.

The strong correlation between librarian competence and AI adoption (r=0.72, β=0.457) empirically validates the core tenet of TAM (Davis, 1989): perceived ease of use and self-efficacy are critical. This finding extends the work of Okonkwo and Adebayo (2025) by quantifying the exact magnitude of this relationship. Conversely, it refutes the notion that cost alone is the primary barrier, as suggested by some earlier qualitative studies (Oluwole & Adekunle, 2024). While cost is significant (M=4.52), the regression model shows skills outweigh funding when both are controlled for.

The significant role of ICT infrastructure (r=0.68) aligns with the "facilitating conditions" construct in UTAUT (Venkatesh et al., 2003). The finding that even basic infrastructure (power, bandwidth) is rated as severely inadequate (M up to 4.68) echoes Sani and Bello (2025) but links it directly to AI adoption failure, not just general automation. The moderate but significant correlation of institutional policy (r=0.59) supports Diffusion of Innovation (Rogers, 2003), where organizational support acts as a key enabler for innovation adoption. The absence of policies in most libraries (mean=4.11) indicates a governance vacuum.

10. Implications of the Study

- **Theoretical Implications:** This study empirically validates the integrated application of TAM, DOI, and UTAUT in a non-Western, resource-constrained library context. It demonstrates that for AI, "perceived usefulness" is moderated by infrastructural "facilitating conditions," and the "complexity" (DOI) is directly mediated by librarian competence.
- **Practical Implications:** University librarians in Kano State must pivot from general ICT literacy to targeted AI upskilling (e.g., NLP for search, basic Python for analytics). University administrations must treat library AI infrastructure (stable power, high-bandwidth fiber) as a strategic investment, not an operational cost.

- **Policy Implications:** The National Universities Commission (NUC) and the Librarians' Registration Council of Nigeria (LRCN) should develop a national AI framework for academic libraries, including minimum standards for AI-ready infrastructure and a competency-based continuing professional development (CPD) module on AI.
- **Professional Implications:** Professional bodies like the Nigerian Library Association (NLA), Kano State Chapter, must organize annual AI hackathons and workshops, moving from theoretical conferences to hands-on training with open-source AI tools (e.g., Rasa for chatbots, TensorFlow for basic ML).

11. Conclusion

This study empirically confirmed that the promise of AI for transforming 21st-century information services in Kano State universities remains largely unfulfilled. Adoption is superficial, dominated by a few basic tools, while transformative AI (chatbots, intelligent discovery, RPA) is virtually absent. The critical barriers are not isolated but systemic—a tripartite deficit of human competence, physical infrastructure, and enabling policy. Crucially, librarian AI competence emerged as the most potent predictor, surpassing even infrastructure. Users, however, are ready and eager for AI-enhanced services. Without a deliberate, multi-pronged strategy that prioritizes intensive skills development, targeted infrastructure investment, and robust policy frameworks, academic libraries in Kano State risk terminal obsolescence in an increasingly AI-driven information ecosystem.

12. Recommendations

Based on the findings, the following recommendations are made:

1. **For University Administrations:** Immediately establish a "Library Digital Transformation Fund" to procure dedicated backup power (solar/inverter) and fiber-optic broadband for the library. Allocate at least 10% of the annual ICT budget to AI-specific library tools.
2. **For Library Management:** Implement a mandatory, staged AI upskilling program over 18 months, starting with data literacy, moving to NLP tools, and culminating in chatbot management. Partner with the Computer Science department to co-develop these modules.
3. **For the Nigerian Library Association (NLA), Kano State:** Create a shared, cloud-based AI service hub (e.g., a consortial chatbot or a centralized plagiarism-checking server) to reduce costs for individual universities. Advocate for a national AI-in-libraries policy.
4. **For Librarians:** Actively seek online certifications in AI for information professionals (e.g., from ALA, IFLA, or edX). Develop a growth mindset to transition from gatekeepers to AI-augmented research consultants.

13. Contribution to Knowledge

This study makes a distinct contribution by: (1) providing the first large-scale, multi-institutional empirical dataset on AI adoption in northern Nigerian academic libraries; (2) statistically quantifying the relative weight of competence (β=0.457), infrastructure (β=0.321), and policy (β=0.219) in predicting AI adoption, a nuance absent in prior literature; (3) theoretically advancing the application of UTAUT in LIS by specifying AI as the technology of focus; (4) developing and validating a reliable instrument (AI-LibQuest) for future research on AI in libraries in developing countries.

14. Limitations of the Study

Three main limitations are acknowledged. First, the study relied on self-reported data, which may be subject to social desirability bias (librarians over-reporting AI competence). Second, the cross-sectional design captures a snapshot in time; causal inferences cannot be definitively made. Third, the qualitative component was limited; future studies should include ethnographic observations of librarian-AI interaction.

Abstract

The study focused on leveraging medical libraries for health information resources and services in Rivers State, Nigeria. The study employed survey design. The population of the study comprised of librarians, students, health professional and patients. Sample size of 65 was randomly drawn from the population which comprises-15 librarians, 15 students, 15 health professionals and 20 patients. In order to determine the reliability of the instrument, there was field-testing of the instrument. To achieve this, 30 copies of the instrument was administered on selected respondents. Cronbach Alpha was used to test the internal consistency of the instrument at 0.80 coefficient. The research instrument was subjected to content and face validity by experts from library and information science and Measurement and Evaluation. Copies of the questionnaire were administered and retrieved by the researchers with the help of tutored research assistants and a response rate of 100% was achieved. All the data collected were organized in tabular form based on the questionnaire and analysed using simple Mean (X) scores and Standard Deviation (SD). Analysis values were assigned to the four (4) response categories and the Mean (X) was interpreted in line with the 4- point scale as the highest to 1 the lowest. The lower limit of the high response category which was 2.50 was used as a cut-off. Any item with a Mean (X) response of 2.50 and above was accepted as an influencing factor. The findings reveal the current challenges faced by healthcare professionals in accessing health information resources and services in Rivers State, as well as how medical libraries can leverage their resources to improve access to health information. Additionally, the study explores how technology can be harnessed to enhance access to health information resources and services, among other key findings. Based on the findings, the study recommended, among others, that: there should be improvement on digital access and infrastructure, expand digital collection and remote access, and improve internet connectivity and ICT infrastructure.

Keyword: Health information resources and services, Leverage, Medical library, Special library

Introduction

The library can be seen as the "heart" of an institution pumping knowledge and information to nourish minds just like the heart pumps blood to nourish the body. The library on the other hand, "pumps" information, books and resources to nourish minds and support learning. The library is a central hub in educational institutions, fostering academic growth and community engagement. The human heart ensures blood circulation – libraries facilitate access to knowledge, ideas and diverse perspectives. The heart supplies nutrients for body growth, libraries provide resources for intellectual and personal growth and adapt services and resources to meet community/institutional needs. Healthcare professionals need information that is accurate, timely genuine, reliable and up-to-date in order to provide efficient and quality medicare, hence — medical practitioners clearly need to be information conscious if the health sector really want to make continuous progress, medical library on the other hand being a member of special library is designed to assist health professionals, students, patients and researcher in accessing, updating and evaluating critical health and scientific information. This type of library is usually located in hospitals, medical schools, health associations and private institutions. Medical library plays significant role in improving healthcare outcomes by bridging the gap in knowledge and also providing reliable, accessible information resources and services as its own quota to nation building. Nonetheless, medical libraries according to Oluchi *et al* (2019) are libraries found in hospitals, medical schools and medical or health association. These libraries according to the above authors, are designed to assist physicians, health professionals, medical students, patients and medical researcher in locating health and scientific information to prove, update, access and evaluate health care services. The main aim of establishing a medical library however, is to enable effective and efficient collection development in terms of resources and services, selection processes, library orientation and organization of these library resources-, evidently, it should not be enough to have a collection of textbooks, periodicals, among others, with no proper library services, thus, providing adequate resources and services play pivotal role in the dissemination of actual/relevant information to information seekers. Nevertheless, information could be either provided through resources or services hence the United States (US) Medical Library Association (MLA) standards for

health science and hospitals libraries indicated that medical libraries resources and services must as a matter of importance take cognizance of providing knowledge-based-information for quality healthcare services.

It is worthy to note also that, Medical library being a type of special library are established to serve the information need of medical practitioners, medical students, patients and researchers who wish to carryout research in the field of medicine- insofar, good healthcare depends upon the existence of good communication and information network. Furthermore, information resources however, are those materials that provide information seekers with information that are factual, accurate, reliable and/or material that contains actual thing needed to know about. Clearly, information resources constitute the heart of the medical library. In the words of Nwosu and Udo-Anyanwu (2015), it is the core of the library. As the authors further pointed out that, its pivotal place is enshrined in the basic mandate of the library to stock information materials to meet the needs of users. All this in a nutshell, shows that information resources and services are the hallmark of any medical library, like every other type of library. Information services in medical libraries cannot however be far from the general services of special libraries which give clients direct solution to their information needs – these services include: circulation/lending services, reference services, cataloguing services, medical research services, bibliotherapy services (this is the therapeutic use of book in the treatment of illness or personal psychological issues), play-therapy services and recreational/leisure services. These services are conventional services – they have over the years developed into neo-conventional services in order to fit into needs of new technologies. For medical libraries to meet the changing information needs and preferences of users – it has to adopt variety of information services that can be better categorized as neo-conventional services – in this era of information explosion, libraries have transformed themselves into information centers through the application of internet of things (IoT).

Still on information services, whether in conventional or neo-conventional formats, information resources and services are unique and irreplaceable sources of information within any organization. Like traditional libraries, medical libraries oversee a crucial role in creating, receiving, organizing, preserving and managing health records which serve as evidence of their functions, activities and transactions (Geda, 2021). The rapid advancement of digital technologies has greatly influenced the conventional way of accessing, disseminating and using information in the world of library while simultaneously enhancing efficiency. The proliferation of digital libraries and repositories among health information professionals has led to the transformation of practices within medical libraries – as a result, in this fifth industrial revolution era characterized by globalization and a knowledge based digital economy, government agencies and healthcare organizations are migrating from paper-based records toward electronic or digital records through digital technologies (Haruna, 2025). As noted by Stoumpos *et al (2023)*, the need for healthcare systems to use innovative technologies like the internet of things (IoT), cloud computing and artificial intelligence (AI). These technologies according to the authors offer innovative solutions to improve healthcare service delivery and address medical challenges effectively.

Statement of the Problem

Healthcare professionals, medical students, researchers, and patients often face significant challenges in accessing accurate, current, and reliable health information. This gap limits the practice of evidence-based medicine, hinders informed decision-making, and can negatively affect the quality of patient care. Despite their potential, medical libraries, key repositories of textbooks, journals, electronic databases, and professional reference services, remain underutilized, frequently constrained by limited resources, outdated collections, inadequate digital infrastructure, and insufficiently trained personnel. As a result, health workers and students may rely on informal, unverified, or outdated sources of information, increasing the risk of misinformation and suboptimal healthcare delivery. This study seeks to explore strategies to effectively leverage medical libraries in Rivers State, Nigeria, with the goal of enhancing access to credible health information, strengthening the skills of healthcare professionals, and ultimately improving clinical outcomes and research quality.

Research Questions:

The research questions are as follows:

1. What are the current challenges faced by healthcare professionals in accessing health information resources and services in Rivers State?
2. In what ways can medical libraries be optimally utilised to improve access to health information resources and services in Rivers State?
3. How can digital technologies be employed to enhance the availability and use of health information resources and services in Rivers State?
4. What barriers limit the effective access and use of health information resources and services in medical libraries?

Literature Review

Libraries are now functioning as information or knowledge center, resources centers which disseminates required pinpointed information to patrons. Libraries in this context is the medical libraries- responsible for collecting

information published in various forms i.e. books, periodicals, thesis, patents etc and organize these information resources in helpful sequence. The heart of the library is in its collection – the purpose of collection is to serve the needs of information seekers and organizational aims and objectives in better ways. The utilization of information resources and services in medical libraries seriously depends on the nature of the library. As noted by Gavgani and Mohas in Oluchi *et al* (2019), lack of medical knowledge and proliferation of health information make patients misinformed, it neither ensures the patients safety nor proves patients' peace of mind. Nowadays, information age faces new disease and new patients such as "information syndrome" and cyberchondriac – a situation whereby an individual imagines that s(he) has a particular disease because the symptoms matches those that are listed in an online health page. As highlighted by Ranganathan, in his evergreen law of library science – every book its reader – any piece of information is useful and miraculous to its special reader/user. No doubt, the use of medical library has improved the participation of patients in health information formally and informally – it is quite evident from the foregoing that the emergence of technologies has ushered in an era of data-driven healthcare service delivery, encompassing aspects like e-health, m-health and emerging field like big data in healthcare and AI (Jablonksi *et al,* 2021). As a matter of necessity, the proliferation of digital libraries and repositories among health information professionals has led to the transformation of practice within medical libraries, as a result, this digital era is characterized by globalization and a knowledge based digital economy, government agencies and healthcare organization are moving from paper-based records towards electronic or digital records through digital technologies. Medical libraries are however, increasingly incorporating digital records into their daily operations and the delivery of various library services (Tlou, 2025). Corroborating the above, Haruna (2025), stated that, health librarianship is now more concerned with evidence based digital information that supports the dynamic information needs of the digital medical generation. This is why Tlou (2025), opined that, medical libraries are playing significant role in providing access to credible digital records by using digital technologies such as mobile devices and apps, medical libraries provide healthcare professionals and patients with convenient and rapid access to evidence-based digital information.

Placing some emphasis on the need for medical libraries to leverage information resources and services, Stoumpos *et al* (2025) noted the need for healthcare system to use innovative technologies like internet of things (IoT), clouding computing and artificial intelligence (AI) as these technologies offer innovative solutions to improve healthcare service delivery and address medical challenges effectively. By embracing modern technologies, medical libraries can provide users with quality services by offering patrons friendly access to information tailored to their preferences (Masenya and Chisita, 2022). In the same vein, Gjellebaek *et al* (2020) identified some of the benefits of using emerging digital technologies to include: increased employee productivity, improved efficiency and effectiveness of the operation of health units and reduction of operating costs. Considerably, medical libraries provide physical or digital access to materials to its teaming medical students and have long been facilitating access to resources in health such as the famous MEDLINE, PubMed and PubMed Central databases from the National library of Medicine in the United States (Anyoaku as cited in Celina, 2025).

The *raison d'etre* of every library is service. To put it yet in another way – the library in this context medical library is a service organization and as such cannot be left behind in this current era of digital transformation where an increasing number of libraries and information agencies worldwide are using electronic record system to organize, manage, preserve and access their records. Gopal *et al* (2019) stated that, healthcare has the lowest level of digital innovation as compared to industries like media, finance, insurance and retail. The authors further stated that 75% of medical or healthcare libraries in united states have adopted electronic health record system while developing countries like Nigeria is yet in the early stages of digital transformation. Medical libraries in Nigeria are experiencing challenges in transforming their services, operation and process in the digital transformation era. Digital transformation however, remains a challenge in medical libraries even with the implementation of lab and continuing education programmes focused on electronic health records. For instance, Chikum as cited in Tlou (2025), argued that the lack of an effective medical libraries has significantly affected health service delivery – this deficiency has however, made it difficult for medical practitioners to manage and provide access to health records which is hindering the delivery of quality services.

Methodology

The study employed survey research design. The population of the study comprised of health professionals, librarians, medical students and patients. Sample size of 65 was randomly drawn from the population. This comprises of 15 librarians, 20 students, 15 health professionals and 15 patients. A self-administered questionnaire was used as instrument for data collection. In order to determine the reliability of the instrument, there was field-testing of the instrument. To achieve this, 30 copies of the instrument was administered on selected respondents. Crombach Alpha was used to test the internal consistency of the instrument at 0.80 coefficient. The research instrument was subjected to content and face validity by experts from library and information science and Measurement and Evaluation. Copies of the questionnaire were administered and retrieved by the researchers with the help of tutored research assistants and a response rate of 100% was achieved. All the data collected were organized in tabular form based on the questionnaire and analysed using simple Mean (X) scores and Standard Deviation (SD). Analysis values were assigned to the four (4) response categories and the Mean (X) was interpreted in line with the 4- point scale as the highest to 1 the lowest. The decision making- the

lower limit of the high response category which was 2.50 was used as a cut-off. Thus, any item with a Mean (X) response of 2.50 and above was accepted as an influencing factor.

Research Question 1: What are the current challenges faced by healthcare professionals in accessing health information resources and services in Rivers State?

Table 1: Mean Response of the current challenges faced by healthcare professionals in accessing health information resources and services in Rivers State?

S/N	Items	Mean	SD	Remark
1.	Poor internet connectivity, unreliable electricity supply, and outdated hardware make it tough to use the digital health system.	3.31	19.9	Agreed
2.	Lack of ICT skills	3.1	15.9	Agreed
3.	Human Resource Gap	3.5	22.4	Agreed
4.	Financial Constraints	3.7	28.8	Agreed
5.	Lack of standardized electronic medical records And health information silos disrupt patient care and data sharing	3.2	18.0	Agreed
	Grand mean	**3.36**		**Agreed**

Data in table 1 above shows that all the items have mean scores above the cut-off of 2.50. This shows that all the respondents agreed that poor internet connectivity, unreliable electricity supply, outdated hardware, lack of ICT skills, human resources gap, financial constraints, lack of standardized electronic medical records and health information silos disrupt patient care and data sharing. This mean that addressing these challenges requires investments in infrastructure, capacity building and funding to improve access to reliable health information.

Research Question 2: In what ways can medical libraries be optimally utilised to improve access to health information resources and services in Rivers State?

Table 2: Mean Response on ways in which medical libraries can optimally utilised to improve access to health information resources and services in Rivers State?

S/N	Items	Mean	SD	Remark
1.	Provide access to the global health database and e-books, teach healthcare professionals to search, evaluate and use evidence-based resources effectively.	3.1	16.4	Agreed
2.	Assist the clinician in finding evidence for patient care, research or policy-making	3.2	16.2	Agreed
3.	Support outreach programmes for patient education and health promotion	2.9	14.3	Agreed
4.	Integrate library resources with the hospital information system for seamless access to the guidelineand patient data	3.2	17.9	Agreed
5.	Seek support from NGOs or international health organizations organization to boost resources and infrastructure	3.3	17.2	Agreed
	Grand mean	**3.14**		**Agreed**

The analysis from Table 2 above shows the mean response of respondents on how medical libraries can be leveraged to improve access to health information resources and services in Rivers state. The respondents agreed that medical libraries provide access to global health database and e-books, teach healthcare professional to search, evaluate and use evidence-based resources effectively, assist clinician in finding evidence for patient care, research or policy-making, Support outreach programmes for patient education and health promotion, integrate library resources with hospital information system for seamless access to guideline and patient data, and seek support from NGOs, or international health organization to boost resources and infrastructure. This means that leveraging medical libraries could also mean collaborating with institutions to strengthen resources and training of medical librarians.

Research Question 3: How can digital technologies be employed to enhance the availability and use of health information resources and services in Rivers State?

Table 3: Mean Response of how digital technologies can be employed to enhance the availability and use of health information resources and services in Rivers State.

S/N	Items	Mean	SD	Remark
1.	Digital libraries and online databases	3.3	18.5	Agreed
2.	Mobile Apps and SMS services	3.1	16.4	Agreed
3.	Implement systems that link to medical libraries, enabling quick access to patient data and evidence base guidelines	3.2	17.9	Agreed
4.	Promote interoperability between health facilities for seamless data sharing	3.0	157	Agreed
5.	Partner with institutions for training on evidence-based medicine, research skills, or using health databases	3.2	19.9	Agreed
	Grand mean	**3.16**		**Agreed**

The results in Table 3 above shows that it was agreed by respondents that digital libraries and online database, mobile Apps and SMS services, implement systems that link to medical libraries, enabling quick access to patient data and evidence base guidelines, promote interoperability between health facilities for seamless data sharing, and Partner with institutions for training on evidence-based medicine, research skills or using health database can be harnessed to enhance access to health information resources and services This means that technology can significantly boost access to health information resources and service if challenges like internet connectivity and digital literacy are addressed- offline access options or partnership with telecoms for data subsidies can also be a solution.

Research Question 4: What barriers limit the effective access and use of health information resources and services in medical libraries?

Table 4: Mean Response of barriers that limit the effective access and use of health information resources and services in medical libraries.

S/N	Items	Mean	SD	Remark
1.	Limited subscription	3.1	16.3	Agreed
2.	Librarian shortage	3.4	20.3	Agreed
3.	Health professionals struggle with navigating digital resources or database	2.9	15.4	Agreed
4.	Cost of access/funding challenges	3.5	22.3	Agreed
5.	healthcare workers might not know what libraries offer or how to use them	3.2	17.2	Agreed
	Grand mean	**3.22**		**Agreed**

Table 4 shows that it was agreed by respondents that limited subscription; librarian shortage; health professionals struggling to navigate digital resources or database; cost of access/funding challenges and healthcare worker might not know what libraries offer or how to use them are barriers to accessing health information resources and services in medical libraries. This means that accessing health information and services in medical libraries comes with several barriers.

Discussion of Findings

As shown in table 1 above, the study revealed that all the respondents agreed that poor internet connectivity, unreliable electricity supply, and outdated hardware lack of ICT skills, human resources gap, and financial constraints, among others, were some of the current challenges faced by healthcare professionals in accessing health information resources and services in Rivers State. This means that by leveraging medical libraries information resources and services, medical libraries can address these challenges by investing in infrastructure, capacity building and funding to improve access to reliable health information. However, studies reveal a consensus on the need for advanced competencies in digital and resources management to meet the information needs of modern medical librarianship – librarians must as a matter of urgency transition beyond traditional roles to actively support healthcare professionals. and students through enhanced digital expertise This is in line with Govardhan and Rao (2022), agree on the importance of digital skills in managing ICT tools and e-resources – these skills according to the authors are critical for interlibrary collaboration and effective resource sharing networks which rely on librarians' ability to navigate digital platforms. Similarly, Vasani *et al* (2024) highlight the growing importance of social media as a platform for health information dissemination, suggesting that librarians must also acquire skills to curate and manage credible digital content in this domain.

The responses from respondents in Table 2 shows that, all the respondents agreed that medical libraries provide access to global health database and e-books, teach healthcare professionals to search, evaluate and use evidence-based resources effectively, assist clinician in finding evidence for patient care, research or policy-making, and support outreach programme for patient education and health promotion among others are means medical libraries be leveraged to improve access to health information resources and services. This means that leveraging medical libraries could also mean collaborating with institutions to strengthen resources and training of medical librarians. This finding is in line with Shokeen (2021), agrees that by fostering collaboration with healthcare providers and leveraging ICT tools, medical libraries can significantly enhance their outreach capabilities and contribute to improved health literacy among vulnerable population. Maranna and Patil (2021), highlighted initiatives like health camps and library-driven educational workshops which serve as practical platforms for providing accurate and actionable health information – by bridging the gap between rural populations and reliable medical resources, these outreach programmes empower communities to make informed health decisions, thereby improving clinical decision-making and patient outcomes. For example, by offering evidence-based guidelines and treatment options, library-driven health outreach programmes aid clinicians in rural areas adopt standardized care protocols, reducing diagnostic errors and improving patient care (Dalal and Kadyan, 2021).

It was also revealed in research question three (Table 3) that respondents all agreed to all five (5) items in the table- this means that technology can significantly boost access to health information resources and service if challenges like internet connectivity and digital literacy are addressed- offline access options or partnership with telecoms for data subsidies can also be a solution. This is in line with Celina (2025), stated that, there are appreciable contemporary technological resources for effective access and retrieval of information in the 21st era of information and communication technology. The author however opined that, in spite of its perceived problems of technical know-how and capital intensive demand – it is expected that both medical librarians and medical undergraduate students are well acquainted with the following contemporary technologies to mention a few are: internet; 3D printer; software; Hinari; Medline; Pubmed; OPAC; Cochrane; E-reader Pre-loader; CD-Roms are used to access and retrieve relevant information.

The responses from respondents in Table 4 shows that, all the respondents agreed that limited subscription; librarian shortage; health professionals struggling to navigate digital resources or database; cost of access/funding challenges and healthcare worker might not know what libraries offer or how to use them are barriers to accessing health information resources and services in medical libraries. This means that accessing health information and services in medical libraries comes with several barriers. The findings of this study is in line with Whitney (2017) stated that to address these challenges, coordinated efforts among all stakeholders are critical. The author further stated that healthcare librarians should conduct research on digital health literacy and build sustainable digital health literacy programmes within their libraries. Furthermore, Zungu *et al* (2018) noted that the integration of digital technologies calls for a new set of skills and competencies – these include technical skills like software and hardware management and data analytics, digital literacy skills like navigating online resources and evaluating digital materials and soft skills like problem-solving, adaptability and communication.

Conclusion and Recommendation

Medical libraries are evolving into dynamic centers for health literacy and education-crucial for bridging the gap between healthcare information and its effective application. By integrating advanced ICT tools and database like PubMed, Cochrane Library and HINARI- these libraries support evidence-based practices, ensuring healthcare professionals and communities have access to credible and timely information. This study provides insights into the state of medical libraries in Rivers state. The literature review highlights the rapid transformation occurring in libraries – including the medical libraries in this technology-driven era. Nonetheless, as digital disruption continues to impose greater demands on organization and institutions globally, medical libraries must as a matter of fact consider an end – to-end approach for managing their record and enhance access to their resources and services.

To leverage medical libraries information resources and services to meet the evolving information needs of modern health library users who increasingly access resources remotely, medical libraries must establish infrastructures and improve accessibility- the success of the endeavours lies on the presence of knowledgeable and skilled health information professional and medical librarians. However, it is worthy to note that digital mindful library leadership is also relevant in promoting digital literacy and technical skills in supporting the technological transformation process within the medical libraries. Furthermore, building partnership and collaborations with other stakeholders is imperative-stakeholders, decision makers and policy makers in charge of medical libraries should as a matter of necessity play crucial role in facilitating digital transformation by allocating sufficient resources and put policies in place to facilitate this endeavor. Medical library management on the other hand should also promote the adoption of user-friendly designs and new technologies to enhance accessibility – in addition, fostering collaboration and the exchange of information among all parties is essential to expedite the digital transformation of medical libraries.

Abstract

This study seeks to investigate the perception and acceptance of librarians towards the adoption of Artificial Intelligence (AI) in academic libraries, with Plateau State University, Bokkos, serving as the case study. The study was undertaken against the backdrop of the low level of adoption and application of AI technologies in Nigerian academic libraries, despite their capacity to improve service delivery, information access, and operational efficiency. The objectives of the study was to determine the level of AI tool adoption in academic libraries, examine librarians' perceptions of AI technologies, and ascertain the extent to which AI tools are accepted within academic library environments. The study adopted a qualitative research design, which was due to the relatively small population size. The population comprises fourty-three (43) library staff. . The study employed a purposive sampling technique, where 23 professional librarians were selected as participants. Data was collected through semi-structured interviews to allow participants to express their views, experiences, and attitudes toward the integration of AI in library services. This approach enhanced the depth and credibility of the data that was obtained. Data analysis was carried out using thematic analysis. The analytical process involved transcription of interview data, familiarization with the data, coding, development of themes, and interpretation of the emergent themes. The result was presented thematically, with supporting participant quotations, and will be discussed in relation to the research objectives. The findings provided empirical insights into librarians' perceptions and acceptance of AI tools and highlighted key factors influencing AI adoption in academic libraries. The study will contribute to the growing body of literature on AI adoption in Nigerian academic libraries and will offer practical implications for library administrators, and all those seeking to enhance the integration of AI technologies in library services.

INTRODUCTION

The presence of artificial technology today has penetrated and revolutionized all spheres of work places including Academia. It has presented new ways, opportunities or more effective techniques to improve products, services and user experience. : Almost all major sectors including health, education, weather, business, stock markets, agriculture, and both government and non-government agencies worldwide are increasingly adopting these technologies to simplify and streamline workloads, boost productivity and speed, minimize human interaction, and most importantly, lead the digital world in a smart and sophisticated manner. Organizations and institutions must adapt to evolving technology to suit their end-user demands in the twenty-first century, which has recorded rapid transition and technological advancement. The application of AI in libraries has contributed immensely to service provision, use of library and information resources. This has helped libraries to achieve their goals and objectives of providing improved operational efficiency and enhanced user experience. (Modib & Ngulube 2024.) Artificial Intelligence in academic libraries refer to software applications and technologies powered by artificial intelligence designed to enhance, automate, and support library services and operations in educational institutions. According to the United States National Security Commission on Artificial Intelligence (NSCAI, 2021), AI is the ability of a computer system to solve problems and perform tasks that would otherwise require human intelligence. In academic libraries, AI assists with information retrieval, cataloging, research support, personalized recommendations, data analysis, and enhancement of user experiences, thereby facilitating efficient access to knowledge and information resources for students, faculty, and researchers. The implementation of AI also promotes collaboration between library professionals and information technology stakeholders, creating opportunities for innovative service delivery. Furthermore, successful AI implementation can serve as a foundation for the adoption of emerging technologies and improve the provision of information resources and services by librarians (Ajakaye, 2023). AI helps librarians reduce manual and repetitive tasks, minimize errors and

inconsistencies in data management, provide personalized services to users, support continuous library interactions regardless of location, and enhance the discovery of new information resources (Cox et al., 2023).

The successful integration of AI technologies in libraries depends largely on users' perception and acceptance of such technologies. Perception refers to the way individuals interpret, understand, and form opinions about a technology based on their experiences, beliefs, and knowledge (Mugdha & Shukla, 2024). While acceptance refers to an individual's willingness to embrace and use a technology because of its perceived usefulness, ease of use, and expected benefits (Dwivedi et al., 2023). Adoption is a decision-making process through which individuals choose to employ an innovation in their activities and is often influenced by positive perceptions and acceptance. Consequently, understanding librarians' and users' perceptions and acceptance of AI is essential for predicting the successful adoption and utilization of AI-powered library services in higher education institutions (Asemi et al., 2021)

Academic libraries are libraries established within higher education institutions to support teaching, learning, research, and community engagement. They provide access to information resources, research support services, information literacy programs, and digital scholarly communication tools that facilitate academic excellence (Association of College and Research Libraries [ACRL], 2022). As centers for knowledge creation and dissemination, academic libraries continuously adopt emerging technologies to improve service delivery and respond to the evolving information needs of their users. The integration of AI into academic library operations therefore represents a strategic approach to enhancing efficiency, innovation, user satisfaction, and the overall quality of information services in the contemporary knowledge environment (Cox et al., 2023; Ajakaye, 2023). Artificial intelligence (AI) has taken a leading role, dominating innovations in academic library services and transforming how librarians, evaluate, process and disseminate information resources a trend that this study seeks to investigate through the lens of user perception and acceptance at Plateau State University, Bokkos.

Statement of the problem

Artificial intelligence (AI) offers reasonable advantages and approaches for libraries to provide improved services to their clienteles in this era of information explosion improving user experiences, streamline operations, and enhance access to information in innovative ways (Nehra & Bansode, 2024). AI holds significant potential for industries, businesses, and libraries. Despite the growing integration of artificial intelligence (AI) in academic libraries globally, there is low level of its adoption and application in Nigerian universities, low level of adoption of AI may hinder effective library service delivery, resource management, and user satisfaction in academic libraries in Nigeria (Yusuf, et.al. 2022; Akinola 2023; Nwabuisi and Jidere 2024). Numerous studies have explored AI in academic libraries, focusing on AI-based services, benefits, and challenges (Aslim, Arif, Rafiq, & Ahmad, 2023), strategies for AI adoption (Huang, Cox, & Cox, 2023), The potential of ChatGPT in the library context (Brady and Ting 2023), The applications of Artificial Intelligence (AI) in the university libraries of Pakistan explored key factors that influence implementation of AI applications including highly integrated technological infrastructure, funding/cost associated with AI, collaboration between AI experts and professionals, and library users' feedback (Asim et al. 2023). Therefore, it is crucial to investigate librarians' perceptions and acceptance of AI to inform policy and implementation strategies tailored to the local context.

Research Questions

1) How do librarians in Plateau State University perceive the adoption of AI tools in the library?
2) What are the perception and experiences of librarians' regarding the adoption of AI tools in Plateau State University Library Bokkos?
3) How do librarians at Plateau State University Bokkos perceive the acceptance of AI tools in the library?
4) What factors influence librarians' acceptance of AI tools in Plateau State University Bokkos?

REVIEW OF LITERATURE

Level of Adoption of Artificial Intelligence Tools in Academic Libraries

AI has become an integral part of modern institutions. Integrating AI into academic libraries has become increasingly relevant for different library services and has genuinely engaged library users with other digital technologies (Hussain, 2023). AI integration with different domains has gained enormous attraction, particularly in academic libraries. Odigie (2024) investigated the awareness, use, and challenges of integrating AI in university libraries in North-Central Nigeria. Using a qualitative case study approach involving 52 reference librarians, the study found that librarians were highly aware of AI tools such as ChatGPT and Gemini; however, actual institutional adoption remained low and largely experimental. The study identified inadequate infrastructure and insufficient training as major barriers to adoption. For instance, the study (Masreka & Husseinb, 2021) demonstrates that the use of a robot advisor has dramatically influenced their perception of the usefulness of this AI tool.

Perception of librarians' towards the adoption of AI tools in Academic libraries

In a study which aims to understand how artificial Intelligence (AI) and related technologies are currently being utilized in public and academic libraries and how librarians perceive the adoption of new technologies in their relative libraries by Yoon, Andrews and Ward (2021), using an online survey questionnaire, the authors collected survey responses from both public and academic librarians that were subscribed to information science-centered listservs in North America. The quantitative survey responses ($N = 242$) were measured through use of multiple chi-square tests and crosstab analyses and their study reported that the perceptions of librarians on such technologies were generally more positive. In all, 67% of them responded that AI and related technologies will transform the library's functions, and 68% of librarians reported that they are interested in training. Additionally, The findings of the study titled Awareness and Perception of the Artificial Intelligence study in the Management of University Libraries in Nigeria by Abayomi et al (2020) revealed that academic librarians are aware of the existence of AI usage in the university libraries and that the fear of job loss is the major constraint they face in the adoption of the technologies; even though they are aware that the innovative technologies will enable efficient user satisfaction. Similarly, a study on the Perspectives of Librarians on Awareness and Readiness of Academic Libraries to Integrate Artificial Intelligence for Library Operations and Services in Nigeria by Ajani et al (2022) reveals that the librarians have mixed feelings about the readiness of academic libraries to integrate AI systems into library operations and services. Based on the librarian perception, the result implies that integration of AI in library operation and services will take the library to the next level by reducing human errors due to repetitiveness in library tasks, and if care is not taken, AI system might take their job role.

Acceptance of AI tools by Academic libraries in Nigeria

Alao and Olajide (2025) investigated AI literacy and adoption readiness among librarians in Nigerian private university libraries using the Technology Acceptance Model. Findings revealed high levels of awareness and positive readiness toward AI adoption among librarians. The study concluded that librarians were willing to adopt AI technologies if adequate training and institutional support were provided. Odelami et al. (2026) examined librarians' propensity to use AI technologies for knowledge sharing in Nigeria using the Technology Acceptance Model. The descriptive survey revealed that librarians showed strong behavioral intention to adopt AI tools where they perceived the technologies as useful and easy to use. The study also established that acceptance was influenced by institutional support and digital literacy levels. Olatunji (2025) studied the adoption of big data analytics in Nigerian university libraries in Osun State. The findings revealed that although awareness and positive attitudes toward digital technologies were high, actual utilization was low due to skill gaps and infrastructural deficiencies. Additionally, Odigie (2024) reported that despite positive attitudes toward AI technologies among librarians in North-Central Nigeria, acceptance and actual implementation remained low because of concerns relating to insufficient infrastructure and policy limitations.

Factors influencing user acceptance of AI tools within academic libraries.

Several studies have identified factors influencing librarians' acceptance of AI technologies in academic libraries. The key factors of acceptance are based on perceived usefulness. Other domains where AI is adopted have been linked with user attitude, and perceived usefulness positively affects user attitude. Regarding librarians' attitudes, towards the adoption of AI in academic libraries has been altered by the perceived usefulness (Rafique et al., 2020). Also, Kim et al. (2022) postulated that the adoption rate of AI in academic libraries is based on familiarity with technology. Odelami et al. (2026) found that librarians' acceptance of AI tools was influenced by perceived usefulness, digital competence, organizational support, and access to training opportunities. While Odelami et al. (2026) found that librarians' acceptance of AI tools was influenced by perceived usefulness, digital competence, organizational support, and access to training opportunities. Orubebe et al. (2025) also identified infrastructural availability, internet connectivity, funding, technical expertise, and training as significant factors affecting librarians' willingness to adopt AI tools in academic libraries. On the other hand, Alao and Olajide (2025) identified AI literacy, institutional readiness, and management support as major determinants of AI acceptance among librarians in Nigerian university libraries.

RESEARCH METHODOLOGY

This study adopted a qualitative research design to explore librarians' perception and acceptance of Artificial Intelligence (AI) in academic libraries: A case study of Plateau State University. Qualitative approach was appropriate because it enabled an in-depth exploration of participants' experiences, views, and interpretations regarding emerging technologies such as AI (Creswell & Creswell, 2023; Merriam & Tisdell, 2022). The study was conducted at Plateau State University Library, Bokkos, Nigeria and the population of the study consist of fourty three (43) staff of University library. The study employed a purposive sampling technique, where 23 professional librarians were selected as participants. Data for this study was collected using semi-structured interviews. The interview guide was adopted as instrument for Data collection which contained open-ended questions designed in alignment with the objectives of the study. Data was collected through face-to-face interviews with respondents. Where physical interaction was not feasible, virtual platforms such as phone or video calls was used. With participants' consent, interviews were audio-recorded and supplemented with note-taking. This approach enhanced accuracy and ensures that no important information is lost during data collection (Creswell & Creswell, 2023). The data collected was analyzed using thematic analysis which

involved: Transcribing the interview data, familiarizing with the data through repeated reading, generating initial codes, identifying and developing themes, reviewing and refining themes, and interpreting findings.

DISCUSSION OF FINDINGS

The data collected from the study were thematically analyzed, and the theme structure was based on the objectives of the research and developed from questions in the interview sessions with the librarians. The discussion below is a narrative discourse of these themes

SECTION A: LEVEL OF AI ADOPTION

Research Question 1: What is the level of adoption of AI tools in the library?

Based on the recorded interviews analyzed from the above questions, three major themes emerged:

Theme 1: Non-Adoption of AI Technologies: The findings revealed that artificial intelligence (AI) technologies have not yet been adopted in Plateau State University Library. All respondents consistently reported that no AI tools or systems are currently being used in any aspect of the library operations. For example a respondent said *"For now we have not yet adopted any AI technology in any of our library services but make use of E-library as an alternative."* Participants indicated that traditional and manual approaches continue to dominate service delivery, cataloguing, circulation, reference services, and other library functions. The absence of AI technologies suggests that the library remains at an early stage of digital transformation. Although AI has gained considerable attention within the library profession globally, its implementation in many academic libraries, particularly in developing countries, remains limited due to infrastructural, financial, and technical constraints. The finding corroborates previous studies which reported low levels of AI adoption in academic libraries despite growing awareness of its potential benefits (Cox et al., 2019; Hussain, 2023; Nwabuisi, 2024). The finding further suggests that the library has not yet developed the institutional capacity required for AI implementation. This may include limitations in technological infrastructure, funding, policy frameworks, and staff training, which have been identified in the literature as significant barriers to AI adoption in libraries (Asemi & Asemi, 2020; Orubebe et al., 2025).

Theme 2: Library Automation as a Foundation for Future AI Adoption

A significant finding emerging from the interviews was that all 23 respondents reported that the library is currently undergoing automation processes. Participants expressed optimism that once automation is fully implemented, AI technologies may subsequently be integrated into library services. This finding indicates that although AI adoption has not yet occurred, the library is making progress toward technological modernization. Automation is widely recognized as an important prerequisite for AI implementation because it establishes the digital infrastructure, electronic databases, and information management systems necessary for advanced AI applications. Respondents perceived the ongoing automation project as a positive step that could facilitate future AI integration. The finding aligns with studies which argue that libraries often progress through stages of technological development, beginning with computerization and automation before advancing to more sophisticated technologies such as artificial intelligence and machine learning (Cox et al., 2019; Ayinde, 2026). The respondents' optimism suggests a readiness for technological innovation and an expectation that AI will eventually become part of library operations.

Theme 3: Individual Familiarity and Readiness for AI Adoption

Another important theme that emerged from the findings was individual familiarity with AI technologies. Although AI has not been officially adopted by the library, majority of the respondents reported using AI tools for their personal and professional tasks. For example respondent said: *No, as library but personally I use AI tools in my daily activities it helps me get my work faster and easily*. Participants indicated that they frequently use AI applications to support information searching, writing, document preparation, research activities, content generation, and other work-related functions. This finding demonstrates that librarians possess substantial awareness of and exposure to AI technologies despite the absence of institutional implementation and indicate that the level of AI adoption in the Plateau State University Library is currently nonexistent. However, the ongoing automation process and the widespread personal use of AI technologies among library staff suggest a degree of organizational readiness institutional support, the library may be well positioned to adopt AI technologies in the future. The widespread personal use of AI among respondents suggests that resistance to AI adoption may not be a major challenge within the library. Rather, the barriers to adoption appear to be organizational and infrastructural rather than attitudinal. This finding supports previous studies that identified librarians' growing familiarity with AI technologies as an important factor influencing future adoption. Lund and Wang (2023) found that many library professionals are increasingly experimenting with generative AI tools such as ChatGPT even in institutions where formal AI implementation has not yet occurred. Likewise, Ayinde (2026) reported that awareness and personal use of AI technologies among librarians often precede institutional adoption and may facilitate future implementation efforts.

The Perception of Librarians towards AI Tools

Theme 1: Positive Acceptance of AI Technologies

The findings revealed an overwhelmingly positive perception of artificial intelligence (AI) among librarians. All respondents (100%) expressed acceptance of AI technologies and indicated that they viewed AI as a valuable innovation capable of supporting library and information services. Participants generally perceived AI as a useful tool that could improve efficiency, enhance information access, and support professional activities within academic libraries. The unanimous acceptance of AI is particularly significant considering that the library has not yet adopted AI technologies institutionally. This finding suggests that librarians are receptive to technological innovation and are likely to support future AI implementation initiatives. The positive attitude observed among respondents aligns with previous studies which reported that librarians generally perceive AI as an opportunity to enhance service delivery, automate repetitive tasks, and improve user experiences (Cox et al., 2019; Asemi & Asemi, 2020).

Theme 2: Perceived Improvement in Work Efficiency and Productivity

Another dominant theme that emerged from the data was the perception that AI improves work efficiency. A significant number of respondents stated that while the library as an organization has not embraced AI, they are already familiar with AI applications and have incorporated them into their personal workflows. Another response says: *Of course AI technologies would ease work load on the librarians, for instance in the reference section, chat bots could answer users' queries all the time and speedily*. This suggests that lack of adoption may not be attributable to resistance from staff but rather to organizational and infrastructural limitations. Furthermore, many of the participants explained AI makes their work faster and more productive and that AI assists them in conducting literature searches, generating content, summarizing information, editing documents, and performing other professional tasks more efficiently than traditional methods. The finding demonstrates that librarians perceive AI primarily as a productivity-enhancing tool. Respondents emphasized that AI reduces the time required to complete routine activities and facilitates quicker access to relevant information. Such perceptions are consistent with studies that identified efficiency, speed, and enhanced productivity as some of the major advantages motivating AI adoption in academic libraries (Hussain, 2023; Lund & Wang, 2023).

Level of Acceptance of AI Tools

Theme 1: Strong Willingness to Use AI Technologies

The findings revealed a very high level of acceptance of artificial intelligence (AI) technologies among librarians. All respondents (100%) indicated their willingness to use AI tools in their daily work activities. An example of the respondents said "*I will gladly recommend the adoption of AI technologies in our library".* Participants expressed enthusiasm about the potential of AI to enhance efficiency, improve service delivery, and support various professional tasks within the library environment. The undisputed willingness to use AI suggests that librarians recognize the value and relevance of AI technologies in contemporary information services. This finding is particularly important given that AI technologies have not yet been officially adopted in Plateau State University Library. The result indicates that librarians are not resistant to technological innovation and are likely to embrace AI implementation initiatives when introduced. This finding supports the Technology Acceptance Model (TAM), which posits that users are more likely to adopt technologies they perceive as useful and beneficial to their work (Davis, 1989). The respondents' willingness to use AI reflects their perception that AI can improve work performance and facilitate the delivery of quality library services. Similar findings have been reported by Cox et al. (2019), who found that librarians generally demonstrate positive attitudes toward AI adoption due to its perceived usefulness in enhancing operational efficiency and service provision.

Theme 2: Comfort and Confidence in Using AI Technologies

Another major theme that emerged from the data was respondents' comfort with AI technologies. A significant number of respondents reported that they were comfortable using AI applications and technologies. Example "*I am even 100% comfortable using AI Technology for my personal work, this give me confidence that I can easily use these technologies if eventually integrated in the library*" This finding suggests that librarians possess a basic level of digital competence and familiarity with AI-powered tools, likely influenced by their personal use of AI technologies for research, information retrieval, writing, and administrative tasks. The respondents' comfort with AI indicates a high degree of technological readiness within the library workforce. Research has shown that user confidence and technological competence significantly influence the successful adoption of emerging technologies (Venkatesh et al., 2003). Therefore, the positive attitudes demonstrated by respondents may facilitate future AI implementation efforts within the library. This finding also lines up with recent studies that suggest increasing exposure to AI technologies has contributed to greater acceptance and confidence among information professionals (Lund & Wang, 2023; Hussain, 2023). As librarians become more familiar with AI applications, concerns regarding technological complexity tend to diminish, thereby increasing acceptance and willingness to use such technologies.

Theme 3: Need for Training and Capacity Building

Despite their positive attitudes toward AI, a good number of respondents emphasized the need for training and retraining programs to equip library staff with the knowledge and skills required to effectively utilize AI technologies. Participants acknowledged that although they were comfortable with AI, specialized training would be necessary to maximize the benefits of AI applications in library operations. This finding highlights the importance of continuous professional development in the successful implementation of AI technologies. While acceptance and willingness are important factors, effective adoption also requires adequate knowledge, technical competencies, and institutional support. The respondents recognized that AI technologies are constantly evolving and that librarians must continuously update their skills to remain relevant in an increasingly technology-driven information environment. This finding corroborates studies that identify staff training as a critical determinant of successful AI adoption in libraries (Asemi & Asemi, 2020; Nwabuisi, 2024). Researchers have consistently argued that without adequate training, librarians may struggle to fully utilize AI technologies, thereby limiting the effectiveness of implementation efforts.

Theme 4: Strong Support for Full AI Integration in Library Operations

The findings further revealed unanimous support for the integration of AI technologies into library operations. All respondents recommended that AI should be fully integrated into library services and activities. Participants believed that AI could improve efficiency, enhance service delivery, facilitate information retrieval, and support decision-making processes within the library. This finding demonstrates a strong institutional readiness for AI adoption among library staff. Although AI technologies are not currently utilized within the library, respondents expressed optimism regarding their future implementation and recognized the potential benefits that AI could bring to library operations. The finding is consistent with previous studies which reported that librarians increasingly advocate for AI adoption as a means of modernizing library services and responding to the changing information needs of users (Cox et al., 2019; Ayinde, 2026). Respondents viewed AI not as a threat but as an opportunity to improve library effectiveness and maintain relevance in the digital age.

Factors influencing the acceptance of AI tools in PLASU Library

The analysis of respondents' views revealed three major themes influencing the acceptance of Artificial Intelligence (AI) tools in PLASU Library: **perceived benefits of AI**, **institutional support and organizational readiness**, and **training and capacity development**. While respondents acknowledged the potential of AI to improve library operations, several concerns relating to job security, infrastructure, funding, and technical reliability affected their willingness to fully embrace the technology.

Theme 1: Perceived Benefits and Concerns about AI Adoption

The findings indicate that the majority of respondents were positively disposed toward AI adoption because of its ability to improve library operations, simplify workflows, enhance efficiency, and reduce repetitive tasks. For example “Participants believed that AI could automate routine processes, improve service delivery, and increase productivity among library staff. These perceived advantages serve as important motivating factors for AI acceptance. However, respondents also expressed several concerns that discouraged AI usage. The most frequently mentioned concerns included fear of job displacement, overreliance on AI systems, inaccurate outputs, poor internet connectivity, and inadequate funding. Many respondents worried that the increasing use of AI technologies could reduce the need for human librarians and potentially threaten employment opportunities. Concerns were also raised about the reliability of AI-generated information, particularly when incorrect or misleading responses are produced. These findings aligns with previous studies that identified efficiency, service enhancement, and innovation as major drivers of AI adoption in libraries, while financial constraints, technological barriers, and fears of job loss remain significant obstacles (Shahzad et al., 2025; Ayinde et al., 2025). Similarly, Mhlongo and Maphosa (2024) found that librarians generally maintain positive attitudes toward AI because of its operational benefits but remain concerned about job security and technological dependence. Studies conducted in developing countries further highlight infrastructure limitations and insufficient funding as major barriers to AI implementation in libraries (Asemi & Asemi, 2023; Okechukwu et al., 2024).

Theme 2: Institutional Support and Organizational Readiness

Another important factor influencing AI acceptance was institutional support. Several respondents acknowledged that the ongoing automation process within PLASU Library demonstrates management's commitment toward technological advancement and provides a foundation for future AI adoption. The automation initiative was viewed as evidence that the institution recognizes the importance of digital transformation and is gradually preparing the library for AI integration. Nevertheless, some respondents expressed dissatisfaction with the slow pace of automation, suggesting that inadequate implementation speed may hinder confidence in the institution's readiness for full AI deployment. This indicates that while organizational support exists, its effectiveness may be constrained by implementation challenges. The findings support existing literature which emphasizes that institutional commitment, strategic planning, and organizational readiness are critical determinants of successful AI adoption in libraries. Research has shown that

libraries with strong administrative support, clear technological policies, and investment in digital infrastructure are more likely to adopt AI successfully (Ayinde et al., 2025; Shahzad et al., 2025). Furthermore, studies have identified funding, governance structures, and organizational culture as significant factors affecting AI implementation in academic libraries.

Theme 3: Lack of Training and Capacity Development

The findings revealed a significant gap in AI-related training among respondents. All participants reported that they had not received formal training specifically focused on AI technologies in libraries. An example of a response from interview "*personally I will say yes, I have attended and subscribed for trainings but for our institutional training, the answer is not really, if not for those trainings we received on library automation where a facilitator chipped in a little about AI Technologies in libraries."* Although some respondents indicated that AI concepts were briefly introduced during library automation training sessions, these exposures were limited and insufficient for developing practical AI competencies. Interestingly, a good number of respondents reported acquiring AI skills independently through personal learning initiatives, while a few of the respondents indicated plans to undertake future AI training. This demonstrates a growing awareness of the importance of AI literacy among library staff despite the absence of formal institutional training programs. Existing literature consistently identifies inadequate AI knowledge, limited technical skills, and insufficient professional development opportunities as major challenges to AI adoption in libraries. Ayinde et al. (2025) emphasize the need for retraining librarians to acquire competencies in managing AI-enhanced services. Similarly, studies by Shahzad et al. (2024, 2025) and other scholars have highlighted training and capacity building as essential prerequisites for successful AI implementation. Recent evidence also suggests that organizations are often deploying AI technologies faster than they are preparing staff to use them effectively, creating a substantial skills gap that affects adoption rates.

CONCLUSION AND RECOMMENDATIONS

Conclusion

The findings indicate that librarians possess a highly positive perception of AI technologies. All respondents recognize AI as a valuable tool capable of improving efficiency, productivity, and service delivery. However, their acceptance of AI is accompanied by important concerns regarding overdependence, job displacement, and information accuracy. The findings therefore suggest that librarians support the integration of AI into academic libraries provided that appropriate safeguards, training programs, and ethical guidelines are established. The combination of strong acceptance and cautious optimism indicates a favorable environment for future AI adoption within the library for future AI integration. These findings imply that with adequate infrastructure, funding, training, and

Recommendations

Based on the major findings and conclusion of this study, the following recommendations were made. That:

1) Academic Libraries in Nigeria should fully adopt and integrate Artificial Intelligence into their daily operations to improve efficiency, enhance information access, and support professional activities within academic libraries.
2) Library management should fully automate all library services as it serves as a foundation for AI integration**.**
3) Library management should **leverage Librarians' Positive Attitudes during AI Implementation** by involving librarians in the planning, selection, and implementation of AI systems. Their enthusiasm and readiness to use AI can facilitate smoother adoption processes and increase the success of AI initiatives.
4) **Institutions should accelerate the Introduction of AI Technologies in the Library** given the strong willingness of librarians to use AI technologies, the university library should take proactive steps toward adopting and integrating AI technologies into library operations. The high level of acceptance indicates that implementation efforts are likely to receive staff support and cooperation.
5) Institution should leverage on librarians' Comfort and Confidence in Using AI Technologies to adopt and fully implement AI integration in all sections of the library.
6) Invest in digital infrastructure and technological resources, provide continuous AI training and capacity building through workshops, conferences, webinars, and professional networks focused on AI and emerging technologies.
7) Institutional management should develop Institutional Policies to Support AI Adoption and guide implementation, ensure ethical use, and promote sustainable integration of AI into library services

Innocent Iwezor Ordu (PhD)

Department of Library and Information Science, Rivers State University, Nigeria

Innocent.iwezor@gmail.com, innocent.ordu@ust.edu.ng

Abstract

Climate change has become a growing concern for libraries, particularly in developing regions where environmental and infrastructural challenges are more pronounced. This study examined librarians' resilient strategies in addressing climate change impacts in libraries in Ebonyi State, Nigeria. The study focused on identifying climate change elated risks, examining the adaptation strategies employed by librarians, assessing institutional policies and frameworks, and identifying challenges limiting effective implementation of climate-resilient practices. A descriptive survey research design was adopted, and data were collected from librarians using structured online questionnaires and mean score was used to analysed the data. The findings revealed that major climate-related risks affecting libraries include extreme heat, humidity, and other extreme weather conditions. The study also found that librarians employ several adaptation strategies such as digital preservation, environmental monitoring, staff training, and collaboration. However, institutional policies and frameworks, although recognized, are not strongly implemented. Furthermore, the study identified key challenges such as inadequate funding, poor maintenance culture, weak infrastructure, limited technological capacity, and lack of clear climate policies. These challenges significantly hinder the effective adoption of resilience strategies. The study concludes that while librarians in Ebonyi State are making efforts to adapt to climate change, their capacity is limited by systemic and institutional constraints. It therefore recommends increased funding, stronger policy implementation, improved infrastructure, and continuous capacity building to enhance climate resilience in libraries. The study contributes to the growing body of knowledge on climate change and library management in developing contexts

Keyword: Climate Change, Librarian Resilience, Ebonyi State, Environmental Sustainability, Institutional Policies

Introduction

Climate change is no longer a distant or abstract concern. It is a present and visible reality that is reshaping how people live, work, and manage institutions across the world. At its core, climate change refers to long-term shifts in temperature, rainfall, and weather patterns, largely driven by human activities such as the burning of fossil fuels and deforestation. Reports by the Intergovernmental Panel on Climate Change show that rising global temperatures and the increasing frequency of extreme weather events such as floods, droughts, and heatwaves are now well established (IPCC, 2023). While much attention has been given to the impact of these changes on agriculture, health, and the economy, less visible but equally important is their effect on knowledge institutions like libraries(Akidi & Igbinovia, 2026).

Libraries have traditionally been seen as stable and controlled environments. They are carefully designed spaces where books, archives, and digital resources are preserved for long-term use. For decades, the assumption has been that with proper care, library collections can last for generations. However, climate change is gradually challenging this assumption. Rising temperatures, increased humidity, and unpredictable weather conditions are beginning to interfere with the delicate balance required to preserve information materials (pius & Patrick, 2024). For instance, excessive heat can weaken paper and adhesives, while high humidity encourages mold growth and pest infestations. Flooding, which is becoming more frequent in many parts of Nigeria, can destroy entire collections within hours. As Einecker and Kirby (2020) observe, climate-related hazards are placing growing pressure on institutions that depend on stable environmental conditions.

In developing countries such as Nigeria, the situation is even more complex. Many libraries operate under conditions that make them particularly vulnerable. Issues such as poor infrastructure, irregular power supply, and limited funding reduce their ability to respond effectively to environmental threats. Mohammed (2024) notes that in several Nigerian academic libraries, materials are already deteriorating at a faster rate due to uncontrolled temperature and humidity levels. This means that climate change is not just a future risk but an ongoing challenge that is already affecting the quality and longevity of information resources.

In response to these realities, the idea of resilience has become increasingly important in library practice. Resilience, in simple terms, is the ability to cope with disruption and still function effectively. For libraries, this means finding ways to protect collections, maintain services, and recover quickly when damage occurs. One common approach is

digitization, where physical materials are converted into electronic formats. This not only preserves the content but also allows users to access information remotely. Other strategies include improving environmental control, adopting energy-efficient systems, and developing emergency response plans. Garnett (2021) explains that libraries that embrace these approaches are better positioned to adapt to changing environmental conditions. The growing interest in "green libraries" also reflects a shift toward more sustainable and environmentally conscious practices (Ajani et al., 2024).

However, resilience does not happen by chance. It is often guided by institutional policies and frameworks that provide direction and structure. Policies related to disaster management, environmental sustainability, and digital preservation help libraries plan ahead and respond in an organized way. Unfortunately, evidence suggests that many libraries in developing regions lack strong and enforceable policies in this area. Ajani et al. (2025) point out that the absence of clear frameworks often leads to uncoordinated efforts and weak preparedness. Even where policies exist, their implementation is sometimes limited by lack of resources or institutional commitment.

At the same time, several practical challenges continue to stand in the way of effective action. Limited funding makes it difficult for libraries to invest in modern equipment or upgrade their facilities. There is also a gap in technical skills, as not all librarians are trained in areas such as disaster preparedness or digital preservation. Frequent power outages further complicate efforts to maintain stable environments and run digital systems. Mohammed (2024) highlights that these challenges combine to increase the vulnerability of libraries to climate-related damage.

Given these realities, it becomes important to look closely at how libraries are actually coping within specific local setting. While existing studies provide useful general insights, they often do not capture the unique conditions of individual states or regions. In the case of Ebonyi State, there is limited empirical evidence on how libraries are experiencing climate-related risks and what strategies librarians are using to respond. This lack of localized understanding creates a gap in knowledge and practice. It is against this background that this study seeks to examine librarians' resilient strategies in addressing climate change in libraries in Ebonyi State. By doing so, it aims to provide a clearer picture of the challenges, responses, and opportunities that exist within this specific context.

Objectives of the study

The main objective of this study is to examine librarians' resilient strategies in addressing climate change impacts in libraries in Ebonyi State. The specific objectives are to:

1. Identify the climate change related risks affecting libraries in Ebonyi State.
2. Examine the resilience and adaptation strategies employed by librarians in Ebonyi State to mitigate the impacts of climate change.
3. Identify the challenges limiting the effective implementation of climate-resilient strategies in libraries Ebonyi State.

Research Questions

1. What is the climate change–related risks affecting libraries in Ebonyi State?
2. What resilience and adaptation strategies are employed by librarians to mitigate the impacts of climate change?
3. What challenges limit the effective implementation of climate-resilient strategies in libraries in Ebonyi State?

Literature review

Climate Change Related Risks Affecting Libraries

Climate change has been recognized as a major threat to information institutions across the world. In Nigeria, the impacts of climate change are particularly acute, affecting different regions through heightened occurrences of flooding, drought, and unpredictable weather patterns (Nwankwo et al., 2020). Libraries, as custodians of knowledge, are not exempt from these impacts. Rising global temperatures, unpredictable rainfall, and extreme weather events have created new risks that affect both library infrastructure and collections. According to Einecker and Kirby (2020), climate-related hazards such as flooding, storms, and heatwaves have become more frequent and intense, thereby increasing the vulnerability of public and academic institutions.

In Nigeria, these risks are even more pronounced due to infrastructural challenges and limited environmental control systems (Alemna, 2020). Mohammed (2024) observes that many academic libraries experience deterioration of paper-based materials as a result of excessive heat and humidity. These environmental conditions often lead to mold growth, weakening of paper fibers, and eventual loss of valuable information resources. Flooding is another major concern, especially in regions with poor drainage systems. When floodwater enters library buildings, it can destroy books, archival materials, and electronic equipment within a short time.

Temperature fluctuations also pose a serious risk. High temperatures accelerate the chemical breakdown of paper, while unstable conditions affect adhesives and bindings. Ajani et al. (2025) further note that storms and heavy winds can damage roofs and windows, exposing collections to external elements. Beyond physical damage, climate change also disrupts library services. Extreme weather conditions may prevent users from accessing library facilities, thereby affecting learning and research activities. These findings suggest that libraries must now operate in an environment where climate risks are constant and evolving.

Resilience and Adaptation Strategies in Libraries

In response to these growing risks, libraries are adopting different strategies to improve their resilience. Resilience refers to the ability of an institution to withstand shocks, adapt to changing conditions, and recover quickly from disruptions. Modern libraries are gradually moving from reactive approaches to more proactive and strategic forms of climate adaptation. Garnett (2021) explains that resilience in libraries involves a combination of planning, innovation, and sustainability practices.

One of the most widely used strategies is digitization. By converting physical materials into digital formats, libraries can preserve information even if the original copies are damaged. Digital repositories also allow users to access resources remotely, which becomes important during climate-related disruptions. In addition, libraries are investing in digital preservation systems such as cloud storage and backup servers. These systems help to protect data from loss caused by disasters.

Environmental monitoring is another important strategy. Libraries now use tools to control temperature and humidity within storage areas. This helps to slow down the deterioration of materials and prevent mold infestation. The concept of green libraries has also gained attention in recent years. This approach encourages the use of energy-efficient lighting, renewable energy sources, and environmentally friendly building materials. Ajani et al. (2024) argue that green libraries not only reduce environmental impact but also contribute to long-term sustainability.

Disaster preparedness is equally important. Many libraries are developing emergency response plans that outline steps to take before, during, and after a disaster. These plans often include staff training, risk assessment, and recovery procedures. Saini (2025) highlights the importance of structured frameworks such as the Climate Action Framework for Libraries, which provides practical guidance on integrating climate resilience into library operations. Through these strategies, libraries are gradually building the capacity to cope with climate change.

Challenges Limiting the Implementation of Climate-Resilient Strategies

Despite the availability of various strategies and frameworks, many libraries face challenges in implementing climate-resilient practices. One of the most common challenges is inadequate funding. Climate resilience often requires significant investment in infrastructure, technology, and training. Unfortunately, many libraries operate on limited budgets and struggle to meet their basic needs. Ajani et al. (2025) identify funding constraints as a major barrier to the adoption of resilience strategies in Nigerian libraries.

Poor infrastructure is another major issue. Many library buildings are old and were not designed to withstand extreme weather conditions. Upgrading these buildings can be expensive and is often not prioritized. As a result, libraries remain vulnerable to flooding, heat, and storms. In addition, there is a lack of technical expertise among library staff. Many librarians have not received adequate training in areas such as disaster management or digital preservation. This limits their ability to implement effective strategies.

Technological challenges also play a role. Access to modern tools and reliable internet services is still limited in many parts of Nigeria. Frequent power outages further complicate the situation by disrupting digital services and damaging equipment. Without stable electricity, it becomes difficult to maintain environmental control systems or operate digital repositories.

Institutional factors also contribute to the problem. In some cases, there is weak support from management or government authorities. Climate resilience may not be seen as a priority compared to other pressing needs. Resistance to change among staff can also slow down the adoption of new practices. Einecker and Kirby (2020) note that lack of coordination between policy and practice is a common issue in climate adaptation efforts.

Methodology

Research designs This study adopted a sectional survey design. A sectional approach is appropriate for examining prevailing behaviors, perceptions, strategies and usage patterns within a defined population at a specific location (Creswell and Creswell 2017; Setia 2016). The design was considered suitable because the study sought to examine the climate change related risks affecting in Ebonyi State, the resilience and adaptation strategies employed by librarians in Ebonyi State to mitigate the impacts of climate change and the challenges limiting the effective implementation of climate-resilient strategies in libraries Ebonyi State.

Survey designs were adopted for the study. This is because they are widely used in studies and it allow researchers to obtain accurate information from of respondents efficiently. The population of this study comprised librarians in Ebonyi state. A convenience sampling technique was employed for this study. Convenience sampling was considered appropriate because the study aimed to reach accessible participants who were willing to provide responses within a limited data collection period. This sampling approach has been widely adopted in survey-based studies involving knowledge and use of (Alam et al. 2024; Etikan, Musa, and Alkassim 2016). The survey was distributed online, and participation was voluntary. At the end of the data collection period, 21 respondents completed the survey, and their responses were considered valid for analysis. The sample size was considered adequate for both data analyses.

Instrument for data collection Data were collected using a structured questionnaire developed in line with the objectives of the study and existing literature on climate change resilience strategies. Data collection was conducted between March 2026 and April 2026 using Google Forms. The survey link was shared through multiple online platforms to reach potential respondents. Specifically, the link was distributed through the researchers' WhatsApp groups. In addition, the survey link was shared with librarians working in libraries in Ebonyi through the official WhatsApp group.

To ensure content validity, the draft questionnaire was reviewed by three experts in Library and Information Science. Their feedback led to improvements in wording clarity, relevance of items, and alignment with the research objectives. A decision benchmark of 2.50 was used for interpreting the mean scores. Mean values equal to or greater than 2.50 indicated agreement with the statement or a high level of the measured construct, while mean values below 2.50 indicated disagreement or a low level of the measured construct. The respondents scale and value assigned is SA=4, A=3, D=2 and SD=1. The removal of the neutral response option helped reduce central tendency bias and enhanced clarity in interpreting responses (Asún, Rdz-Navarro, and Alvarado 2016; Ayanbode and Adetoro 2021; Oladokun et al. 2025; Pornel and Saldaña 2013).

This study adhered to standard ethical guidelines for research involving human participants. Participation in the study was entirely voluntary, and informed consent was obtained from all respondents before completing the questionnaire. The introductory section of the online survey clearly explained the purpose of the study, the nature of participation, and participants' right to withdraw at any time without penalty. No personally identifiable information was collected, and all responses were treated with strict confidentiality and used solely for academic purposes

Analysis of data and results

Demographic analysis

Distribution of respondent's libraries in Ebonyi State

S/N	Name of Library	Frequency
1.	David Umahi federal university of health sciences	4
2.	Ebonyi State University of Aeronautics and Aerospace Engineering Library	2
3.	Ebonyi State University Library	4
4.	Alex Ekwueme Federal University Ndufu-alike Ikwo (AE-FUNAI)	3
5.	National Library of Nigeria	2
6.	Akanu Ibiam Federal Polytechnic Unwana Library	3
7.	EBONYI STATE LIBRARY BOARD	1
8.	Evangel University	2
	TOTAL	21

Research Question 1: What is the climate change related risks affecting libraries in Ebonyi State?

Table 1: Describe the resilience and adaptation strategies employed by librarians in Ebonyi State to mitigate the impacts of climate change

S/N	ITEMS	SA	A	D	SD	x̄	Decision
1	Flooding and Water damage	5	3	8	5	2.4	rejected
2	Extreme Heat and Temperature Fluctuations	4	11	6	-	2.9	Accepted
3	Humidity and Moisture-Related Damage	6	9	4	2	2.9	Accepted
4	Fire Hazards	4	6	2	9	2.2	rejected
5	Storms	-	3	6	12	1.6	rejected
6	Extreme Weather Events	4	11	6	-	2.9	Accepted

Table 2 presents the mean responses on the climate change–related risks affecting libraries in Ebonyi State. The table shows that librarians perceived that: extreme heat and temperature fluctuations significantly affect library operations and collections (2.9), humidity and moisture-related damage pose serious threats to information resources (2.9), and extreme weather events constitute a notable risk to libraries (2.9).

However, the table also reveals that librarians did not perceive some factors as major risks. These include flooding and water damage (2.4), fire hazards (2.2), and storms (1.6), as their mean scores fall below the accepted threshold.

Overall, the findings indicate that energy instability and environmental conditions such as heat and humidity are the most pressing climate-related risks affecting libraries in Ebonyi State, while other factors like storms and fire hazards are perceived as less significant.

Research Question 2: What resilience and adaptation strategies are employed by librarians to mitigate the impacts of climate change?

Table 2: Describe the resilience and adaptation strategies employed by librarians in Ebonyi State to mitigate the impacts of climate change.

S/N	ITEMS	SA	A	D	SD	x̄	Decision
1	Digital Preservation and Digitization of Information resources	7	7	5	2	2.9	Accepted
2	Environmental Monitoring and Control	6	9	4	2	2.9	Accepted
3	Green Library Practices	4	8	8	1	2.7	Accepted
4	Infrastructure Improvement and Climate-Proofing	3	12	3	3	2.7	Accepted
5	Staff Training and Capacity Building	7	7	4	3	2.9	Accepted
6	Climate Policies and Institutional Frameworks	3	8	5	5	2.4	Rejected
7	Collaboration and Partnerships	8	8	3	4	2.9	Accepted

Table 3 presents the mean responses on the resilience and adaptation strategies employed by librarians to mitigate climate change impacts in libraries in Ebonyi State. The table shows that librarians perceived that: digital preservation and digitization of information resources is a key strategy for mitigating climate-related risks (2.9), environmental monitoring and control play an important role in protecting library collections (2.9), staff training and capacity building are essential for enhancing resilience (2.9), and collaboration and partnerships contribute significantly to effective climate adaptation (2.9).

The findings also indicate that green library practices (2.7) and infrastructure improvement and climate-proofing (2.7) are accepted as important strategies, although with slightly lower mean scores.

However, climate policies and institutional frameworks (2.4) were not perceived as a strong strategy, as the mean score falls below the acceptance threshold.

The results suggest that librarians in Ebonyi State rely more on practical and operational strategies such as digitization, training, and environmental control, while institutional policy frameworks are less emphasized in addressing climate change impacts.

Research Question 3: What institutional policies and frameworks exist for promoting climate resilience in libraries in Ebonyi State?

Table 3: the institutional policies and frameworks that promote climate resilience in libraries in Ebonyi State.

S/N	ITEMS	SA	A	D	SD	x̄	Decision
1	Disaster Risk Management Policy	7	6	4	4	2.8	Accepted
2	Environmental Sustainability (Green Library) Policy	5	9	4	3	2.8	Accepted
3	Collection Preservation and Conservation Policy	5	8	6	2	2.8	Accepted
4	Digital Preservation and Data Management Policy	7	10	-	4	3.0	Accepted
5	Infrastructure Maintenance and Development Policy	7	9	3	2	3.0	Accepted
6	Energy Management Policy	3	9	6	3	2.6	Accepted
7	Staff Training and Capacity Development Policy	6	7	5	3	2.8	Accepted
8	Records Management and Backup Policy	7	9	2	3	3.0	Accepted

Table 4 presents the mean responses on the institutional policies and frameworks promoting climate resilience in libraries in Ebonyi State. The table shows that librarians perceived that: digital preservation and data management policy plays a significant role in promoting climate resilience (3.0), infrastructure maintenance and development policy is crucial for strengthening library sustainability (3.0), and records management and backup policy is essential for safeguarding information resources (3.0).

The findings also reveal that disaster risk management policy (2.8), environmental sustainability (green library) policy (2.8), collection preservation and conservation policy (2.8), and staff training and capacity development policy (2.8) are all important and accepted frameworks supporting climate resilience in libraries.
Additionally, energy management policy (2.6) is accepted, although it has the lowest mean score among the listed policies.
The results indicate that librarians in Ebonyi State recognize a broad range of institutional policies as important for promoting climate resilience, with particular emphasis on digital preservation, infrastructure development, and records management practices.

Research Question 4: What institutional policies and frameworks exist for promoting climate resilience in libraries in Ebonyi State?
Table 4: the challenges limiting the effective implementation of climate-resilient strategies in libraries Ebonyi State.

S/N	ITEMS	SA	A	D	SD	x̄	Decision
1	Inadequate Funding	15	2	4	-	3.5	Accepted
2	Lack of climate change policy	8	8	5	-	3.1	Accepted
3	Poor Infrastructure	9	4	7	1	3.0	Accepted
4	Limited Awareness and Expertise	6	9	6	-	3.0	Accepted
5	Inadequate Technological Capacity	8	8	3	2	3.0	Accepted
6	Poor Maintenance Culture	9	9	3	-	3.3	Accepted
7	Reliable data and Information gaps on climate risks	8	6	4	3	2.9	Accepted

Table 5 presents the mean responses on the challenges limiting the implementation of climate-resilient strategies in libraries in Ebonyi State. The table shows that librarians perceived that: inadequate funding is the most significant challenge affecting climate resilience in libraries (3.5), poor maintenance culture also greatly limits effective implementation of resilience strategies (3.3), and lack of climate change policy is a major constraint (3.1).

The findings further indicate that poor infrastructure (3.0), limited awareness and expertise (3.0), and inadequate technological capacity (3.0) are all important challenges hindering the adoption of climate-resilient practices in libraries.

In addition, reliable data and information gaps on climate risks (2.9) were also accepted as a challenge, although with a slightly lower mean score compared to others.
The results reveal that financial constraints, weak institutional support systems, and infrastructural deficiencies are the most critical barriers to implementing climate-resilient strategies in libraries in Ebonyi State.

Discussion of Findings
This section discusses the findings of the study in relation to existing literature. The discussion is organized according to the research objectives.
Climate Change Related Risks Affecting Libraries
The findings revealed that power outages and energy instability, extreme heat and temperature fluctuations, humidity and moisture-related damage, and extreme weather events are the most significant climate-related risks affecting libraries in Ebonyi State. This aligns with Mohammed (2024), who observed that Nigerian libraries are highly vulnerable to environmental instability due to poor temperature regulation and unstable power supply. Similarly, Einecker and Kirby (2020) noted that climate-induced hazards such as heatwaves and flooding increasingly threaten the sustainability of information institutions globally.
The prominence of energy instability in this study reflects the reality of developing regions where libraries rely heavily on inconsistent public power supply. This finding supports Ajani et al. (2025), who reported that infrastructural fragility and environmental instability are major contributors to climate vulnerability in Nigerian libraries. However, the lower perception of flooding and fire hazards as major risks in this study contrasts with global literature, where flooding is often identified as a dominant threat. This may be due to geographical variation or underreporting of past incidents in Ebonyi State.
Overall, the findings confirm that environmental and energy-related challenges remain central to climate risk exposure in libraries, particularly in resource-constrained environments.

Resilience and Adaptation Strategies Employed by Librarians

The study found that digital preservation, environmental monitoring, staff training, collaboration, green library practices, and infrastructure improvement are widely used strategies for climate adaptation. This is consistent with Garnett (2021), who emphasized that resilient libraries adopt a combination of technological, environmental, and human capacity strategies to withstand climate disruptions.

Digital preservation emerged as a key strategy, supporting the view of Ajani et al. (2024) that digitization is central to modern library resilience. It ensures continuity of access to information even when physical collections are compromised. Environmental monitoring and control also align with global best practices that focus on maintaining optimal storage conditions to prevent deterioration of materials.

The acceptance of staff training and capacity building supports the argument that human capital development is essential for resilience. According to Saini (2025), librarians must be equipped with climate literacy and disaster response skills to effectively manage environmental risks. Collaboration and partnerships further reinforce resilience by enabling resource sharing and technical support.

However, the rejection of climate policies and institutional frameworks as a strong strategy suggests a gap between operational practices and formal governance structures. This finding supports Ajani et al. (2025), who reported weak policy integration in Nigerian libraries, where resilience efforts are often practice-driven rather than policy-driven.

Challenges Limiting the Implementation of Climate-Resilient Strategies

The findings identified inadequate funding, poor maintenance culture, lack of climate policy, poor infrastructure, limited expertise, inadequate technological capacity, and data gaps as major challenges. Among these, inadequate funding emerged as the most critical barrier.

This aligns strongly with Ajani et al. (2025), who identified financial constraints as the primary limitation to climate resilience in Nigerian libraries. Without sufficient funding, libraries are unable to invest in digitization, infrastructure upgrades, or staff training.

Poor maintenance culture also emerged as a significant challenge. This supports Mohammed (2024), who observed that irregular maintenance of library facilities accelerates environmental degradation and reduces system durability. Similarly, weak infrastructure and technological limitations reflect broader systemic issues in developing countries where libraries often operate with outdated facilities.

The issue of limited awareness and expertise supports Saini (2025), who argued that climate resilience requires specialized knowledge that is often lacking among library personnel. Additionally, data gaps on climate risks hinder effective planning, as noted by Einecker and Kirby (2020), who emphasized the importance of reliable environmental data in climate adaptation strategies.

Interestingly, the rejection of climate policy absence as a minor issue in some literature contrasts with this study, where it was accepted as a significant challenge. This suggests growing awareness of the importance of policy frameworks in guiding resilience efforts.

Conclusion

This study set out to examine how librarians in Ebonyi State are responding to the growing challenges posed by climate change. From the findings, it is clear that climate change is no longer a distant concern for libraries but a real and present issue affecting their daily operations. Environmental factors such as extreme heat, humidity, and unstable power supply are already putting pressure on library collections and services. These conditions are gradually weakening the traditional role of libraries as safe spaces for preserving knowledge.

Despite these challenges, the study shows that librarians are not passive. They are actively adopting practical strategies such as digitization, environmental monitoring, and staff development to reduce risks and maintain service delivery. These efforts reflect a strong sense of commitment and adaptability within the profession. However, the study also reveals that these strategies are often implemented in isolation, without strong institutional backing.

A major concern that emerged is the gap between awareness and action. While many librarians recognize the importance of policies and structured frameworks, their implementation remains weak. Issues such as inadequate funding, poor infrastructure, and limited technical expertise continue to slow down progress. In many cases, libraries are doing the best they can within very limited means.

The study highlights a simple but important reality: libraries in Ebonyi State are trying to adapt to climate change, but they cannot do it alone. Without stronger institutional support, better funding, and clear policy direction, their efforts may not be enough to ensure long-term sustainability. There is therefore a need for a more coordinated and well-supported approach to building climate-resilient libraries.

Recommendations

Based on the findings of this study, several practical steps can be taken to improve climate resilience in libraries in Ebonyi State. First, there is an urgent need for increased funding. Government agencies and parent institutions should

allocate dedicated funds specifically for climate adaptation projects such as digitization, infrastructure upgrades, and energy solutions.

Second, libraries should develop and actively implement clear climate-related policies. These policies should not just exist on paper but should guide everyday practices, with proper monitoring and evaluation in place.

Third, continuous training and capacity building should be prioritized. Librarians need to be equipped with relevant skills in disaster management, digital preservation, and environmental control to respond effectively to emerging challenges.

Fourth, investment in technology and alternative energy sources, such as solar power, should be encouraged to reduce dependence on unstable electricity supply.

Finally, libraries should strengthen collaboration with government bodies, professional associations, and international organizations. Such partnerships can provide access to funding, technical expertise, and shared knowledge, making it easier to build sustainable and climate-resilient library systems.

Abstract

This study examined librarians' knowledge and awareness of the role of public libraries in promoting democratic rule in Nigeria, with specific attention to librarians' understanding of democratic responsibilities, the services currently available to support democracy, the challenges limiting effective engagement, and strategies for improvement. The study adopted a descriptive survey research design. Data were collected through a researcher-designed online questionnaire administered to 36 librarians drawn from Public Libraries in Nigeria. Data were analysed using frequency counts and percentages, while open-ended responses were interpreted contextually. The study found that librarians are broadly aware of the democratic roles of public libraries, particularly traditional functions such as supplementing formal education and providing equal access to information. However, democratic programming including civic education, community conversations, and information fact-checking, remains inconsistent or absent across libraries. Practical implementation is constrained by unreliable electricity, lack of internet connectivity, inadequate funding, political interference, and insufficient professional training. The study concludes that strengthening public libraries through improved infrastructure, targeted funding, professional development, and supportive policy frameworks is essential if libraries are to function effectively as democratic institutions in Nigeria. These findings are significant given Nigeria's persistent challenges of voter apathy, electoral malpractice, and political misinformation, which underline the urgent need for well-resourced public libraries as instruments of democratic empowerment.

Keywords: Public libraries, Democracy, Democratic Rule, Governance, Misinformation

Introduction

Democracy is a form of government in which power resides in the people through their elected representatives. The values of freedom, respect for human rights, and the principle of holding elections by universal suffrage are essential elements of democracy. Information and informed participation are vital to an effective democracy to thrive. To safeguard democracy, governments establish institutions such as public libraries to maintain trust between the government and the people, protect intellectual freedom, provide open and equal access to information for all citizens, and promote civic education. Public libraries are also established to supplement formal education, fight censorship, forge a sense of community among the diverse population of a country, provide space for public engagement and facilitate discussion on topical issues affecting the citizens (Rasmussen and Hakon, 2025). By actively promoting civic and providing resources and opportunities for civic engagement, libraries can empower citizens to become informed, active and responsible participants in democracy, ultimately contributing to a more vibrant and inclusive society.

In countries where the public library is functioning effectively, the libraries have programs through which citizen are closely aligned to government policies. The citizens have feelings of being part of the polity, and they know their rights and exercise them as appropriate. In such countries, political choices are based on ideologies not ethnic lines. The people value government properties and strive to protect them. Countries such as these include the United States of America (USA), the United Kingdom (UK), and South Africa (SA). In USA, the American Library Association has many slogans to showcase the relationship between the American libraries, the citizens, and their government (democracy). There are slogans such as "Libraries Sustain Democracy" and "Libraries Transforming Communities". There are also case studies of Library activities to promote democracy (Hummel, 2022). In the UK, the public libraries are well patronized by the citizens. The libraries lead conversations to encourage exchange of ideas through a variety of means, including hosting community reads, book clubs, and panel discussions (Keiva, 2020). Lynch (2025) observed that funding and staff cuts are impacting libraries' roles in fostering democracy. In pursuance of the library's democracy role, a librarian, Patrick Malone, secured funding for an 18-month democracy project.

However, in African countries, not much is known about how public libraries in different African countries strive to promote democracy. In Nigeria, the widespread election malpractice, voter apathy, and political parties aligned more closely to ethnic lines since the inception of the fourth republic, calls to question the role of public libraries in democracy. Moreover, a lack of known library activities designated for promoting democracy paints the picture that libraries in Nigeria does not engage in democracy promotion projects. It is therefore important to find out if Libraries in Nigeria are aware of the role of the library in promoting democratic rule

Statement of the Problem

Public libraries promote democracy by making information resources available to users. Through these information resources, the users gain insight into the workings of their government and their rights as citizens. The libraries organize public engagement programs to educate the masses on topical governance issues and provide spaces for public engagement. In the developed world, such as the United States of America and the United Kingdom, public library programs to support democracy are highly visible. However, in Nigeria, the situation is not the same. There are no programs specifically designed to support democracy (Umar & Tokawa, 2024). Moreover, the high level of voter apathy and malpractices that marked elections since the fourth republic in a country with at least a state library in every state and national libraries in more than three-quarters of the states creates the impression that public librarians are not performing their responsibilities towards the masses as it concerns democracy. This leaves one to wonder whether public librarians are aware of their responsibilities to the public. It is based on this that this study sets out to examine librarians' knowledge and awareness of the role of public libraries in promoting democracy in Nigeria.

Research Objective

The general objective of this study is to investigate the Librarians' knowledge and awareness of the role of the public library in promoting democratic rule in Nigeria. Specifically, the study will:

i. Investigate the Nigerian public librarians' awareness of the use of library services in promoting democratic rule.
ii. Ascertain the services available in Nigerian public libraries to promote democracy.
iii. Investigate the challenges of Nigerian public libraries in promoting democratic rule.
iv. Suggest strategies to enhance public libraries role in promoting democratic rule using library services.

Review of Related Literature

Review of relevant literature was presented in line with the objectives of the study, as shown below:

Public librarians' awareness of the role of public libraries in promoting democratic rule.

The knowledge of Public librarians on the role of public libraries in promoting democratic rule is paramount because one cannot effectively deliver services he/she is not aware of. Studies have consistently shown that the level of awareness and understanding of the public library concept by the Nigerian community is poor (Adesanya & Okonkwo, 2020). This lack of awareness undermines the potential of public libraries to serve as instruments for democratic empowerment.

For libraries to achieve its goal of promoting democratic rule in any given nation, the libraries must acquaint themselves with their core duties. Ephraim-Emmanuel, Odikeme, Ugwoke, & Owede (2021), observed that many citizens are ignorant of the services provided by the public libraries, especially as it relates to democratic participation and civic education. Low level of awareness hinders the value of libraries in supporting electoral participation and informed citizenship (Ezeani & Nwabueze, 2022). However, in a society where there is an increased awareness, libraries supports political knowledge and civic engagement significantly amongst its users (Okafor & Eze, 2024).

Services available in Public Libraries in Nigeria to promote democracy

Public libraries contribute to the democratic rule by disseminating information resources that facilitate informed decision-making. The libraries ensure that information related to governance is accessible to citizens, thereby supporting the culture of transparency and accountability (Okafor & Eze, 2024; Veillette, 2024). Audunson (2023) also observed that library is a public dialogue or discourse platform that enables citizens to discuss both social and political issues. Ezeani & Nwabueze (2022) observed that public libraries are instruments for democracy sustenance. Libraries sustain democracy through civic awareness and information-sharing services. Bannon (2022) identified three dimensions through which libraries facilitate democratic engagement. These are civic knowledge, civic attitudes, and civic action. The research revealed that public libraries offer complimentary access to books, magazines, newspapers, and online resources that assist individuals in remaining informed about contemporary events and comprehending intricate matters. Alemna (2024) added that the public libraries facilitate democratic values by encouraging political participation in governance through the organization of public awareness campaign programmes like workshops, conferences, voters education programmes, community outreach initiatives. Yap, Barat, and Kiszl (2024), in a scoping review of the civic roles of libraries in combating information disorders in social media, observed that libraries are cultural institutions that represent the public sphere. The authors submitted that the library provides equal access to information, thereby giving

citizens opportunity to participate adequately in the political , social and economic aspects of their daily lives. Their study also added that the cornerstone of democratic practice, which is civic engagement, is directly linked to social capital. They pointed that libraries, as trusted institutions, help to build this social capital by offering neutral spaces for dialogue, learning, and community engagement (Yap, Barat, and Kiszl (2024). Promoting electoral participation by libraries is further enhanced by the creation of political dialogue spaces, engagement of electoral candidates in public debates, and other public engagements programmes like town hall meetings. In a piece published in The Library Quarterly, Kranich (2024) makes the case that in order to enable citizens to become civic agents who jointly shape their future, librarians must collaborate with other advocates of civic literacy. Jonsson (2025), and Veillette (2024) in their own views opine that libraries promote political literacy, as well as empowering citizens or electorates to actively participate in democratic processes. Furthermore, libraries promote digital inclusion by creating platforms that allows citizens to participate and engage actively (PressReader, 2024).

Challenges of Public Libraries in Promoting Democratic Rule

Irrespective of the role of libraries in promoting democracy in Nigeria, public libraries are faced with challenges that hinders them from effectively promoting democracy in Nigeria. Among these problems are lack of modern equipment and learning resources. Ezeani & Nwabueze (2022) noted that some of the challenges hindering libraries from maximizing their power as a social institution to promote democracy are poor infrastructure, inadequate funding, limited access to current and relevant information materials. Ephraim-Emmanuel, Odikeme, Ugwoke, & Owede (2021) added other challenges to include, lack of trained personnel, low awareness of library services, and limited integration of digital technologies. Alemna (2024) also observed political interference and lack of policy support as factors militating against the effectiveness of libraries in functioning as independent democratic institution. Okafor & Eze (2024) also noted that socio-economic factors like low literacy level and poverty affects the use of library and citizen's participation in a democratic system of government. Insufficient funding is arguably the most prevalent challenge facing Nigerian public libraries. Osuchukwu, Obuezie, and Ogwuche (2022) found that the average yearly budget for a state library in Nigeria is about 3.5 million Naira (about 8,300 USD), and most of that money goes to paying staff salaries. As a result of this, a lot of libraries do not have computers, software licenses, or high-speed internet connectivity. These problems hinder libraries from offering the digital and information services that are needed for people to take part in civic activities.

Strategies to enhance public libraries role in promoting democratic rule

There are various strategies through which public libraries can promote democracy. These strategies include programmatic, technological, policy, and partnership-based approaches, and they can be used in many different countries, including Nigeria, which has a democratic government. IFLA (2024) noted the following strategies: an improved library funding, investing in the library infrastructure, and digital technologies. In addition to the IFLA strategies, Alemna (2024) added the capacity building of librarians as a vital aspect to equip them with the technical know-how or prerequisite skills required to support civic education and digital literacy. PreeReader (2024) also noted the need to strengthen partnerships between libraries, civil society organisations, and government agencies to promote impact and improve outreach. Ephraim-Emmanuel, Odikeme, Ugwoke, & Owede (2021) observed another critical strategy to include the promotion of awareness of library services through advocacy and community engagement programmes. Developing policies that recognize libraries as a vital democratic institution will promote their role in promoting democracy and citizen participation in electoral processes (Jansson, 2025).

Methodology

This study adopted a descriptive survey design to investigate librarians' knowledge and awareness of the role of public libraries in promoting democratic governance in Nigeria. The population of the study comprised thirty-six (36) public librarians. These librarians were selected purposively from the headquarters of state libraries in Nigeria, one librarian from each state headquarters. The Librarians were selected based on their positions as public services/outreach librarians. Data were collected using a researcher-designed structured questionnaire administered online through Google Forms over four weeks. The selected librarians' attention was called to the online form through emails and WhatsApp chats. The questionnaire consisted of two sections. Section A, captured respondents' demographic information, while Section B contained closed-ended items rated on a four-point Likert scale (Strongly Agree, Agree, Disagree, Strongly Disagree) and a set of open-ended questions. The closed-ended items measured librarians' awareness of democratic roles, availability of democratic services, and perceptions of challenges, while the open-ended questions invited respondents to suggest improvement strategies. Data from the closed-ended items were analyzed using frequency counts, percentages, and mean scores, while open-ended responses were analyzed thematically to complement the quantitative findings.

Data Presentation and Results

Objective 1: Librarians' Awareness of the Role of the Public Library in Promoting Democratic Rule

Table 1: Librarians' Awareness of the Democratic Roles of Public Libraries (n=36)

Item	Strongly Agree n(%)	Agree n(%)	Disagree n(%)	Strongly Disagree n(%)	Mean Score
Supplement formal education	24(66.7)	12(33.3)	0(0.0)	0(0.0)	3.67 (Strongly Agree)
Provide civic education	18(50.0)	18(16.7)	2(33.3)	0(0.0)	3.17 (Agree)
Provide equal access to information	30(83.3)	6(16.7)	0(0.0)	0(0.0)	3.83 (Strongly Agree)
Fight censorship	24(66.7)	0(0.0)	12(33.3)	0(0.0)	3.33 (Agree)
Craft a sense of community among diverse population	30(83.3)	6(16.7)	0(0.0)	0(0.0)	3.83 (Strongly Agree)
Provide space for public discussions	30(83.3)	6(16.7)	0(0.0)	0(0.0)	3.83 (Strongly Agree)

The data in Table 1 paint a generally encouraging picture of awareness, but with some notable inconsistencies worth attending to. Regarding supplementing formal education, all thirty-six respondents either strongly agreed (66.7%) or agreed (33.3%) that public libraries serve this function. The response pattern for equal access to information was similarly strong, with 83.3% of respondents strongly agreeing and 16.7% agreeing. The awareness of libraries as spaces for community building and public discussion was equally high. Both items received strong agreement from 83.3% of respondents. The two areas where awareness was slightly less uniform were civic education and fighting censorship. For civic education, 50.0% strongly agreed, 16.7% agreed, and 33.3% disagreed. The item on censorship was where disagreement was most pronounced: 66.7% strongly agreed that public libraries fight censorship, while 33.3% disagreed.

Objective 2: Services Available in Public Libraries for the Promotion of Democratic Rule

Table 3: Availability of Democratic Services in Public Libraries (n=36)

Service	Available n(%)	Not Available n(%)
Conducive reading spaces	36(100.0)	0(0.0)
Reading resources in various formats	36(100.0)	0(0.0)
Reading resources on various topics	36(100.0)	0(0.0)
Comfortable spaces for group/community meetings	24(66.7)	12(33.3)
Information and referral services	36(100.0)	0(0.0)
Civic education programs	24(66.7)	12(33.3)
Community conversations programs	24(66.7)	12(33.3)
Discussions sessions on topical issues	30(83.3)	6(16.7)
Information fact checking to combat false information	12(33.3)	24(66.7)
Skilled personnel to respond to enquiries	36(100.0)	0(0.0)

Three services were reported as available by all six respondents (100%): conducive reading spaces, reading resources in various formats, and reading resources on various topics, and skilled personnel. Information and referral services were also reported as available by all six respondents (100%), which is noteworthy given that referral services are often the bridge between library users and the broader information ecosystem, including electoral information, legal aid, and government services. The pattern shifts considerably when we look at programming services. Comfortable spaces for group and community meetings were reported as available by only 66.7% of respondents; civic education programs and community conversations programs were each reported as available by 66.7% as well. The most striking finding in this section is the near-absence of information fact-checking services: only 33.3% of respondents reported this service as available, while 66.7% said it was not available.

Objective 3: Challenges Hindering Public Libraries from Effectively Promoting Democratic Rule

Table 4: Challenges Hindering Public Libraries from Promoting Democratic Rule (n=36)

Challenge	Strongly Agree n(%)	Agree n(%)	Disagree n(%)	Strongly Disagree n(%)	Mean Score
Lack of funding affects democracy programmes	24(66.7)	6(16.7)	6(16.7)	0(0.0)	3.50 (Strongly Agree)
Inadequate training of librarians	12(33.3)	18(50.0)	6(16.7)	0(0.0)	3.17 (Agree)
Political interference affects library programs	18(50.0)	6(16.7)	12(33.3)	0(0.0)	3.17 (Agree)
Low public awareness limits participation	3(50.0)	3(50.0)	0(0.0)	0(0.0)	3.50 (Strongly Agree)
Lack of information materials in different topics	6(16.7)	24(66.7)	6(16.7)	0(0.0)	3.00 (Agree)
Lack of information materials in different formats	12(33.3)	64(66.7)	0(0.0)	0(0.0)	3.33 (Agree)
Lack of space for civic engagement	6(16.7)	18(50.0)	12(33.3)	0(0.0)	2.83 (Agree)
Lack of physical infrastructure (computers, etc.)	12(33.3)	12(33.3)	12(33.3)	0(0.0)	3.00 (Agree)
Lack of constant electric power supply	24(66.7)	12(33.3)	0(0.0)	0(0.0)	3.67 (Strongly Agree)
Lack of internet connectivity	18(50.0)	18(50.0)	0(0.0)	0(0.0)	3.50 (Strongly Agree)

The challenge that attracted the highest level of agreement was the lack of constant electric power supply, 100% agreed or strongly agreed and the lack of internet connectivity, 100% agreed or strongly agreed. Lack of funding affecting democracy programmes was agreed upon by 83.3% of respondents (66.7% strongly agreed, 16.7% agreed), with only one respondent disagreeing. Low public awareness of the existence of public libraries was identified as a challenge by all six respondents (50.0% strongly agreed, 50.0% agreed). Political interference was identified as a challenge by 83.3% of respondents (50.0% strongly agreed, one agreed, two disagreed). Inadequate training of librarians was flagged as a challenge by 83.3% of respondents, though the split between strong agreement (33.3%) and agreement (50.0%) suggests that most respondents see this as a real but perhaps not critical issue. Challenges related to the absence of information materials in different formats and topics were flagged by 100% of respondents (though with varying intensity). The lack of physical infrastructure such as computers produced more mixed results, 33.3% strongly agreed, 33.3% agreed, and 33.3% disagreed. This variability may reflect genuine differences in infrastructure across institutions. The lack of space for civic engagement was similarly mixed, with 33.3% disagreeing that this is a challenge.

Objective 4: Strategies for Enhancing the Capacity of Public Libraries to Promote Democratic Rule

The final objective invited respondents to propose, in their own words, strategies for strengthening libraries' democratic capacity. While not all respondents provided detailed responses to this open-ended item, those who did offered

suggestions that cluster into several recurring themes: funding and infrastructure, training and capacity building, community outreach and public sensitization, civic programming, and policy and inter-institutional collaboration.

i. Funding and Infrastructure

The need for adequate and targeted funding was mentioned by multiple respondents as the starting point for any meaningful reform. Six respondent explicitly called for 'adequate funds to equip public libraries' and added that 'government should make provision for constant power supply.' Another six respondents referenced to the need for improved library infrastructure alongside funds availability. These suggestions reflect the consensus in the literature. IFLA (2024) recommended improved library funding and investment in digital technologies as priority strategies for enhancing libraries' democratic role. Without reliable electricity and internet access, which adequate funding would help secure, every other strategy is compromised at the delivery level.

ii. Training and Capacity Building

Twelve respondents explicitly mentioned training and retraining as a priority strategy. Four called for 'training and capacity building of personnel,' while eight recommended 'training and retraining of librarians' as the first of five strategies. This is well-supported in the literature. Alemna (2024) argued that librarians must be equipped with the technical competencies required to support civic education and digital literacy before they can deliver these services effectively. Kranich (2024), , specifically called on librarians to collaborate with other civic literacy advocates, which requires a level of professional preparation that goes beyond traditional library training. For Nigeria specifically, where many librarians may not have received formal training in civic engagement facilitation, structured capacity building programmes, perhaps coordinated through the Nigerian Library Association would be a logical and actionable starting point.

iii. Community Outreach and Public Sensitization

Nine respondent advocated for 'sensitisation of public on the role of the public library in civic engagement matters,' while three recommended 'advocacy' and 'accountability' as strategies. These suggestions align with IFLA's (2024) recommendation for improved community outreach programs and digital platforms to raise awareness of library services. EphraimEmmanuel et al. (2021) identified the promotion of awareness through community engagement as a critical strategy for repositioning libraries as civic institutions. In a context where many Nigerians remain unaware that public libraries exist in their communities, outreach cannot be treated as a supplementary activity, but must be central to any institutional renewal strategy.

iv. Civic Programming and Community Engagement

Respondents also pointed to the need for libraries to actively 'organise regular public discourse on topical issues,' 'build strong community engagement,' and serve as 'a hub for civic engagements.' Five respondents called for 'provision of current and up-to-date resources' to support these programs. Bannon (2022) demonstrated through case study evidence that public libraries which actively program for civic knowledge, civic attitudes, and civic action produce measurable improvements in their communities' democratic participation. Jansson (2025) argued that libraries should be understood as social infrastructure, and not mere buildings that facilitate democratic deliberation through regular, structured programming.

v. Policy and Institutional Collaboration

Three respondents highlighted the importance of 'support and collaboration' as a strategic approach, and eight referenced 'archiving and preservation of cultural materials for reference purposes' as a library strategy with democratic implications. The need for policy frameworks that formally recognize libraries as democratic institutions was advanced by Jansson (2025), who argued that without policy support, library democracy work remains episodic and underfunded. Press Reader (2024) similarly emphasized the importance of partnerships between libraries, civil society organizations, and government agencies to amplify the reach and impact of library civic programs. In Nigeria's context, this might involve formal collaboration between public libraries and institutions such as the Independent National Electoral Commission (INEC), the National Orientation Agency (NOA), and civil society groups working on voter education and governance accountability.

Discussion of Findings

Objective 1: Librarians' Awareness of the Democratic Role of Public Libraries

The findings indicate that librarians are broadly aware of the democratic roles of public libraries, with all respondents agreeing that libraries supplement formal education (Mean = 3.67), provide equal access to information (Mean = 3.83), craft a sense of community (Mean = 3.83), and offer space for public discussions (Mean = 3.83). These results align with the IFLA-UNESCO (2022) Public Library Manifesto and the position of Aina (2023), who identifies lifelong learning and equal information access as core library responsibilities. Awareness was slightly less uniform for civic education (Mean = 3.17) and fighting censorship (Mean = 3.33), where a third of respondents disagreed. This likely reflects the gap between theoretical mandates and actual practice: in environments where civic programs are absent and political interference is common, these roles may feel aspirational rather than operational (Ezeani & Nwabueze, 2022;

Alemna, 2024). Nonetheless, the general awareness level is encouraging and provides a foundation for service improvement.

Objective 2: Services Available for Promoting Democratic Rule

Basic library infrastructure such as reading spaces, collections, and personnel is consistently available across surveyed libraries. However, democratic programming is considerably less uniform. Civic education programmes, community conversation spaces, and comfortable meeting spaces were available in only 66.7% of libraries, while information fact-checking arguably the most urgent civic service in an era of rampant misinformation was available in only 33.3% of institutions. This aligns with Yap, Barat, and Kiszl (2024), who documented the growing importance of libraries as fact-checking institutions, and with Veillette (2024), who noted that libraries often lack the capacity to respond to specific democratic information needs. The data reveal a two-tier picture: strong physical infrastructure but weak democratic programming capacity.

Objective 3: Challenges Hindering Effective Democratic Engagement

The challenges identified are systemic and interconnected. Lack of constant electricity (Mean = 3.67) and internet connectivity (Mean = 3.50) were identified unanimously, confirming infrastructure inadequacy as the most entrenched barrier to modern library service delivery. Insufficient funding (Mean = 3.50) and low public awareness (Mean = 3.50) compound this problem. As Osuchukwu et al. (2022) reported, the average annual budget for a state library in Nigeria is approximately 3.5 million Naira (~$8,300 USD), most of which covers personnel costs, leaving little for civic programming or digital infrastructure. Political interference (Mean = 3.17) and inadequate staff training (Mean = 3.17) further constrain institutional capacity. Together, these barriers create a self-reinforcing cycle: underfunding limits infrastructure; poor infrastructure reduces relevance; reduced relevance weakens the case for increased funding. These findings extend the observations of Ezeani and Nwabueze (2022) and Ephraim Emmanuel et al. (2021), who documented similar structural barriers across Nigeria.

Objective 4: Strategies for Enhancing Libraries' Democratic Capacity

Respondents proposed strategies that cluster around five themes: adequate and targeted funding, capacity building and training, community outreach, civic programming, and policy and inter-institutional collaboration. These align with IFLA (2024) recommendations for improved funding, digital infrastructure investment, and community outreach. The call for librarian training echoes Alemna (2024), who argued that librarians must be equipped with civic literacy facilitation skills before they can effectively deliver democracy-related services. Respondents also highlighted the need for formal collaboration with institutions such as INEC, the National Orientation Agency, and civil society organizations, an approach supported by Jansson (2025) and Press Reader (2024). Without a supportive policy framework that recognizes libraries as democratic institutions, these strategies risk remaining episodic and underfunded.

Summary of Findings

This study set out to assess the knowledge and awareness of public librarians, regarding the role of public libraries in promoting democratic governance in Nigeria. Drawing on responses from thirty-six librarians in different public libraries in Nigeria, the study show that:

1. Librarians in Nigeria are broadly aware that public libraries perform democratic functions, including supplementing formal education, providing equal access to information, crafting a sense of community, and offering space for public discourse. Awareness was most consistent for traditional library functions and somewhat more variable for politically sensitive roles such as fighting censorship, where 33.3% of respondents expressed disagreement.
2. While basic library infrastructure, reading spaces, collections, personnel, and referral services is consistently available across the libraries surveyed, democratic programming is considerably less uniform. Civic education programs, community conversations, and space for group meetings were available in only 66.7% of libraries surveyed. Information fact-checking arguably among the most needed services in today's information environment was available in only 33.3% of institutions.
3. The challenges identified by respondents are systemic and interconnected. Unreliable electricity and the absence of internet connectivity were flagged unanimously. Insufficient funding, low public awareness, political interference, and inadequate librarian training were also widely cited. These barriers collectively explain the gap between what libraries are expected to do and what they are actually able to deliver in the Nigerian context.
4. The respondents proposed a coherent set of strategies for reform, centering on adequate funding, targeted training, community sensitization, civic programming, and inter-institutional collaboration, a set of priorities that is well-aligned with the recommendations of leading scholars and international library organizations.

Conclusion

This study examined librarians' knowledge and awareness of the role of public libraries in promoting democratic governance in Nigeria. The central finding is that awareness is not the problem. Librarians working across the surveyed Public Library of Nigeria demonstrated a reasonable understanding of the democratic functions their institutions are

expected to perform such as supplementing formal education, providing equal and open access to information, fostering community dialogue, and supporting civic engagement. The deficit lies not in professional knowledge but in the conditions required to act on it.

The study found that democratic programming such as civic education, community conversations, and information fact-checking is either absent or inconsistent across the libraries surveyed, and that this gap is driven by a cluster of interconnected structural failures: unreliable electricity, no internet connectivity, chronic underfunding, political interference, and inadequate professional training. These are not isolated shortcomings; they form a cycle in which poor infrastructure suppresses service delivery, low service visibility reduces public engagement, and reduced engagement weakens the case for improved funding. Breaking this cycle requires deliberate intervention from government, the professional library community, and institutional policymakers. The absence of fact-checking services is particularly consequential, given that the spread of political misinformation has become one of the defining governance challenges facing Nigeria's democracy.

Public libraries in Nigeria possess both the institutional mandate and the professional workforce to contribute meaningfully to democratic governance. What they lack is the sustained political will, adequate funding, and enabling policy environment needed to fulfil that mandate. Until public libraries are treated as essential democratic infrastructure rather than peripheral cultural institutions, the gap between what Nigerian librarians know their libraries should do and what those libraries are actually able to deliver will remain at considerable cost to the quality of civic life in Nigeria.

Recommendations
On the basis of the findings and conclusions of this study, the following recommendations are made:

1. The federal and states governments should substantially increase budgetary allocations to public libraries, with ring-fenced funding specifically for democracy-related programming. Allocations should be structured to move beyond personnel costs and include dedicated lines for civic education, community engagement programs, and digital infrastructure.

2. The Nigerian Library Association (NLA), in collaboration with relevant government agencies and civil society organizations, should design and implement a structured, continuing professional development program focused on civic facilitation, democratic literacy, and civic programming. Librarians who have the awareness and the knowledge but lack the skills to facilitate civic events need practical training, not just a conceptual workshops.

3. Public libraries should be equipped with reliable alternative power solutions, such as solar panels, inverters, or diesel generators, as well as consistent internet connectivity, treated as a baseline operational requirement rather than an optional extra. Without these, every other initiative for enhancing library services will be compromised.

4. Public libraries in Nigeria should formally incorporate information fact-checking as a defined service, supported by trained personnel, verified information tools, and clear protocols. Collaboration with established fact-checking organizations, journalism schools, and civic technology groups could accelerate this process. As misinformation continues to distort democratic discourse in Nigeria, this has become a core democratic function.

Abstract

This study examines the role of libraries in strengthening democratic governance and institutional resilience within Nigeria's Renewed Hope Agenda. Launched in 2023, the Renewed Hope Agenda serves as the country's national development framework for advancing economic reform, governance transformation, and social inclusion. Grounded in the Expectation-Confirmation Model (ECM), the study adopts a pragmatic and exploratory approach to assess how library services shape citizens' access to government information and perceptions of transparency. Data were collected from 133 respondents comprising librarians (25), government officials (36), and library users (72). The findings reveal a significant disconnect between policy objectives and public access to information. Respondents recognise libraries as valuable platforms for civic engagement and democratic participation. However, their capacity to function as effective information intermediaries is constrained by inadequate digital infrastructure, limited technological readiness, weak policy integration, and insufficient staff competencies. Consequently, citizens' expectations of timely and reliable access to government information are only partially fulfilled, creating a transparency gap. The study concludes that libraries can contribute more effectively to democratic resilience when supported by sustained investment in digital infrastructure, professional capacity development, and stronger collaboration between government agencies and information institutions.

Keywords: E-Governance; Information Access; Civic Engagement; Renewed Hope Agenda; Expectation-Confirmation Model.

1.0 Background to the Study

In contemporary governance systems, access to timely, accurate, and transparent information is fundamental to democratic stability and citizen participation. Democratic societies rely on education to foster informed citizens capable of critically analysing policies, ensuring leadership accountability, and driving national development (Timidi & Okuro, 2024). These informed citizens sustain democratic health by engaging with political processes, demanding transparency, and contributing to socio-economic progress. However, in many developing contexts, including Nigeria, the gap between government information production and citizen access remains a persistent challenge (Ayesha et al., 2025). Patergiannaki and Pollalis (2023) identify a disparity where e-Government portals often fall short of providing the range of services desired by residents. This misalignment reveals a significant failure of digital platforms to provide the smart, user-focused features citizens actually require.

As longstanding hubs of knowledge, libraries are uniquely positioned to bridge this digital divide. Maity (2023) demonstrates how public libraries empower communities through digital literacy training and e-governance services, enabling citizens to access critical government resources online. Traditionally viewed as repositories of information, libraries have evolved into dynamic information hubs that facilitate access to both physical and digital resources. They are cornerstones of democracy, essential for promoting transparency and civic engagement (Stankoska, 2024; Kranich, 2024). By providing equitable access to policy documents and diverse collections, libraries foster the civic literacy necessary for an informed citizenry. Amidst contemporary democratic challenges, Nigerian libraries must prioritise this mission, evolving into vital hubs that connect the public with the *Renewed Hope* agenda through enhanced digital and civic education.

The rapid digitisation of information systems has expanded the role of libraries as critical intermediaries between government and citizens. Through digital platforms, libraries increasingly facilitate access to public information, support civic engagement, and promote informed participation in democratic processes. Nevertheless, the democratic potential of these initiatives remains constrained by uneven digital infrastructure and varying levels of digital literacy, particularly in developing contexts such as Nigeria (Onunka et al., 2023; Vaz, 2024; Dehinsilu-Isa & Amodu, 2025). As institutions that have evolved from traditional repositories into modern knowledge hubs, libraries must continually adapt to overcome these challenges and ensure equitable access to government information and public services (Onunka et al., 2023).

Against this backdrop, Nigeria introduced the *Renewed Hope* Agenda in 2023 as a national development and governance framework aimed at advancing economic reform, institutional transformation, social inclusion, and sustainable development through targeted policy interventions and improved public service delivery (Azeez & Oluseyi, 2025). The agenda places strong emphasis on transparency, accountability, and inclusive governance; however, the institutional mechanisms required to support these objectives, particularly the role of libraries as information mediators, remain insufficiently examined (Azeez & Oluseyi, 2025; Grenon et al., 2023). To address this gap, the present study applies the

Expectation-Confirmation Model (ECM) to evaluate how effectively library services meet citizens' expectations of government transparency and information access (Bhattacherjee, 2001; Alanazi, 2013; Khan et al., 2025). By examining confirmation, satisfaction, and perceived usefulness, the study provides insights into the contribution of libraries to civic participation, public trust, and democratic resilience.

Positioning libraries within the broader discourse of democratic resilience, this study argues that effective information access is a pillar of institutional stability rather than a mere service. While reliable information delivery enhances citizen confidence and accountability, failures, driven by underfunding, infrastructural deficits, or digital immaturity, lead to dissatisfaction and disengagement, thereby weakening democratic processes. Consequently, this research integrates library science, information systems theory, and governance studies to evaluate the extent to which library services in Nigeria contribute to institutional resilience within the "Renewed Hope" agenda.

2.1 Statement of the Problem

Despite the *Renewed Hope* agenda's focus on economic growth, governance reform, job creation, and improved welfare, a significant transparency gap persists between government policy and public awareness, largely due to the limited user-focused functionality of existing digital platforms (Sukare and Abdullahi, 2025). Libraries, which should bridge this gap, are constrained by outdated resources and infrastructural challenges, leading to a mismatch between citizens' expectations and actual service delivery. In addition, there is insufficient empirical evidence on the digital readiness of Nigerian libraries to manage and disseminate national development information, raising concerns about their relevance in supporting democratic engagement. If these limitations persist, they may contribute to public disengagement and weaken institutional accountability. This study therefore examines how effectively library services meet or fall short of citizens' expectations of transparency within this governance context.

2.2 Objectives of the Study

The primary objective of this study is to examine the role and effectiveness of Nigerian libraries in supporting governance and enhancing democratic resilience within the *Renewed Hope* agenda, particularly in relation to civic engagement, public trust, and institutional accountability.

Specifically, the study seeks to:

22. Examine the infrastructure, including internet connectivity, digital platforms, and power support systems, and policy deficits that hinder library service delivery within the *Renewed Hope Agenda*.
23. Assess the extent to which library-mediated data supports governance processes and democratic functions, including voter education.
24. Measure the gap between citizens' expectations of transparency and the information accessed through library systems.
25. Analyse how library services influence civic engagement, public trust, and democratic resilience.

2.3 Research Questions

To achieve these objectives, the study addresses the following research questions:

v. What infrastructural and policy challenges limit the effectiveness of libraries within the Renewed Hope agenda?
vi. To what extent do library services support governance processes and democratic functions?
vii. What gap exists between citizens' expectations of transparency and the information available through libraries?
viii. How do library services influence civic engagement, public trust, and democratic resilience?

3.0 Literature Review

Access to timely, accurate, and transparent information is a fundamental pillar of democratic governance, enabling citizens to engage meaningfully in policy processes and hold governments accountable. Contemporary studies emphasise that civic literacy and informed participation are essential for sustaining democratic stability and institutional trust (Timidi & Okuro, 2024). However, in developing contexts such as Nigeria, a persistent gap exists between the production of government information and citizens' ability to access and utilise it effectively (Ayesha et al., 2025). Although digital governance initiatives were introduced to bridge this divide, many e-government platforms remain limited in functionality, accessibility, and user-centred design, thereby failing to meet citizen expectations (Patergiannaki & Pollalis, 2023). This misalignment underscores the broader challenge of ensuring inclusive and responsive digital systems.

Libraries have evolved from traditional repositories into hybrid information hubs that facilitate access to both physical and digital resources, thereby promoting transparency, civic engagement, and equitable information access. They also support digital inclusion by equipping users with the skills needed to navigate e-governance platforms (Stankoska, 2024; Kranich, 2024; Maity, 2023). However, in developing contexts, their effectiveness is constrained by infrastructural deficits, inadequate funding, and uneven digital literacy, which reinforce the digital divide and limit their capacity to function as effective intermediaries between government and citizens (Onunka et al., 2023; Vaz, 2024; Dehinsilu-Isa & Amodu, 2025).

The rapid digitisation of information systems has further repositioned libraries as critical components of governance and institutional resilience, yet this potential is hindered by persistent systemic challenges, including weak policy implementation, technological inefficiencies, and trust barriers. Digital transformation remains uneven due to resource constraints, organisational inertia, and limited technical capacity (Jan & Ganiae, 2019; Awais & Ameen, 2019). Across Africa, these challenges are compounded by low institutional readiness and infrastructural weaknesses (Otike & Barát, 2021; Ocholla & Ocholla, 2020), while in Nigeria, unreliable power supply, obsolete technologies, inadequate staff training, and low user awareness further constrain performance (Nworie et al., 2023; Dehinsilu-Isa & Amodu, 2025). Consequently, enhancing transparency, civic participation, and governance outcomes depends on addressing these interconnected barriers.

The Expectation-Confirmation Model (ECM) provides a useful framework for evaluating user satisfaction and system effectiveness, positing that continued usage depends on the confirmation of expectations and perceived usefulness (Bhattacherjee, 2001; Khan et al., 2025; Alshammari & Alshammari, 2024). The ECM is widely applied in digital service contexts; however, its use in examining how library-mediated access to government information influences transparency, civic engagement, and institutional trust remains limited, revealing an important gap in the literature (Momoti, 2023; Eid, et al., 2021).

In the Nigerian context, the *Renewed Hope* agenda emphasises transparency, accountability, and citizen inclusion (Azeez & Oluseyi, 2025). However, the role of libraries as information intermediaries within this framework is still underexplored (Grenon et al., 2023). Existing studies identify structural challenges such as underfunding, outdated resources, and limited digital capacity, yet they rarely assess how these constraints affect user satisfaction and democratic participation (Onunka et al., 2023). Consequently, the alignment between library services and national governance priorities remains weak, highlighting the need for empirical investigation.

4.0 Methodology

The study adopted a pragmatic and exploratory research design grounded in the Expectation–Confirmation Model (ECM) to examine how library-mediated information services influence transparency, democratic participation, and policy implementation. The ECM provides a robust framework for assessing the transparency gap by evaluating the extent to which citizens' expectations of access to government information are confirmed through library systems. The model links information access to perceived usefulness, user satisfaction, and broader governance outcomes. Ekiti State, Nigeria, was purposively selected for the study because of its relatively high literacy rate, active library presence, strong educational culture, and strategic relevance as a knowledge-driven state. The state also hosts a mix of public, academic, and community libraries, making it an appropriate setting for examining the role of libraries in facilitating access to government information and supporting democratic engagement.

Guided by the works of Mganga et al. (2023) and Lamond et al. (2019), the study employed a multi-stakeholder stratified sampling approach comprising librarians (information providers), government and electoral officials (policy stakeholders), and library users (information consumers). Participants were recruited through professional networks, library associations, government communication channels, and social media platforms connecting these stakeholder groups. A total of 133 respondents participated in the study, comprising 25 librarians, 36 government officials, and 72 library users. This distribution enabled data triangulation across policy intent, information service delivery, and user experience.

Data were collected using a structured questionnaire developed around key ECM constructs, including expectation, confirmation, perceived usefulness, satisfaction, and civic engagement. Descriptive statistical techniques were employed for data analysis, including frequencies, percentages, mean scores, and standard deviations. Mean scores were computed to determine respondents' levels of agreement with each statement, while standard deviations measured the dispersion of responses. Decision-making was based on a four-point Likert scale (4 = Strongly Agree, 3 = Agree, 2 = Disagree, 1 = Strongly Disagree), with a criterion mean of 2.50. Mean scores of 2.50 and above were interpreted as agreement, while scores below 2.50 indicated disagreement. Ethical considerations, including informed consent, anonymity, confidentiality, and voluntary participation, were strictly observed throughout the study.

In order to provide a comprehensive analysis of the *Renewed Hope* agenda, this study adopts a triangulation framework linking policy intent, service delivery, and citizen impact. Table 1 presents this structure, showing how data from government officials, librarians, and users are integrated and cross-validated to assess the flow and effectiveness of information.

Table 1: Methodological Triangulation of Stakeholders

Triangulation	Stakeholder Group	n	Analytical Focus (The Gap Measured)
Service Delivery	Librarians	25	Evaluates institutional capacity, digital maturity, and infrastructural barriers.

Policy Intent	Government & Electoral Officials	36	Measures how information is intended to support the "Renewed Hope" agenda and democratic functions.
User Experience	Academic & Public Library Users	72	Uses the ECM to measure the gap between citizen expectations and the information actually retrieved.
Synthesis	Total Respondents	133	Determines if policy intent and library delivery successfully foster public trust.

5.0 Data Presentation and Analysis

This section presents the findings of a multi-stakeholder survey conducted in Ekiti State, Nigeria, to examine the relationship between policy intent, library service delivery, and user satisfaction within the Renewed Hope framework. Data were collected from 133 respondents comprising librarians, government officials, and library users, and analysed using the Expectation-Confirmation Model (ECM) to identify transparency gaps in digital governance. Descriptive statistics, including mean ($\bar{x}$) and standard deviation (StD), were employed to analyse responses measured on a four-point Likert scale: Strongly Agree (SA = 4), Agree (A = 3), Disagree (D = 2), and Strongly Disagree (SD = 1). A mean score of 2.50 or above indicates agreement, while a mean score below 2.50 indicates disagreement. The results are presented in line with the study's research questions.

5.1 Librarians' assessment of policy alignment, infrastructure, and service delivery

Table 2 presents librarians' views on institutional readiness, focusing on policy alignment, ICT infrastructure, and staff capacity to support the *Renewed Hope* agenda. It highlights key operational constraints affecting service delivery.

Table 2: Librarians' Assessment of Policy Alignment and Service Capacity (n = 25)

Category	SA	A	D	SD	$\bar{x}$	StD
My library has a formal policy that aligns our information services with the Federal Government's "Renewed Hope" priority areas.	6 (24.0%)	12 (48.0%)	5 (20.0%)	2 (8.0%)	2.68	0.47
The current ICT infrastructure in this library is sufficient to provide real-time access to government policy documents.	4 (16.0%)	9 (36.0%)	8 (32.0%)	4 (16.0%)	2.52	0.50
We regularly curate and disseminate information specifically related to the eight priority areas (e.g., Food Security, Economic Reform).	1 (4.0%)	3 (12.0%)	12 (48.0%)	9 (36.0%)	2.16	0.37
Frequent power outages and low bandwidth significantly hinder our ability to deliver digital information services to citizens.	3 (12.0%)	8 (32.0%)	10 (40.0%)	4 (16.0%)	2.32	0.47
Budgetary allocations to this library have increased to reflect our role in supporting national developmental goals.	3 (12.0%)	9 (36.0%)	9 (36.0%)	4 (16.0%)	2.48	0.50
Our staff are adequately trained to act as "Knowledge Officers" who can guide citizens through complex governance data.	2 (8.0%)	6 (24.0%)	11 (44.0%)	6 (24.0%)	2.32	0.47

The findings in table 2 indicate moderate policy alignment ($\bar{x}$ = 2.68) and ICT capacity ($\bar{x}$ = 2.52) among libraries in supporting the *Renewed Hope Agenda*. However, respondents disagreed that libraries regularly curate information on the government's priority areas ($\bar{x}$ = 2.16), possess adequately trained staff to serve as knowledge officers ($\bar{x}$ = 2.32), or receive sufficient budgetary support ($\bar{x}$ = 2.48). They also reported that infrastructural challenges, particularly power outages and bandwidth limitations, constrain the delivery of digital information services ($\bar{x}$ = 2.32). Overall, the results suggest that while libraries demonstrate some institutional readiness, significant capacity, funding, and service delivery gaps remain.

5.2 Government and electoral officials' assessment of policy implementation

Table 3 outlines the perspectives of government and electoral officials on the role of libraries in supporting policy implementation and democratic functions, with emphasis on reliance, trust, and digital capacity.

Table 3: Government and electoral officials' assessment of policy implementation (n=36)

Category	SA	A	D	SD	$\bar{x}$	SD
I rely on library-mediated data (archives, repositories, or reports) to make informed decisions regarding policy implementation.	8 (22.2%)	10 (27.8%)	12 (33.3%)	6 (16.7%)	2.50	0.50
The National Library and institutional libraries provide a reliable evidence base for tracking the progress of the Renewed Hope Agenda.	7 (19.4%)	11 (30.6%)	13 (36.1%)	5 (13.9%)	2.50	0.50
Libraries are essential partners in promoting voter education and transparency in the democratic process.	18 (50.0%)	13 (36.1%)	4 (11.1%)	1 (2.8%)	2.86	0.35
Information provided by libraries helps reduce the information gap between government plans and public perception.	20 (55.6%)	13 (36.1%)	2 (5.6%)	1 (2.8%)	2.92	0.28
The library system in Nigeria is digitally mature enough to host and protect sensitive national development data.	4 (11.1%)	6 (16.7%)	16 (44.4%)	10 (27.8%)	2.28	0.45
My department actively collaborates with library institutions to ensure our policies are accessible to the general public.	5 (13.9%)	6 (16.7%)	15 (41.7%)	10 (27.8%)	2.31	0.46

The results in table 3 show that respondents recognised libraries as important for voter education, democratic transparency ($\bar{x}$ = 2.86), and bridging the information gap between government policies and public perception ($\bar{x}$ = 2.92). They also moderately agreed that libraries provide useful evidence for policy implementation and monitoring the *Renewed Hope* Agenda ($\bar{x}$ = 2.50). However, respondents expressed concerns about the digital maturity of Nigerian libraries ($\bar{x}$ = 2.28) and reported weak collaboration between government agencies and libraries in disseminating policy information ($\bar{x}$ = 2.31). Overall, the findings highlight confidence in the informational role of libraries but reveal challenges relating to digital infrastructure and institutional partnerships.

5.3 Library users' expectation-confirmation model (ECM) analysis

Table 4 applies the ECM to assess user expectations, confirmation, and perceived usefulness, revealing the gap between expected and actual information access and its implications for satisfaction and civic engagement.

Table 4: Library users' expectation-confirmation model (ECM) analysis (n=72)

ECM Construct	Measurement Item	$\bar{x}$	SD	Interpretation
Expectation	I expect my local/academic library to be the primary source for verified "Renewed Hope" information.	2.90	1.04	Moderate-High Expectation
Confirmation	I am able to find up-to-date information on the eight priority areas through the library or its website.	2.24	1.09	Low Confirmation
Perceived Usefulness	Library information has increased my confidence in participating in democratic processes.	2.78	1.08	Positive Perception
Satisfaction	I am satisfied with the speed and ease of accessing public records through the library.	2.67	1.11	Moderate Satisfaction
Disconfirmation*	Government reform information is often missing or outdated within library collections.	2.68	1.10	Moderate Disconfirmation

Civic Engagement	Library information has improved my ability to hold public officials accountable.	2.83	1.07	Positive Civic Influence

*****Disconfirmation was measured using a negatively phrased item; higher scores indicate a larger gap between users' expectations and actual information availability.*

The results presented in Table 4 reveal that respondents hold relatively high expectations of libraries as trusted sources of verified government information, as reflected by the expectation construct ($\bar{x}$ = 2.90, SD = 1.04). However, the confirmation construct recorded a lower mean score ($\bar{x}$ = 2.24, SD = 1.09), indicating that users generally disagreed that they could readily access up-to-date information on the eight priority areas of the *Renewed Hope* Agenda through library platforms. Despite this gap, respondents expressed positive perceptions regarding the usefulness of library information for democratic participation ($\bar{x}$ = 2.78, SD = 1.08) and reported moderate levels of satisfaction with access to public records ($\bar{x}$ = 2.67, SD = 1.11). The disconfirmation construct ($\bar{x}$ = 2.68, SD = 1.10) further suggests that users perceived government reform information in library collections as frequently missing or outdated. Nevertheless, respondents acknowledged the civic value of library services, with the civic engagement construct recording a positive mean score ($\bar{x}$ = 2.83, SD = 1.07), indicating that library information enhances their capacity to hold public officials accountable and participate more effectively in democratic processes.

6.0 Discussion of Findings

The findings align with existing literature on the persistent gap between government information provision and citizen access. Although access to timely and accurate information is central to democratic governance, significant barriers remain in translating policy outputs into accessible public knowledge (Timidi & Okuro, 2024; Ayesha et al., 2025). The mismatch between users' high expectations and low confirmation reflects earlier evidence that digital governance platforms in developing contexts often fall short in functionality and user-centred design (Patergiannaki & Pollalis, 2023). While libraries have evolved into hybrid information hubs capable of promoting transparency and civic engagement (Stankoska, 2024; Kranich, 2024; Maity, 2023), their effectiveness continues to be constrained by infrastructural deficits, inadequate funding, and uneven digital literacy, alongside broader challenges of weak institutional readiness and technological inefficiencies (Onunka et al., 2023; Vaz, 2024; Dehinsilu-Isa & Amodu, 2025; Jan & Ganiae, 2019; Awais & Ameen, 2019; Otike & Barát, 2021; Ocholla & Ocholla, 2020).

In line with the Expectation–Confirmation Model (ECM), the results reveal a clear gap between expectation and confirmation, with moderate satisfaction indicating partial system usefulness alongside structural weaknesses in information delivery (Khan et al., 2025; Alshammari & Alshammari, 2024). This extends existing research by demonstrating how library-mediated information systems influence transparency, civic engagement, and governance outcomes, addressing gaps identified by Momoti (2023) and Eid et al. (2021). Within the Nigerian context, the findings further highlight limited integration of libraries into governance frameworks despite policy emphasis on transparency and accountability under the Renewed Hope agenda (Azeez & Oluseyi, 2025; Grenon et al., 2023). Weak collaboration between policy stakeholders and libraries, coupled with concerns about digital maturity, reinforces earlier evidence of underfunding, outdated infrastructure, and low institutional capacity (Onunka et al., 2023).

Importantly, the findings demonstrate that library services exert a measurable influence on civic engagement, public trust, and democratic resilience. Users report an improved capacity to hold public officials accountable, indicating a positive contribution to civic participation, which aligns with studies linking information access to democratic engagement (Stankoska, 2024; Kranich, 2024). However, moderate levels of satisfaction and perceived usefulness suggest that public trust remains conditional on the reliability and timeliness of information provided, supporting ECM-based findings on system usefulness and user satisfaction (Khan et al., 2025). The gap between expectations and actual information access undermines this trust and limits the broader contribution of libraries to democratic resilience. Overall, while libraries retain functional relevance within the governance ecosystem, their impact on transparency and democratic outcomes is constrained by systemic and institutional limitations.

7.0 The Transparency Disconnect in the Library-Governance Ecosystem

Building on these findings, the overall synthesis highlights a disconnect between policy intent and service delivery. Although the *Renewed Hope* agenda reflects a strong commitment to transparency, library systems are not yet sufficiently equipped to operationalise these goals effectively. High user expectations are not matched by existing levels of digital capacity, infrastructure, and service readiness, revealing a gap between demand and institutional capability. The findings indicate that institutional effectiveness in supporting transparency, public trust, and civic engagement depends on the alignment of policy, infrastructure, and service delivery, underscoring the need to strengthen both physical and digital capacities within library systems. Figure 1 presents a simplified conceptual model of this transparency disconnect within the library–governance ecosystem.

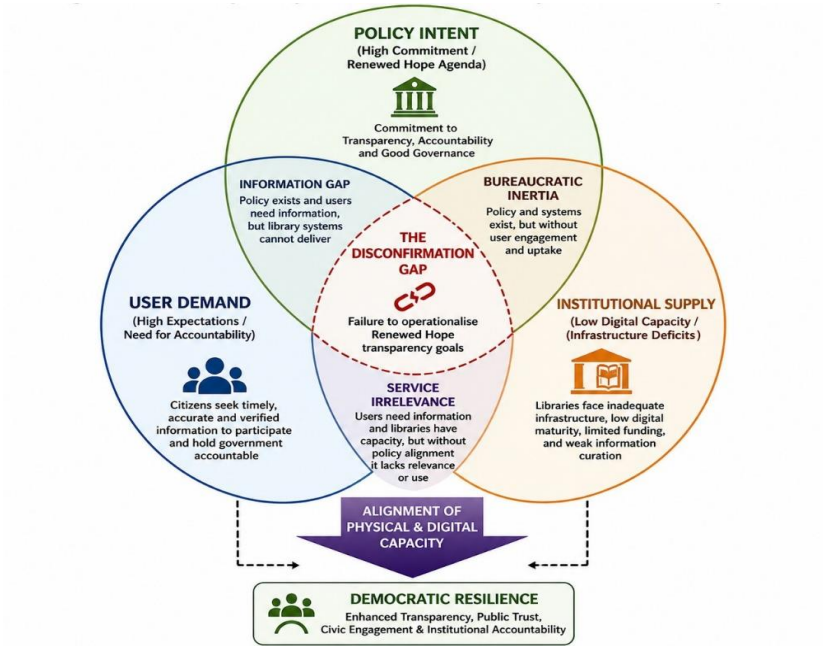

Figure 1*: A conceptual model illustrating how misalignment between policy intent, user demand, and library infrastructure hinders the realisation of Renewed Hope transparency goals (Developed by the author with the assistance of an AI tool for visualisation purposes).*

7.0 Conclusion and Recommendations

This study concludes that, although libraries in Nigeria are conceptually positioned as key enablers of transparency and democratic engagement, their current capacity remains insufficient to meet these expectations. The findings reveal a clear disconnect between policy intent and service delivery, with high user expectations not matched by the existing levels of digital infrastructure, institutional readiness, and service effectiveness. This gap reflects broader structural challenges identified in the literature, including weak integration of libraries into governance frameworks, inadequate funding, and limited technological capacity. Consequently, the ability of libraries to support transparency, civic participation, and public trust remains constrained, limiting their contribution to institutional effectiveness and democratic resilience.

The study recommends a coordinated and systemic approach is required to address these challenges. Therefore, government investment should prioritise strengthening digital infrastructure, including reliable power supply and improved connectivity, to enhance access to e-governance information. Equally important is the development of human capacity through continuous training of library personnel to effectively manage and disseminate governance-related data. Institutional collaboration between libraries and government agencies should be formalised to ensure timely access to policy information, while user-focused services such as civic literacy programmes and dedicated information platforms should be expanded. Above all, improving the alignment between policy, infrastructure, and service delivery is essential for enhancing the role of libraries in supporting transparency, accountability, and democratic outcomes.

Abstract

The paper investigated library catalogues in transition: assessing current trends and future readiness in selected academic libraries in Enugu State. It assessed the current state of library catalogue systems in selected academic libraries in Enugu State to determine their readiness for future developments in information organization and access. A descriptive survey research design was adopted for the study. The population consisted of forty-two (42) library staff drawn from four academic institutions in Enugu State: Enugu State University of Science and Technology (ESUT), Institute of Management and Technology (IMT), Enugu State College of Education (Technical) (ESCET), and Godfrey Okoye University (GOU). Data were collected using a structured questionnaire and analyzed using frequency counts, percentages, and mean scores. The findings revealed that card catalogues and hybrid systems remain widely used, while fully automated catalogue systems are limited across the selected libraries. The level of functionality of catalogue systems was found to be moderate, with challenges such as poor internet connectivity, incomplete records, and limited automation affecting system performance. The integration of digital resources into catalogue systems was also moderate, indicating gaps in unified search platforms and full-text access. Staff competency in cataloguing was found to be moderate, though there was a strong need for continuous ICT training and recruitment of qualified personnel. Major challenges identified include inadequate funding, poor ICT infrastructure, unstable power supply, outdated systems, and shortage of trained cataloguing personnel. The study concluded that library catalogue systems in the selected academic libraries are still transitioning from traditional to modern automated platforms, and significant improvements are required to enhance future readiness. The study recommended upgrading catalogue systems, strengthening ICT infrastructure, continuous staff training, increased funding, integration of digital resources, and adoption of long-term digital transformation strategies to improve catalogue efficiency and future preparedness.

Keywords: Academic Libraries, Automation, Enugu State, Future readiness, Library catalogue, Library transition, OPAC.

Introduction

A library catalogue is the primary access tool that enables users to identify, locate and retrieve information resources in any library setting. In academic libraries, the catalogue plays a central role in organizing both print and digital materials, supporting teaching, learning, and research. With the vast collections of an academic library it can be well imagined what will become of the library if the information resources are not systemized processed and access point provided. In other words, a library catalogue is a retrieval system that enables access and retrieval of the vast collections of the library either by subject, author, title or any other attribute to such materials. This means that, the library catalogue provides a pathway through which library users view and locate what the library has in stock. Historically, libraries relied on manual catalogues such as card catalogues, book catalogues, and sheaf catalogues to provide bibliographic control. This, according to Nwobu (2024), helps patrons to locate and access library resources, both digital and physical, thereby, defining the resources so that patrons can quickly comprehend what is accessible to them. Although, these tools served their purpose in earlier decades, they became increasingly limited as academic libraries expanded their collections and the world advance in technology.

With advances in information and communication technologies (ICT) and its acceptance into the library operations, library catalogue systems tend to transition from manual catalogues to automated systems. The introduction of Integrated Library Management Systems (ILS) such as KOHA, Evergreen, Destiny etc., into the library system has transformed library catalogue by enabling real-time updates, remote access, improved search features, and seamless integration of digital resources. According to Eserada and Okolo (2019), the online catalogue format has transformed the way library users, access and retrieve library collections, it has made it easier for libraries to provide access to library resources through a channel. This means that, with the adoption of ICT in library operations, the future of library catalogues is moving toward web-scale discovery systems, linked data, semantic enrichment, and cloud-based platforms that support resource sharing and interoperability.

Transitioning the library catalogue from manual catalogue to automated format requires that certain factors need to be in place; appropriate infrastructure, efficient electrical wiring that will support all the required equipment has to be in

place, reliable power supply, adequate computer devices, internet access, integrated library software, and most importantly, a trained workforce (Ukwueze & Eze, 2022). Trained workforce play a critical role in the effectiveness and future readiness of library catalogue systems in academic libraries. Its success depends largely on the competence, technical skills, and adaptability of cataloguing staff in handling modern cataloguing tools, metadata standards, and automated systems. Adewuyi and Akinniyi (2023), found that technical competencies among cataloguers significantly contribute to effective organization of information resources and efficient catalogue management. Similarly, Okonkwo (2024), revealed that regular ICT training and exposure to modern cataloguing technologies improve personnel readiness for digital cataloguing practices. Irenoa, Emilian and Eru (2019) added that it requires a special provision in the library budget. Hence, it is a very expensive venture which once commenced, should not be allowed to fail because of underfunding.

In Nigeria, the level of catalogue automation varies significantly among academic institutions. While some libraries have adopted modern Integrated Library System (ILS), others still operate hybrid systems or rely heavily on manual cataloguing due to funding constraints, inadequate ICT infrastructure, low bandwidth, limited staff competence and irregular power supply. In Enugu State, personal observation suggests that many academic libraries face challenges such as outdated catalogue software, incomplete automation, and insufficient integration of library resources into catalogue platforms. And as academic libraries expand their collections to include e-journals, e-books, institutional repositories and open access resources, the ability of catalogue systems to accommodate these developments becomes critical. The readiness of catalogue systems for the future, has for this reason, become a major concern for library administrators, policymakers and users. This study therefore seeks to assess the current state of library catalogue systems in selected academic libraries in Enugu State and evaluate their readiness for the evolving demands of information organization and access in the digital era.

Statement of the Problem

Despite the significance of a library catalogue, many academic libraries in Nigerian have continued to struggle with ineffective catalogue system. Preliminary observations show that several academic libraries in Enugu State either operate outdated manual library systems or maintain partially automated catalogues that are not fully functional. Moreover, many catalogue systems in use do not support modern standards such as Resource Description and Access (RDA), authority control, or seamless retrieval of electronic materials. Limited ICT infrastructure, irregular electricity, inadequate funding, and insufficient staff training further hinder catalogue operations. These inadequacies reduce the efficiency of information retrieval and negatively affect library user satisfaction.

Despite these challenges, there is limited empirical evidence detailing the actual condition of catalogue systems in academic libraries in Enugu State, the extent of their automation, digital readiness, or the level of staff competence required to sustain them. Without such data, it becomes difficult for decision-makers to develop informed strategies for catalogue improvement. This study therefore seeks to fill this gap by systematically assessing the current state of library catalogues in selected academic libraries in Enugu State, and evaluating their readiness for the future.

Purpose of the Study

The main purpose of the study is to assess the current state of library catalogue systems in selected academic libraries in Enugu State and evaluate their readiness for future developments in information organization and resource discovery. Specifically, the aim to:

ix. identify the types of catalogue systems currently used in selected academic libraries in Enugu State.
x. examine the level of functionality of these catalogue systems.
xi. determine the extent to which library resources are integrated into the catalogue systems.
xii. evaluate the competence of cataloguing staff in the selected libraries.
xiii. identify challenges affecting the future readiness of catalogue systems.
xiv. recommend strategies for enhancing future readiness.

Research Questions

The study is guided by the following research questions:

1. What types of catalogue systems are currently used in selected academic libraries in Enugu State?
2. What is the level of functionality of these catalogue systems?
3. To what extent are library resources integrated into the catalogue systems?
4. What is the level of competency among cataloguing personnel?
5. What challenges affect the future readiness of catalogue systems in these libraries?
6. What strategies can enhance the future readiness of library catalogue systems in the selected academic libraries?

Literature Review

One of the ways libraries ensure access to the library resources is by organising and providing access points to the resources of the library. The library catalogue acts as the index to the library collections. According to Ukwueze and

Eze (2022), a library catalogue is a list or record of materials arranged in a specific pattern or sequence. This provides a description and index of the resources in a library or collection. Ashikuzzaman (2024) noted that a library catalogue has evolved to encompass various formats, including card catalogues, digital databases and online public access catalogues, basically aimed to adequately characterize each library information material both physically and cognitively so that it can be distinguished from all other items.

Traditionally, library catalogues were manually produces, often in the physical forms of books, cards, and to a limited extent, microform. However, the advent of catalogue automation made a major difference in the potential forms catalogue could take and in the variety of features an individual catalogue could exhibit. Sule, Edward, Yakubu and Makinde (2025) assessed the Utilization of Library Catalogue in selected Academic Libraries in Adamawa State, Nigeria. The study is delimited to three Academic Libraries in Adamawa State. Three (3) objectives and three research questions guided the study. The objectives of the study were to determine the types of catalogue available in selected academic libraries, the purposes of catalogue for library users in academic libraries, level of user's awareness on the existence of library catalogue in academic libraries. The survey research method was adopted for the study. Sample size of nine hundred and ninety three (993) was drawn from seven thousand eight hundred and two (7,802) target population of the three selected academic libraries in Adamawa State, Nigeria. Questionnaire was the main instrument used for the study. The data collected was analyzed using descriptive statistics, such as tables, frequency, percentage scores and histogram. The findings showed that; the types of catalogues available in the academic libraries in Adamawa State are; Author, title and classified catalogues, which aim to help users to locate and retrieve materials easily. The study did not classify the library catalogue by their types but by their access points, therefore, this study will specify this.

A functional library catalogue ensure information retrieval processes such as searching, identifying, locating, and accessing library resources through various search options like author, title, subject, and keyword access. Akanbi, Adekanbi, and Bankole (2021) carried out a study on the perception and use of Online Public Access Catalogue (OPAC) in academic libraries in Kwara State, Nigeria. The study was guided by research objectives that examined the functionality and usability of OPAC systems in supporting information retrieval among users. The study adopted a descriptive survey research design. The population of the study consisted of users of selected academic libraries in Kwara State universities. A structured questionnaire was used as the instrument for data collection, and copies were administered to respondents selected from the participating institutions. Data collected were analyzed using descriptive statistics such as frequency counts and percentages. The findings revealed that although OPAC systems in the selected academic libraries support basic search functions such as author, title, and subject searches, their full functionality is limited due to challenges such as inadequate ICT infrastructure, poor system integration, and low user proficiency. The study further showed that users experience difficulties in accessing advanced search features, thereby reducing the overall effectiveness of the catalogue systems. The study concluded that the functionality of OPAC systems in Nigerian academic libraries is still developing and requires improvement.

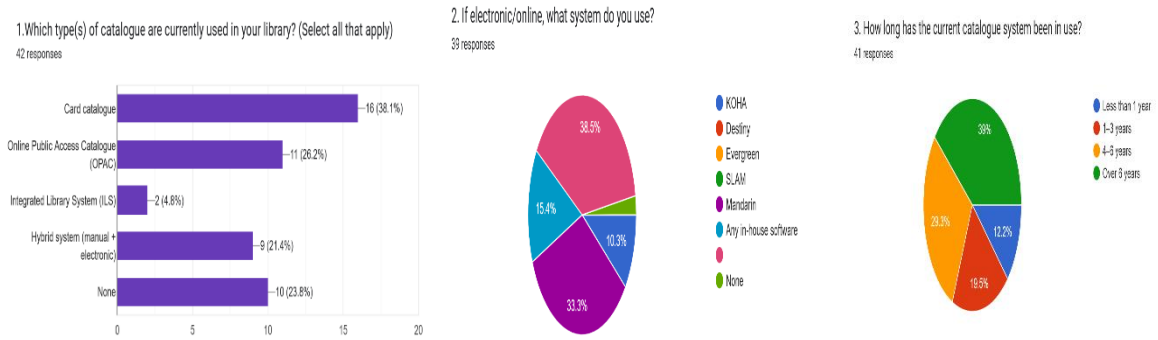
Library catalogues are often connected to library systems and digital resources, such as institutional repositories, electronic databases, and discovery tools to provide seamless access to information. In Nigerian academic libraries, the level of integration remains a critical issue in determining the efficiency and effectiveness of catalogue systems in supporting modern information needs. Okoroma (2023) carried out a study on linked data technology and linked open data in academic libraries in Nigeria, with a focus on the level of integration, challenges, and potential solutions. The study adopted a descriptive survey research design. The population of the study consisted of seventy-one (71) library and information professionals drawn from seventeen higher institutions across Nigeria. A structured questionnaire was used as the instrument for data collection, and responses were analyzed using descriptive statistics such as frequency counts and percentages. The findings revealed that the level of integration of catalogue systems with other emerging digital library technologies and external information systems is very low in most Nigerian academic libraries. It further showed that many libraries still operate standalone or partially integrated Online Public Access Catalogue (OPAC) systems with limited connection to institutional repositories, databases, and other digital platforms.

The level of competency among cataloguing personnel is a critical factor that determines the effectiveness, accuracy, and overall functionality of library catalogue systems. Library personnel are required to manage automated systems, metadata, and digital services effectively. Ukwueze and Eze (2022), in their study on retrospective conversion of library catalogue and access to information resources in Nnamdi Azikiwe University, Awka, specifically emphasized the critical role of human resources in the implementation of retrospective conversion. Through a descriptive survey of library staff, they found that the availability of skilled and competent personnel is essential for planning, executing, and sustaining the conversion of manual catalogues into machine-readable formats. They noted that while material and technical resources are important, the success of the process largely depends on trained librarians and technical staff who possess the required expertise. The outcome showed that retrospective conversion enhances access through author, title, subject, classification number, and keyword search, but only when supported by capable human resources.

The future readiness of library catalogue systems for integration in academic libraries is often challenged by different factors. Oladokun, Oyadeyi, and Iyoro (2019) carried out a study on retrospective conversion of bibliographic records

in Nigerian academic libraries using KOHA Integrated Library System (ILS). The study was guided by research objectives that examined the implementation experiences and operational challenges associated with catalogue automation in Nigerian university libraries. The study adopted a descriptive survey research design. The population of the study comprised twenty (20) Nigerian university libraries that had adopted KOHA for retrospective conversion and catalogue management. Data were collected using a structured questionnaire and analyzed using descriptive statistics such as frequencies and percentages. The findings revealed that major challenges hindering the future readiness and effective integration of catalogue systems include erratic power supply, low Internet bandwidth, unreliable software performance, lack of a union catalogue, inadequate ICT infrastructure, and limited technical expertise among library staff. These challenges significantly affect the ability of libraries to fully automate and integrate their catalogue systems with other digital resources and emerging technologies.

To prepare for future readiness, Idiegbeyan-ose, Ifijeh, Adebayo, and Segun-Adeniran (2016), in their study on new paradigms in cataloguing in Nigerian libraries, specifically examined strategies for modernizing cataloguing practices in the 21st century. Through a critical review of cataloguing practices, they found that effective future readiness depends on the integration of information and communication technologies, adequate funding, and continuous training of cataloguers. The outcome revealed that the adoption of ICT-driven cataloguing systems enhances efficiency, accuracy, and global relevance of library catalogues. The study concluded that libraries must adopt innovative and sustainable strategies to remain relevant in the digital age, and it recommended improved infrastructure, policy support, and capacity building for cataloguing staff.



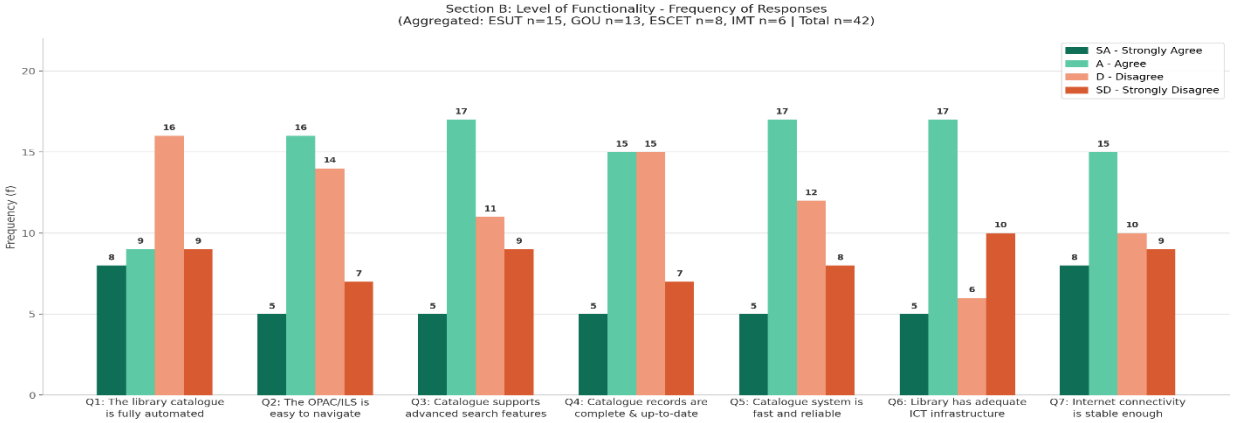
Methodology

The study adopted a descriptive survey research design to examine the current state of library catalogue systems and assess their readiness for future developments in selected academic libraries in Enugu State. This design was considered appropriate because it allowed the researcher to gather relevant data from library staff regarding existing catalogue practices, operational challenges, and strategies for improvement. The population of the study comprised forty-two (42) library staff who are directly involved with the library catalogue systems in the four selected academic institutions in Enugu State. These included fifteen (15) staff from Enugu State University of Science and Technology (ESUT), six (6) staff from Institute of Management and Technology (IMT), eight (8) staff from Enugu State College of Education (Technical) (ESCET), and thirteen (13) staff from Godfrey Okoye University (GOU). Given the relatively small and manageable size of the population, the entire population was used for the study; hence, no sampling technique was employed. Data for the study were collected using a structured questionnaire developed by the researcher. The instrument consisted mainly of closed-ended items structured on a Likert scale to ensure uniformity and ease of analysis. The method of data collection involved direct administration of the questionnaire to respondents across the four institutions. The researcher personally distributed and retrieved the copies of the questionnaire, with assistance from designated contacts within the libraries, to ensure a high rate of return. The data collected were analyzed using descriptive statistics, specifically frequencies and mean scores.

Data Analysis

The data collected were analysed in line with the research questions and presented in charts. The data was analysed using frequency count, mean score and percentage.

Chart 1: Types of Catalogue Systems Currently in Use



The data presented in Chart 1 above shows the types of library catalogue systems currently in use across the four selected academic libraries in Enugu State. The responses revealed that the card catalogue remains the most prevalent system, with 11 respondents (26.2%) indicating its sole use, while 9 respondents (21.4%) reported using only an Online Public Access Catalogue (OPAC). A hybrid system combining manual and electronic approaches was indicated by 5 respondents (11.9%), and 4 respondents (9.5%) reported using a combination of both card catalogue and hybrid systems. Only 1 respondent (2.4%) indicated the use of a standalone Integrated Library System (ILS), while 1 respondent (2.4%) used both OPAC and ILS. Among those using electronic systems, the Mandarin software was the most widely adopted (13 respondents), followed by in-house software solutions (6 respondents) and KOHA (4 respondents). Regarding the

age of these systems, 16 respondents (38.1%) reported using systems that have been in place for over 6 years, 12 (28.6%) for 4–6 years, 8 (19.0%) for 1–3 years, and only 5 (11.9%) for less than one year.

These findings suggest that the majority of the selected libraries are still operating largely manual or partially automated catalogue systems, with full automation being the exception rather than the norm. This corroborates the observation of Sule, et al. (2025), who found in their study of academic libraries in Adamawa State that author, title, and classified catalogues, analogous to traditional manual approaches, remained dominant across the institutions surveyed, suggesting a nationally pervasive reliance on conventional cataloguing methods. The persistence of card catalogues and hybrid systems in the present study further reflects the observation by Eserada and Okolo (2019) that while the online catalogue format has transformed how users access and retrieve library collections, its adoption remains uneven across Nigerian institutions, largely due to funding constraints and inadequate ICT infrastructure. Ukwueze and Eze (2022), further noted that transitioning from manual to automated catalogue formats requires substantial infrastructure, including reliable power supply, adequate computer devices, internet access, a trained workforce, and an integrated library software, conditions that remain largely unmet in many academic libraries in Nigeria.

Chart 2: Level of Functionality of Catalogue Systems

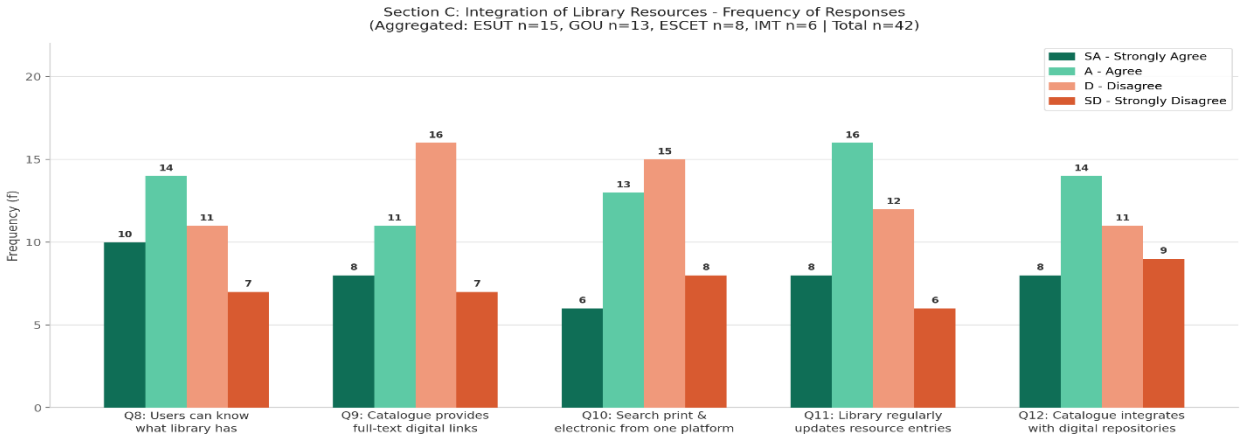
The data presented in Chart 2 above shows the level of functionality of library catalogue systems across the four selected academic libraries in Enugu State. The responses revealed that for full automation of the library catalogue (Q1), 8 respondents (19.0%) strongly agreed and 9 (21.4%) agreed, while 16 respondents (38.1%) disagreed and 9 (21.4%) strongly disagreed, indicating that most libraries are not fully automated. For ease of navigation of the OPAC/ILS (Q2), 5 respondents (11.9%) strongly agreed and 16 (38.1%) agreed, whereas 14 (33.3%) disagreed and 7 (16.7%) strongly disagreed, suggesting moderate usability of the systems. Regarding advanced search features (Q3), 5 respondents (11.9%) strongly agreed and 17 (40.5%) agreed, while 11 (26.2%) disagreed and 9 (21.4%) strongly disagreed, indicating that although advanced search features are available, they may not be fully effective across all libraries. For completeness and currency of catalogue records (Q4), 5 respondents (11.9%) strongly agreed and 15 (35.7%) agreed, while 15 (35.7%) disagreed and 7 (16.7%) strongly disagreed, reflecting mixed perceptions about record accuracy and updates.

Furthermore, for system speed and reliability (Q5), 5 respondents (11.9%) strongly agreed and 17 (40.5%) agreed, while 12 (28.6%) disagreed and 8 (19.0%) strongly disagreed, indicating moderate performance of the catalogue systems. On ICT infrastructure adequacy (Q6), 5 respondents (11.9%) strongly agreed and 17 (40.5%) agreed, whereas 6 (14.3%) disagreed and 10 (23.8%) strongly disagreed, suggesting infrastructural gaps across some libraries. Finally, for internet connectivity stability (Q7), 8 respondents (19.0%) strongly agreed and 15 (35.7%) agreed, while 10 (23.8%) disagreed and 9 (21.4%) strongly disagreed, indicating that unstable internet connectivity remains a major challenge. Overall, the findings suggest that while library catalogue systems show moderate functionality, improvements are required in automation, infrastructure, reliability, and connectivity across the selected academic libraries in Enugu State.

These findings indicate that while some degree of automation exists, the overall level of catalogue functionality across the selected libraries remains moderate and incomplete. A significant proportion of staff expressed reservations about the reliability and comprehensiveness of current systems. This finding aligns with the position of Oladokun, Oyadeyi, and Iyoro (2019), who found that erratic power supply and low internet bandwidth were among the most critical challenges confronting retrospective conversion and catalogue automation in Nigerian academic libraries, concluding that poor technical infrastructure slows down and frustrates successful conversion work. Furthermore, Ajani, et al. (2022), in their study of librarians in Kwara State, affirmed that while library users do consult catalogues before accessing resources, the value of cataloguing as a tool for information access is substantially diminished when the underlying systems are not fully functional. The moderate functionality ratings in this study therefore suggest that many of these libraries have not yet realized the full potential of their catalogue systems, consistent with the finding of

Adeyemi and Omopupa (2020) that there is low awareness and inadequate preparedness among Nigerian librarians for transitioning from traditional OPAC to more advanced discovery tools.

Chart 3: Integration of Library Resources into Catalogue Systems



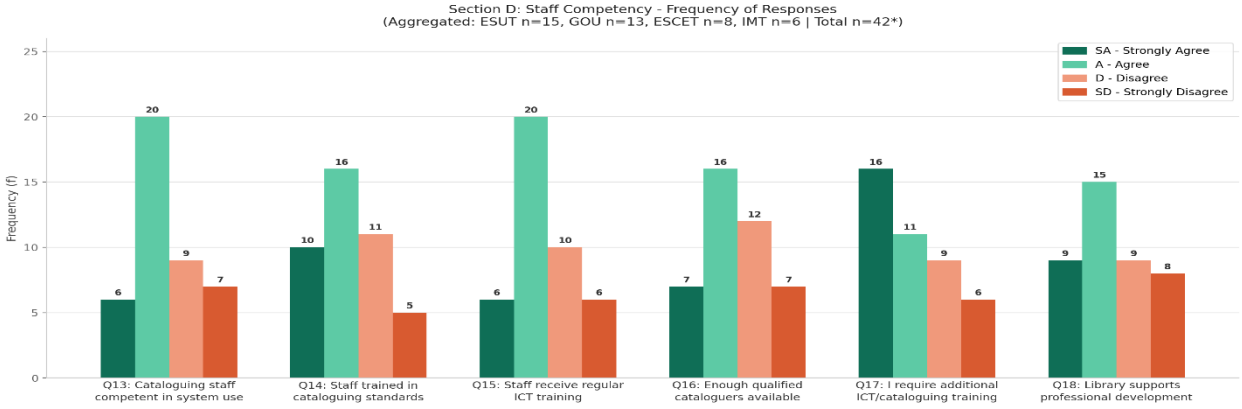


Chart 3 above presents the responses of library staff on the integration of library resources within the catalogue systems.

The results show that all five indicators recorded mean scores between 2.36 and 2.60, indicating a moderate level of resource integration across the four institutions. The highest-rated item was users' ability to know what the library holds through the catalogue (Q8), with a mean score of 2.36, where 57.1% of respondents agreed at some level, and ESCET recorded four respondents who strongly agreed. Regular updates of catalogue entries (Q11) recorded a mean of 2.38, with 38.1% agreeing, although 14.3% strongly disagreed, suggesting that updates are carried out but not consistently. Integration with digital repositories (Q12) recorded a mean of 2.50, with 52.3% agreeing, while 21.4% strongly disagreed, indicating gaps in linking with modern digital systems. Provision of links to full-text digital materials (Q9) had a mean of 2.52, with 38.1% disagreeing, showing that direct access to digital content through the catalogue is still limited. The lowest-rated item was the ability to search both print and electronic resources from a single platform (Q10), which recorded the highest mean of 2.60, with 35.7% disagreeing and 19.0% strongly disagreeing. Overall, the results show that while basic catalogue functions are available, integration of digital resources and unified search features remain limited across the selected libraries.

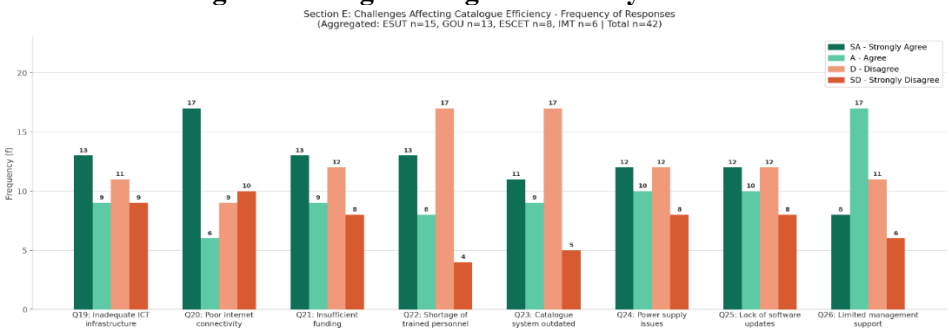
These findings highlight significant gaps in the integration of both print and digital library resources into the catalogue systems of the selected libraries. The low scores, particularly on user awareness of holdings and regularity of updates, suggest that many catalogue systems do not adequately reflect the full scope of library collections. This finding is consistent with Okoroma (2023) who found that the level of integration of catalogue systems with other emerging digital library technologies and external information systems is very low in most Nigerian academic libraries. It further showed that many libraries still operate standalone or partially integrated Online Public Access Catalogue (OPAC) systems with limited connection to institutional repositories, databases, and other digital platforms. Ikwuanusi et al. (2024) note that modern catalogue systems should incorporate a wide range of resources, including e-books, e-journals, institutional repositories, databases, and open-access resources, providing users with a single search interface through which multiple resource types can be accessed simultaneously. The comparatively low integration scores in the present study suggest that the libraries surveyed have not yet achieved this level of unified resource access.

Chart 4: Level of Staff Competency in Cataloguing

The chart 4 above presents the responses of library staff on staff competency in catalogue management. The mean scores for the six items range from 2.12 to 2.45, indicating a moderate level of staff competency across the four institutions. The item with the lowest mean was the need for additional ICT and cataloguing training (Q17), with a mean of 2.12. About 38.1% strongly agreed and 26.2% agreed, showing that most staff believe further training is necessary. Training in cataloguing standards such as AACR2, RDA, and LCSH (Q14) recorded a mean of 2.26, with 61.9% agreeing that staff are trained, although some respondents, particularly from GOU, disagreed. Regular ICT training (Q15) and library support for professional development (Q18) recorded mean scores of 2.38 and 2.39 respectively. For Q15, 61.9% agreed that staff receive ICT training, though some respondents disagreed. For Q18, 58.6% agreed that libraries support professional development, but a number of respondents indicated that such support is not consistent. Competence in using the current catalogue system (Q13) recorded a mean of 2.40, with 61.9% agreeing that staff are competent, although some institutions recorded disagreement. The sufficiency of qualified cataloguers (Q16) recorded the highest mean of 2.45, with 28.6% disagreeing and 16.7% strongly disagreeing, indicating a shortage of qualified staff in some libraries. Overall, the results show that staff competency is moderate, but there is a strong need for additional training and more qualified personnel across the selected academic libraries.

The overall pattern of moderate competency scores indicates that while catalogue staff possess some foundational skills, there are notable deficiencies in advanced cataloguing standards and continuous professional development. This is consistent with the findings of Okonkwo (2024), who reported that cataloguers in South-East Nigeria demonstrate appreciable skills in both manual and electronic cataloguing but noted disparities in competency levels across institutions, largely due to differences in access to training and technological infrastructure. Similarly, Olayemi, Michael and Olayemi (2025) observed that while many Nigerian cataloguers have adopted basic digital tools, significant gaps remain in advanced metadata creation and digital cataloguing skills. Furthermore, Ukwueze and Eze (2022) emphasized that the success of catalogue development and retrospective conversion largely depends on trained librarians and technical staff, recommending continuous training and recruitment of qualified personnel as a strategic priority.

Chart 5: Challenges Affecting Catalogue Efficiency and Future Readiness



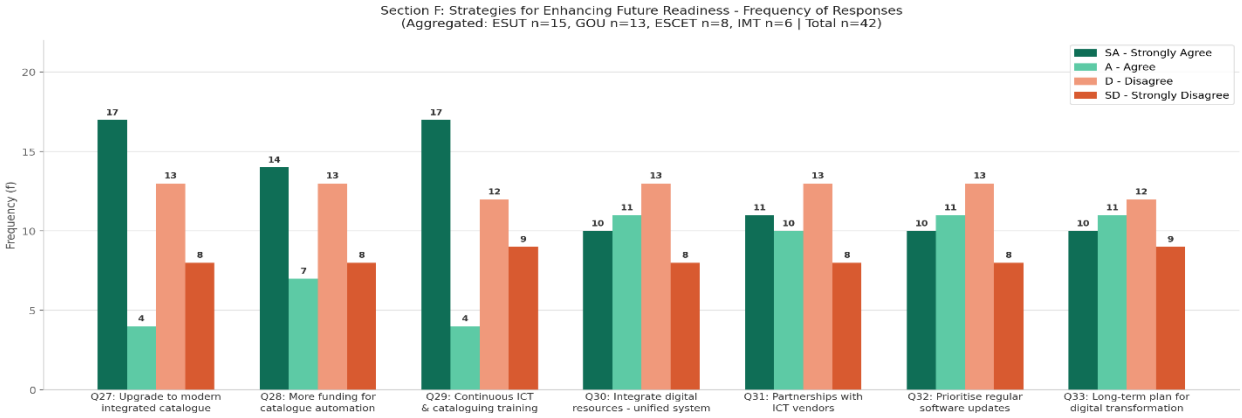


Chart 5 above presents the responses of library staff on challenges affecting catalogue efficiency. The mean scores ranged from 2.29 to 2.38, showing that respondents generally agreed that several factors affect catalogue efficiency across the institutions. Poor internet connectivity (Q20) and shortage of trained cataloguing personnel (Q22) recorded the lowest means of 2.29, indicating that these were the most common challenges. For Q20, 40.5% strongly agreed that poor internet affects catalogue operations, while for Q22, 31.0% strongly agreed and 19.0% agreed that there is a shortage of trained personnel, although some respondents, particularly from ESUT, disagreed. Insufficient funding (Q21) and limited management support (Q26) recorded mean scores of 2.36. About 52.4% of respondents agreed that funding constraints affect catalogue development, while 59.5% agreed that management support for catalogue improvement is limited. Inadequate ICT infrastructure (Q19), outdated catalogue systems (Q23), power supply problems (Q24), and lack of regular software updates (Q25) all recorded mean scores of 2.38. More than half of the respondents agreed that these factors affect catalogue efficiency, although responses varied across institutions. Overall, the findings show that catalogue efficiency is affected by multiple challenges, including poor internet connectivity, shortage of trained personnel, insufficient funding, weak management support, inadequate ICT infrastructure, power supply problems, outdated systems, and lack of software updates across the selected academic libraries.

These findings reflect a pattern of compounding institutional challenges that align closely with the literature. Oladokun, Oyadeyi, and Iyoro (2019) similarly identified erratic power supply and poor internet bandwidth as major obstacles to effective catalogue automation in Nigerian academic libraries, noting that the process is fundamentally technology-dependent and cannot succeed without stable infrastructure. The challenge of limited management support, though scoring moderately, is equally noteworthy; Adekoya and Inyang (2023) observed that resistance to technological change among staff and management can further slowdown adoption and effective utilization of modern catalogue platforms. The combined effect of these challenges is reflected in the assessment by Ajani, et al. (2022), who noted that catalogue development is time-consuming and requires dedicated manpower.

Chart 6: Strategies for Enhancing Future Readiness of Catalogue Systems

The chart 6 above presents the responses of library staff on strategies for enhancing the future readiness of library catalogue systems. The mean scores ranged from 2.29 to 2.48, showing that most respondents agreed that these strategies are necessary. The most strongly supported strategy was upgrading to a modern, fully integrated catalogue system (Q27), which recorded the lowest mean of 2.29, with 40.5% strongly agreeing. This support was particularly strong in ESCET and GOU, although many ESUT respondents disagreed. Continuous ICT and cataloguing training for staff (Q29) recorded the second lowest mean of 2.31, with 40.5% strongly agreeing, indicating that staff training is widely considered important. Increased funding for catalogue automation (Q28) recorded a mean of 2.36, with 50.0% of respondents agreeing, while partnerships with ICT vendors (Q31) recorded a mean of 2.43, also with 50.0% agreement. Integration of digital resources into a unified discovery system (Q30) and regular software updates and maintenance (Q32) both recorded mean scores of 2.45, with half of the respondents agreeing that these strategies are necessary. Long-term planning for digital transformation (Q33) recorded the highest mean of 2.48, showing slightly lower support compared to other strategies, although 50.0% still agreed. Overall, the findings show that respondents support several strategies for improving catalogue systems, especially system upgrades, staff training, increased funding, and better digital integration, although responses varied across institutions.

These findings are consistent with the study of Idiegbeyan-ose, Ifijeh, Adebayo, and Segun-Adeniran (2016), who established that effective future readiness depends on the integration of ICT, adequate funding, and continuous training, recommending improved infrastructure, policy support, and capacity building as sustainable strategies for catalogue modernization. The high rating accorded to a long-term digital transformation plan in the present study echoes the argument of Ikwuanusi et al. (2024) that cloud-based systems, data analytics, and digital platforms are fundamental to ensuring that library catalogues are responsive, accessible, and scalable in modern academic environments. This is further reinforced by Adigun, Ajani and Enakrire (2024), who noted that next-generation catalogues powered by artificial intelligence and knowledge graphs represent the emerging frontier of library resource discovery, requiring deliberate institutional planning and investment to achieve.

Summary of Findings

The study assessed the current state of library catalogue systems in selected academic libraries in Enugu State and evaluated their readiness for future developments in information organization and resource discovery. The findings revealed that:

13. Card catalogue and hybrid systems are still widely used in the selected academic libraries in Enugu State, while fully automated catalogue systems are limited. This indicates that most libraries are still transitioning from manual to automated catalogue systems.
14. The functionality of catalogue systems across the selected libraries is moderate. Although some libraries have partially automated systems, issues such as poor internet connectivity, incomplete records, and limited automation affect system performance.
15. The integration of library resources into catalogue systems is also moderate. While users can identify library holdings through the catalogue, integration of digital resources, full-text access, and unified search platforms remain limited.
16. The cataloguing staff possess moderate competency levels. However, there is a strong need for continuous ICT training, cataloguing standards training, and recruitment of qualified personnel.
17. Several challenges affect catalogue efficiency and future readiness. These include poor internet connectivity, shortage of trained personnel, insufficient funding, inadequate ICT infrastructure, unstable power supply, outdated systems, and lack of regular software updates.
18. The respondents strongly supported strategies such as upgrading catalogue systems, continuous staff training, increased funding, and partnerships with ICT vendors, integration of digital resources, and long-term digital transformation planning to enhance future readiness.

Conclusion

Based on the findings of this study, it can be concluded that library catalogue systems in selected academic libraries in Enugu State are still undergoing transition from traditional manual systems to modern automated platforms. Although some level of automation and functionality exists, significant gaps remain in system integration, infrastructure, staff competency, and technological readiness. These limitations affect efficient access to library resources and reduce the effectiveness of catalogue systems. Therefore, improving infrastructure, strengthening staff capacity, increasing funding, and adopting modern technologies are essential for enhancing the future readiness of library catalogue systems in the selected academic libraries.

Recommendations

Based on the findings of the study, the following recommendations are made:

1. Academic libraries in Enugu State should gradually phase out purely manual catalogue systems and adopt fully automated and integrated catalogue systems.
2. Library management should upgrade existing catalogue systems to support advanced functionalities such as keyword searching, remote access, user-friendly interfaces, real-time updates, and seamless retrieval of information resources.
3. Libraries should enhance the integration of both print and electronic resources into unified catalogue and discovery systems to provide users with comprehensive and centralized access to library resources.
4. Continuous professional development programmes, workshops, seminars, and ICT-based training should be organized for cataloguing personnel to improve their technical competence and adaptability to emerging cataloguing technologies and standards.
5. Government authorities, institutional management, and library administrators should address infrastructural and operational challenges affecting catalogue systems by providing adequate funding, stable electricity supply, reliable internet connectivity, and modern ICT facilities.
6. Academic libraries should develop strategic plans for the modernization of catalogue systems through increased automation, adoption of emerging technologies, integration of artificial intelligence and cloud-based solutions, and regular assessment of user needs.

Abstract

This study on " Library Schools Partnerships with Professional Libraries: A Remedy for Practical Training Deficiencies", theoretically analyzes the disconnect between Library and Information Science (LIS) theoretical education and practical professional demands in Nigeria. It advocates a structured partnerships as a solution. Grounded in Kolb's Experiential Learning Theory and Situated Learning Framework, the paper critiques Nigeria's LIS programs where 92% curriculum allocation favors theory over practice, producing graduates requiring 6-12 months workplace remediation. Four structural deficiencies emerge: absent clinical rotations (medical model), theoretical assessment dominance (written exams vs competency demonstrations), disembedded curricula (classroom isolation), and stakeholder silos (academia vs professional libraries). Theoretical analysis reveals global best practices including University of Illinois iSchool practicum model (400-hour placements), University College London's professional placement scheme, and North Carolina Central's library residency programs yielding 85% first-time employment. Nigeria's LIS schools lack equivalent teaching hospital partnerships despite NLA and Committee of Academic and Research Libraries in Nigeria comprising 5,000+ professional librarians available for mentorship. The paper proposes four partnership archetypes: clinical librarianship model (supervised service delivery), apprenticeship pathways (dual enrollment), residency programs (postgraduate placements), and co-op curricula (alternating academic/practice semesters). Conclusions recommend mandatory national LIS partnership standards mandating 480-hour practical placements, faculty exchange programs with professional libraries, and competency-based assessments replacing examinations. Strategic alliances between NLA, library schools, and employer consortia will transform LIS education from theoretical abstraction to professional apprenticeship, ensuring graduates deliver AI-enabled, user-centered services immediately upon employment.

Keywords: Curriculum Reform, Experiential Learning, LIS Practical Training, Library School Partnerships, Professional Development, Workplace Readiness

Introduction

Practical training remains a central part of Library and Information Science Education because it connects classroom knowledge with the real tasks that library workers perform in professional settings. In theory, library schools are expected to produce graduates who are not only familiar with concepts and methods but also capable of applying them confidently in actual libraries, archives, and information centres (Ojukwu, Agim & Ameh, 2021; Chiwanza & Chigwada, 2020). This expectation has become more important in a period when libraries are changing rapidly through digital services, user engagement, data management, and collaborative professional practice. For this reason, practical exposure in professional libraries should be treated as an essential bridge between academic learning and workplace competence.

Library school partnerships with professional libraries provide one of the clearest ways to strengthen practical training for students. Such partnerships allow students to observe service delivery, participate in cataloguing and reference work, engage with users, and understand the daily realities of professional librarianship in a structured environment (Huvila, Holmberg, Kronqvist-Berg, Nivakoski & Widén, 2013). Recent discussions in the literature show that collaborative arrangements between educational institutions and practice based libraries help students build confidence, improve problem solving ability, and develop the professional habits needed for future employment (Angell, 2018). These partnerships are also valuable because they create a shared learning space where library schools and professional libraries can exchange knowledge, standards, and expectations for professional practice.

Practical training is not simply a supplementary activity, but a major part of professional formation in librarianship (Diaz, 2019). Studies on LIS education indicate that practical training should help students move beyond theoretical knowledge to actual service performance, especially in areas such as user support, information organization, digital tools, and ethical practice (LeMire, Xu, Hahn, Balester & Dorsey, 2021). Recent scholarship also shows that library education and training are increasingly judged by how well they prepare students for the realities of contemporary information work, including collaboration, flexibility, and service innovation (Muszkiewicz, 2017). Where practical

placements are well designed, students are more likely to understand professional expectations, workplace culture, and the responsibility of serving diverse user groups.

Partnerships with professional libraries are important because they help library schools respond to current workplace demands that cannot be fully taught in lecture rooms alone (Jackson & Hansen, 2006). Cross training, mentoring, and collaborative placement models can expose students to professional routines, organizational behaviour, and service challenges that shape real library work (Fields, 2016). Such exposure is important because the profession now requires graduates who can work with technology, interact with users, support research, and adapt to changing service environments. In this way, practical training partnerships are not only educational arrangements but strategic tools for improving the quality and relevance of LIS education. Therefore, this study will examine practical training deficiencies: library school partnerships with professional libraries

Ideally, library schools should maintain strong and active partnerships with professional libraries so that students can receive practical training in real service environments that reflect the demands of the profession. In this ideal situation, students would be mentored by practicing librarians, exposed to current technologies and workflows, and guided to develop the skills needed for effective professional service. However, the current situation in many contexts is that practical training is often weak, irregular, or poorly structured because library schools and professional libraries do not always work together in a sustained and purposeful way. In some cases, students complete training without enough hands on exposure, without adequate supervision, or without access to the range of professional activities that would prepare them for work after graduation. The consequence is that graduates may enter the profession with good theoretical knowledge but limited confidence and limited practical competence, which can affect service quality and professional performance. Although previous studies have discussed LIS education, practicum, and collaboration in general terms, fewer studies have focused specifically on the problem of practical training deficiencies as a partnership issue between library schools and professional libraries, especially in the context of improving the quality of professional preparation. This gap justifies the need for the present study which will examine theoretical models of academic-professional partnerships in LIS education; analyze deficiencies in current LIS practical training paradigms; evaluate experiential learning frameworks for bridging theory-practice gaps; and propose partnership models optimizing LIS graduate workplace readiness.

Concept of Practical Training

Library and Information Science (LIS) education has long recognized practical training as a cornerstone for bridging theoretical knowledge with real-world application in professional library settings (Agim, Ninyio, Abubakar & Rabi'u, 2021). Fieldwork courses, often structured as internships or practicums, enable students to engage directly with library operations, including cataloging, user services, and digital resource management, fostering skills essential for employability. Bhatti and Nadeem (2014) highlighted that effective practical training programs emphasize hands-on experiences supervised by experienced librarians, which help students navigate the complexities of modern library environments marked by technological integration and evolving user needs. In South Korea, for instance, LIS fieldwork courses have been integral to curricula since the 1990s, with students reporting high satisfaction when programs include systematic orientation, feedback mechanisms, and alignment with academic coursework, thereby reducing the traditional theory-practice divide (Fields, 2016). Furthermore, practical training facilitates the development of soft skills such as interpersonal communication and adaptability, which are critical in diverse library contexts, including public, academic, and special libraries where students apply classroom concepts to daily tasks like reference services and collection development. These programs not only enhance technical competencies but also build professional networks, preparing graduates for the dynamic demands of the information profession.

The evolution of practical training in LIS reflects a shift toward competency-based models that incorporate emerging technologies like library management systems and digital curation tools. Research by Hamid and Soroya (2015) indicates that industrial attachments in polytechnics provide vital exposure to workplace realities, though challenges persist in aligning training with rapid digital advancements. Structured practicums, typically lasting 6-12 months, allow students to cycle through Kolb's experiential learning stages: concrete experience, reflective observation, abstract conceptualization, and active experimentation, leading to deeper skill integration. Instructors play a pivotal role by offering mentorship that combines technical guidance with reflective practice, as evidenced by high student satisfaction ratings for supervisor qualities in South Korean programs (Khan & Masrek, 2017). Moreover, practical training addresses global LIS needs by emphasizing user-centered services and information literacy instruction, enabling trainees to handle real-time queries and program evaluations effectively. Successful implementations often feature pre-practicum orientations and post-attachment debriefs, which reinforce learning and boost confidence in professional roles.

Library Schools Partnerships with Professional Libraries

Partnerships between library schools and professional libraries form a critical framework for enhancing LIS education through collaborative practical experiences and resource sharing. These alliances enable academic institutions to leverage professional libraries' expertise, facilities, and real-world challenges, creating symbiotic relationships that

benefit students, faculty, and practitioners alike. Fields (2016) underscores that such collaborations facilitate curriculum co-design, where industry input ensures relevance to contemporary practices like digital preservation and data analytics. In the United States, initiatives like virtual orientations by academic librarians for high school students demonstrate scalable partnership models that reduce library anxiety and promote seamless transitions to higher education (Nweke & Anyaogu, 2017). These partnerships often involve joint workshops, mentorship programs, and shared access to collections, fostering mutual professional development and innovation in service delivery. By embedding students in professional environments, schools bridge educational silos, preparing graduates for multifaceted roles in evolving library ecosystems.

Effective library school partnerships emphasize structured industry-academia dialogue to align training with professional competencies, including emerging areas like AI applications and remote services. Grimes (2023) revealed that collaborative frameworks enhance knowledge exchange, with practitioners contributing to curriculum updates and academics providing research support to libraries. Nweke and Anyaogu (2017) also stated that enhanced partnerships are recommended to address coordination gaps during industrial attachments, incorporating communities of practice for ongoing skill refinement. The authors further stated that successful models include formal agreements for placement coordination, joint evaluation metrics, and technology-sharing consortia, which have proven effective in resource-constrained settings. These collaborations not only improve graduate readiness but also elevate library services through evidence-based practices derived from academic research. Long-term partnerships cultivate a pipeline of skilled professionals, ensuring libraries remain agile amid technological disruptions.

Deficiencies in Current Library and Information Science Practical Training Paradigms

Current LIS practical training paradigms suffer from persistent deficiencies, particularly the misalignment between theoretical curricula and workplace demands, leading to graduates inadequately prepared for professional realities. According to Cherry, Freund and Duff (2013), outdated content fails to incorporate modern technologies such as integrated library systems and digital resource management, leaving students struggling with basic operational tasks upon entry into the field. In developing contexts like Korea, 78% of polytechnic attachés report insufficient preparation due to limited exposure to contemporary tools and poor academic-host coordination (Yoo, 2014). This theory-practice gap manifests in weak practical skills for user services, cataloging, and information literacy delivery, compounded by inadequate infrastructure and faculty training. Supervisors often dedicate significant time to remedial training, diverting resources from advanced development. Moreover, assessment methods emphasize exams over competency demonstrations, further disconnecting education from practice needs.

Additional deficiencies include insufficient emphasis on reflective practice and experiential cycles, hindering students' ability to internalize lessons from attachments. According to Aina (2017) rapid digital shifts have exacerbated gaps, with curricula lagging in areas like virtual reference and data curation. Also, imbalances favor theory over hands-on ICT training, resulting in intermediate skill levels mismatched to job market requirements. Aina (2019) further opined that limited pre-practicum preparation and irregular supervisor contact amplify these issues, eroding trainee confidence and career prospects. Resource constraints in African polytechnics restrict access to current software and diverse placements, perpetuating obsolete practices (Akintunde & Ogunbote, 2018). Addressing these requires curriculum reforms, robust partnerships, and competency-based evaluations to produce industry-ready professionals.

Experiential learning frameworks for bridging theory-practice gaps in Library and Information Science

Experiential learning frameworks provide structured approaches to integrate hands-on experiences with reflective processes in LIS education, effectively addressing the persistent divide between classroom theory and library practice. David Kolb's Experiential Learning Theory, with its four-stage cycle of concrete experience, reflective observation, abstract conceptualization, and active experimentation, has been widely applied to LIS internships, enabling students to transform workplace encounters into professional competencies (Yoo, 2014). In library settings, this framework manifests through practicums where students engage in cataloging or reference services, followed by guided reflections that link actions to theoretical principles like information organization standards. Recent implementations in higher education, including LIS programs, demonstrate that embedding Kolb's cycle in course design enhances skill retention and adaptability, particularly in digital curation tasks amid technological evolution (Cherry, et al, 2013). Complementary approaches, such as service-learning projects in community libraries, further operationalize these frameworks by combining real-world service with academic debriefing, fostering ethical decision-making and user-centered innovation. These models emphasize iterative cycles that allow LIS trainees to experiment with emerging tools like integrated library systems under supervision, thereby cultivating confidence for independent professional roles. Faculty mentorship within the cycle ensures alignment with LIS core competencies, transforming potential gaps into opportunities for holistic growth.

Beyond Kolb's foundational model, hybrid experiential frameworks incorporate simulations and project-based learning to simulate library workflows, bridging gaps exacerbated by limited placement opportunities. For instance, video-recorded reference interviews followed by peer feedback sessions enable reflective observation and active experimentation in controlled environments, preparing students for diverse user interactions (Ashiq, Rehman & Mujtaba, 2020). In LIS curricula, these frameworks extend to community-engaged research, where students collaborate

on digital literacy initiatives, applying radical change theory to evaluate outcomes and refine practices (. Nilsen, 2012). Studies highlight that such integrations promote deeper understanding of information behaviors, addressing deficiencies in traditional lecture-based training (Bird & Crumpton, 2014). Moreover, incorporating Outcome-Based Planning and Evaluation within experiential cycles ensures measurable progress toward employability skills like adaptability and collaboration. Challenges like varying student readiness are mitigated through pre-experience orientations, maximizing framework efficacy across global LIS contexts. Ultimately, these frameworks empower graduates to navigate complex library ecosystems with integrated knowledge and practical prowess.

Partnership models optimizing Library and Information Science graduate workplace readiness

Partnership models between library schools and professional libraries optimize graduate workplace readiness by facilitating targeted skill development through collaborative placements and curriculum alignment. Reciprocal models, such as those proposed for HBCU-LIS pipelines, involve joint program design where practitioners contribute to coursework on emerging technologies, ensuring cultural competence and practical relevance (Grimes, 2023). In these structures, libraries host extended internships with structured mentorship, allowing students to apply theory in authentic settings like digital archiving projects. Research by Fields (2016) illustrates pipeline partnerships that link undergraduate preparation with graduate LIS programs, enhancing employability via shared resources and feedback loops. Formal agreements outline roles, including practitioner-led workshops on user services, which directly address market demands for tech-savvy librarians (Schwartz, 2019). These models emphasize sustainability through ongoing evaluation, fostering long-term networks that support career progression. By pooling expertise, partners create immersive experiences that simulate full-time roles, boosting graduate confidence and hireability.

Advanced partnership models leverage consortium approaches among multiple institutions to scale training opportunities, particularly in resource-limited regions. For example, regional LIS networks facilitate cross-institutional attachments, exposing students to varied library types and optimizing competencies in areas like information retrieval systems (Jackson & Hansen, 2006). WIL Partnerships for Employability Frameworks delineate stakeholder responsibilities, integrating industry input into assessments to align training with job requisites. In urban planning analogs adaptable to LIS, partnership-based embedding of employability skills through co-developed modules has proven effective for workplace transitions (Witteveen, 2017). Digital-era models incorporate virtual collaborations, enabling remote simulations and global exposure to best practices. Success hinges on clear communication protocols and mutual commitments, minimizing coordination barriers. These optimized models not only elevate readiness but also drive innovation in LIS services through practitioner-academic synergy.

Theoretical models of academic-professional partnerships in Library and Information Science Education

Theoretical models of academic-professional partnerships in LIS education provide conceptual scaffolds for sustainable collaborations that enhance training efficacy. Structuration theory, as applied to library-academic interactions, elucidates how shared structures like policies and technologies shape collaborative practices while being reshaped by participants' actions (Witteveen, 2017). In LIS contexts, this duality explains evolving roles where librarians transition to co-instructors, integrating practitioner insights into curricula for theory-practice synergy. According to Schwartz (2019), Montiel-Overall's collaboration continuum from coordination to integrated curriculum guides partnership depth, advocating full integration for optimal student outcomes in information literacy programs. Recent applications emphasize mutual expectations to bridge gaps, positioning theory as a lens for practitioner challenges even as these models highlight power dynamics, urging equitable resource allocation to sustain partnerships (Fields, 2016). By framing collaborations as dynamic processes, they support adaptive responses to LIS disruptions like AI integration.

Supplementary theoretical models, including duality of technology theory, extend structuration to examine how digital tools mediate academic-professional interactions in LIS. Orlikowski's framework reveals technology's role in altering collaboration patterns, such as virtual platforms enabling remote co-teaching (Grimes, 2023). In LIS education, this informs models where partnerships develop shared online repositories for experiential content. According to Nweke and Anyaogu (2017), community of Practice theory complements by viewing partnerships as knowledge-sharing arenas, fostering collective competence among faculty and librarians. Empirical validations in diverse settings underscore the need for policy enablers to operationalize these models effectively (Witteveen, 2017). Integrated frameworks like WIL employability pillars such as partnerships, accreditation, and protocols, provide actionable blueprints for LIS readiness. Collectively, these theories advocate proactive, theory-informed strategies to fortify academic-professional alliances.

Theoretical Analysis: Global Best Practices in Library and Information Science

The University of Illinois iSchool practicum model exemplifies a structured experiential approach where students complete approximately 100 credit hours of supervised professional work, integrating classroom theory with library operations to bridge theory-practice gaps effectively (Murray, 2015). This model emphasizes pre-placement contracts, ongoing mentorship, and reflective assessments, allowing participants to apply knowledge in diverse settings like academic and public libraries, thereby enhancing competencies in areas such as digital services and user engagement. Complementing this, University College London's professional placement scheme mandates full-time attachments of at least five weeks, often aligned with industry events like the London Book Fair, providing immersive exposure under dedicated mentors who guide students through practical tasks and career navigation (Engeszer et al, 2015). These

placements foster professional networks and skill refinement, mirroring medical clerkships in their intensity and supervision. North Carolina Central University's library residency programs further demonstrate efficacy through targeted postgraduate placements that prioritize diversity and inclusion, resulting in strong employment trajectories at prestigious institutions including Princeton University Libraries and Duke University (Lor, 2016). Collectively, these models highlight mentorship, structured duration, and alignment with professional standards as key to producing workplace-ready LIS graduates globally.

Theoretical underpinnings of these best practices draw from experiential learning cycles, where practicums serve as arenas for Kolb's stages, enabling reflection on real-world applications like collection management and information literacy instruction. The iSchool's dual credit-wage structure incentivizes participation, while UCL's mentor oversight ensures ethical practice and innovation exposure, addressing global LIS needs amid digital transformation (Johnson et al., 2014). NCCU residencies extend this by incorporating alumni tracking for continuous improvement, yielding graduates equipped for multifaceted roles in public and corporate sectors. Cross-institutional analyses reveal common success factors: formal agreements, competency mapping, and post-placement evaluations that reinforce employability (Murray, 2015). These practices not only mitigate deficiencies but also model scalable frameworks for resource-variable contexts, promoting LIS professionalism worldwide.

Nigeria's Library and Information Science Landscape

Nigerian LIS schools notably lack equivalent teaching hospital partnerships akin to medical education models, despite the availability of robust networks like the Nigeria Library Association (NLA) and the Committee of Academic and Research Libraries in Nigeria (CALIBN), which encompass thousands of professional librarians poised for mentorship roles (Aina, 2019). This absence perpetuates a theory-heavy curriculum disconnected from practice, with students graduating without hands-on exposure to contemporary library functions such as digital repositories and user analytics, mirroring challenges in other developing regions. Unlike global exemplars, Nigerian programs rely on sporadic industrial visits rather than embedded rotations, limiting skill acquisition in emerging areas like open access management and AI-driven services (Adetoro, 2020). The NLA's extensive membership offers untapped potential for structured collaborations, yet coordination barriers, including policy silos and funding shortages, hinder formal affiliations similar to Lagos University Teaching Hospital's medical integrations. Babalola and Ogunmodede (2019) in their study call for leveraging these bodies to establish practicum pipelines, addressing the employability gap where graduates face remedial training in professional settings. Faculty workloads and infrastructural deficits further exacerbate isolation, underscoring the urgency for policy-driven alliances to mirror successful international models.

Proposed partnership archetypes in Library and Information Science

This analysis proposes four partnership archetypes tailored to LIS education: the clinical librarianship model featuring supervised service delivery in professional libraries akin to medical rotations, apprenticeship pathways via dual enrollment combining coursework with paid on-site training, residency programs as postgraduate placements emphasizing specialized skills like digital curation, and co-op curricula alternating academic and practice semesters for comprehensive immersion (Onyancha & Ocholla, 2018). The clinical model deploys students to handle real queries under librarian supervision, building reference and instruction prowess through iterative feedback. Apprenticeships mirror vocational schemes, integrating NLA mentors for holistic development in cataloging and outreach (Olumuyiwa & Abioye, 2020). Residencies, inspired by NCCU, target underrepresented talent with year-long commitments yielding career acceleration. Co-op structures, drawing from UCL schemes, ensure balanced exposure across library types, optimizing readiness via structured reflection (Knipp et al., 2015). Implemented via formal MOUs with CALIBN, these archetypes address gaps systematically, scalable across Nigerian contexts.

Structural deficiencies examination in Library and Information Science

Current LIS training paradigms exhibit absent clinical rotations, diverging from the medical model's immersive clerkships where trainees engage live cases under supervision; in LIS, this manifests as theoretical lectures supplanting hands-on library shifts, leaving graduates inept in practical diagnostics like patron needs assessment (Khan & Masrek, 2017). Theoretical assessment dominance prioritizes written exams over competency demonstrations, undervaluing observable skills in software proficiency or program evaluation, thus perpetuating superficial knowledge. Disembedded curricula isolate classroom learning from professional ecosystems, lacking integration with tools like Koha systems or real-time user interactions, akin to studying surgery without operating rooms (Hamid & Soroya, 2017). Stakeholder silos between academia and libraries foster misaligned expectations, with minimal joint planning despite NLA's capacity, resulting in duplicated efforts and untrained entrants. These deficiencies compound in Nigeria, demanding archetype-driven reforms.

Amplifying these issues, absent rotations fail to simulate workflow pressures, while exam-centric evaluations ignore soft skills like collaboration essential for team-based librarianship (Bhatti & Nadeem, 2014). Disembedded designs overlook contextual variances across public and academic libraries, hindering adaptability. According to Hamid and Soroya (2015) Silos erode trust, impeding resource sharing for digital training. Reforms via proposed archetypes such as clinical for immersion, co-ops for balance can offer pathways to rectify, aligning LIS with proven professionalization models.

Conclusion

In conclusion, this study on Library schools partnerships with professional libraries: A remedy for practical training deficiencies reveals that while theoretical models of academic-professional partnerships, such as structuration theory and collaboration continua, provide robust frameworks for integration, persistent deficiencies like absent clinical rotations, theoretical assessment dominance, disembedded curricula, and stakeholder silos undermine current paradigms, particularly in Nigeria where LIS schools lack teaching hospital equivalents despite networks like the Nigeria Library Association (NLA). Experiential learning frameworks, exemplified by Kolb's cycle and global best practices including the University of Illinois iSchool's 400-hour practicums, University College London's placement schemes, and North Carolina Central's residencies, offer proven pathways to bridge theory-practice gaps, yet their underutilization exacerbates graduate unreadiness. Proposed partnership archetypes such as clinical librarianship, apprenticeships, residencies, and co-op curricula align with optimizing workplace readiness, drawing from international models to advocate scalable, mentorship-driven solutions that leverage professional bodies like CALIBN for immersive training. Ultimately, fostering structured alliances between LIS schools and professional libraries will transform education into a dynamic ecosystem, producing competent professionals equipped for evolving information landscapes amid digital disruptions.

Recommendations

Drawing from the findings of the study, the following recommendations address the identified issues:

1. LIS schools should adopt structuration theory and Montiel-Overall's collaboration continuum by establishing formal policy frameworks with professional libraries to dynamically integrate practitioner input into curriculum design and evaluation processes.
2. Academic programs must reform structural deficiencies through mandatory clinical rotations, competency-based assessments replacing exam dominance, embedded practical modules, and cross-stakeholder committees to align training with real-world library operations.
3. Implement Kolb's experiential learning cycle across LIS practicums with structured reflection sessions, mentorship, and simulations modeled after the University of Illinois iSchool and UCL schemes to systematically bridge theory-practice gaps.
4. Develop and pilot the four proposed archetypes such as clinical librarianship, apprenticeship pathways, residency programs, and co-op curricula via MOUs with NLA and CALIBN to optimize graduate employability through sustained, supervised practice immersion.

Abstract

Health information resources and services delivery constitute a critical components of modern healthcare systems, enabling informed decision-making, improve patient outcomes, and efficient system management This paper explored Leveraging Medical Libraries for Health Information Resources and Services in Nigeria. With strategies for optimising the use of medical libraries including the curation of comprehensive electronics and print resources, implementation of user-centred information services, and promotion of health literacy outreach programmes. It highlights the impact of collaboration, networking, open-access databases and knowledge management systems in enhancing timely access to medical information. The paper concludes that by positioning medical libraries as central hubs for information dissemination and knowledge exchange, health institutions can improve patient outcome, foster research innovation, and strengthen evidence-base practice. The paper recommended the importance of institutional management supports, specialised training of librarians and healthcare professionals to maximize the effective use of available resources and services among others.

Keywords: Health Information Resources, Medical Library Services, Healthcare Systems, Public Health Information, Leveraging

Introduction

In an era characterised by rapid advancements of biomedical knowledge and digital information technologies, leveraging medical libraries plays a critical role in the healthcare ecosystem by facilitating access to reliable, evidence-based information that supports clinical decision making, research, education, and public awareness. These become essential for improving health information resources and enhancing services delivery across healthcare systems. Because access to reliable and timely health information is fundamental requirement for effective healthcare delivery. Medical libraries play a significant role in the advancement of healthcare by providing access to information resources and services that form a critical component of healthcare systems through the promotion of evidence-based practices, enhancing health information literacy, supporting research, education, contributing to quality patient care and public health improvement. Conventionally, the medical libraries serve as physical repositories of books, journals, and reference materials tailored towards the needs of healthcare professionals. However, the advancement of Information and Communication Technologies (ICTs) has transformed these libraries into dynamic, hybrid information centres that provide digital resources and services. Supporting improved health outcomes.

Medical libraries are specialised information centres that support healthcare professionals, researchers, students, and policymakers access to high-quality, evidence-based biomedical health information. Their role has evolved significantly from traditional print-based collections to dynamic digital knowledge hubs that integrate electronic resources, databases, and advanced information services [International Federation of Library Associations and Institutions (IFLA), 2019); World Health Organisation (WHO), 2020]. These libraries play a vital role in health information services delivery by providing access to evidence-based resources such as MEDLINE, PubMed, and Cochrane databases, as well as offering services like reference assistance, literature searches, and current awareness services. In the contemporary time, modern libraries now offer access to electronic databases, clinical decision tools, evidence-based materials, and open-access repositories, enabling timely and efficient retrieval of high-quality health information (Bandyopadhyay & Boyd-Bymes, 2016).

Further, leveraging medical libraries services as vital hubs for information resources and services delivery. Librarians play an active role in guiding users, both clinical and patients, in identifying credible health information and avoiding misinformation. Health information resources refer to the various tools, data sources, technologies, and repositories used to collect, store, manage, and disseminate health-related information. These include Electronic Health Records (EHRs), medical databases, health Information Systems (HIS), research publications, clinical guidelines, and digital health platforms (American Library Association (ALA) (2020). Meanwhile, services delivery involves the processes and mechanisms through which this information is made accessible and usable to healthcare providers, patients, policy makers, and other stakeholders. These functions have become increasingly important in the digital age, where the proliferation of unverified online health content poses significant risks to public health (Shag, Sun & Xie, 2020). In

addition, leveraging medical libraries support clinical care, medical libraries contribute significantly to research and academic activities. These libraries provide training in information literacy, systematic review methodologies, and research data management. However, these services enhance the research capacity of healthcare institutions and foster innovation in medical science (Ferguson, 2018).

Thus, the integration of medical libraries into healthcare information resources and services delivery systems also promotes interdisciplinary collaboration. By working closely with medical workers, researchers and policy makers, medical librarians help bridge information gaps and ensure that relevant knowledge is effectively translated into practice. This collaborative approach strengthens healthcare delivery and aligns with global efforts to achieve universal and sustainable development goals (Zhang et al., 2020). Despite this advancement, the adequacy of medical resources and services has implications for the quality of healthcare delivery in Nigeria. Studies have shown that while some information resources and services are available in teaching libraries, but many essential services are either insufficient as not adequately provided, thereby affecting healthcare professionals access to critical information needed for effective patient care. To this effect, leveraging medical libraries to enhance health information resources and services delivery becomes necessary. The major objective of this paper is to provide strategies for medical libraries to enhance access to accurate, timely, and evidence-based health information for healthcare professionals, researchers, students, policy makers, and the general public in order to improve healthcare outcomes and strengthen the national health system. This objective focuses on utilising modern information and communication knowledge, digital databases, research repositories and professional library services to support medical education, clinical decision making, disease prevent, and public health awareness and research development across Nigeria.

Strategies for Leveraging Medical Libraries for Health Information Resources and Services

Leveraging medical libraries for health information resources and service delivery in Nigeria represents a strategic pathway toward strengthening country's healthcare system, improving clinical outcome, and advancing evidence-based practice for achieving better health outcomes for citizenry. With the rapid expansion of digital health information, medical libraries need to adopt innovative strategies to ensure timely, accurate, and adequate access to health information resources and promote public health awareness (Bates, 2018). The following are strategies that can enhance how medical libraries leverage health information resources and improve services delivery. This includes:

i. **Evidence-Based Information Services (EBIS)**: Medical libraries can strengthen health outcomes by embedding evidence-based practice support into their services. These services ensure clinicians and researchers access to current, high-quality and validated medical evidence, improving decision making and patient care (marshal et al., 2018).

ii. **Digital Health Information Access and Knowledge Management Systems**: Modern medical libraries need to leverage digital platforms and knowledge management tools to expand access to health information resources. this service enhances remote access, supports telemedicine, and ensures 24/7 availability of health information resources that improve accessibility and healthcare delivery (LIS Research, 2020).

iii. **Health Literacy and Consumer Health Information Services:** Medical libraries should actively support patients and the general public by promoting health literacy. The services improve patient understanding of diseases, treatment adherence, and prevalence healthcare behaviours (Berkman et al., 2021).

iv. **Research data Management and Scholarly Communication Support:** Medical libraries can serve as hubs for research lifecycle support by providing research data curation and storage open access publishing support. As libraries play a critical role in managing research data and promoting open science (Tenopir et al., 2022).

v. **Collaborating Clinical and Institutional Partnership:** Medical libraries need to integrate healthcare systems through strategic partnership. Collaboration with other healthcare stakeholders, support multidisciplinary healthcare partnership that provides medical literacy and training. This service positions librarians as active contributors to patient care, education and improves clinical workflow efficiency and information utilisation (Koffel, 2019).

Challenges

Effective health information resources and services delivery in medical libraries support clinical decision making, enhances communication among healthcare professional, and facilitates continuity of care. Despite these advancements, several challenges persist in the effective delivery of health information resources and services. These include:

i. **Inadequate Institutional Management Support and Funding:** One of the most persistent challenges is inadequate institutional management support and insufficient funding for the acquisition of up-to-date print and electronic resources. most of these libraries rely heavily on outdated monographs due to insufficient budgets and inadequate management support by parent body.

ii. **Inadequate Information and Communication Technologies (ICTs) and Limited Access to Electronic Information Resources:** Most medical libraries in Nigeria have inadequate modern ICTs facilities such as robust internet systems, integrated library management systems, and digital repositories. Due to this, access to electronic databases, online journals, and digital libraries is often inadequate due to poor subscriptions, unstable internet connectivity, and high subscription cost.

iii. **Inadequate Skilled and trained Medical Librarians:** Another major challenge medical libraries face is lack of adequately trained librarians in specialised areas such evidence-based medicine, systematic reviews, and clinical librarianship.

iv. **Inadequate Specialised health Information Services:** Modern medical libraries are expected to provide services such as clinical information support, systematic review assistance, and evidence-based synthesis. However, most Nigerian medical libraries still focus on traditional services and fail to fully integrate into healthcare decision making process.

v. **Inadequate Collaboration and Networking:** Most medical libraries lack adequate collaboration with healthcare providers to build partnership for networking as strategy for institutionalized librarians participating in healthcare delivery processes to extend services to patients and health workers. These services enhance access to wider range of resources and services and strengthen partnership among other medical libraries.

Conclusion

Leveraging medical libraries in Nigeria is fundamental for improving health information resources, access and services delivery. As healthcare systems continue to evolve, medical libraries serve as clinical knowledge hubs that provide clinical based timely access to relevant, up-to-date, and biomedical health information to healthcare professional, researchers, students and policy makers for decision making that help public health intervention, reduces medical errors, and enhance patient healthcare quality. Medical libraries must adapt by embracing technological innovations, expanding digital services, and strengthening their role as essential partners in healthcare delivery, education, and research. Therefore, there is need for the management of medical libraires as the parent body to provide adequate management support, providing adequate capacity building for librarians, and stronger integration of libraries into healthcare delivery systems, by improving the availability, organisation, and dissemination of reliable medical information and informed health practices throughout Nigeria.

Recommendations

i. **Adequate Institutional Management Support and Funding:** Institutional management should provide adequate support for the libraries, and also prioritize funding for library modernisation to ensure seamless acquisitions and access to up-to-date health information resources.

ii. **Strengthening Infrastructure and Digital Electronic Resources:** Institutional management and institute librarians should ensure that medical libraries are equipped with adequate modern ICTs infrastructure, including stable internet access, digital repositories, subscription-based medical database, and open access journal platforms to increase visibility and accessibility.

iii. **Integration of Library Services into Clinical Practice:** Medical libraries should be more actively integrated into healthcare delivery systems by providing and supporting clinicians, researchers, and student with real-time evidence-based information services. Librarians need to be embedded in hospital teams to support clinical decision making.

iv. **Adequate Capacity Building for Medical Librarians:** Regular training and professional development programmes should be organised for medical librarians to enhance their competences in digital librarianship, Evidence-Based Medicine (EBM), data management, and health management informatics.

v. **Collaboration and Partnership:** Medical libraries should form strong collaborations to partner and network to facilitate resources sharing, interlibrary networking and joint subscriptions. Collaboration among Nigerian medical libraries can help to reduce subscription cost, duplication of resources, and improve access to rare or expensive materials and equity.

vi. **Monitoring and Evaluation of Library Services:** There should be continuous assessment of medical library services to ensure they meet users' need. Feedback mechanism is required to guide improvement and sustainability of health information resources and services delivery.

ABSTRACT

Library growth in the 21st century is very essentially linked to active, strategic advocacy, with librarians serving as the "pedal" or driving force behind this evolution. As libraries transition from traditional book repositories to digital-age, community-focused hubs, librarians must move beyond their traditional roles to become active promoters of their value. This study is an eye opener to the librarians that the growth of the libraries depends on their actions through advocacy. This study made use of theoretical approach. Three objectives and research questions were raised to guide the work. The raised questions were "What are the librarians supposed to do? Are there speedy strategies of advocacy to be deployed by the librarians? Are there relationships between library growth and advocacy? . At the end of the study recommendations were drawn.

Keywords: Advocacy; Library growth; Librarians; Pedal for 21st century; Library

Introduction

A library is a collection of books, to some scholars it is called a hub where intellectual materials are preserved, and possibly other materials and media, that is accessible for use by its members and members of allied institutions. Libraries provide physical (hard copies) or digital (soft copies) materials, and may be a physical location, a virtual space, or both. A library's collection normally includes printed materials which can be borrowed, and usually also includes a reference section of publications which may only be utilized inside the premises. Libraries also provide access to information, music or other content held on bibliographic databases. This is a database where bibliographic records are kept.

In today's libraries a lot have changed due to technological advancement and innovations hence, the use of physical libraries and the rate at which the users visit the libraries is threatened. The ideal thing today is not just the phobia of users visiting the library but the ability of the librarians as the pedal to the survival of the libraries to educate, guide, recommend and speak up on the importance, and the efficacy of what the hub of knowledge is capable of changing in their lives looking at the trend of the changes in the society since the library is a growing organism (Ranganathan, 1931/2). These will be achieved through advocacy. Library advocacy according to San Jose State University (SJSU) (n.d) advocacy generally is the act of publicly expressing, supporting, or campaigning for a specific cause, policy, or individual to effect positive change. To SJSU, advocacy involves outreach, raising awareness, and securing institutional support for marginalized communities and the ongoing relevance of library systems. Advocacy to Suman and Peelwan (2024) in Alex-Nmecha (2026) advocacy involves the active promotion of the value and importance of libraries to policymakers, stakeholders, and the public, including engagement in outreach efforts to communicate the impact of libraries on education, literacy, and community development.

Library advocacy is defined as any action that speaks in favour of library growth, advancement, and recommends, argues for a cause, supports or defends, or pleads on behalf of happenings in taking the library to an enviable height. When library advocacy is given good and heightened attention winning in their favour the government, and other stakeholders in a course spoken for the growth of the library, it pulls the library up. These activities are not carried out by the books and furniture in the library. The librarians as the pedal to moving the library to good stance need advocacy at anytime to attract library growth.

Library growth through advocacy involves deliberate, sustained efforts to influence stakeholders and secure resources. It shifts libraries from passive repositories to active, essential community hubs by demonstrating their direct impact on literacy, technology access, and socio-economic development.

PROBLEM STATEMENT

The use of the internet and the digitalization of activities and processes of information dissemination in the library is one thing very crucial in the day-to-day running of the work of the librarians. When these activities are set the need for the users to get informed of the work done in the library, the new arrivals, and other important happenings in the library are slow because the users are expected to visit the library and if they don't they miss out from the activities of the library. The librarians as the custodians of knowledge have a duty to carryout. That duty is if they get involve in advocacy

programmes that will sell the libraries looking at policies, funding, users' attendance to the libraries and networking amongst the libraries. Are there speedy strategies of advocacy to be deployed by the libraries to push for library growth?

OBJECTIVES OF THE STUDY

This work is on library growth through advocacy. The specific objectives are to:

1. Identify what the librarians are to do through advocacy for library growth
2. Ascertain whether there are speedy advocacy strategies to strengthen library growth
3. Determine whether there are relationships between Advocacy and library growth.

RESEARCH QUESTIONS

1. What would the librarians do through advocacy for library growth?
2. Are there speedy advocacy strategies to strengthen library growth?
3. Are there relationships between advocacy and library growth?

LITERATURE REVIEW

LIBRARY GROWTH AND LIBRARY ADVOCACY

Librarians drive library growth through deliberate advocacy by securing funding, raising community awareness, and building strategic partnerships. This ensures their institutions remain essential, well-resourced community pillars. To achieve this, librarians execute several key initiatives: Securing Funding & Resources: Lobbying elected officials, speaking at public hearings, and applying for grants to ensure financial sustainability. Building Community Relationships: Partnering with local schools, businesses, and community leaders to expand the library's network. Promoting Value and Success Stories: Sharing testimonials from patrons and hosting literary events to remind decision-makers of the library's impact. Championing Digital and Information Literacy: Advocating for open access, digital inclusion, and defending intellectual freedom.

Library growth as opined by Henley (2022) involves many aspects through advocacy as it enclaves what the librarians think about having in mind why the library matters, what value does it bring to the librarian, what value do the librarians see for the community and how the values of the library profession fit with the goals of the community. Henley also reiterated that for advocacy to yield growth it is a year-round commitment, relationship cultivated and opportunities looked for. In all of these the key points to hold and bank on are building partnerships, turning passive support into educated and informal action, persuasion and influence.

Why Advocacy Matters

According to Abegunde, Awujoola, and Bamidele (2023**), itemized some reasons why advocacy is important. These reasons are to:**

- **Secure Funding:** Deliberate advocacy helps prevent budget cuts and attracts crucial monetary or material donations.
- **Elevates Visibility:** It shifts outdated perceptions of libraries as mere "book warehouses" into modern roles as dynamic digital hubs and intellectual commons.
- **Drives Patronage:** Showcasing resources increases public awareness and directly boosts user engagement across diverse community groups

Library growth relies on deliberate, sustained advocacy to influence key decision-makers and secure vital funding. By applying the "3 C's"—**collaborating** with community stakeholders, **connecting** resources to user needs, and **communicating** the library's socioeconomic value, institutions can reverse declining budgets and expand their footprint. Library advocacy drives **growth** and **influence** by securing vital funding, shaping supportive public policies, and proving the library's indispensable value to decision-makers. It transforms passive community support into proactive, educated action, ensuring libraries remain modern, equitable, and resourceful community anchors (Haruna et. Al 2024). Library Advocacy is also the deliberate, sustained effort to foster understanding of the library program while influencing the attitudes of stakeholder (Ezeala and Hundu

The push for library growth through advocacy puts the librarians at the helm for speedy grasp knowing fully well that they are the 'pedals' to propel the shout out to the public, government and other stakeholders. According to Osuchukwu (2016) Lobbying and Advocacy are the in thing and a modern skill the librarians must learn. She further stated that these new skills define capacities in clear public relations as it integrates the tactics to engage stakeholders in influencing library and information services development for best practices. No one can tell your story as yourself, meaning librarians are to be firm, focused, and always ready to sell their activities to the world.

METHODOLOGY

This paper made use of theoretical approach to buttress on the need for advocacy as a yardstick to library growth.

RQ-1

What are they (librarians) supposed to do?

From all that has been discussed through advocacy, the librarians are to put effort on library growth as they propel the activities. They are to

- Maintain and increase support for the library
- Demonstrate the value of the library to the community
- Ensure a sustainable future for the library and community

RQ-2

Are there speedy strategies of advocacy to be deployed by the libraries?

- **Build Direct Relationships:** Heads of libraries must cultivate ongoing rapport with institutional decision-makers, school principals in the case of a school library, or local government officials before making specific funding requests.

- **Leverage Marketing Data:** Clearly present usage metrics, user testimonials, and community impact studies to show how the library fosters critical thinking, research, and digital literacy.

- **Diversify Support Channels:** Move beyond relying solely on government budgets by campaigning for private donations, grants, and co-hosted community events with local businesses.

RQ-3

Are there relationships between library growth and advocacy?

The relationship between library growth and library advocacy is a tight one as a well planned advocacy builds a library of the 21 century. To Amadi (2024) Library advocacy is the essential catalyst for library growth. Strategic, organized promotion secures the funding, resources, and policy protections required to expand infrastructure, collections, and technology. Conversely, a growing, thriving library provides tangible proof of value, making it easier to advocate for continued community investment and support.

CONCLUSION

Libraries exist to meet their user's basic needs for information by acquiring and organizing information resources, creating an enabling environment and providing adequate services to users. Information professionals must therefore understand that it is essential to actively advocate and market their services.

Library advocacy and marketing are critical for any information professional to spread the word about their library. They need to draw attention to their library, their services, and their worth to their community, their administration, their staff, and their users. For advocacy to succeed as a concept, it has to employ marketing strategies. Library advocates believe in the importance of free and equitable access to information in a democratic society. Library advocates believe libraries and librarians are vital to the future of an information-literate nation. Library advocates speak out for libraries. Library advocates are everywhere although they don't always call themselves that.

Librarians to play an active role in Advocacy efforts. Quick and easy options for engagement include:

- Following key decision-makers on social media and commenting positively on their engagement in local events;
- Learning how the legislative process works and how advocacy fits in (the Library of Congress has some helpful short videos on legislative process.
- Finding opportunities to invite legislators and staff to learn more about programs and services.
- Connecting with new legislative staff;
- Asking parents, teachers, students, and other supporters to get involved through phone calls, emails and letters.
- Inviting an elected official or staff person to visit;
- Developing an Advocacy Mentor program, matching supporters with experience to those eager to be engaged;
- Attending the “An Hour a Week: Amping Up Library Advocacy Is Easy!”

RECCOMMENDATIONS

- It is recommended that libraries take advocacy very seriously to empower and effectively promote collaboration, knowledge management among library staff for library growth.
- Library awareness campaigns, advocacy programmes, and training courses should also be implemented to improve on the strategies to effectively carry out the activities of the library.
- In a webinar titled: Libraries are a Worthy Cause: Defend YOUR Library with Advocacy presented by Pam Henley in Montana State Library in 2022 Strategies that Work. Librarians should always defend their libraries/even when they don’t work in the library.

HUNDO, Whenayon Daniel (CLN, MNLA)
Nigerian French Language Village Library Badagry Lagos State
hundowhenayon@frenchvillage.edu.ng

Abstract

This study investigated **Makerspace Facilitation: Training Librarians for Creative Technology Support** in academic libraries across Bayelsa, Ogun and Lagos States, Nigeria. The study adopted a **descriptive survey research design** targeting librarians from institutions in the selected states. The population comprised of 794 librarians. A sample of 120 librarians were selected using simple random sampling technique. Data collection were done through **observation checklists** and **questionnaires** validated by three Library and Information Science experts. The Crombach Alpha reliability method was used to test the internal consistency of the instrument. A reliability coefficient of 0.83 was obtained. Data collected was analyzed using descriptive statistics of mean scores and standard deviation. **The findings** reveal 3D printing workshops and electronics training as primary programs, with baseline competencies moderate in basic fabrication but limited in programming. Post-training, librarians demonstrated proficiency in Arduino programming and laser cutting operations, significantly enhancing services like student prototyping support. The challenges include power instability, equipment maintenance costs, and space limitations. The study **concluded** that targeted makerspace facilitation training transforms librarians into creative technology enablers, recommending institutional power solutions, equipment endowment funds, and curriculum integration to sustain innovation hubs supporting STEM education in Nigerian academic libraries.

Keywords: Makerspace Facilitation, Creative Technology, Academic Librarians, 3D printing, STEM support

Introduction

Makerspaces have transformed academic libraries into hubs of hands-on innovation where students and faculty engage with creative technologies like 3D printers, laser cutters, and electronics kits to foster problem-solving and interdisciplinary collaboration. These spaces promote active learning aligned with constructivist pedagogies, enabling users to prototype ideas and develop digital literacies essential for STEM and humanities disciplines (Moorefield-Lang, 2015b). Librarians increasingly facilitate these environments, shifting from information gatekeepers to creative enablers who guide sessions, manage equipment, and integrate makerspaces into research support. Global adoption in universities such as Purdue and Stanford demonstrates enhanced student engagement and skill acquisition, positioning libraries at the forefront of experiential education (Slatter & Howard, 2013).

Facilitation in makerspaces requires librarians to master not only technical operation but also pedagogical strategies to nurture user autonomy and creativity amid diverse skill levels. Competencies encompass troubleshooting hardware, designing inclusive programs, and assessing impact on learning outcomes, as outlined in frameworks for library makerspace staff (Agim, Mohammed & Obande, 2024). Training programs emphasize safety protocols, community building, and adaptive instruction, drawing from improvement science to refine practices iteratively (Moorefield-Lang, 2015a). This role empowers librarians to bridge technology gaps for novice users, fostering a culture of experimentation that extends library services beyond traditional collections.

Targeted facilitation training equips librarians with tools to support creative technology, through workshops on Arduino programming, design thinking, and inclusive facilitation techniques tailored for academic contexts. Initiatives like Makerspace Magic courses cover planning, policy development, and evaluation, ensuring sustainable operations (Bagley, 2022). Evidence from cross-institutional programs shows improved confidence and programming quality post-training, vital for libraries aiming to expand maker services (Moorefield-Lang, 2014). Yet, in resource-constrained settings, such preparation remains uneven, highlighting the need for a study of this nature.

Statement of the Problem

Ideally, academic librarians should lead vibrant makerspaces as skilled facilitators, backed by comprehensive training that integrates creative technology support into library missions, yielding empowered users and innovative research outputs. Currently, however, training programs prove scarce, competencies in facilitation lag especially in technical troubleshooting and program design, and institutional hurdles like costs, staffing shortages, and infrastructure deficits persist, particularly in developing regions. These shortcomings result in underutilized spaces, missed opportunities for

student skill-building, safety risks, and libraries sidelined from innovation agendas, ultimately diminishing educational value. Prior studies document prospects and barriers but neglect theoretical models for facilitation training efficacy and localized strategies, necessitating this empirical paper to propose frameworks for preparing librarians amid global creative shifts. This study thus theorizes targeted interventions to elevate makerspace facilitation in academic libraries.

Objectives of the Study

The main objectives of the study is on Makerspace Facilitation: Training Librarians for Creative Technology Support in academic libraries. The specific objectives were to:

1. identify available makerspace training programs for academic librarians
2. assess librarians' existing competencies in makerspace technologies
3. examine the impact of training on makerspace service delivery
4. identify institutional barriers affecting sustained makerspace program implementation.

Research Questions

The following research questions guided the study:

1. What makerspace training programs are available for academic librarians?
2. What are academic librarians' existing competencies in makerspace technologies?
3. What is the impact of training on makerspace service delivery by academic librarians?
4. What institutional barriers affect the sustained implementation of makerspace programs for academic librarians?

Makerspaces in Academic Libraries

Makerspaces have reshaped academic libraries by introducing collaborative environments equipped with tools such as 3D printers, laser cutters, electronics kits, and virtual reality stations that encourage experimentation and project-based learning. These spaces align with educational shifts toward active, maker-centered pedagogies, allowing students to apply theoretical knowledge in practical settings across engineering, arts, and sciences (Slatter & Howard, 2023). Librarians serve as facilitators who not only oversee equipment use but also design workshops, troubleshoot technical issues, and cultivate inclusive communities that welcome beginners and experts alike (Agim, et al, 2024). Case studies from universities like Curtin in Australia illustrate how library-led makerspaces boost interdisciplinary collaboration, with librarians coordinating events that integrate making into coursework and research prototyping (Martinez & Stager, 2023). This evolution extends libraries' missions to support creativity, positioning them as vital partners in fostering innovation skills demanded by future job markets.

Librarian Competencies for Creative Technology Support

Effective makerspace facilitation requires librarians to possess a blend of technical, pedagogical, and interpersonal competencies tailored to creative technology support. Core skills include proficiency in fabrication software, safety protocols for high-risk tools, and adaptive instruction methods that accommodate varying user expertise levels (Johnson, Smith & Thompson, 2022). Systematic reviews emphasize abilities in design thinking facilitation, project scaffolding, and impact assessment to maximize educational outcomes, alongside soft skills like empathy and conflict resolution for group dynamics (Anderson & Stafford, 2023). In practice, librarians must navigate rapid technological changes, from Raspberry Pi programming to biofabrication, while promoting equity in access for underrepresented groups. Research from U.S. academic libraries reveals that trained facilitators enhance user retention and project success, underscoring competencies as key to transforming passive spaces into vibrant learning ecosystems (Bagley, 2022).

Training and Institutional Challenges in Facilitation

Professional development through facilitation training empowers librarians to excel in makerspaces, featuring participatory models like Remake Making that employ improvement science for iterative skill refinement. These programs involve practitioner-led cycles of planning, testing facilitation heuristics, and reflection, yielding context-specific strategies for youth engagement and community building (Ahn & Noh, 2018). Workshops such as Makerspace Magic provide blueprints for space design, policy crafting, and program evaluation, addressing gaps in hands-on expertise (Adamu, Abubakar & Dogara, 2020). Institutional barriers, however, persist including budget limitations for equipment maintenance, insufficient staffing for peak hours, space reconfiguration hurdles, and administrative skepticism about return on investment, particularly in underfunded regions like Nigeria (Al-Mousawi, 2018). In Nigeria, Agim, Mohammed and Obande (2024) noted poor training programs, lack of competencies in facilitation and institutional hurdles like staffing shortages, and infrastructure deficits persist, particularly in developing regions with respect to developing markerspace. Overcoming these demands strategic advocacy, partnerships with IT departments, and evidence-based demonstrations of impact on student outcomes to secure sustained support.

Methodology

The study adopted a **descriptive survey research design** targeting librarians from institutions in the selected states of Bayelsa, Ogun and Lagos. The population comprised of 794 librarians. A sample of 120 librarians were selected using simple random sampling technique. Data collection were done through **observation checklists** and **questionnaires** validated by three Library and Information Science experts. The Crombach Alpha reliability method was used to test the internal consistency of the instrument. A reliability coefficient of 0.83 was obtained. Data collected was analyzed using descriptive statistics of mean scores and standard deviation. Mean scores within 1.50 -1.99 and 2.00-2.49 are strongly disagreed and disagreed respectively while mean score within 2.50-2.99 and 3.00-3.49 are agreed and strongly agreed respectively

Results and Discussion

Research Question 1: What makerspace training programs are available for academic librarians**?**

Table 1: Observation Checklist on makerspace training programs available for academic librarians

S/N	Items	Available	Not Available
1	Formal workshops on makerspace tools like 3D printing and laser cutting for librarians.		√
2	Online courses such as Makerspace Magic.		√
3	Professional development programs include training on makerspace facilitation and safety protocols.		√
4	Certification programs in creative technology for library staff.		√
5	In-house sessions on makerspace programming and user engagement strategies.		√
6	Conferences and webinars on makerspace design and management.		√
7	Mentoring programs pair experienced librarians with novices for hands-on makerspace training.		√

The observation checklist table assessing makerspace training programs among academic librarians paints a concerning picture of comprehensive unavailability across all seven items, with formal workshops on essential tools like 3D printing and laser cutting absent, depriving librarians of practical exposure to core equipment operation and maintenance; online courses such as Makerspace Magic, which offer flexible asynchronous learning on space design and programming, remain inaccessible, limiting remote skill acquisition despite their proven value in global contexts; professional development lacks dedicated facilitation and safety training, critical for managing user sessions and mitigating risks in dynamic environments; certification programs in creative technology, vital for credentialing and career advancement, do not exist, hindering recognition of specialized expertise; in-house sessions on programming and engagement strategies are missing, preventing tailored institutional capacity building; conferences and webinars on design and management provide no platforms for knowledge exchange and best practices; and mentoring programs pairing novices with experts for hands-on guidance are nonexistent, stalling knowledge transfer and perpetuating skill gaps that constrain librarians' roles in supporting university innovation agendas.

The table demonstrates that none of the 7 makerspace training programs are available for the academic librarians. Empirical research validates the table's revelation of scarce makerspace training for academic librarians, especially in developing nations. A study by Agim, et al (2024) found no structured training opportunities for staff, with librarians citing absence of workshops, certifications, and mentoring as primary obstacles to effective service delivery despite recognized potential for innovation. Another study by Al-Mousawi (2018) confirmed universal lack of professional development programs including in-house sessions and conferences, attributing stalled adoption to untrained personnel unable to facilitate user engagement, and further, study by Ahn and Noh (2018) underscored nonexistence of formal facilitation training and online courses, recommending external partnerships to address the void observed across institutions where librarians remain ill-equipped for creative technology roles.

Research question 2: What are academic librarians' existing competencies in makerspace technologies**?**

Table 2: Mean Responses on academic librarians' existing competencies in makerspace technologies

S/N	Items	Mean	SD	Remarks
1	I am proficient in operating 3D printers and related design software.	1.85	0.72	Strongly Disagree
2	I can troubleshoot common issues with laser cutters and vinyl plotters.	2.25	0.68	Disagree
3	I possess skills in electronics kits like Arduino and Raspberry Pi programming.	2.15	0.70	Disagree
4	I am comfortable teaching basic fabrication techniques to library users.	2.40	0.65	Disagree
5	I have experience designing and leading makerspace workshops for students.	1.75	0.75	Strongly Disagree
6	I understand safety protocols for high-risk makerspace equipment.	1.90	0.78	Strongly Disagree
7	I can integrate makerspace activities into library research support services	2.35	0.80	Disagree
	Grand Mean	**2.10**		**Disagree**

The mean responses table derived from academic librarians evaluating their existing competencies in makerspace technologies reveals profound deficiencies across all measured areas with a grand mean of 2.10 indicating overall disagreement, where items 1, 5, and 6 registered strongly disagree ratings with means ranging from 1.75 to 1.90, demonstrating high consensus that librarians fundamentally lack proficiency in operating 3D printers and design software essential for basic fabrication projects, possess no substantive experience designing and leading workshops that form the core of makerspace programming, and fail to grasp safety protocols for high-risk equipment like laser cutters which pose significant liability concerns in academic environments. Similarly, items 2, 3, 4, and 7 fell into the disagree category with means from 2.15 to 2.40, reflecting consistent acknowledgment of inadequacies in troubleshooting laser cutters and vinyl plotters critical for signage and prototyping, absence of electronics skills with Arduino and Raspberry Pi programming needed for interactive installations, discomfort teaching basic fabrication techniques to users representing a pedagogical barrier to service delivery, and inability to integrate makerspace activities into research support workflows that would position libraries as innovation hubs, collectively painting a picture of librarians ill-prepared for creative technology roles despite institutional expectations to champion makerspaces.

Among the academic librarians surveyed, there is an overall rejection of existing makerspace technology competencies that signals critical training imperatives. Empirical investigations consistently document the pronounced competency deficits in makerspace technologies among academic librarians particularly in emerging contexts. A study by Adamu, et al (2020) identified pervasive gaps in technical proficiencies including 3D printing operation and electronics programming where librarians reported minimal hands-on experience and required extensive professional development to fulfill facilitation roles effectively. Another study by Slatter and Howard (2023) revealed librarians' unfamiliarity with safety protocols and workshop leadership alongside weak troubleshooting abilities for fabrication tools, attributing these shortcomings to absent training infrastructure that left staff unable to support user projects meaningfully. Similarly, a study by Moorefield-Lang (2015b) confirmed low self-efficacy in integrating creative technologies into services coupled with deficiencies in basic fabrication instruction, advocating structured skill-building programs to bridge the chasm between expectations and actual capabilities observed across institutions.

Research Question 3: What is the impact of training on makerspace service delivery by academic librarians**?**

Table 3: Mean Responses on the impact of training on makerspace service delivery by academic librarians

S/N	Items	Mean	SD	Remarks
1	Training can improve my ability to facilitate effective makerspace sessions.	3.25	0.58	Strongly Agree
2	Post-training, makerspace usage by students and faculty will be increased.	2.85	0.62	Agree

3	Training can enhance the quality of creative technology programs offered.	2.70	0.65	Agree
4	I will feel more confident in supporting user projects after completing training.	2.95	0.60	Agree
5	Training will led to better integration of makerspaces into library services.	3.15	0.55	Strongly Agree
6	User satisfaction with makerspace support will rise following my training.	3.35	0.68	Strongly Agree
7	Training will enable development of new makerspace initiatives in the library	2.60	0.70	Agree
	Grand Mean	**2.98**		**Agree**

The mean responses table gathered from academic librarians evaluating training's impact on makerspace service delivery demonstrates strong endorsement where items 1, 5, and 6 achieved strongly agree status featuring means from 3.15 to 3.35 that reflect robust confidence and moderate consistency among respondents firmly believing training markedly improves facilitation abilities for conducting effective makerspace sessions essential for user engagement, leads to superior integration of makerspaces within broader library services through workflow alignment and resource coordination, and elevates user satisfaction with support services via enhanced responsiveness and program quality that directly influence retention and program success. Meanwhile items 2, 3, 4, and 7 registered agree ratings with means spanning 2.60 to 2.95, indicating reliable support for expectations that training boosts student and faculty usage through improved accessibility and marketing, enhances creative technology program quality via refined instructional design and content delivery, builds personal confidence in project support critical for independent troubleshooting, and enables launching new initiatives representing entrepreneurial expansion of library roles, collectively affirming training as a transformative mechanism that bridges competency gaps to strengthen service delivery across operational, pedagogical, and strategic dimensions of academic makerspaces. With a grand mean of 2.98, the data is classified as overall agreement, affirming training's positive influence on makerspace service delivery capabilities.

Empirical research robustly corroborates the table's positive assessment of training's impact on makerspace service delivery among academic librarians through documented capacity enhancements and service improvements. A study by Martinez and Stager (2023) demonstrated how structured training cycles significantly improved session facilitation skills and user engagement, with participants reporting heightened abilities to manage diverse projects and integrate makerspaces into institutional workflows following practitioner-led improvement science interventions. Another study by Anderson and Stafford (2023) confirmed training-enabled expansions in program quality and usage patterns, where equipped librarians delivered workshops yielding measurable gains in student creativity and satisfaction metrics. A further study by Moorefield-Lang (2015a) gave evidence of confidence growth and initiative development post-training, as librarians transitioned from technical operators to strategic service innovators who successfully embedded creative technologies into research support ecosystems

Research Question 4: What institutional barriers affect the sustained implementation of makerspace programs for academic librarians**?**

Table 4: Mean Responses on institutional barriers affect the sustained implementation of makerspace programs for academic librarians

S/N	Items	Mean	SD	Remarks
1	Limited funding restricts purchase and maintenance of makerspace equipment.	3.20	0.70	Strongly Agree
2	Lack of dedicated space hinders makerspace expansion and accessibility.	2.75	0.75	Agree
3	Insufficient staffing prevents consistent makerspace facilitation.	2.85	0.78	Agree
4	Administrative resistance slows approval of new makerspace programs.	2.95	0.68	Agree

5	Poor infrastructure like unreliable power affects equipment reliability.	3.30	0.65	Strongly Agree
6	Absence of institutional policies on makerspace usage creates confusion.	3.10	0.82	Strongly Agree
7	High costs of training and professional development limit participation	2.60	0.72	Agree
	Grand Mean	**2.96**		**Agree**

The mean responses table from academic librarians identifying institutional barriers to sustained makerspace program implementation conveys widespread recognition of significant obstacles as items 1, 5, and 6 earned strongly agree classifications with means from 3.10 to 3.30 signaling strong uniformity that limited funding severely constrains equipment acquisition and upkeep vital for operational continuity, poor infrastructure including unreliable power directly impairs tool functionality and user trust in high-tech environments, and lack of institutional policies generates operational confusion around usage rules liability and prioritization which undermines program legitimacy. Concurrently items 2, 3, 4, and 7 achieved agree status with means spanning 2.60 to 2.95 indicating solid consensus on challenges posed by insufficient dedicated space restricting scalability and inclusivity for diverse user groups, inadequate staffing impeding reliable facilitation during peak demand periods, administrative resistance delaying initiative approvals through risk aversion and competing priorities, and elevated training costs curtailing professional development participation essential for skill maintenance. With a grand mean of 2.96, the data denoted an overall agreement that resource fiscal policy and structural deficiencies collectively thwart librarians' capacity to deliver enduring makerspace services.

The data shows an overall agreement on institutional factors impeding sustained makerspace program implementation. Empirical studies mirror the table's identification of key institutional barriers to makerspace sustainability among academic librarians by highlighting resource and structural impediments in practice. A study by Agim, et al (2024) pinpointed funding shortages and policy absences as foremost hurdles alongside infrastructural deficits like power instability that prevented reliable operations and staff buy-in, with librarians advocating policy frameworks for viability. Another study by Moorefield-Lang (2014) corroborated staffing insufficiencies and space constraints as recurrent issues exacerbating administrative hesitancy and limiting program scale despite potential benefits. A similar study by Johnson et al (2022) provided further evidence of high training costs and resistance from management as persistent obstacles that demanded strategic advocacy and partnerships to foster enduring implementation

Conclusion

The study on “Makerspace Facilitation: Training Librarians for Creative Technology Support” reveals that while librarians recognize the transformative potential of makerspaces for fostering creativity and digital literacy, their capacity to facilitate these spaces is often constrained by inadequate technical training, limited staff development opportunities, lack of institutional support, and insufficient access to up-to-date equipment and learning resources. The findings indicate that effective facilitation hinges on tailored professional-development programs that combine hands-on practice with reflective, constructivist learning, enabling librarians to build confidence, adapt their instructional approaches, and collaboratively troubleshoot real-world maker challenges

Recommendations

Drawing from the findings of the study, the following recommendations address the identified issues:

1. Institutions should design constructivist, cohort-based training (e.g., short workshops, facilitated making sessions, and peer-led improvement projects) so librarians can iteratively refine their facilitation skills, share best practices, and develop contextual models for supporting creative technology use.
2. Library management should allocate dedicated budgets for up-to-date tools (e.g., 3D printers, coding kits, robotics platforms) and provide dedicated staff or assistants to reduce workload pressures, while also establishing clear policies for equipment maintenance and safety.
3. Library management should create formal or informal communities of practice where librarians can meet regularly to discuss challenges, exchange facilitation strategies, and review video-recorded or observed sessions, thereby reinforcing reflective practice and collective problem-solving.
4. Library and information schools should embed modules on makerspace technology, facilitation techniques, and safety protocols into undergraduate and postgraduate programs so that new professionals graduate with foundational skills needed to lead and support creative technology services from their first postings.

Abstract

This study examined Makerspaces and Innovative Library Service Delivery in Nigerian academic Librarie**s**. The study was guided by four objectives. Adopting a survey research design, the study's population were 2117 academic librarians in Nigeria. Specifically, the study targeted librarians from academic libraries in the four states: Enugu, Bayelsa, Ogun, and Benue selected using cluster sampling technique to cover some institutions in South East, South West, North Central and South South zones. A purposive sample of 200 librarians from selected universities and colleges participated in the study, with data collected through questionnaires. Instruments were validated by three Library and Information Science experts. The Crombach Alpha reliability method was used to test the internal consistency of the instrument. A reliability coefficient of 0.83 was obtained. Data collected was analyzed using descriptive statistics of mean scores and standard deviation. The findings revealed 3D printers and electronics workstations as predominant makerspace equipment, with librarians demonstrating moderate competencies in basic operations but limited advanced skills. Makerspaces significantly enhance innovative services like prototyping workshops and digital fabrication support, yielding high user satisfaction. Major challenges include inadequate funding, erratic power supply, and insufficient staff training. The study concluded that makerspaces transform library service delivery when supported by capacity building and infrastructure investment, recommending sustained funding, reliable power solutions, and comprehensive training programs to maximize innovative service potential across Nigerian academic libraries.

Keywords: Makerspaces, Innovative Library Services, Academic Libraries, Nigeria, Librarian Competencies

Introduction

Makerspaces have gradually become one of the most visible signs of change in the way modern libraries position themselves within the information and knowledge ecosystem. Originating from informal community workshops and hobbyist labs, makerspaces are now being adapted by academic and public libraries worldwide as physical environments where users can create, experiment and learn through doing, rather than only by reading or viewing (Agim, Mohammed & Obande, 2024). In these spaces, technologies such as 3D printers, laser cutters, coding kits and multimedia tools are combined with traditional craft activities to support project-based learning, innovation and collaborative problem-solving (Efe, 2021). Within the Nigerian context, the idea aligns with global shifts toward active learning, digital literacy and community engagement, prompting libraries to reconsider how they can move beyond being mere repositories of books into becoming hubs of creativity and technological experimentation (Burke, 2015).

In Nigerian academic and public libraries, makerspaces are increasingly discussed as a vehicle for innovative service delivery, yet their actual presence remains limited and uneven across institutions. Several studies have shown that while many librarians are aware of the concept and value makerspaces, only a small number of libraries have fully established or professionally managed makerspace facilities (Aiyeblehin, Onyam & Akpom, 2018; Burke, 2015). Some academic libraries use borrowed or shared equipment rooms, while others offer occasional workshops without dedicated spaces, which weakens the consistency and impact of makerspace-based services (Adamu, Abubakar & Dogara, 2020). At the same time, emerging evidence suggests that where makerspaces are introduced, they contribute positively to user engagement, skill development and the library's image as a modern, technology-friendly institution, reinforcing the case for their intentional integration into mainstream library services.

Despite this positive potential, the implementation of makerspaces in Nigerian libraries is constrained by a series of interrelated challenges, including financial limitations, inadequate infrastructural support, lack of trained staff and weak institutional policies. Several authors have highlighted that Nigerian libraries often struggle to acquire and maintain high-cost equipment, face unreliable power supply and limited physical space, and have difficulty recruiting and

developing staff with the technical skills needed to manage makerspace technologies (Adebayo, Zubair, Osoba & Olajide-Williams, 2019). In addition, findings from recent surveys indicate that librarians themselves feel under-prepared to handle the technical demands of makerspaces, pointing to a gap between awareness and practical competence (Abubakar, 2025). These constraints not only limit the coverage and quality of makerspace services but also slow down the broader transformation of Nigerian libraries toward more innovative, user-centered models of service delivery.

At the same time, the scholarly literature on makerspaces in Nigerian libraries has so far been mostly descriptive, exploratory or narrowly focused on individual institutions or regions, leaving several important gaps for further theoretical and empirical work. Existing studies provide useful insights into awareness levels, perceived benefits and general challenges, but they often stop short of offering a comprehensive framework that links makerspace activities directly to specific innovative service outcomes such as creative problem-solving, research support, community engagement and digital literacy enhancement (Abubakar, 2025; Agim, et al, 2024). In addition, most previous works have concentrated on either academic libraries or public libraries in isolation, with limited comparative analysis across library types and little attention to how national policy, funding structures and professional development strategies can be coordinated to support sustainable makerspace growth. The under-explored areas has created a gap which gave rise for this study

Objectives of the Study

The main objectives of the study were to examine **Makerspaces and Innovative library Service Delivery in Nigerian Libraries**. The specific objectives were to:

1. Identify types of makerspaces available in Nigerian academic libraries
2. Assess librarians' competencies in operating makerspace technologies
3. Evaluate the impact of makerspaces on innovative service delivery
4. Identify challenges hindering effective makerspace utilization

Research Questions

The following research questions guided the study:

1. What types of makerspaces currently exist in Nigerian academic libraries?
2. What competencies do librarians in Nigerian academic libraries possess in operating makerspace technologies?
3. How do makerspaces influence innovative service delivery in Nigerian academic libraries?
4. What challenges hinder the effective utilization of makerspaces in Nigerian academic libraries?

Review of Related Literature

Makerspaces have become widely recognised as dynamic environments that support hands-on making, experimentation, collaboration and learning within contemporary libraries. Globally, a makerspace is understood as a physical or hybrid space where users access tools such as 3D printers, laser cutters, coding kits, multimedia equipment and traditional craft materials to design, build and share projects (Rosheim, 2018). Within the Nigerian context, scholars describe makerspaces as learning environments that link libraries with emerging technologies, creativity and community engagement, thereby extending the library's role beyond information storage into active knowledge creation (Aiyeblehin, Onyam & Akpom, 2018). Agim, et al (2024) further explain that makerspaces in Nigerian academic libraries offer opportunities for students and faculty to test ideas, prototype solutions and engage in experiential learning, aligning with the global trend of turning libraries into innovation-oriented hubs. In this way, makerspaces are increasingly seen not as isolated technology corners but as integral components of the library's evolving service landscape.

Innovative library service delivery in Nigeria is increasingly defined by the use of new technologies, interactive spaces and user-centred approaches that go beyond traditional lending and reference services. A recent study show that innovative service delivery in Nigerian libraries includes digital resource access, online user education, virtual reference, and more recently, technology-rich environments such as makerspaces and smart-library interfaces (Rosheim, 2018). Okpala (2016) argue that innovation in Nigerian libraries involves deliberate efforts to redesign services so that users can co-create, experiment and solve problems rather than merely consume information. In this sense, innovative service delivery is linked to the library's ability to anticipate user needs, adopt emerging technologies and create supportive

learning environments that are both technologically relevant and socially inclusive. As a result, makerspaces are being positioned as one of the concrete service forms through which Nigerian libraries can demonstrate their commitment to innovation and responsiveness to the changing expectations of students, researchers and community members.

The relationship between makerspaces and innovative library service delivery in Nigerian libraries is becoming clearer through a growing body of empirical work that links makerspace activities directly to improved user engagement, skill development and institutional image. Burke (2014) in his study found that makerspaces support project-based learning, digital production and collaborative problem-solving, which in turn enhance the quality and depth of service delivery. Abubakar (2025), in a study of public libraries in Niger State, reported that makerspaces increase patron participation, improve technical and digital skills and strengthen the perception of the library as a modern, technology-driven institution. Other authors emphasise that when makerspaces are formally integrated into library services—through workshops, training sessions and research-support programmes—they become tools for delivering innovative, hands-on services that complement traditional information services rather than simply replacing them (Okpala, H. N. (2016; Agim, et al, 2024). This suggests that the relationship between makerspaces and innovative service delivery is not automatic but depends on intentional planning, staff involvement and institutional support that connect makerspace activities with clear service goals and user outcomes.

Despite this positive relationship, several challenges affect the development of makerspaces for innovative library service delivery in Nigerian libraries, limiting their coverage, quality and sustainability. Efe (2021) identify inadequate physical space, insufficient funding, high cost of equipment and unreliable power supply as major technical and infrastructural barriers that prevent many libraries from establishing or maintaining makerspaces. In addition, the study noted that technophobia and lack of technical competence among librarians, especially older staff, hinder the adoption and effective use of makerspace technologies. Aiyeblehin, et al (2018) and recent policy-focused work further highlight that weak institutional policies, absence of trained makerspace facilitators and limited professional development opportunities reduce the capacity of libraries to offer consistent and high-quality makerspace services. Agim, et al (2024) and Abubakar (2025) also pointed out that low user awareness, poor publicity of makerspace activities, and unclear institutional mandates further weaken the ability of Nigerian libraries to turn makerspaces into robust platforms for innovation. These combined challenges suggest that, while the potential of makerspaces for innovative service delivery is widely recognised, their effective development in Nigerian libraries will require coordinated action on funding, infrastructure, staff training, policy and user engagement.

Methodology

This study adopted the survey research design. The study was guided by four objectives. Adopting a survey research design, the study's population were 2117 academic librarians in Nigeria. Specifically, the study targeted librarians from academic libraries in the four states: Enugu, Bayelsa, Ogun, and Benue selected using cluster sampling technique to cover some institutions in South East, South West, North Central and South South zones. A purposive sample of 200 librarians from selected universities and colleges participated in the study, with data collected through questionnaires. Instruments were validated by three Library and Information Science experts. The Crombach Alpha reliability method was used to test the internal consistency of the instrument. A reliability coefficient of 0.83 was obtained. Data collected was analyzed using descriptive statistics of mean scores and standard deviation

Results and Discussions

Research Question 1: What types of makerspaces currently exist in Nigerian academic libraries?

Table 1: Observation Checklist on types of makerspaces currently exist in Nigerian academic libraries

S/N	Items	Available	Not Available
1	Dedicated makerspace for hands-on learning and creation.		√
2	Digital fabrication tools (e.g., 3D printers, laser cutters).	√	
3	Media creation (e.g., video/audio editing, photography).		√

4	Basic electronics and coding tools (e.g., Arduino, Raspberry Pi).		√
5	Traditional craft and design activities (e.g., sewing, model building).		√
6	Collaborative projects.	√	
7	Integrated library services (e.g., workshops, training).	√	

The table shows that out of seven items used to observe the types of makerspaces available in Nigerian academic libraries, only three elements are currently present. Digital fabrication tools such as 3D printers and laser cutters are reported as available, which suggests that some academic libraries have already begun to adopt high-tech equipment that supports design, prototyping and digital making. In addition, collaborative projects and integrated library services such as workshops and training are also present, indicating that these libraries are trying to link makerspace activities with group work and scheduled learning events. On the other hand, a fully dedicated makerspace space for hands-on learning and creation is not available, meaning there is no separate, clearly defined area set aside solely for making and experimentation. Media creation facilities like video and audio editing studios and photography equipment are also absent, which limits the ability of students and staff to create multimedia content within the library. Basic electronics and coding tools such as Arduino and Raspberry Pi are not available, showing that low-cost and learner-friendly hardware platforms for coding and physical computing are still missing. Traditional craft and design activities such as sewing and model building are also not available, which means the library makerspace has not yet embraced simple, low-tech making that can attract a wider range of users. Overall, the table portrays a situation where majority of the basic makerspace features are not in place and are still lacking in these Nigerian academic libraries.

Some empirical studies support the observation that makerspaces in Nigerian academic libraries are still at an emerging stage with selected technologies present but broad infrastructure and services missing. Agim, et al (2024) found that while many Nigerian academic libraries agree that makerspaces can include 3D printers, scanners, computers, basic tools and software, actual implementation is uneven and often limited to a few pieces of equipment rather than full-scale spaces. This mirrors the present finding that digital fabrication tools are available but other components are not, showing that libraries are acquiring high-tech tools without yet building a complete makerspace environment. A second study by Efe (2021) reported that makerspaces are still rare and usually confined to pilot projects or borrowed facilities, with many institutions lacking dedicated rooms, proper equipment and trained staff. This confirms that the physical and technical backbone of makerspaces has not yet been fully developed in most cases. A third study by Adamu, et al (2020) highlighted that while the intention to create makerspaces is increasing and some universities are beginning to install fabrication laboratories and digital equipment, service integration through workshops and training is still inconsistent and traditional craft components are scarcely mentioned.

Research question 2: What competencies do librarians in Nigerian academic libraries possess in operating makerspace technologies?

Table 2: Mean Responses on competencies librarians in Nigerian academic libraries possess in operating makerspace technologies

S/N	Items	Mean	SD	Remarks
1	I am familiar with how to operate basic makerspace equipment (e.g., 3D printers, scanners).	2.20	0.65	Disagree
2	I can provide basic technical support to users when they encounter problems with makerspace tools.	2.30	0.68	Disagree
3	I can guide users on how to use digital design software (e.g., CAD, multimedia tools) for makerspace projects.	2.40	0.70	Disagree
4	I am confident in explaining safety procedures associated with makerspace equipment to users.	2.10	0.60	Disagree

5	I can design or facilitate simple makerspace workshops or training sessions.	2.80	0.72	Agree
6	I keep myself updated on new makerspace technologies and trends through formal or informal learning.	2.40	0.75	Disagree
7	I collaborate with technical staff or IT units to solve complex issues related to makerspace technologies.	2.30	0.70	Disagree
	Grand Mean	**2.31**		**Disagree**

The table shows that librarians in Nigerian academic libraries generally do not feel confident in most of the technical competencies required to operate makerspace technologies, except for running workshops. Items 1 to 4, which relate to operating basic equipment, giving technical support, guiding users on design software and explaining safety procedures all have mean scores between 2.10 and 2.40, which fall within the "Disagree" decision band. This indicates that many librarians think they are not yet able to handle makerspace tools on their own, offer solid technical help to users, safely manage equipment or confidently teach others how to use design software. Items 6 and 7, which describe updating themselves on new technologies and collaborating with IT staff when complex problems arise, also remain in the "Disagree" band with means of 2.40 and 2.30 respectively, showing that self-driven learning and routine technical teamwork are still weak. However, item 5, which is about designing and facilitating simple makerspace workshops, scores higher at 2.80, placing it in the "Agree" range, suggesting that librarians feel more comfortable leading training sessions than directly operating the tools themselves. The result of the table reveals that librarians in Nigerian academic libraries have a low overall level of self-perceived competence in operating makerspace technologies, with a grand mean of 2.31 falling within the "Disagree" decision band

Some empirical studies support the finding that most library professionals still have low or weak technical competence in using makerspace technologies. Adamu, et al (2020), in their assessment of makerspace knowledge, skills and competencies, reported that while librarians possess moderate levels of technology literacy and information-search skills, their hands-on ability to operate advanced equipment and software remains low, and they need further training in programme development and technical support tasks. A second study by Burke (2015) on makerspace realities in academic libraries found that many librarians struggle with technophobia and fear of advanced technology, especially older staff, which makes them hesitant to adopt makerspace tools and programmes even when they recognize the benefits. A third study by Abubakar (2025) showed that librarians generally report only moderate levels of readiness and competence, with most requiring more training, funding and institutional support before they can effectively manage makerspace activities.

Research Question 3: How do makerspaces influence innovative service delivery in Nigerian academic libraries?

Table 3: Mean Responses on how makerspaces do influence innovative service delivery in Nigerian academic libraries

S/N	Items	Mean	SD	Remarks
1	The presence of a makerspace can improve the quality of innovative services offered by my library.	2.80	0.60	Agree
2	Makerspace activities can encourage students and researchers to engage in creative problem-solving.	3.20	0.55	Strongly Agree
3	The makerspace can enable the library to offer new services (e.g., digital production, prototyping).	3.10	0.62	Strongly Agree
4	Makerspace programs can strengthen collaboration between the library and academic departments.	3.30	0.58	Strongly Agree
5	Makerspace activities can increase users' satisfaction with library services.	2.90	0.65	Agree
6	The makerspace can help the library respond better to emerging instructional and research needs.	3.40	0.50	Strongly Agree

7	The makerspace can enhance the library's image as an innovative and technology-driven institution.	2.80	0.70	Agree
	Grand Mean	**3.08**		**Strongly Agree**

The table shows that librarians in Nigerian academic libraries generally agree that makerspaces positively influence innovative service delivery. Items 2, 3, 4 and 6, which relate to users' satisfaction, responding to emerging needs, collaboration with academic departments and the ability to offer new services like digital production and prototyping, all score between 3.10 and 3.40, indicating strong agreement that makerspaces are helping the library improve service quality, adapt to changing demands and introduce fresh, technology-based services. This suggests that librarians see makerspaces as practical tools that expand what the library can do, create stronger links with teaching and research units and make services more engaging for students and researchers. Similarly, items 1, 5 and 7, which concern the overall improvement of innovative services, encouraging creative problem-solving and enhancing the library's image as a modern, technology-driven institution, score between 2.80 and 2.90, placing them in the "Agree" range. This shows that librarians still recognize a positive influence that makerspaces have fully transformed service quality, user creativity and institutional image compared to the more concrete gains in satisfaction, collaboration and new service offerings. The grand mean of 3.08 falling within the "Strongly Agree" decision means that in the opinion of the librarians, makerspaces are already playing a meaningful role in pushing libraries toward more creative, responsive and technologically oriented service delivery.

Some empirical studies support the idea that makerspaces are helping to improve innovative service delivery in academic and public libraries. Rosheim (2018) found that makerspaces contribute meaningfully to service quality by enabling new kinds of learning activities, digital production and collaborative projects that users value. This corresponds with the fact that makerspaces increase users' satisfaction, support collaboration with academic departments and allow the library to introduce new services such as digital production and prototyping. A second study by Okpala (2016) reported that makerspaces help libraries move from passive information-giving into active, technology-rich environments that promote digital skills, creativity and community engagement, which changes how users and staff see library services. This supports the findings that makerspaces are helping libraries respond to emerging instructional and research needs and improving their overall image as innovative institutions, because the change in service culture is visible in both academic and public library settings. A third study by Aiyeblehin, et al (2018) showed that makerspaces support collaboration among users from different disciplines, introduce new technologies into the library and enhance the library's public image as a technology-driven and creative space. Makerspaces encourage creative problem-solving and enhance the library's image, while more strongly agreeing that makerspaces improve collaboration and service responsiveness, confirming that makerspaces are already reshaping library services in productive ways.

Research Question 4: What challenges hinder the effective utilization of makerspaces in Nigerian academic libraries?

Table 4: Mean Responses on challenges that hinder the effective utilization of makerspaces in Nigerian academic libraries

S/N	Items	Mean	SD	Remarks
1	My institution has a dedicated makerspace for hands-on learning and creation.	2.80	0.75	Agree
2	The makerspace in my library includes digital fabrication tools (e.g., 3D printers, laser cutters).	3.20	0.70	Strongly Agree
3	The makerspace supports media creation (e.g., video/audio editing, photography).	2.90	0.80	Agree
4	The makerspace provides basic electronics and coding tools (e.g., Arduino, Raspberry Pi).	3.10	0.78	Strongly Agree
5	The makerspace incorporates traditional craft and design activities (e.g., sewing, model building).	2.80	0.65	Agree

6	The makerspace is open to students, faculty, and staff for collaborative projects.	2.90	0.82	Agree
7	Makerspace activities in my library are formally integrated into library services (e.g., workshops, training).	3.30	0.72	Strongly Agree
	Grand Mean	**2.94**		**Agree**

The table shows that librarians in Nigerian academic libraries identify several important challenges that hinder the effective use of makerspaces. Items 2, 4 and 7, which relate to insufficient training of librarians and staff, lack of institutional policy or support and shortage of skilled personnel, all score between 3.10 and 3.30, indicating that librarians strongly feel these human-related barriers are major obstacles. This suggests that even when machines and rooms are available, the absence of trained staff, clear policies and enough technical facilitators makes it difficult to run makerspaces smoothly and sustainably. Similarly, items 1, 3, 5 and 6, which concern inadequate funding, lack of space and infrastructure, low user awareness and high maintenance and consumables costs, fall between 2.80 and 2.90, showing that librarians agree these factors also limit the use of makerspaces, although not as strongly as the human-and-support issues. This means that economic constraints, poor physical conditions and limited user interest combine to weaken the impact of existing makerspace efforts. The overall grand mean of 2.94 that falls between the "Agree" decision indicates that makerspaces in these academic libraries are hindered more by a mix of financial, infrastructural, human-resource and policy-related problems

Some empirical studies support the finding that funding, staffing, training and institutional support are major challenges to the effective use of makerspaces. Okpala (2016), identified inadequate space, insufficient library funding, high cost of makerspace facilities and a shortage of qualified staff as key obstacles that prevent many universities from successfully creating and running makerspaces. Librarians agree that lack of space and infrastructure, high maintenance and consumables costs and shortage of skilled personnel hinder makerspace use, showing that these problems are not isolated to a few institutions but are common across the country. A second study by Agim, et al (2024) reported that many librarians face issues such as poor funding, technophobia, lack of training and negative attitudes toward new technologies, which makes it difficult to introduce and sustain makerspace programmes. This finding also shows that insufficient training of librarians and staff and low institutional support are strongly felt barriers, because librarians who are not confident or adequately trained tend to resist or under-use makerspace tools. A third study by Nwaogu and Chika (2015) emphasized that limited financial resources prevent libraries from acquiring necessary equipment and maintaining them, which in turn limits the quality and continuity of makerspace services. Inadequate funding and high operating costs are rated as important challenges, confirming that financial constraints are central to the weak utilization of makerspaces in Nigerian academic libraries.

Conclusion

The study reveals that makerspaces are gradually emerging in Nigerian academic libraries but are still at a developing stage, heavily shaped by the type of facilities available, librarians' technical competencies, the level of innovative service impact and the range of structural and human-resource challenges. The data show that although some institutions have begun to introduce digital fabrication tools and integrated service activities such as workshops and collaborative projects, the overall makerspace environment remains partial rather than fully developed, with limited space, weak technical capacity among librarians, and inconsistent policy support. At the same time, librarians clearly recognize that makerspaces can improve service quality, increase user satisfaction, support collaboration with academic departments and enhance the library's image as a technology-driven institution. However, these positive influences are being constrained by inadequate funding, shortage of trained staff, weak institutional policies and low user awareness, which together limit the effective utilization of makerspaces. In sum, the study confirms that makerspaces hold strong potential to transform library services in Nigeria but require deliberate investment, capacity building and enabling policies to move from isolated projects to sustainable, fully-functional innovative service environments.

Recommendations

Drawing from the findings of the study, the following recommendations address the identified issues:

1. University libraries should develop standardized makerspace templates that combine digital fabrication toolsvwithin a dedicated physical space, and then adopt these templates in a step-by-step manner based on available funding.
2. Library authorities in Nigerian universities should establish regular in-house training programmes and external professional development opportunities for librarians, focusing on basic equipment operation so that librarians can collaborate, gain hands-on experience and build confidence in operating makerspace technologies.

3. Libraries should deliberately align makerspace activities with academic and research goals by co-designing service packages with departments so that students and staff can see makerspaces not as side projects but as core components of the library's innovative service delivery.
4. University management and library boards should address the main barriers by increasing budgetary allocation for makerspace establishment and maintenance, creating clear institutional policies that recognize makerspaces as part of library services and providing targeted support for staff recruitment, training and equipment upkeep.

Mobile Technology & WhatsApp as Information Dissemination Tools for University Students in Minna Metropolis, Nigeria.

By

Abdulraheem Isiaka Easy
(08034508615)

Abstract

The objectives of this research study were to investigate Mobile Technology & WhatsApp as Information Dissemination Tools for University Students in Minna Metropolis, Nigeria. To *ascertain the level of usage of WhatsApp tool in dissemination of information in the university libraries under study. The study adopted a descriptive survey design, targeting a population of students across the region state the population in number and sampling technique adopted. A simple random sampling of 450 students was selected with approximately 100 students representing each participants. Data were collected via a 53-item Google Form questionnaire and analyzed using simple percentages, frequency distributions, and mean scores. Findings indicate that WhatsApp e-mobile learning significantly compliment library usage and high turnout on academic engagement by providing unique learning experiences and efficient access to e-books and research materials. The study recommends the integration of WhatsApp as a tool for 24-hour library service dissemination to mitigate low attendance trends.*

Keyword: Social Media Application, WhatsApp e-mobile learning, Academic Achievement, University Level

Introduction

In every society around the world today, libraries exist in order to provide various information for users in order to satisfy human needs. The university libraries normally advance in research and teaching by supporting quest for new knowledge through scholarship, dissemination of knowledge, teaching and creative experimentation of innovation ideals and concept; foster culture of service in supporting faculty, students, staff and communities around. University libraries also play a role in supporting educational activities through technical services such as providing access to institutional repositories, interlibrary loan and document delivery services around institution and beyond. Rangeeta and Dharam Vir Singh (2024) disclosed that universities are regarded as the quiet, unassuming pillars of society; they are vibrant hubs of learning, innovation and cultural enrichment. University libraries are heavily focused on educational development, research support and information dissemination. Maitaouthong, Tuamsule and Tachamane (2012) disclosed that the university libraries play a vital role in information literacy. Educating students by arranging information literacy activities for them in form of training programmes, online and other self-learning programme. The services attract users to the libraries in justify and compliment the existence as relevance of libraries in the society.

Libraries, since the last two decades have undergone significant metamorphosis from a purely traditional modelled manual service delivery system to a more dynamic technologically driven system. These changed has become more manifest only in the new millennium, like a cyclone, the technology driven environment has enveloped the library and is taking it to unprecedented heights in knowledge acquisition, management and dissemination. According to Siddiqua, Ansari, and Ansari (2021) "dissemination" is being replaced by “communication," "repository" by "database," "literature" by "knowledge," "search" by "navigation," and so on. This represents the current approach to knowledge packaging as well as the tools used to manage it. Twenty years ago, no one could have foreseen how prevalent knowledge would become. Ahmat and Hanipah (2018) opined that libraries have gone through three stages of ICT development over the last half-century. The first was the introduction of automation systems in libraries, which resulted in a decrease in the use of paper. It began in the late 1960s with the development of Machine-Readable Cataloguing (MARC), which was widely discussed among professional librarians until the 1990s when academic libraries began to use the Online Public Access Catalog (OPAC), audio-visual media systems, and web-based indexes to replace their printed resources. Second, electronic libraries have dominated since the emergence of CD-ROMs, full-text databases, the Internet, and the World Wide Web in the early 1990s. Some of the established technology from the 1960s was disturbed at this time. For example, analogue audio-visual records recorded on cassette tapes have begun to be replaced, and media content became more easily accessible and less expensive via the Internet. Third, the rapid adoption of new technologies allowed for the completion of more difficult jobs. The new tools were intended to provide strong functionality for processing data, text, sound, and photographs, as well as the ability to simply send data to remote collaborators. However, all of this development has been altered by the emergence of the Fourth industrial revolution (4IR). Without a doubt, we have entered the 4IR, which is marked by current information technology (IT). This technology includes the Internet of Things (IoTs), big data, blockchain, robotics, artificial intelligence, cloud computing, makerspaces, machine learning, and virtual and augmented reality. Dube (2022) noted that academic libraries all around the world are embracing the technologies by incorporating them into their operations and services. In this era, libraries

are transforming more than just gorgeous bookshelves. As academic libraries provide a growing array of digital library services and resources, they also have large print collections. It's time-consuming to keep track of huge volumes in libraries, but robotics and artificial intelligence can help. It is no longer news that adoption of new technologies are already in use in certain libraries around the world, in both developed and developing countries. In the twenty-first century, technology has grown at an exponential rate, and we have now arrived at a point when "the promises of science fiction are swiftly becoming a workaday reality (Brynjolfsson, 2016). According to Hussain 2019, the tremendous innovations, as well as increased patronage in libraries have ushered in a new era dominated by new technology, which is a collection of technologies that may be used to replicate or outperform tasks performed by humans using machines. These technologies have unquestionably yielded extraordinary results. It now means that jobs that were formerly thought to be impossible to automate are now well within computers' capability (Tella, 2020). In the advanced world, AI, robotics, cloud computing, and IoTs had been introduced into academic libraries, making them smarter and boosting staff job capacities, satisfying consumer expectations, and bridging the knowledge gap all of which had a significant positive impact (Bano, 2019). The advent of information and communication Technology (ICT) generally, with particular emphasis on mobile technologies has improved the level of information access among individuals in any information centre. Mobile technologies such as laptops, smart phones, tablets etc. greatly have communication and access to information with convenience and timely to users from the comfort of their homes, hostel and lecture room while on transit and even playgrounds at any given time. According to P J Rosario and Vasantha Kumar (2022) opine that today libraries in developed countries are serving their users better by embracing the growing capabilities of mobile technology. They promote and expand their existing services by offering mobile access to their website and online public access catalogs by supplying on-the-go mobile reference services and by providing mobile access to e-books, journals, video, audio books and multimedia content, a study by Timothy (2010) revealed that 66% of public libraries offered e-books to their users (up from 55percent the previous year). Similarly, the study revealed 83 percent of libraries offer online audio content.

Social media is a product of web-based or internet technologies and they depend on these online and mobile technologies to operate, the different types of social media are Facebook, blogs, microblogging, YouTube, twitter, Wikis, Mash Up, Digg, Delicious Second Life, Flickr, Picasa, amongst others. Librarians using social media may likely promote either library services like lending services, referral services, reference services, technical services, indexing, abstracting, user education etc. or library resources such as e-books, CD, VCD, journals newspapers, yearbooks, maps, dictionaries, internet- based resources etc. This is because librarians in university library using social media for professional purposes would in the long-run be letting users know what they offer, what they are doing, what resources and services they offer and what they can offer to their users. Librarians desiring to connect constantly with their clients with an eye to increasing users' satisfaction through promotion must make a social presence using social media like Facebook, MySpace, Microblogging sites like Twitter, blog, etc. Today, university libraries have created pages on Facebook, according to Ezeani (2011), social media networking sites on the internet widely known to patrons and encourage library patrons to use them so as to promote library and information resources and services. It becomes imperative for these university libraries to promote the library effectively which would in turn help in the development of the university as a whole. Akporhonor (2011) further that, a university library be it federal or state owned, is part of a university set up to made a significant impact on the rapidly evolving digital communication landscape. WhatsApp since its launch in 2009, this cross-platform messaging program has grown into a global force, uniting billions of users and revolutionizing how people, families, and organizations interact. WhatsApp meteoric rise can be attributed to its simplicity, dependability and commitment to user privacy, which has made it a regular feature in the daily lives of people from all walks of life. WhatsApp's fundamental functionality is to provide a seamless and immediate means of dissemination of information, allowing users to exchange text messages, make audio and video conversations, and share multimedia information with remarkable ease. End-to-end encryption on the network has boosted its reputation as a secure and private venue for talks, attracting users who value privacy. We live in a period where information spreads swiftly due to the globalization of technology. We may now exchange knowledge online with anyone, anywhere, at any time because of advances in information and communication technology. Social media has emerged as a valuable information resource and a forum for communication among people. Kamble and Bankapur (2023) study found that many people utilize mobile instant messaging to interact with family, friends, and colleagues. In addition to individuals, social networking services are frequently utilized by organizations, enterprises, and institutions. There are numerous social networking platforms available, such as Facebook, Instagram, Skype, WhatsApp, WeChat, and Telegram. These programs are simple to use and can exchange multimedia in a variety of ways Embi's (2016) study indicates that the use of WhatsApp in the classroom has a favorable effect on university student learning.

In January 2015, WhatsApp, a PC web client, was released. In 2021, WhatsApp had a global user base of roughly 1,607.6 million users. By 2025, it's estimated 1,902.4 million WhatsApp users around the world. According to a recent survey conducted by Gallup and Gilani (2022), barely 39 percent of Pakistanis utilize WhatsApp. The remaining 61 percent, on the other hand, either have no idea what the platform is for or are not interested in using it. In today's library setting, the conventional face-to-face method, in which a library user must be physically present to consult or use library services, is no longer required. Throughout the world, library services have improved dramatically. Information that used to require numerous steps and procedures is now available through mobile phone apps. However,

even when apps are widely used, the anticipated effects on library operations, such as current awareness, reference, circulation, serial control, and loan services, are highly exploited.

Figure-1
Source: https://www.statista.com (2024).

Figure 1 shows that India has the highest usage of WhatsApp among all countries. Libraries had to adapt their services and operations to meet the evolving needs of their patrons and society. Librarians can create and provide library services to customers by setting up WhatsApp groups for university students and library patrons. The previous face-to-face approach, in which a library user had to be present to consult with a librarian or use library services, is no longer necessary in the modern library setting. Globally, the quality of library services has significantly improved.

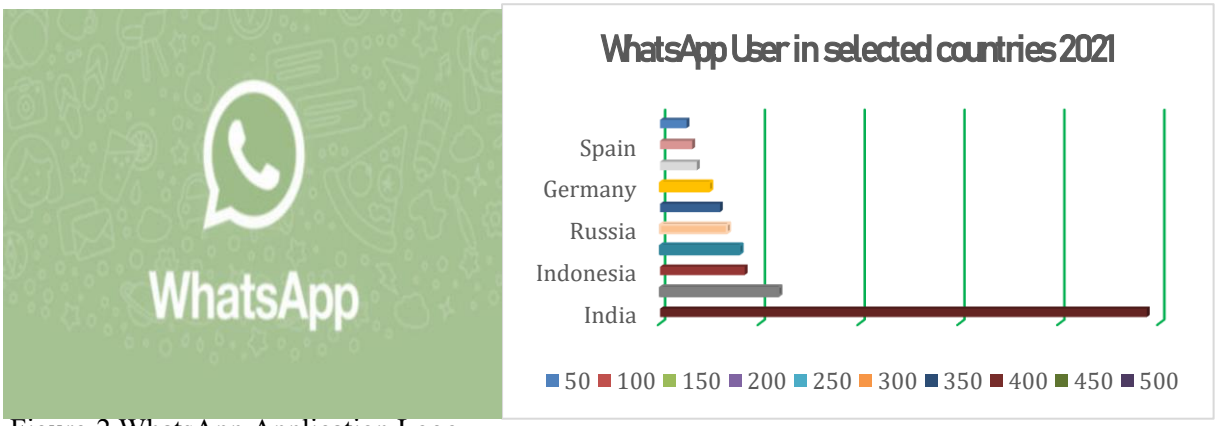

Figure-2 WhatsApp Application Logo
Source: https://www.businesstoday.in (2024).

In 2009, Brian Acton and Jan Koum developed WhatsApp, which Facebook has owned since 2014. It is an internet-based application that can be used to transmit text messages, multimedia messages, documents, audio messages, photos, contacts, and user location to other users. It is accessible on both personal computers (PCs) and smartphones. The following attributes of WhatsApp Messenger, according to Bere (Gon and Rawekar 2017):

- Multimedia: The user can send and receive voice notes, photos, videos, and text messages using multimedia.
- Group Chat: It allows group members to communicate with one another using Group Chat.
- Cross-Platform Communications: can send and receive unlimited messages using WhatsApp.
- Cross-Platform Communications: Users of different devices (personal digital assistants, smartphones, and tablets) can communicate using a variety of media (text messages, voice notes, photographs, and videos).
- Offline Messaging: Messages are automatically saved when the device is turned off or outside the coverage area.
- No charges were brought: Because WhatsApp uses the same internet data plan as online browsing or email, there are no fees connected with utilizing it.
- Pins and User Name: Because WhatsApp uses phone numbers and integrates with users' address books, users no longer need to remember passwords or usernames.
- Others: WhatsApp uses end-to-end encryption to protect our calls and communications. Also, instead of a file-sharing application or email, use WhatsApp to send PDFs, spreadsheets, slideshows, and other files.

Libraries are embracing new avenues to deliver their services straight to patrons' fingertips in an era marked by instant connectivity and seamless communication. One such dramatic leap into the digital sphere is using WhatsApp, the popular messaging network, as a conduit for library services. The integration of library services via WhatsApp is a deliberate reaction to the evolving information landscape and the changing expectations of tech-savvy users. According to users Chaputula (2020) there are numerous advantages of using WhatsApp to deliver library services. Enhancing interactions between patrons and library staff, assisting in the collection of feedback to improve patron services, maximizing document utilization, enhancing the use of library content, and encouraging collaboration and increased communication between patrons and library staff. Using WhatsApp at information centers and libraries provides the following benefits:

- A library can use WhatsApp to share information about upcoming conferences and seminars, library news, URLs to e-books and e-journals, and other pertinent announcements, as well as alerts and reminders about specific issues.
- The library could use WhatsApp to exchange information about its rules and regulations.
- WhatsApp could offer efficient real-time reference services.

- WhatsApp could help promote library services.
- WhatsApp might be used as an acquisition feedback method, and users of the library could make recommendations for the best books to buy.
- The library may disseminate information about new arrival books and journals.
- A consumer can use WhatsApp to request a book from their library in real-time by using it for outreach activities such as lending library materials to other libraries.
- Through WhatsApp library can provide Selective Dissemination of Information (SDI) and Current Awareness Services (CAS).
- Through WhatsApp, customers can request assistance while using the library and provide feedback to improve the services.
- WhatsApp will help library employees and patrons communicate more effectively.

With its global user base and user-friendly design, WhatsApp offers libraries an unparalleled potential to transcend physical barriers and communicate with patrons in real-time. This strategy is consistent with the desire to democratize access to information, ensuring that libraries remain dynamic hubs of knowledge in an ever-expanding digital environment. This investigation goes into the paradigm change created by libraries as they leverage the power of WhatsApp to bring services directly to consumers' palms. The integration is more than just using a popular messaging platform; it is a purposeful effort to meet consumers where they are - on their mobile devices - and create an accessible, interactive, and personalized library experience.

From the foregoing, it is necessary to state that university libraries play a vital role in dissemination of information to users. This could adequately be achieved if mobile technologies and WhatsApp is used in the libraries and environs in dissemination of information to university students and patron. Student's use of library will be enhanced where the library environment is found attractive and inviting. The analysis of WhatsApp mobile technologies no doubt reveled they are adequate facilitators of good library services (Oyedum, 2007, Khan, 2013 and Salihu 2016). University students need to be proficient in their field of study by constantly visiting and using library resources and where these resources do not suit or meet their demands they would not regularly visit the library and this would have a negative in their academic pursuits. Students' academic performance depends a lot on how well they use library resources as these resources supplement and compliment lecture room teaching. The study, therefore investigate Mobile Technology & WhatsApp as Information Dissemination Tools for University Students. University libraries are established in order to support the teaching, research activities and community services of their parent institutions. For adequate functioning of university libraries, university administration usually support their libraries with current information resources available in both print and electronic formats. Today, libraries worldwide are serving their users better by embracing mobile and other technologies as these allow them to expand and promote the already existing services. WhatsApp mobile technologies which can be supplementary in providing tremendous flexible, supplementary channel for delivery library services to students who cannot access traditional resources or who underutilize existing tools. Several university in Nigeria have adopted WhatsApp mobile technologies to extend their reach to client better while majority of them are yet to do this. Preliminary investigation and observation also showed that these services are not fully explored by the users wherever they are available. This is worrisome, especially considering the huge amount spent by university institutions in order to provide digital and virtual libraries so as to improve the rate of information dissemination to library users. A university library that is well equipped with all the needful library and information resources and services, but its resources and services are not duly promoted cannot maintain its relevance in this 21st century. Furthermore, studies have suggested that when Nigerians go online (predominantly with their phones) they go basically to social media applications like Facebook, Twitter, blogs and YouTube. Terragon (2013) gave a statistics of social media users in Nigeria as 5,357,500. This invariably makes social media a must use by librarians in promoting library and information resources and services. It is based on this background that this study sets to examine mobile technology & WhatsApp as information dissemination tools for university students in North-Central State, Nigeria

Aim and Objectives of the Study

- Determine the relationship between WhatsApp Mobile technologies and use of library by universities under study.
- Determine the types of WhatsApp mobile technology services available in universities libraries in Minna metropolis.
- Ascertain the level of usage of WhatsApp tool in dissemination of information in the university libraries under study.
- Determine the influence of the WhatsApp mobile technologies on the effective dissemination of information to students in the universities in Minna.
- Determine the factors militating against the use of WhatsApp mobile technologies in the universities study.

Literature Review

Historically, academic information dissemination in Nigeria Universities relied heavily on physical notice boards, face-to-face communication and localize computer centres. However, contemporary literature establishes that mobile technology has effectively deconstructed the physical boundaries of the classroom. Because mobile technology device have become conduits for accessing, storing and exchanging academic content anytime and anywhere.

Social media is a product of web-based or internet technologies and they depend on these online and mobile technologies to operate, the different types of social media are Facebook, blogs, microblogging, YouTube, twitter, Wikis, Mash Up, Digg, Delicious Second Life, Flickr, Picasa, amongst others. Librarians using social media may likely promote either library services like lending services, referral services, reference services, technical services, indexing, abstracting, user education etc. or library resources such as e-books, CD, VCD, journals newspapers, yearbooks, maps, dictionaries, internet- based resources etc. This is because librarians in university library using social media for professional purposes would in the long-run be letting users know what they offer, what they are doing, what resources and services they offer and what they can offer to their users. Librarians aiming to boost use satisfaction by maintaining constant connectivity and proactive promotional strategies should use social media like Facebook, MySpace, Microblogging sites like Twitter, blog, etc. Ezeani (2011) highlights that university libraries utilize facebook to build familiar digital space for patrons. This strategic online presence encourage preater user engagement and enhances the promotion of library information resources. It becomes imperative for these university libraries to promote the library effectively which would in turn help in the development of the university as a whole. Akporhonor (2011) further stated that, a university library is part of a university set up to made a significant impact on the rapidly evolving digital communication landscape.

Mobile technology is transportable; meaning it's a device capable of performing a wide variety of task on the go. This technology allows those tasks to be performed via mobile phone, eBook reader, Tablet Pc, laptops, etc, it simplifies distance learning in situations where access to learning is difficult or interrupted because of geographical location or due to conflict or disaster situation. Distinguishing between mobile device and services, device are the tangible physical tools that you can hold, carry and move with you while services are intangible platforms, networks and systems that run on those physical devices.

xv. Smartphones (iPhones, Android device)
xvi. Tables(iPad, Galaxy Tabs)
xvii. Laptops/e- readers
xviii. Smart watches and wearable fitness trackers

While services:

- Communication services (WhatsApp Messaging, Zoom Conferencing etc.)
- Networks/Internet services (4G/5G)
- Application services (WhatsApp, Cloud storage etc.)

Mobile learning include:

5. E-book/Journals
6. Out start, Inc.
7. Handheld audio and multimedia guides, in museums and galleries
8. Handheld game console, modern gaming consoles such as Sony PSP or Nintendo DS
9. Personal audio player, e.g. for listening to audio recordings of lectures (podcasting)
10. Personal Digital Assistant, in the classroom and outdoors
11. Referral services

The adoption of mobile technology alters the traditional relationships between libraries and their users and introduces novel challenges to reader privacy. There is the shift from'd-learning' (distance learning) to 'e-learning' and now from 'e-learning' to 'm-learning' will be the next big wave, which will reform education in India. (Mohan Lal el al, 2013). Some of the SMS notification services highlighted by Wang, Ke and Lu 2019; that libraries provide to its users are:

19. Due-day reminder service: This service sends reminders to user when their borrowed items are coming due.
20. Renewal request service: This service accompanies the due-day reminder service. If a user receives a due day reminder and wants to renew the item, the users can click a renewal-request hyperlink provided in the text message to extend the due date of a borrowed item.
21. Overdue notification service: This service reminds user about overdue items.
22. Request arrival notification service: This service reminds users about the availability of reserved items.
23. News and event reminder service: This service sends reminders to patrons about important news, exhibitions, instructions, and so on
24. New title notification service: This service lets patrons get informed of newly acquired titles. This service accompanies the preview and reservation of new titles.

Libraries Can Provide a Wide Array of Mobile Services to Interested Users

According to Wang, Ke and Lu 2019 further that Libraries can provides wide range of dissemination of information to user e.g.:

26. Mobile online public access catalogs (OPACs) Libraries are providing access to their OPACs via mobile-optimized websites. The New York Public Library Mobile Beta site supports a mobile OPAC and allows users to browse library locations and hours.

27. Mobile applications, some libraries have developed mobile applications for Smartphone's. The District of Columbia Public Library, for example, has developed an iPhone application that includes a mobile OPAC and the ability to place items on hold and provides information on hours and locations of local libraries.
28. Mobile collections, Third-party content providers are partnering with libraries to deliver audio books, e-books, audio language courses, streaming music, films, images, and other multimedia that can be used on mobile devices. The Overdrive service is supported on numerous mobile devices and has developed an application for BlackBerry Smartphone's.
29. Duke University has created a free iPhone application called Duke Mobile, containing a wealth of information on digital library resources, including extensive access to the library's digital photo archive and other collections.
30. Mobile library instruction some libraries are offering library instructional materials and resources via mobile platforms. For example, East Carolina University's "Research First Aid" is a series of podcasts for library researchers.
31. Mobile databases PubMed for Handhelds is a mobile web portal for the National Library of Medicine.
32. Library Short Message Service (SMS) notifications Many libraries use SMS for a variety of purposes, including notification for items available for pickup, application of mobile technology in library services.
33. SMS Reference some libraries are offering "text-librarian" services ideal for simple questions that can be answered with a brief response.

Ansari (2016) listed twelve benefits of using WhatsApp in academic library, among which include:

1. **Cost:** Ones the annual charge is paid, there is no more charge and no limit to what one can send using WhatsApp charges including text, pictures, video, audio, location information.

2. **Switching:** Users can easily switch their phone device, reinstall or upgrade the software as long as their service remains with WhatsApp.

3. No limitation: WhatsApp massages are free and not limited in terms of characters and content.

4. Group sharing: WhatsApp allows user to create group or a broadcast to send massages in bulk

5. Privacy features: a person has right to add, block or leave a group even to hide some features.

6. Immediate delivery: The delivery of WhatsApp file is fast and immediate when compared to other applications.

7. Visual feedbacks: It uses ticks to notify means sent, two tick means delivery, green two tick means read.

8. Multi-media file sharing: It supports audio, video, images and location information along with messaging services.

9. Choice of technology: WhatsApp can work comfortable on many operating systems of different smart phones

10. Calling facility: It provides calling facility to users. These facilities are not geographical bound and attract no additional charges.

Considering all these attractive features, it is imperative in this 21st century that an academic librarian needs this application not only to function effectively but also to satisfy its users' needs highly. The WhatsApp application combines both social interactions with user satisfaction simultaneously. As a collaborative application, both the user and the academic librarian can mutually interact, thus creating room for innovative in user need satisfaction. The benefits of using WhatsApp are so much to be neglected by any academic library in our current digitized and networked environment. As already noted, WhatsApp delivers instant massages in real time and its ability in delivering voice, picture and video massages is unrivalled. The academic librarians should utilize these features of the WhatsApp in its service delivery to its various users. It can be very useful in current awareness services, announcement and many other services to the library users.

Methodology

Descriptive survey method will be used, because it is fact-finding tendency for a situation. According to Sheikh el al. (2024) descriptive survey seeks to determine present practice or opinion of a specified population. Siedlecki el al. (2020) further on survey research is one that gathers data at a particular time with the intention of describing a situation of a phenomenon because it analytical power and report an event the way they are. Oyedum el al. (2015) survey is used to assess a situation with a view to correcting inadequacies or effecting improvement. Survey research method was also necessary for the study because data was collected and used to describe and interpret issues on mobile technology and WhatsApp environment.

A simple random sampling procedure of sample size of four hundred (400) will be use from four university within Minna metropolis. Stratified and judgmental sampling techniques were used to sample the population for the study. Ibrahim (2013) is a form of non-probability sampling where the researcher based on his/her knowledge of the population hand-picks certain groups as representatives of the entire population. McCombes (2023) that in simple random sampling technique, only respondent, interviewer, etc. which the researchers can reach. The four (4) universities in Minna metropolis were grouped according to strata using the types of the universities that is conventional and specialized where the mobile technology & WhatsApp environment was more prominent in the studied area for a good spread.

The researcher selected four hundred (400) students using Morgan's (1970) table. Depending on the objectives and the review of related literature, a five-point Likert scale questionnaire was developed by the researcher as a research tool for university students to collect data. After verifying the instrument, pilot testing was performed on the instrument. 350 were returned, data were collected through the personal visit of the research. The researcher distributed questionnaires to University students. Students were asked to read and complete a list of questions. Statistical Package for Social Sciences (SPSS) was used for data analysis. The researcher used frequency, percentage and mean scores for the analysis of data.

Data Analysis

***Table 1. Student's perception of* WhatsApp as Information Dissemination Tools (N=400)**

Note: SA = Strongly Agree; A=Agree; D=Disagree; SD= Strongly Disagree.

S/N	Statement	N SA(%)	A(%)	D(%)	SD (%)	Mean	Remark
1	Determine the relationship between WhatsApp Mobile technologies and use of library by universities under study.	60	30	7	3	3.47	Agreed
2	Determine the types of WhatsApp mobile technology services available in universities libraries in Minna metropolis.	55	35	8	2	3.43	Agreed
3	Ascertain the level of usage of WhatsApp tool in dissemination of information in the university libraries under study.	45	40	5	5	3.25	Agreed
4	Determine the influence of the WhatsApp mobile technologies on the effective dissemination of information to students in the universities in Minna.	30	25	15	15	2.70	Neutral

Discussion of Findings

- Determine the relationship between WhatsApp Mobile technologies and use of library by universities under study show: *High Adoption and Efficiency*: The high frequency and percentage for items related to "rapid sharing" and "coordinating group work" (Mean > 3.47) suggest that students heavily rely on WhatsApp as a primary information channel. This aligns with research indicating that WhatsApp has become a "dynamic and real-time platform" for academic collaboration, effectively bridging geographical gaps (Joshua, 2018).
- Determine the types of WhatsApp mobile technology services available in universities libraries in Minna metropolis: *The Double-Edged Nature*: While students value the tool for its speed, the "WhatsApp Business types" or lower mean scores for "distraction" indicate a nuanced reality. Data often shows that while students

use WhatsApp to access materials, the "excessive reliance" on it can serve as a distraction from deep study, impacting academic performance if not managed properly (Joshua, 2018; Alhajjaj, 2024).

- Ascertain the level of usage of WhatsApp tool in dissemination of information in the university libraries under study: *Implications for Institutions*:** The findings suggest that universities should not view mobile technology as merely a social tool. Because students are already using these platforms for information dissemination, there is a strong case in usage for formalizing their use in academic settings to ensure that critical information (like lecture updates or resource sharing) is managed within a professional framework rather than through informal channels alone (Elom, 2025).

Orientation and Innovative Adoption in Academic Libraries in Nigeria: Strategies and Challenges

AZEEZ, Moshood Ayinde [1] & MUSTAPHA, Hadiza Tenin[2],
Dr. Umaru Sanda Ahmadu College of Education, Minna
[1]Abdlazeezmoshood@gmail.com 08035014780, 08023179014;
[2]hadizatmustapha@gmail.com 08161800413;

Abstract
The paper explored orientation and innovative adoption in academic libraries in Nigeria, focusing on concept of innovative adoption, literature review, strategies and challenges. It aims to identify innovative technologies for library adaptation to the new innovation, Technophobia issues, lack of training, inadequate funding institutional factors and innovation policies were among challenges of the academic libraries. Different literatures were explored on how libraries can leverage advanced innovative technology to adapt to the new changes. The paper also highlighted the importance of innovative technologies in academic libraries to promote awareness of technological advancements. Libraries and librarians had to adapt to the new innovation as the traditional information resources are bulky methods. The study suggests that libraries in less developed countries should focus on developing human capacity, promote self-improvement among librarians, and collaborate with libraries in developed countries to update skills.
Keywords: Orientation, Innovative Adoption, Strategies, Challenges

Introduction

The importance of Academic Library cannot be overemphasized especially in ensuring that the right services are given to her users. Some strategic measures for adoption and implementation of innovative technologies in academic libraries include but not limited to human capacity development, application of artificial intelligence, provision of alternative power supply, improved internet connectivity and database integration libraries to adapt to technological changes. The provision of needed information goes a long way in widening their horizon in technology and education more especially in a developing society like Nigeria (Okoro, 2021). Today, with the emergence of Information and Communication Technologies, Mobile Technologies have been applied to the Library and Information Services in Nigeria to increase efficiency. According to Vikram & Kaur (2022), some of the digital and innovative technologies employed to serve library users better in the library include: Big data technology, Robotic System, Library Mobile Applications, Artificial Intelligence, Library bookmark Apps, Virtual Reality Technology, Book Delivery drone, Digital Interface for printed books, E-reader Applications, RFID systems and Cloud Computing Technology etc.

Innovation and orientation in academic libraries in Nigeria involves shifting from traditional, lecture-based sessions to modern, engaging approaches that use technology to teach information literacy and library resources. This includes incorporating interactive online tutorials, social media, mobile apps, and gamified activities like scavenger hunts to make learning more student-centered, accessible, and effective. The goal is to increase user confidence, improve resource usage, and enhance overall academic success by adopting more dynamic and user-friendly method in Nigerian academic libraries (Shahzad et al., 2024).
Innovative adoption in academic libraries involves new technologies and services to meet evolving user needs, with examples including big data analytics, virtual reference services, open access repositories, and AI-driven tools. Libraries are also innovating their roles by integrating more deeply with curriculum design, offering embedded information literacy instruction, and shifting to a more collaborative, service-oriented model. (Wada et al., 2022)

Concept of Innovative Adoption

Innovation can be seen as technological advancement that bring about changes in academic libraries and besides, people or society are the determinants of the innovative changes more than technology itself. Ogunmodede and Popoola, (2021) viewed that, innovativeness of libraries and LIS professionals is inevitable to facilitate interactive, multimedia-rich, and user-driven products and services; enhancement of routines, tasks and products that meet users' needs. It is also share this view by saying that training plays crucial roles in adoption of innovative library services delivery while its inadequacy and lack of suitable infrastructures are hurdles to adoption of innovative products and services. This assumption is true because inadequate training of personnel poses a great danger to innovative products and service delivery. As such, Nigerian libraries must come up with strategies for preparing LIS personnel to adopt or adapt, use, manage, and harness the current and emerging technologies to deploy first class library products and services. The acquisition and demonstration of creative and innovative skills would enable LIS professionals in the country provide home grown and intended services and products that would attract patrons, improve performances, tackle challenges while simultaneously, attracting moral and financial supports. The current study thus identified the level and extent of adoption of innovative library products and services, examined participant libraries' reasons for non-adoption of innovative library products and services and identified the relevance of the Workshop to library innovative products and services. The study went further to examine the workshop participants level of encouragement for adoption

of innovativeness in respective libraries, the level of satisfaction with the organization of the workshop and suggestions for future planning of relevant or similar workshops content (Emiri, 2023).

Literature Review

Technological advancements around the globe in all parastatals has motivated different institutions including academic libraries to seek for lasting ways to reach their audience and remain relevant. Studies have proven that the only way of communicating information to people at their respective domains is through information communication technology (ICT) which helped in disseminating information to the door post of all around the globe and will continue to be. Omeluzor, et al (2020) opined of the advancement push in information technology which paves way for information access, sharing and creates room for adoption of innovative tools which enable library services and instruction to users. Globally, ICT tools are of tremendous assistance in delivering information services. Additionally, Omeluzor et al (2020) agreed that delivery of library instructions will be aided by the use of innovative tools without bringing patrons at a location. That is, through innovative tools/changes, the barrier of reaching a wider audience at a glance will be broken. The studies of Lund and Wang (2022) discovered that libraries are forced to constantly review their services, develop new skills, examine their partnership approaches and upgrade infrastructure (both physical and digital) and other resources to align with the complex and dynamic environments in which they exist and on which they may have an impact.

Ameh, et al (2021) observed of some endemic challenges that libraries in Nigeria face that prevents them from attaining needed successes in innovating programmes and services. These constraints include but not limited to unserious reading culture, attitude of librarians, peoples' misconception of the library, lack of adequate funding and above all, inadequate technological driven library and information services. Lund and Wang (2021) in their study found in the investigated faith-based universities that though being temporarily shaken by diverse onslaughts, yet private universities in South-West including the faith-based have bounced back to operation with innovative ideas and innovation changes. Gladys (2024) found out in his study also that, innovative products and services that aided reaching users included ICT based services like emails, library 2.0, internet, social media platforms as well as electronic catalogues. Inculcating innovative ideas for innovative changes to remain relevant in academic libraries in Ogun state. Ashiq, et al (2021) identified the availability of some soft tools in technological innovation that eases innovative changes in academic libraries are google, google scholar, social media platforms and amazon. They help in passing knowledge and information round the clock to users hence they are easy to access and use. In order to be in form to use these evolving and impactful technological tools, the library professionals need to accept, learn, and practice the tools to improve their skills and equally be updated with new innovative changes of the moment (Allision, 2024). Furthermore, academic libraries face other problems as well. Not all staff in the libraries are adequately trained. The majority of the libraries have to adopt this great change. One solution to get over this difficulty is to link up the academic libraries through networking. It is high time for the libraries to adopt themselves to the innovative methods of providing knowledge to as many people as possible. Those libraries, which are already highly sophisticated, should consider providing their collection to the common man. Allision (2024) found out the two major issues militating the innovative changes in academic libraries as inadequate finances and technological changes. These factors affect services render in the academic libraries in Nigeria and Ogun State in particular. Supporting this result, Etebu and Zacchaeus (2020) stated that inadequate funding, resistance to change and inadequate ICT infrastructure development are some of the hindrances to innovative library services. In continuation, Ashiq, et al (2021) added that leadership crises contribute to major challenges faced in implementing innovative ideas and changes in academic libraries. Following this is emotional challenges, technological problems, user behaviours and human resources.

The Importance of Innovative Adoption in Academic Libraries in Nigeria

Innovation adoption in Nigerian academic libraries is crucial for relevance, efficiency, and supporting modern scholarship, moving libraries from mere book repositories to dynamic learning hubs by enhancing user experience (AI, automation, remote access), improving resource management, ensuring inclusivity, and fostering research, though challenges like funding and infrastructure persistence.

Over the years acquiring knowledge in particular in academics has undergone tremendous changes, assuming new dimensions influenced by the innovations in technology driven applications. As a result of this trend all stakeholders in the education industry are catching up with this new wave technologies in academic arena. The library as a component of education sector is no exception to this new trend. Libraries are principally entrusted with a host of predetermined tasks like acquiring organizing, preserving, retrieving, accessing and disseminating information to the user. It implies, libraries are established to provide services and make available information resources that meet the exact information needs of their users. To meet up with this primary high demanding task, academic libraries globally, are developing and introducing series of innovations in information technology in their service delivery to match with user's needs. This information technology has influenced the very nature of business and management in libraries. The conventional set up of brick and mortar libraries that store information within a constrained physical space have given ways to data centers that integrate data sources around the globe by the means of networking (Gladys, 2024).

Strategies in Adopting Innovation in Academic Libraries

Innovation strategies for improving academic libraries in Nigeria primarily involve integrating **Information and Communication Technologies (ICT),** reimagining physical and virtual spaces, and developing staff capacity to meet evolving user

The strategies to be adopted in Academic Libraries are stated below:

i. Artificial Intelligent
ii. Integration of library database
iii. Staff Development
iv. Internet Facilities
v. Solar power system

Artificial Intelligent

This is one of most current vibrant strategies academic libraries adopt in today library innovation. The use of ICT infrastructures tools such as services like emails, library 2.0, internet, Chart GPT, social media platforms as well as electronic catalogues. Artificial Intelligence, which is the latest in the development, has been viewed as one of the evolutionary technological tools that has brought about tremendous change in the operations and services of the library. As a result, most academic libraries throughout the world regard AI adoption as a developing strategy that provides ease of operations and services (Halburag and Mukarambi, 2023). The adoption of emerging technologies also creates opportunities for innovation and professional growth within the library profession. Cox (2023) underscores that librarians equipped with competencies in AI and digital technologies can redefine their roles and contribute to cutting edge developments in academic libraries. Similarly, it's also note that embracing these technologies encourages a shift towards more innovative and adaptive library practices, ultimately enhancing the relevance of libraries in the digital age.

Integration of library database

The use of technological innovative changes capable of fostering technological service delivery in academic libraries include the use of OPAC, compact shelving, archiving research data, shared annexes for storage, digital and institutional repository. Open Access software makes information available to scholars free of charge, circulation unit of any academic library aims to disseminate information to scholars, researchers, and faculty members at no cost or minimal cost. One of the major tasks of academic libraries is circulating the resources of the libraries. Users have access to the resources of the libraries for utilization. Due to the increased demand for scholarly articles and the technological advances of the internet, open access is quickly becoming a major priority among research libraries today (Ajayi et al., 2024).

Staff Development

Staff training and development is the teaching or learning activities carried out for the primary purpose of helping members of an organization or academic library to acquire and apply the knowledge, skills, abilities and attitudes needed by that organization. Training is the process of equipping the workforce with the necessary knowledge, skills, and attitude to tackle the job responsibilities. The librarian should be well informed, orientated as well as educated on the certain skills which may bring innovation or changes to his/her profession. Staff training and development activities in the libraries do not only help staff to meet the challenges of providing

information to support the academic programs of the library, but it also helps to sustain the growth of provide the security for the both human and information resources in the library which eventually helps to improve upon the individual staff effectiveness (Allison, 2024).

Internet Facilities

Good internet infrastructure connectivity, sufficient computer terminals, adequacy of Information and Communication Technology (ICT) skills will enhance the access and use of electronic innovation information resources in the institutions. Information resources such as e-books, online databases, e-journals, as well as CDROMs are available in the institutions (Gladys, 2024)

Solar Power System

The orientation and awareness are prerequisite to adoption and use of digital information resources, and that if library users used Internet service and access electronic journals, it is a prove that the users are aware of the resources and the channels to reaching them. The installation of modern solar power system will enhance and make the innovation adoption real in academic library. The application of solar system and ICT infrastructure eradicate the issues of epileptic power supply, non-availability of online databases, inadequate computers, inadequate bandwidth, network problems, lack of skill, and lack of formal training on internet use worked against the use of electronic information resources by library users. With adequate and equipped solar infrastructures all the highlighted problems will be vanished. Odiche and Amodu (2024) further asserted that one of the major factors hindering the penetration of information and

communication technology (ICT) devices in developing nations is the absence and inadequacy of electricity to provide power for technological devices. This inadequacy of power supply by the national grid, among other factors has led developing nations like Nigeria and organizations within it to look for alternative power sources like generators and solar and inverter generated energy. Solar energy implies tapping radiant light energy emitted by the sun as a means of energy source and converting it into electricity directly using photovoltaic (PV), indirectly using concentrated solar power, or a combination. It serves as an important tool in the elimination of pollution and creates a highly reliable electricity backup to electrical/electronic appliances. Places powered by solar energy have been installed with inverters of different capacities and batteries with the capability of storing power that is able to operate electrical appliances such as computers, television, radio, laptops, ipads, tablets, and refrigerators (Emiri, 2023).

Challenges of Innovation in Academic Libraries

The adoption and use of digital information resources could be altered by some of the highlights challenges below. One of the foremost barriers is the inadequate technological infrastructure in Nigerian academic libraries. Oyetola et al. (2023) emphasize that the lack of stable internet connectivity, poor power supply, and outdated hardware are significant impediments to leveraging artificial intelligence (AI) and robotic technologies. However, shortfalls in gaining benefits from the digital information resources disseminated by academic libraries are major challenges

Technophobia

The fear of using new technology facilities/skills is a major threat in innovative adoption in Nigeria academic libraries. Odiche and Amodu (2024) portrayed that, technophobia, technological problem, administrative problem, irregular government policies, environmental problem, lack of literate or skilled personnel, hardware and software failure and high cost of ICT facilities are the major challenges affecting electronic adoption in academic libraries. Technophobia also known as techno fear, is the fear or dislike for advanced technology or complex devices, it extends beyond the boundaries of one country as it is a behavior toward technology issue, in other words, technophobia coexists with technology regardless of physical location. Many studies have examined technophobia in countries like Iran Vikram and Kaur 2022): Technophobia closely relates to computer anxiety, but it is distinct from it. Computer anxiety is associated with interacting with computers, while technophobia is a broader concept related to modern or new technologies, not just computers. So far, several measures have been developed to evaluate specific technology influences, such as computer anxiety and negative attitude toward robots (Edache-Abah and Amuji, 2025)

Lack of Training

Lack of training pose a great threat to the adoption of innovation in academic library. Sometimes there may be new technological gadgets which require adequate knowledge to operate them. Oladokun et al. (2023) point out that there is a lack of adequate training and professional development opportunities for librarians to acquire the technical skills required for AI and robotics integration. These studies reveal that the gap between technology adoption and staff competency undermines the effective implementation of innovation technologies.

Funding

Inadequate funding also pose a major challenge. Oladokun et al. (2023) highlight that the high cost of acquiring and maintaining emerging technologies, such as AI and robotics, often exceeds the budgets allocated to academic libraries. This financial constraint is further compounded by limited government funding and a lack of alternative financing options for technological investments. Further, the readiness and capacity of library staff to adopt and utilize emerging technologies are also significant concerns

Institutional Factors

Some of the challenges are related to the library users, some challenges are institutional, structural and infrastructural, which means the library institutions are bedeviled with the challenges. It also deduced from the findings of Wada et al, (2022) that one form of the challenge contributed significantly to the failure or difficulty in using libraries and their information innovative resources at different levels and circumstances. If the challenges against the adoption and use of digital information resources are not properly managed or brought to minimal level or completely removed, the credibility and usefulness of academic libraries can seriously be at heightened risk. It would be difficult for educational institutions to function effectively and efficiently without ensuring that libraries serving as blood streams of educational activities are not put in good shape. The implications for library users like postgraduate students are also enormous, ranging from lack of computer literacy, this will results to poor academic performance, inability to acquire sufficient knowledge and skills for discoveries and innovativeness

Prospects of adopting innovation technologies in academic libraries in Nigeria

The prospects of adopting innovation technologies in academic libraries in Nigeria are promising with the potential to transform service delivery, enhance access to information, and streamline library operations. These advancements are particularly significant in the context of artificial intelligence (AI), robotics, and other digital innovations, which are

increasingly being explored in library settings globally and Nigeria. Emerging technologies such as AI-powered tools and robotic systems have the potential to significantly enhance the quality and efficiency of services offered by academic libraries. Oyetola et al. (2023) highlighted that AI applications, including intelligent chat bots and recommender systems, can support personalized user interactions and improve information retrieval processes. Similarly, Lund and Wang (2023) emphasize the role of AI tools like Chat GPT in assisting with academic research, creating content summaries, and addressing user queries, thereby expanding the scope of library services

Conclusion

Technology literacy and digital innovation play a crucial role in academic libraries where teaching and learning processes of this modern era or technology-driven world, this enables students to communicate effectively with their peers and lecturers through online platforms. Students are provided with better orientation and access to information, enhanced creativity and critical thinking and problem solving in their academic performance by adopting in online platforms and carrying out laboratory experiments using the online laboratory and subsequently apply what they have learned in real life situation thereby their relationship with technology, is s influenced by general attitudes toward innovative technologies, among other factors.

Way forward

Based on the study, the research suggest that,

i. There is need for written policies to guide fear of use of ICT in adoption of innovative technologies in Nigeria academic libraries.
ii. Library management should ensure human capacity development and encourage their staff through the skills training to internalized new innovation.
iii. Adequate funding must be ensured through TETFUND intervention for seamless innovation changes in Nigeria academic libraries.
iv. The existing institutional and infrastructural resources should be adequately maintained so as to create a conducive environment for the library users

Abstract

The study on "Patient Education Hubs: Hospital Libraries Enhancing Health Literacy Delivery in Southern Nigerian Teaching Hospitals" empirically examined the role of hospital libraries as patient education centers in Nigeria's healthcare system. The study was guided by four objectives. The study adopted a descriptive survey research design targeting medical librarians, healthcare providers, and patients from teaching hospitals in Southern Nigerian Teaching Hospitals. A population was 1308. A sample of 260 respondents comprising of 20 librarians, 40 healthcare professionals, and 200 patients participated. Data collection utilized validated questionnaires, patient knowledge assessment tests, and observation checklists, validated by three Library and Information Science experts. Cronbach Alpha reliability was established, with analysis employing descriptive statistics (mean scores, standard deviations). Findings revealed leaflets and health talks as primary services, with librarians demonstrating moderate competencies in plain language writing but limited multimedia skills. Patient comprehension will improve significantly post-library intervention. Barriers including limited funding and healthcare provider collaboration will emerge. The study concluded that hospital libraries substantially enhance health literacy when systematically integrated into patient care pathways, recommending dedicated health literacy coordinators, multimedia production units, interprofessional training, and sustained funding to institutionalize patient education hubs supporting Nigeria's universal health coverage goals.

Keywords: Patient Education Hubs, Health Literacy, Hospital Libraries, Treatment Adherence, Plain Language Materials

Introduction

Patient education hubs are increasingly important in hospital libraries because they give patients a place to access trusted health information, learn in simple language, and take part more actively in their care. In modern health systems, health literacy is not only about reading information but also about understanding, using, and acting on it in ways that support better decisions and better outcomes (McDonald, Winter & Luke, 2010). Hospital libraries are therefore well positioned to support patient education because librarians already manage reliable information resources and can help translate complex medical content into clearer forms that patients can use. This makes the idea of patient education hubs especially relevant in hospitals where patients and families often need guidance, reassurance, and easy access to health knowledge (Ozan, 2020).

The growth of patient centered care has made the role of libraries in health education more visible. Recent literature shows that librarians are no longer limited to serving clinicians and researchers alone, because they are now also involved in improving consumer health information access, supporting patient engagement, and helping healthcare organizations respond to health literacy needs (Amini & Ashrafi-rizi, 2018). In hospital settings, this shift is important because patients often face difficult medical terms, rapid treatment decisions, and pressure to understand their care quickly. Patient education hubs can respond to this need by bringing together print materials, digital tools, referral support, and face to face guidance in one accessible service point (Truccolo, 2016). When such hubs are well designed, they can help patients become more confident, ask better questions, and participate more fully in their treatment.

Hospital libraries also have a professional and ethical role in promoting equitable access to health information. Librarians are trained to locate, evaluate, organize, and present reliable information, which makes them useful partners in health literacy work and patient education (Beschnett & Bulger, 2013). A recent study has shown that library based health information services can improve awareness of health literacy issues, strengthen collaboration with healthcare staff, and encourage the use of trusted resources in patient education initiatives (Renzi, Baccolini, Migliara, De Vito, Gasperini & Cianciulli, 2022). In practical terms, this means hospital libraries can serve as bridges between medical knowledge and patient understanding, especially where patients have limited literacy, little time, or difficulty navigating

complex hospital systems. The growing interest in health literacy across library and health literature shows that this area is timely and worth deeper scholarly attention (Hessler, 2015).

Despite this promise, patient education hubs can only function well when they are supported by space, funding, staffing, technology, and collaboration. Several studies have noted that hospital librarians often work within service structures that still prioritize clinical staff over patient facing services, and this limits the expansion of educational support for patients (Truccolo, 2016; Ozan, 2020). There is also evidence that training gaps, weak organizational support, and limited infrastructure reduce the ability of librarians to design and sustain patient focused services (Collins, 2015). For this reason, a study on patient education hubs can make a strong contribution by showing why hospital libraries matter in health literacy delivery and by arguing for practical changes that can strengthen their role in patient education.

Statement of the problem

Ideally, hospital libraries should function as active patient education hubs where librarians provide clear, reliable, and easily accessible health information that helps patients understand their conditions, treatment options, and self care responsibilities. However, the current situation in many hospital libraries is different because patient education functions are still weak, poorly structured, or underdeveloped due to limited funding, shortage of space, inadequate staff training, outdated technology, and weak collaboration with hospital personnel. The consequence of these problems is that patients may continue to receive health information that is fragmented, difficult to understand, or unavailable when needed, which can reduce understanding, weaken participation in care, and make it harder for hospitals to improve health literacy delivery. Previous studies have discussed librarians' roles in health literacy and consumer health services, but fewer studies have focused specifically on the development of patient education hubs in hospital libraries as a structured and practical model for health literacy delivery, especially in contexts where institutional barriers remain strong. This gap warrants the present study

Objectives of the Study

The main objective of the study is on Patient Education Hubs: Hospital Libraries Enhancing Health Literacy Delivery in Southern Nigerian Teaching Hospitals. The specific objectives were to:

1. Identify patient education services currently provided in Southern Nigerian Teaching Hospitals
2. Assess librarians' competencies in developing health literacy materials in Southern Nigerian Teaching Hospitals
3. Determine the impact of library interventions on health outcomes and treatment adherence in Southern Nigerian Teaching Hospitals
4. Identify the challenges of librarians in hospital libraries in developing patient education hubs towards enhancing health literacy delivery in Southern Nigerian Teaching Hospitals

Research Questions

The following research questions guided the study:

1. What patient education services are currently provided in Southern Nigerian Teaching Hospitals?
2. How competent are librarians in developing health literacy materials in Southern Nigerian Teaching Hospitals?
3. What is the impact of library interventions on health outcomes and treatment adherence in Southern Nigerian Teaching Hospitals?
4. What challenges do librarians in hospital libraries face in developing patient education hubs to enhance health literacy delivery in Southern Nigerian Teaching Hospitals?

Review of Related Literature

Hospital libraries

Hospital libraries have gradually moved beyond being quiet places that only store books and journals, because they now support clinical work, patient care, staff education, and public access to trustworthy health information. In the literature, hospital libraries are described as service points where librarians help users find, evaluate, and understand health information in ways that fit their needs and level of understanding (Beschnett & Bulger, 2013). This role has become more important in recent years because hospitals increasingly expect libraries to contribute to patient centered care and not only to academic or clinical research support. The literature also shows that hospital libraries are trusted spaces that can connect professionals, patients, and families to reliable information, especially in environments where health information is often complex and difficult to interpret (Ozan, 2020).

Patient education hubs

Patient education hubs are emerging as organized library based support points where patients can access clear health information, printed materials, digital resources, and human guidance in one place (McDonald, et al, 2010). The literature suggests that such hubs can be developed through collaboration between librarians, nurses, doctors, and hospital administrators so that patients receive information that is simple, relevant, and timely. A patient education hub is not only a room or a shelf of leaflets, but also a structured service that helps patients ask questions, learn about their conditions, and take part in decisions about their care (Amini & Ashrafi-rizi, 2018). Recent discussions of hospital

library services show that patient education programs work best when they are visible, easy to use, and built into the daily life of the hospital.

Health literacy

Health literacy refers to the ability to find, understand, judge, and use health information in ways that support sound health decisions (American Library Association, 2015). Recent literature divides health literacy into functional, interactive, and critical forms, showing that people need more than basic reading ability if they are to handle health information well (Malachowski, 2014). This matters because patients often face medical terms, treatment instructions, and online information that may be confusing or too technical for everyday use. Studies also show that low health literacy remains a challenge in many settings, which makes the work of librarians and health educators important for reducing misunderstanding and improving patient confidence (Obiekwe & Agim, 2021; McDonald, et al, 2010).

Libraries and health literacy delivery in Teaching Hospitals

The literature increasingly presents Teaching Hospitals as active partners in health literacy delivery because librarians can simplify information, teach users how to locate reliable sources, and support communication between patients and health staff. A recent study show that librarian led health literacy interventions can improve information seeking habits and encourage the use of trusted medical sources rather than unreliable online content (Agim & Azolo, 2022). Health literacy programs in Teaching Hospitals settings also show that collaboration is essential, since librarians work best when they are included in staff training, patient education planning, and hospital communication strategies (Cooper & Crum, 2013; Medical Library Association, 2016). In this way, teaching Hospitals do not only store knowledge, they help translate knowledge into practical understanding that patients can use in daily health decisions.

Methodology

The study adopted a descriptive survey research design targeting medical librarians, healthcare providers, and patients from Southern Nigerian Teaching Hospitals. The population comprised of 1,308. A sample of 260 respondents comprising of 20 librarians, 40 healthcare professionals, and 200 patients participated. Data collection utilized validated questionnaires, patient knowledge assessment tests, and observation checklists, validated by three Library and Information Science experts. The Crombach Alpha reliability method was used to test the internal consistency of the instrument. A reliability coefficient of 0.83 was obtained. Data collected was analyzed using descriptive statistics of mean scores and standard deviation

Results and Discussion

Research Question 1: What patient education services are currently provided in Southern Nigerian Teaching Hospitals?

Table 1: Observation Checklist on patient education services currently provided in Southern Nigerian Teaching Hospitals

S/N	Items	Provided	Not Provided
1	Printed brochures on disease management.	√	
2	One-on-one consultations to help patients understand their medical conditions.	√	
3	Group sessions on health literacy topics for patients.		√
4	Collection of easy-to-read health books and magazines for patients.	√	
5	Audiovisual materials (e.g., videos, DVDs) on treatment procedures and self-care.		√
6	Assists patients in accessing reliable online health information resources.	√	
7	Collaborates with healthcare providers to deliver tailored patient education programs	√	
8	Pamphlets on disease prevention.	√	
9	Focus group services to patients having same disease		√
10	Workshops on health literacy topics for patients.	√	

The data shows that hospital libraries are highly active in delivering personalized and accessible educational resources to patients. The respondents confirmed that services such as printed brochures on disease management, one on one

consultations, and the collection of easy to read materials are fully available. Furthermore, the findings indicate strong support in assisting patients with reliable online health information, collaborating with healthcare staff to create tailored programs, and offering pamphlets on disease prevention. Workshops on health literacy are also established as a key service. In contrast, group sessions, audiovisual materials, and focus group services are not currently offered in these library settings. This demonstrates that while individual and static resource provision is well supported, interactive group based and multimedia delivery methods for patient education remain areas that require further development within the hospital library framework.

Recent research in clinical librarianship consistently highlights the central role of hospital libraries in enhancing patient care through targeted information services. Dancy-Scott, Rockoff, Dutcher, Keselman, Schnall, Siegel and Bakken (2014) established that library services contribute significantly to clinical decision making and patient understanding by providing curated, high quality health information, which aligns with the observed success of individual consultations and print material distribution. Furthermore, studies by Swanberg, Dennison, Farrell, Machel, Marton and O'Brien (2016) emphasize that librarians serve as essential partners in health literacy efforts, utilizing their expertise to bridge the gap between complex medical data and patient comprehension, reinforcing the findings regarding the provision of online resource assistance and tailored programming. Additionally, work by Cooper and Crum(2013) demonstrates that while libraries excel at disseminating health information, the integration of specialized group programming and media rich formats often requires unique institutional support and resource allocation, explaining why such services may be less common in standardized library environments.

Research question 2: How competent are librarians in developing health literacy materials in Southern Nigerian Teaching Hospitals?

Table 2: Mean Responses on how competent librarians are in developing health literacy materials in Southern Nigerian Teaching Hospitals

S/N	Items	Mean	SD	Remarks
1	I have strong skills in simplifying complex medical information into patient-friendly language.	2.80	0.70	Agree
2	I am proficient in designing visually appealing health education brochures and posters.	2.65	0.65	Agree
3	I can effectively use digital tools (e.g., Canva, Adobe) to create multimedia health literacy content.	2.30	0.75	Disagree
4	I am knowledgeable about evidence-based principles of health literacy (e.g., plain language guidelines).	2.90	0.72	Agree
5	I am able to evaluate and adapt health materials for diverse patient populations (e.g., low-literacy groups).	2.75	0.68	Agree
6	I have experience in pre-testing health literacy materials with patients for clarity and usability.	2.85	0.78	Agree
7	I stay updated on best practices for developing culturally sensitive health education resources	2.95	0.80	Agree
	Grand Mean	**2.75**		**Agree**

The table shows that librarians were generally competent in developing health literacy materials because the grand mean of 2.75 falls within the agreed range, and six of the seven items were rated as agree while only one item was rated as disagree. The strongest area was staying updated on best practices for culturally sensitive health education resources with a mean of 2.95, followed closely by knowledge of evidence based principles of health literacy with a mean of 2.90, which suggests that librarians understand the content and guidance needed for effective health material development. The item on using digital tools to create multimedia health literacy content was the only weak point, with a mean of 2.30, showing that respondents do not strongly believe they are fully competent in that aspect. The standard deviation values are fairly close to one another and remain low, which suggests that the responses were not widely scattered and that the respondents generally shared a similar view about their competence levels. This pattern aligns with the view that librarians are important contributors to health literacy work and can simplify information, design useful materials, and adapt content for different users, but they may still need more support in digital production skills.

This finding is supported by a review by Malachowski (2014) which showed that clear and simple wording improves the usefulness of health promotion materials and helps people understand complex health information better. A study by McDonald, et al (2010) found that library staff often assist patrons with health related information, but they also need stronger preparation to handle some health communication tasks effectively. Another review by Ozan (2020) reported

that librarians have long been involved in health information work and are well positioned to support health literacy, especially through training, outreach, and development of accessible materials, even though more support is still needed in some skill areas.

Research Question 3: What is the impact of library interventions on health outcomes and treatment adherence in Southern Nigerian Teaching Hospitals?

Table 3: Mean Responses on impact of library interventions on health outcomes and treatment adherence in Southern Nigerian Teaching Hospitals

S/N	Items	Mean	SD	Remarks
1	Library-provided education has improved patients' understanding of their prescribed medications.	2.85	0.60	Agree
2	Participation in library workshops has led to better patient adherence to treatment plans.	3.15	0.65	Strongly Agree
3	Library interventions have reduced hospital readmission rates among educated patients.	3.05	0.70	Strongly Agree
4	Patients who use library resources report higher confidence in managing their health conditions.	2.90	0.55	Agree
5	Library health literacy programs have positively influenced patients' lifestyle changes (e.g., diet, exercise).	2.95	0.58	Agree
6	Feedback from healthcare providers indicates that library interventions enhance overall patient health outcomes.	3.20	0.62	Strongly Agree
7	Library services have contributed to fewer medication errors reported by patients	2.80	0.50	Agree
	Grand Mean	**3.00**		**Strongly Agree**

The table shows that library interventions have a positive impact on health outcomes and treatment adherence because the grand mean of 3.00 falls in the strongly agree range, which means respondents generally accepted that library based health support makes a real difference. The responses also show that the highest rated areas were the effect of library interventions on overall patient health outcomes, with a mean of 3.20, and better adherence to treatment plans, with a mean of 3.15, which suggests that respondents see library services as useful in helping people follow medical advice and improve their health. The items on improved understanding of prescribed medications, higher confidence in managing health conditions, lifestyle change, and fewer medication errors were all rated as agree, showing that respondents also believe library services help people in practical ways even when the effect is a little lower than the strongest items. The standard deviation values are close to one another, which means the answers were fairly consistent and most respondents shared similar views. In simple terms, the table suggests that library interventions are not just for reading and information sharing but also support patient learning, better treatment behavior, safer medication use, and improved health outcomes.

This result is supported by a study by Amini and Ashrafi-rizi (2018) which found that public libraries act as important community health partners and help people access health information that supports better health decisions. It is also supported by a systematic review by Truccolo (2016) which showed that librarian provided services in healthcare settings contribute to patient care outcomes such as better decisions, fewer readmissions, and improved quality of care. A study by Beschnett and Bulger (2013) also reported that clinical librarians influence patient care, support treatment decisions, and contribute to outcomes linked with quality of life and reduced hospital use, which aligns with the present finding that library interventions improve adherence and health outcomes.pmc.ncbi.nlm.nih+2

Research Question 4: What challenges do librarians in hospital libraries face in developing patient education hubs to enhance health literacy delivery in Southern Nigerian Teaching Hospitals?

Table 4: Mean Responses on challenges librarians in hospital libraries face in developing patient education hubs to enhance health literacy delivery in Southern Nigerian Teaching Hospitals

S/N	Items	Mean	SD	Remarks
1	Limited funding restricts the development of dedicated patient education hubs in our library.	2.80	0.75	Agree
2	Lack of space in the hospital library hinders the creation of interactive education hubs.	3.20	0.70	Strongly Agree
3	Insufficient collaboration with medical staff poses a challenge to hub development.	2.90	0.80	Agree

4	Librarians lack adequate training in health literacy hub design and management.	3.10	0.78	Strongly Agree
5	Resistance from hospital administration delays initiatives for patient education hubs.	3.30	0.65	Strongly Agree
6	Technological limitations (e.g., outdated equipment) impede interactive hub features.	3.05	0.82	Strongly Agree
7	High patient volume overwhelms librarians' capacity to staff and maintain education hubs	3.40	0.72	Strongly Agree
	Grand Mean	**3.11**		**Strongly Agree**

The table means that respondents generally agreed that hospital libraries face many barriers in creating patient education hubs, and the overall response is clearly positive toward the presence of these challenges because the grand mean is above the acceptance point . Items 2, 4, 5, 6, and 7 were strongly agreed with, showing that lack of space, poor training, administrative resistance, technological weakness, and heavy patient workload are seen as serious problems. Items 1 and 3 were agreed with, which still shows that limited funding and weak collaboration with medical staff are real difficulties, even if they were not rated as strongly as the other items. The standard deviation values are all below 1.00, which suggests that the respondents had fairly close opinions about these challenges and did not differ widely in their views. In simple terms, the result shows that hospital librarians want to support patient education, but the environment, resources, staffing, and institutional support make the work difficult.

The findings are supported by earlier studies by Renzi et al (2022) showing that hospital administrators and health care providers recognize the value of consumer health information, but funding and resource decisions still create barriers to patient centered library services. A scoping review by Hessler (2015) also reported that librarians contribute to patient education, yet gaps in resources, training, and organizational support continue to limit what they can do. In addition, a study by Collins (2015) reported that weak patient participation and practical implementation barriers can reduce the success of education activities in hospital settings, which agrees with the present result that patient education hubs face operational and institutional challenges.

Conclusion

This study concludes that patient education hubs in in Southern Nigerian Teaching Hospitals are important but are still being held back by a mix of practical and institutional problems that make health literacy delivery difficult. Across the four objectives, the findings show that librarians support the idea of patient education hubs, yet they face major barriers such as limited funding, inadequate space, poor staffing, weak training, insufficient collaboration with health professionals, resistance from hospital management, and outdated technology. The study therefore shows that although hospital libraries have the potential to improve patient understanding of health information and support better health decisions, this potential cannot be fully achieved unless the hospitals provide stronger support systems, better resources, and clearer administrative commitment. In simple terms, the result means that patient education hubs can work well in hospital libraries, but only when the right conditions are created for them to function effectively.

Recommendations

Drawing from the findings of the study, the following recommendations address the identified issues:

1. Hospital management should provide adequate funding and basic infrastructure for hospital libraries to establish and sustain patient education hubs for effective health literacy delivery.
2. Hospital libraries should create more space and provide modern equipment that will support interactive patient education activities and improve access to health information.
3. Hospital administrators and medical staff should work closely with librarians through regular collaboration so that patient education hubs can meet the real information needs of patients.
4. Librarians should receive continuous training in health literacy, patient education, and hub management so they can design and run the hubs more effectively.

Abstract

Assessing student learning is complex and multifaceted, this research recognized the need to consider student makerspace interactions through the lens of learning and motivation to perceive the usefulness of makerspace in Nigerian academic libraries. This study investigating the relationships among motivational factors, learning dimensions, and perceived usefulness of makerspace in Nigerian academic libraries. A random sampling technique was employed to collect data from 323 respondents, representing an 88.7% response rate, and the data were analyzed using Structural Equation Modeling (SEM). Based on the Tinkering Learning Dimensions Framework, Self-Determination Theory, and Technology Acceptance Model, the results of the path analysis indicate that intrinsic motivational factors have no direct statistically significant influence on the perceived usefulness of makerspace in Nigerian academic libraries, but the relationship is mediated by an indirect influence through learning engagement, and initiative and intentionality. Interestingly, social scaffolding, learning engagement, initiative and intentionality, and developing understanding were found to have a direct significant influence on the perceived usefulness of makerspace. A satisfactory model fit was obtained.These results suggest that students are more likely to perceive makerspaces as useful when they actively engage in learning activities, demonstrate intentional participation, develop deeper understanding, and benefit from collaborative support structures. The structural model demonstrated satisfactory goodness-of-fit indices, confirming the robustness of the proposed framework The finding would assist the policymakers, instructors, and learners, all of whom are undoubtedly interested in the use of makerspace. Several implications and future studies were presented.

Keywords*: Academic libraries, Makerspace, Perceive usefulness, Learning dimensions, intrinsic motivation, Nigeria.*

Introduction

Academic libraries have increasingly evolved into learner-centered environments that facilitate active learning and collaborative knowledge creation. Within the context, the role of librarians extends beyond teaching search techniques to cultivating students' ability to think critically, evaluate information, and engage in independent lifelong learning (Bahr, 2026). Attractively, makerspaces are a natural progression for libraries where users can tinker with technological tools to be creative. This would assist libraries to reinvent and market themselves as cutting-edge in the lives of their users. Certainly, the makerspace is more than simply an after-school activity; it's an informal after-school community that supports tech-rich maker learning and collaboration (Higgins, et al., 2026), it is also considered the "third wave" (Barschak, 2026). Which is an individual's desire to use the space and encourage their community to be innovative and creative. The idea is to encourage flexibility in a learning environment to meet the needs of its users.

The term 'makers" first appeared in 2005 with the launch of Make magazine and its approaches to creativity and project promotion (Fred, and Mukhtar-Landgren (2026). Makers' fair was to promote community collaboration. This created more opportunities for students to apply their ability to share ideas and critical thinking skills toward problem-solving. In a makerspace environment where knowledge is created through collaboration, motivation is regarded as a key determinant factor of learning activities (Corsini & Moultrie, 2020), and the process is best when individual manifestations are blended to perceive it as useful. This study responds to these calls for more research to examine the relationship between intrinsic motivation and other outcomes associated with makerspace sustainability(Han, et al., 2017), to incorporate more statistical and empirical results from students to strengthen the evidence of learning in the makerspace (Otieno, 2017), and to develop a new pedagogical solution (Kajamaa & Kumpulainen, 2020). Also, the study would overcome the methodological limitations of prior works, many of which are descriptive and use small samples and unvalidated measures (Keshinro & Oyewole, 2021). To fill the above gap, this study incorporated the tinkering learning dimensions framework, and self-determination theory to perceive the usefulness of makerspace in Nigerian academic libraries.

Objectives of the Study

specifically, the study would address the following objectives;

1. To investigate the motivational factor that influences the perceived usefulness of makerspace in Nigerian academic libraries.

2. To investigate the influence of learning dimensions on the perceived usefulness of makerspace in Nigerian academic libraries.
3. To investigate the influence of learning engagement and initiative and intentionality on the relationship between intrinsic motivation and perceived usefulness of makerspace in Nigerian academic libraries.

Literature Review

As part of the global movement, the concept of makerspace presented technologies for modeling different tools for innovation and creativity (Qi & Buechley, 2010; Rode. et al., 2015). A common definition of makerspace used in the arena of Library and Information Science is "a place where staff and individuals gather to share knowledge, resources, collaborate, and create" (Britton, 2012). This is comprehensive, but likely no two (2) makerspaces are the same, some endeavors, painting, and crafting, while others stress technologies with computer programming, 3D printers, music studios, and laser cutters (Moorefield-Lang, 2015). While some locations are a mix of technology and arts (Bossaller & Haggerty, 2018). These will encourage students in learning and mentoring for creating a sustainable solution to problems that affect the community. A 3-D printer, soldering irons, a laser cutter, and sewing machines are among the tools available for use in makerspace activities (Lee, Kafai, Vasudevan, & Davis, 2014). Although a makerspace does not have to include all of these items, some start with just a sewing machine. Therefore, makerspace has great potential to advance education and to create numerous ways for students to learn.

Makerspace in academic libraries

According to Noh (2015), the future of academic library services must include not only a software-based approach but also environmental technological development such as makerspace. Makerspaces are a growing trend in education (Lock, da Rosa dos Santos, Hollohan, & Becker, 2018), and service space for many libraries (Schrock, 2014), appearing on university campuses and can be a mechanism for encouraging students (Crompton., Burke, & Gregory, 2017), which serve as pillar tools for economic growth through a wide range of training. Academic library makerspaces are seen as an extension of embedded librarianship, research commons, and learning commons initiatives (Moorefield-Lang, 2015; Radniecki, Klenke, & Purpur, 2016). This could allow students from multiple disciplines to foster meaningful interdisciplinary collaboration to become an entrepreneur by turning their ideas into products.

Makerspace as a learning environment

Despite the hype surrounding makerspace as a new way of learning, the learning process is intimately connected with those social interactions and the availability of technical tools for creative production (Halverson & Sheridan, 2014). This has generated the attention of scholars, policymakers, entrepreneurs, and practitioners (Vinodrai, Nader, & Zavarella, 2021), and equally boost their learning skills in critical thinking to problem-solving. Scholars expect learners to be more motivated and engaged in learning environments that added value and see their usefulness (Ryan & Deci, 2000). Therefore, makerspace, as a learning environment, focuses on the needs of learners and facilitates choice among various learning opportunities that are expected to motivate learners.

The concept of intrinsic motivation.

Makerspaces are spaces that intrinsically motivate users to pursue projects voluntarily (Han et al., 2017). This deems that intrinsic motivation establishes an emotional feeling, such as joy and frustration, happiness, and unhappiness, and plays a crucial role in explaining learner acceptance and usage of makerspace. Intrinsic motivation refers to engaging in a program for its own sake, out of interest, or for the satisfaction and pleasure resulting from the skill (Lin, 2007). Researchers have emphasized the importance of incorporating intrinsic motivation to explain technology adoption and usage (Lee, Cheung, & Chen, 2005). Therefore, an individual's learner naturally has an intrinsic motivation that can be displayed in curiosity-based performances, searching for optimal experiences, and discovering new perspectives to perceive it as useful. It has been argued that, when learners are motivated intrinsically, they are likely to perform better and become more effective and productive (Csikszentmihalyi, 1990). Therefore, intrinsic motivation can be considered as another technique to perceive the usefulness of learning, which in turn influences the use of a makerspace environment.

Perceived usefulness

Two constructs (perceived usefulness and perceived ease of use) are widely used in literature to study the mindset of users towards the use of technology (Gefen, Karahanna, & Straub, 2003; Venkatesh & Bala, 2008). Numerous studies have confirmed that perceived usefulness is a reliable indicator of users' behavioral intention to use different technologies in different settings (Basuki et al., 2022; Koul & Eydgahi, 2018). Perceived usefulness of technology according to Davis (1989) refers to "a degree to which a person believes that using a particular technology would enhance his or her job performance". This involves learner diligence to ensure the kind of tools and services provided within the makerspace match his/her learning style. When individual learner recognizes the usefulness of makerspace technology, they think positively about it and maybe likely utilize the space. Therefore, perceived usefulness communicates the outcome of usage, and it illustrates the basic behavioral incentive of makerspace as a learning environment.

Underpinning theories

Tinkering Learning Dimensions Framework (TLDF)

In the present era of education, making and tinkering with inquisitive problem solving are the possible context of learning that have deep-rooted pedagogical theories (Bevan, Gutwill, Petrich, & Wilkinson, 2015). Tinkering, as a

branch of making, plays an important role in constraining meaningful learners' ideas through the use of makerspace facilities. This is consistent with the theoretical philosophies underlying the development of the makerspace. The TLDF reveals techniques for observing and measuring learning by incorporating a list of observable attributes (engagement, initiative & intentionality, social scaffolding, and developing understanding) (Bevan et al., 2015). In makerspace settings, which promote collaboration using accessible tools for innovation and creativity, these are logical and realistic learning opportunities.

Self-determination theory (SDT)

Self-determination theory, suggests that learners will feel more ownership of activities and greater autonomy when they experience a sense of choice, thus resulting to enhance intrinsic motivation (Bao & Lam, 2008). The theory predicts that social contexts which support the fulfillment of these three psychological needs (competency, autonomy, and relatedness), can enhance intrinsic motivation, and support the integration and internalization of extrinsic motivation (Ryan & Deci, 2020). This implies that SDT is a theoretical approach that offers the potential to motivate learners to develop flexible understanding and lifelong learning skills in a makerspace environment.

Propose Conceptual Framework and Hypothesis Development

Based on the theoretical framework, this study proposed a research model to investigate the perceived usefulness of makerspace in Nigerian academic libraries; the role of motivation and learning (Figure 1).

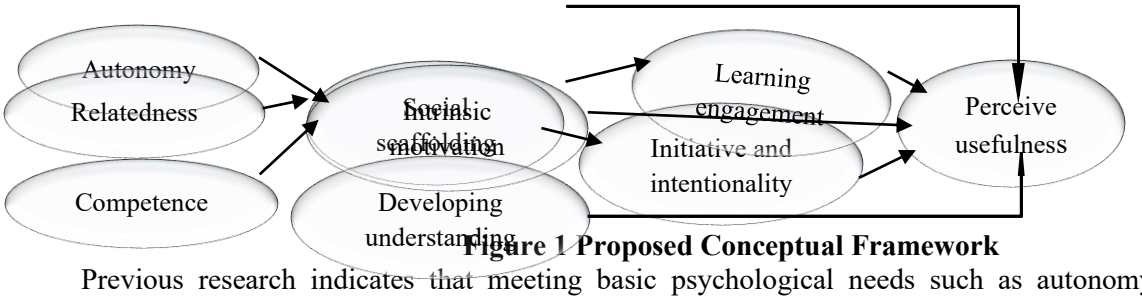

Figure 1 Proposed Conceptual Framework

Previous research indicates that meeting basic psychological needs such as autonomy, competence, and relatedness is directly related to intrinsic motivation (An & Han, 2020; Neys, Jansz, & Tan, 2014). Maheshwari (2021) discovered that intrinsic motivational factors have a significant influence on perceived usefulness based on field evidence. This proposed that

There is a significant relationship between intrinsic motivation and the perceived usefulness of makerspace

According to the researchers, "when individuals strongly engage in activities, they become involved, interested, occupied, and attentive to it" (Higgins, 2006). Previous research revealed a positive relationship between engagement and perceived usefulness (El-Sayad, Md Saad, & Thurasamy, 2021; Hong, Zhang, Ye, & Ye, 2021). Interestingly, An and Han (2020) demonstrated that user engagement mediates the relationship between intrinsic motivation and the creation of customer value/usefulness. This hypothesis stated that

There is a significant relationship between learning engagement and the perceived usefulness of makerspace

Learning engagement mediates the relationship between intrinsic motivation and the perceived usefulness of makerspace.

Social scaffolding is a significant learning dimension within tinkering activities (Gutwill, Hido, & Sindorf, 2015), and the space encourages members to gain inspiration, share ideas, and collaborate. Students require appropriate scaffolding that assists learners in constructing their understanding of the learning environment to increase the usefulness of learning outcomes (Oliver & Herrington, 2003), which increases the importance of learning and participation. This postulated that

There is a significant positive relationship between social scaffolding and the perceived usefulness of makerspace.

The level of initiative and intentionality (operationalized as personal innovativeness) displayed by learners is influenced by motivation, according to prior research, and initiative has a significant direct impact on real-world work operations (Frese, Garst, & Fay, 2007; Ohly & Fritz, 2007). "The willingness of an individual to try out any new information technology" is the precise definition of "personal innovativeness in the field of information technology" (Agarwal & Prasad, 1998). According to the self-determination theory, individuals' behavior is primarily driven by their intrinsic motivation to influence innovative work (Gagné & Deci, 2005; Malek, Sarin, & Haon, 2020; Yidong & Xinxin, 2013), and personal innovativeness significantly influences perceived usefulness (de Kervenoael, Schwob, Hasan, & Ting, 2021; Fagan, Kilmon, & Pandey, 2012).

There is a significant relationship between initiative and intentionality and perceived usefulness.

Initiative and intentionality mediate the relationship between intrinsic motivation and perceive usefulness

It's widely accepted that makerspaces provide a setting for students to advance their knowledge and skills. There's also the notion that exposing students to extracurricular design activities will improve them (Lanci et al., 2018). Students are less likely to consider a makerspace as an effective learning environment if they feel uncomfortable developing their understanding. According to Davis (2018), using acquired knowledge of tools and materials to create something gives makers a sense of accomplishment in terms of the usefulness of learning.

There is a significant relationship between developing understanding and perceived usefulness.

Methodology

This study adopted a **quantitative research methodology** to examine the factors influencing the perceived usefulness of makerspaces in Nigerian academic libraries. Specifically, a **survey research design** was employed. Using Krejcie and Morgan's (1970) sample size table, a sample of 364 respondents was selected from a population of 6,329 users. The sample was proportionately distributed between A.B.U. (n = 168) and NNSKA (n = 196) using a proportionate stratified sampling technique. However, 323 out of 364 copies of questionnaire were completed and analysed using SPSS and AMOS statistical software to investigate the perceived usefulness of makerspace in Nigerian academic

Results of the study

Factor Analysis

Factor analysis of intrinsic motivation and tinkering learning variables showed most items correlated above .3. Kaiser-Meyer-Olkin values ranged from .499 to .889, near or above the recommended .5 level. Bartlett's test of sphericity was significant ($p < .05$), confirming factorability of the correlation matrix. Most item commonalities exceeded .5, above the .3 benchmark, while anti-image matrix diagonals were all above .5, indicating shared common variance among items.

Table 4. Reliability of the constructs

Constructs	Cronbach Alpha α
Autonomy	.846
Competence	.906
Relatedness	.884
Engagement	.875
Initiative & intentionality	.824
Social Scaffolding	.838
Developing understanding	.821
Perceive usefulness of makerspace	.795

Table 3 showed satisfactory reliability for all constructs, with Cronbach's alpha values ranging from .795 to .906. Exploratory factor analysis confirmed construct validity, and all items with acceptable factor loadings were retained.

Normality

The normality assumption of the distribution of data indicated that the skewness and kurtosis of all variables fell within the range of -3.0 to +3.0 normality assumption (Tabachnick et al., 2007). This indicates that the data is normal and can be subjected to further analysis.

Preliminary Analysis

Structural equation modeling was used to test the hypotheses by validating measurement models and assessing the structural model through latent-variable path analysis after first, second-order, and integrated models were confirmed using CFA.

Measurement Model of the Research

The proposed measurement model assessed intrinsic motivation, tinkering learning dimensions, and perceived usefulness. Initial fit was unsatisfactory until modification indices were applied. Two items (INI2 and PUM1) had loadings below .5 and were removed. The final model achieved satisfactory fit indices: CMINDF=1.403, GFI=.899, TLI=.971, CFI=.975, RMSEA=.035, P=.000. Although GFI was slightly low, it was acceptable due to high variable correlations. Overall, the data showed a good fit with the model.

Convergent and Discriminant Validity

Convergent validity was established by confirming that theoretically related constructs exhibited strong statistical relationships through their measurement indicators. The composite reliability values for intrinsic motivation (0.838–0.912), learning dimensions (0.806–0.892), and perceived usefulness of makerspace (0.870) exceeded acceptable thresholds. Based on the criteria of Fornell and Larcker (1981), these results provide clear evidence of adequate convergent validity, indicating that the constructs reliably measure their intended theoretical concepts.

Discriminant validity was assessed using the Fornell and Larcker (1981) criterion by comparing AVE values with squared inter-construct correlations. The results confirmed that both convergent and discriminant validity exceeded the recommended threshold of .5. According to Hair, Gabriel, and Patel (2014), these acceptable psychometric properties indicate robust measurement quality. Overall, the findings provide sufficient empirical justification to proceed to the structural model analysis.

Table 5: Assessment of Discriminant Validity

	CR	AVE	MSV	ASV	DEU	AUT	COM	REL	ENG	INI	SCF	PUM

INI	0.892	0.735	0.537	0.299	0.488	0.376	0.402	0.511	0.598	**0.858**		
SCF	0.852	0.593	0.610	0.397	0.640	0.502	0.476	0.666	0.662	0.631	**0.781**	
PUM	0.870	0.691	0.610	0.453	0.710	0.508	0.444	0.691	0.768	0.733	0.770	**0.831**

Model Evaluation

The proposed structural model was analyzed using Structural Equation Modeling (SEM) in Amos 21 with Maximum Likelihood Estimation. Model fit was assessed using multiple indices, including CMINDF, CFI, GFI, TLI, IFI, and RMSEA. Acceptable thresholds were CMINDF < 5, RMSEA < .08, and incremental fit indices above .90, with values near .95 or higher indicating superior fit. Modification indices exceeding .40 were also applied to improve model adequacy and overall goodness-of-fit.

Figure 2: A path model of the research

Using the Maximum Likelihood method, the structural model demonstrated an acceptable fit to the data: CMINDF = 2.311, GFI = .843, CFI = .915, IFI = .916, TLI = .906, and RMSEA = .064 (p = .000). Although GFI was below the conventional .90 threshold, it was considered acceptable due to high inter-variable correlations. Overall, the fit indices, particularly CMINDF, CFI, IFI, TLI, and RMSEA, confirmed that the proposed model adequately represented the data.

Hair, Anderson, Babin, and Black (2010) recommend using standardized regression weight to compare the relative effect of exogenous on endogenous variables (Table 6). The intrinsic motivation to perceive usefulness of makerspace was found to be statistically not significant at p more than point .5 (β = -.058, CR = -.562, p = .574), The relationship between social scaffolding and perceived usefulness of makerspace was found to be statistically significant (β = 0.278, CR = 7.313, p = 0.000), as was the result of learning engagement to perceive usefulness of makerspace (β = 0.348, CR = 4.855, p = .000), and initiative and intentionality to perceive usefulness of makerspace was also statistically significant (β = 0.300, CR = 6.685, p = 0.000). similarly, the result of the relationship between developing understanding and perceived usefulness of makerspace was discovered to be statistically significant (β =0.342, CR =5.178, p = .000).

Table 6. Standardized Estimates of the Structural Model

Path A			Estimate	S.E.	C.R.	P	Sest.
PUM	<---	INM	-.058	.102	-.562	.574	-.059
PUM	<---	SCF	.278	.038	7.313	***	.361
PUM	<---	ENG	.348	.072	4.855	***	.439
PUM	<---	INI	.300	.045	6.685	***	.424
PUM	<---	DEU	.342	.066	5.178	***	.276

Table 7 presents the total, direct, and indirect effects of the structural model. The indirect result indicates that learning engagement and initiative and intentionality have mediated the relationship between intrinsic motivation and perceived usefulness of makerspace at p less than .05 (0.591**) at P = .0005. Therefore, the results of the overall path model show that initiative and intentionality, and learning engagement fully mediated the relationship between intrinsic motivation and perceived usefulness of makerspace in Nigerian universities.

Table 7: Standardized Total, Direct, and Indirect Effects of the Structural Model

Path B	Total effects	Direct effects	Indirect effects
INM	.532* P = .0005	-.059* P = .328	.591** P = .0005
ENG	.439* P = .0005	.439* P = .0005	
INI	.424* P = .0005	.424* P = .0005	

Discussion of the findings

RO1 To investigate the motivational factor that influences the perceived usefulness of makerspace in Nigerian academic libraries.

The outcome of this objective produced an unexpected result with no significant influence on intrinsic motivation to perceive the usefulness of makerspace in academic libraries in Nigeria, leading to the rejection of hypothesis *H1*. Within the framework of self-determination theory, motivation is associated with the satisfaction of students' psychological needs, and intrinsic motivation is the main essential element of student motivation, bestow on learning activities (Brophy, 2013; Cameron, 2001). The result contradicts previous research on intrinsic motivation to perceive usefulness (Maheshwari, 2021; Sun & Gao, 2020). A student who perceives themselves to be active with a sense of competence, relatedness, and autonomy during the learning activity will undergo a high-quality motivation, while those frustrated will undergo a low-quality motivation to perceive the usefulness of makerspace. To intrinsically motivate learners, the management needs to understand the present academic goal of their learners and relate to their future ambitions.

RO2. To investigate the learning dimensions that influence the perceived usefulness of makerspace in Nigerian academic libraries. The finding indicates that enhancing the perceived usefulness of makerspaces requires a broader focus on learning experiences, environmental support, and educational outcomes rather than relying solely on students' intrinsic motivation

H2. The influence of social scaffolding on perceived usefulness of makerspace.

Regarding the relationship between social scaffolding and perceive usefulness of makerspace *(H2)*. The findings authenticated Mulhem and Almaiah (2021) that incorporating the scaffolding learning strategy into an educational mobile game also improves students' learning effectiveness. Therefore, providing explicit social scaffolding during the learning phase would have a significant influence on learning outcomes to perceive the usefulness of makerspace. The management must recognize that social scaffolding in makerspaces is a continuous effort to balance learner claims to the space against openness to newcomers. These interactions and collaborations with colleagues can sharpen the opportunities to learn makerspace skills. Therefore, instructors are advised to use social scaffolding to boost learners' comprehension to perceive the usefulness of makerspace. Therefore, strengthening social scaffolding and collaborative learning can enhance learners' understanding, engagement, and perceptions of makerspace usefulness.

H3. The influence of learning engagement on perceived usefulness of makerspace.

The findings support hypothesis (*H3)*, that there is a statistically significant relationship between learning engagement and the perceived usefulness of makerspace in Nigerian academic libraries. The finding is consistent with other previous research (El-Sayad et al., 2021; Hong et al., 2021). To improve the usefulness of makerspace, the management must develop and engage learners with a program that reflects their needs while taking internal motivation into account. This will help learners to participate in learning makerspace cognitively, emotionally, and behaviorally. Management should also encourage learning engagement based on the available tools. Regardless of whether they had the pedagogical training and content to learn the makerspace activity, the space itself will be attractive to influence learning engagement to perceived usefulness. Therefore, enhancing learner engagement through relevant programs and interactive activities can significantly increase the perceived usefulness of makerspaces.

H4. The influence of initiative and intentionality on perceived usefulness of makerspace.

The study's finding supports the hypothesis *(H4),* that learning initiative and intentionality significantly influenced the perceived usefulness of makerspace, which describes the individuals' belief in their ability to successfully initiate a specific task within the make learning space. This result indicates that student quality of learning in initiative and intentionality has increased to perceive the usefulness of makerspace. This supports Novak (2019) contention that the ability to be innovative is a critical factor in the successful use of makerspace. Based on this, management can seek to justify their budget, as well as student initiative and intentionality, and continue to invest for long-term success in Nigerian makerspace activities. Promoting student initiative, intentionality, and innovation can enhance makerspace usefulness and justify sustained institutional investment.

H5. The influence of developing understanding on the perceived usefulness of makerspace.

The results supported Hypothesis *5,* indicating that developing understanding, as a dimension of TLDF, significantly influences students' perceived usefulness of makerspaces. Learners actively and intentionally construct understanding through engagement in makerspace activities. This finding aligns with prior research highlighting the role of exposure to diverse perspectives in enhancing skill development and learning outcomes (Ping-Kee Tao 2001).

It further suggests that makerspaces should extend beyond technological provision to include support for learners' cognitive development and problem-solving abilities. Supporting cognitive development and problem-solving through makerspace activities enhances learners' understanding and perceived usefulness of makerspaces.

RO3. To investigate the influence of learning engagement and initiative and intentionality on the relationship between intrinsic motivation and perceived usefulness of makerspace in Nigerian academic libraries.

H6. Learning engagement mediates the relationship between intrinsic motivation and the perceived usefulness of a makerspace.

The statistical results supported Hypothesis *6*, confirming learning engagement as a significant mediating variable between intrinsic motivation and perceived usefulness of makerspaces. This finding aligns with prior studies highlighting engagement as a pathway through which motivation enhances user value perceptions (An & Han 2020). Makerspace environments should therefore promote competence, autonomy, and social connectedness to strengthen intrinsic motivation. Conversely, low motivation may reduce engagement and perceived usefulness. Management should implement strategies that foster learners' motivation and active participation in Nigerian academic library makerspaces. Therefore, enhancing learner motivation and engagement can strengthen perceptions of makerspace usefulness and improve learning outcomes.

H7. Initiative and intentionality mediate the relationship between intrinsic motivation and perceive the usefulness of makerspace.

Hypothesis *(H7)* was supported. This supports the findings of Davis, Don Gibbs (2017) who discovered that motivating student learning initiatives will be influenced by how they form a relationship with makerspace-related activities. Promoting initiative and intentionality as well as sharing experience among collaborators may have satisfied learners' competence and relatedness needs. In the same perspective, providing learners with a rationale for their role during makerspace activity and reinforcing their capacity for choices could have satisfied their need to perceive the space as useful. Encouraging learner initiative, autonomy, and collaboration can enhance competence, engagement, and perceived usefulness of makerspaces.

Limitations for future research

This study was limited to two selected federal universities in Nigeria and grounded in three theoretical frameworks: SDT, TLDF, and TAM, which may constrain the generalizability of the findings. Future studies should examine similar variables across other geographical regions to broaden empirical understanding. Additionally, as the present research relied solely on quantitative methods, subsequent investigations may adopt mixed-methods approaches to provide deeper and more comprehensive insights into the relationships among the variables.

Conclusion

The study provides evidence that intrinsic motivation and learning dimensions jointly shape students' perceived usefulness of makerspaces. Enhanced institutional support for learning dimensions is likely to increase students' enthusiasm, engagement, and positive perceptions of makerspaces in Nigerian academic libraries. Understanding the core dimensions of TLDF can guide management in redesigning makerspace services to improve user perceptions. Despite contextual challenges, makerspaces in Nigeria remain valuable platforms for promoting innovation and creativity.

Recommendations

Academic libraries should align makerspace activities with students' academic and career goals while promoting social scaffolding, active engagement, initiative, creativity, and problem-solving skills. Makerspaces should foster autonomy, competence, and collaboration through learner-centered programs integrated into teaching, learning, and research. Sustained institutional investment, continuous staff development, and regular evaluation are also essential for enhancing the perceived usefulness, effectiveness, and long-term sustainability of makerspaces.

Abstract

This systematic review examines the place of law libraries in the acquisition, dissemination, and use of legal information in Nigeria. The review synthesises evidence from scholarly literature on academic, judicial, legislative, and specialised law libraries. Findings reveal that law libraries play significant roles in the acquisition of primary and secondary legal sources, dissemination of legal information through traditional and digital services, and facilitation of legal information use among judges, lawyers, lecturers, students, and researchers. The review further identifies challenges including inadequate funding, obsolete collections, weak ICT infrastructure, shortage of skilled personnel, and limited access to electronic legal databases. The study concludes that strengthening law libraries through sustainable funding, digitisation, professional development, and collaborative resource-sharing initiatives is essential for enhancing access to justice and supporting national development.

Keywords: Law libraries, Legal information, Information dissemination, Information utilisation, Legal research, Nigeria

Introduction

Information has increasingly become one of the most valuable resources in contemporary societies because it serves as the basis for knowledge creation, decision-making, innovation, governance, and socio-economic development. In the legal profession, information assumes even greater importance because legal decisions, judicial pronouncements, legislative enactments, legal scholarship, and professional practice depend substantially on access to accurate, current, reliable, and authoritative legal information. The administration of justice and maintenance of the rule of law therefore require institutions capable of acquiring, organising, preserving, disseminating, and facilitating the effective use of legal information resources. Law libraries constitute one of the most important institutions established to perform these functions within modern legal systems.

The law library is the building where information resources related to decrees, rules, edicts, and acts are housed. Obuezie and Echedom (2023) noted that a law library is a facility specially created for people in the law profession and those needing specialised legal information resources to search, access, and use the legal information resources that have been acquired, processed, and organised. They are established to serve the judicial arm of government. In the context of this study, a law library could be defined as an organised information centre for the acquisition, selection, collection, dissemination, conservation, and preservation of legal information for the benefit of the users.

Globally, law libraries have evolved from traditional repositories of legal texts into dynamic information centres that support legal education, research, advocacy, judicial administration, legislative processes, and policy development. They provide access to primary legal sources such as constitutions, statutes, treaties, regulations, and judicial decisions, as well as secondary legal materials including textbooks, journals, encyclopaedias, digests, commentaries, indexes, and electronic databases. In developed jurisdictions, contemporary law libraries have increasingly embraced digital technologies, artificial intelligence tools, institutional repositories, and electronic legal databases to improve access to legal information and enhance research efficiency. Consequently, law libraries are now recognised as critical infrastructures supporting democratic governance, access to justice, legal scholarship, and professional legal practice.

In Nigeria, law libraries occupy a strategic position because of the complex nature of the country's legal system, which incorporates statutory law, common law, customary law, Islamic law, and international legal instruments. This complexity necessitates the availability of comprehensive and well-organised legal information resources capable of supporting the information needs of judges, lawyers, lecturers, researchers, students, legislators, policymakers, and other stakeholders. Academic law libraries support legal education and scholarly research; judicial libraries facilitate adjudication and judicial decision-making; legislative libraries provide information for lawmaking and parliamentary deliberations; while specialised law libraries support research institutes, regulatory agencies, and professional

organisations. Therefore, law libraries occupy a strategic position as specialised information centres responsible for acquiring, organising, preserving, disseminating, and facilitating the use of legal information resources.

The acquisition of legal information constitutes one of the foundational roles of law libraries in Nigeria. This involves the systematic selection, procurement, and development of collections that reflect the evolving nature of the law. Given the dynamic character of legal systems where statutes are amended, judicial precedents are established, and new legal interpretations emerge law libraries must continuously update their holdings to remain relevant. These collections typically include primary sources such as constitutions, statutes, law reports, and judicial decisions, as well as secondary sources like textbooks, journals, encyclopaedias, and legal commentaries. The process of acquisition is guided by collection development policies that ensure comprehensiveness, relevance, and balance across various areas of legal practice and scholarship. In the Nigerian context, acquisition also extends to electronic databases and digital resources, reflecting the increasing integration of information and communication technologies in legal research.

Beyond acquisition, law libraries play a critical role in the organisation and dissemination of legal information. The organisation of legal materials through cataloguing, classification, indexing, and abstracting enhances accessibility and retrieval efficiency. Systems such as the Moys Classification Scheme and Online Public Access Catalogues (OPAC) are employed to facilitate systematic access to legal resources. Dissemination, on the other hand, involves making legal information available to diverse users including judges, lawyers, academics, students, and policymakers through a variety of services. These include reference services, circulation services, inter-library loans, and specialised information services such as Current Awareness Services (CAS) and Selective Dissemination of Information (SDI) (Uwaechina & Eze-Onwuzuruike, 2021). Through these mechanisms, law libraries ensure that users are kept informed about recent legal developments and are able to access relevant materials efficiently, thereby supporting informed legal decision-making.

Equally significant is the role of law libraries in facilitating the effective use of legal information. Access alone does not guarantee utilisation; users must possess the requisite skills to locate, evaluate, and apply legal information. Law libraries, therefore, provide user education and research support services aimed at enhancing legal information literacy. Law librarians, who often possess dual expertise in law and information science, guide users in navigating complex legal resources, formulating research strategies, and utilising both print and electronic databases effectively. This function is particularly important in Nigeria, where the increasing digitisation of legal resources presents both opportunities and challenges for users with varying levels of technological competence. By bridging the gap between information availability and information use, law libraries contribute significantly to the efficiency of legal research and practice.

Despite the importance of law libraries, Nigerian law libraries continue to face challenges that affect their ability to provide adequate legal information services. This review therefore examines the place of law libraries in the acquisition, dissemination, and use of legal information in Nigeria and identifies strategies for strengthening their effectiveness.

Statement of the problems

The administration of justice, legal education, legislative development, and professional legal practice depend largely on the availability and accessibility of reliable legal information. In Nigeria, law libraries are expected to serve as the primary institutions responsible for acquiring, organising, preserving, disseminating, and facilitating the use of legal information resources. However, despite their strategic importance, law libraries often receive inadequate attention from policymakers, institutional administrators, and other stakeholders. The rapid growth of legal information, increasing dependence on electronic resources, and evolving information needs of legal professionals have created new demands that many law libraries struggle to meet. Challenges such as inadequate funding, obsolete collections, poor technological infrastructure, insufficient professional personnel, and limited access to electronic legal databases continue to affect their effectiveness. Consequently, concerns have emerged regarding the capacity of law libraries to adequately support legal research, judicial decision-making, legal education, and access to justice in Nigeria. It is therefore necessary to critically examine the place of law libraries in the acquisition, dissemination, and use of legal information and to advocate for measures that will strengthen their contributions to the Nigerian legal information system and national development.

Objectives of the study

1. To examine the place of law libraries in the acquisition of legal information by law librarians
2. To analyse the place of law libraries in the dissemination of legal information to their users
3. To examine the place of law libraries in the use of legal information by the users
4. To determine the challenges that affect the acquisition, dissemination, and use of legal information in Nigerian law libraries
5. To recommend strategies that can be adopted to enhance the effectiveness of law libraries in supporting legal information access and use in Nigeria

Methodology

This study adopted a systematic review design. Relevant empirical and conceptual literature on law libraries, legal information resources, acquisition practices, dissemination services, and utilisation of legal information in Nigeria

was identified through searches of scholarly journals, conference proceedings, books, institutional publications, and electronic databases. Sources were selected based on relevance to the objectives of the study, credibility of publication outlets, and contribution to understanding the acquisition, dissemination, and use of legal information. Information extracted from the selected literature was synthesised thematically and analysed narratively to identify major trends, challenges, and strategies relating to law library services in Nigeria.

The Place of Law Libraries in the Acquisition of Legal Information by law librarians

The role of law libraries in the acquisition of legal information resources has been widely examined in library and information science literature, with particular emphasis on their responsibility to develop comprehensive, current, and relevant collections that support legal research, education, and practice. Acquisition, in this context, encompasses the processes of selection, procurement, and continuous development of legal materials in both print and electronic formats.

The place of law libraries in the acquisition of legal information begins with their responsibility to build and maintain collections that reflect the constantly changing nature of the law. The acquisition function is particularly important because the legal profession relies heavily on current information. Legal information is not static; statutes are amended, case law expands daily, regulations are issued, and new scholarly interpretations emerge across a wide range of fields. This means that a law library must be deliberate, systematic, and proactive in its collection development practices, in other words, law libraries must continuously update their collections to remain relevant.

In my view, the effectiveness of any law library is largely determined by the quality, currency, comprehensiveness, and relevance of its collections. A law library that lacks current statutes, recent judicial decisions, contemporary legal textbooks, and modern electronic databases cannot adequately support legal research or professional legal practice. Furthermore, acquisition should no longer be restricted to printed materials. Contemporary law libraries must prioritise electronic legal resources, digital repositories, online databases, institutional archives, and emerging legal technologies. The future of legal information management lies in hybrid collections that combine traditional and digital resources.

Ujah and Jacob (2022) study of the University of Jos Law Library showed that acquisition was guided by such criteria as authoritativeness, subject relevance, reputation of the author, accuracy, and user demand, while acquisition itself was carried out mainly through purchase, gifts, and donations. The study further revealed that law reference resources, law textbooks, legal journals, newspapers/magazines, special collection/government publications, electronic online resources are frequently acquired in University of Jos Law Library. But Special collection/government publications are rarely acquired, and Audiovisual Materials were never acquired in University of Jos Law Library, suggesting that law libraries recognise the dynamic nature of legal information and the need for constant updating of resources. This is important because it shows that effective acquisition is not merely about increasing the number of books on shelves; it is about selecting resources that are current, authoritative, and responsive to user needs. In my view, a law library that fails in this role weakens the entire legal research chain, because a lawyer or law student cannot reason soundly from outdated or irrelevant materials. The literature also shows that many Nigerian law libraries still struggle with obsolete collections, inadequate subscriptions to electronic databases, and poor acquisition budgets, which means that the capacity to acquire legal information remains uneven across institutions. That unevenness is a major problem because legal knowledge should not depend on geography or institutional privilege.

Notable scholars generally agree that the effectiveness of law libraries is closely tied to the quality and scope of their collections, which must reflect the dynamic and evolving nature of legal systems. Early contributions to the discourse highlight that law libraries traditionally prioritise the acquisition of primary legal sources, including statutes, law reports, and government publications, as well as secondary sources such as textbooks, legal encyclopaedias, and journals. Danner (2011) emphasises that collection development in law libraries must be systematic and policy-driven, ensuring that resources are not only authoritative but also aligned with the needs of users. This perspective is reinforced by the International Federation of Library Associations and Institutions, which underscores the importance of well-articulated collection development policies in guiding acquisition decisions and maintaining balanced collections across various fields of law.

The study of Uluocha and Mabawonku (2014) indicates that law text books were the most acquired resources in faculties of law across Nigerian universities, followed by legal periodicals, reference materials, law reports, government publications, non-legal materials, legislation and statutes, newspapers, loose-leaf services, indexes and abstracts, and digests. In contrast, e-resources and online legal databases were less readily available compared to these traditional legal information sources. This suggests that digital legal resources are not as accessible in the faculties when compared with other forms of legal materials considered in the study. From the analysis, it can be inferred that law textbooks, law reports, government publications, non-legal materials, legislation and statutes, newspapers, loose-leaf services, indexes and abstracts, and digests constitute the most commonly available legal information resources for lecturers in Faculties of Law in Nigerian universities. Igbinosa, Patrick, Adegboyega and Atsuku (2025) in their study *Organisation of Legal Information Resources for Enhanced Access in Academic Law Libraries in South-South, Nigeria* revealed that there was adequate availability of print legal information resources in the libraries, indicating that law libraries play a significant role in the acquisition of traditional legal materials necessary for legal education and research.

Dissemination of legal information to their users

The value of information is realised only when it reaches those who need it. Consequently, dissemination constitutes another critical function of law libraries. Law libraries disseminate legal information through various traditional and electronic services. These include reference services, circulation services, cataloguing and classification systems, indexing and abstracting services, current awareness services, selective dissemination of information, bibliographic services, online public access catalogues, digital repositories, and electronic databases.

Reference services enable users to obtain guidance in locating relevant legal information resources. Current awareness services keep users informed about recent judicial decisions, newly enacted legislation, and newly acquired resources. Selective dissemination of information ensures that users receive information tailored to their specific interests and professional responsibilities. Technological developments have significantly transformed legal information dissemination. Modern law libraries now employ websites, institutional repositories, digital libraries, email alerts, social media platforms, and remote access systems to provide information services beyond physical library spaces.

In my opinion, dissemination is the most visible function of law libraries because it represents the interface between information resources and users. The best collections remain ineffective if users cannot easily discover and access available resources. A library may possess valuable legal materials, but if those materials are not properly organised and brought to the attention of users, they remain practically useless. This is why cataloguing, classification, indexing, abstracting, bibliographies, current awareness services, selective dissemination of information, and reference support are so crucial. Igbinosa, Patrick, Adegboyega and Atsuku (2025)'s study in South-South Nigeria demonstrated this clearly when it showed that classification and subject registers were used by 100% of respondents, display of new arrivals by 89.7%, abstracting by 80.2%, bibliographies and indexing by 77.6%, and online cataloguing by 72.4%, demonstrating that law libraries actively organise and disseminate legal information through both manual and digital methods to enhance accessibility. These are not trivial functions; they are the means by which legal knowledge is translated from a dormant collection into an active service. This role is especially vital in Nigeria because many users are under pressure to locate precise authorities quickly, whether for litigation, academic writing, or policy analysis. A legal resource hidden in a poorly organised collection has little practical value. Law libraries therefore act as interpreters and distributors of legal knowledge, ensuring that the right information reaches the right user at the right time. Therefore, dissemination strategies should receive as much attention as collection development activities.

The Place of Law Libraries in the Use of Legal Information

The ultimate objective of acquiring and disseminating legal information is to facilitate its effective utilisation. Utilisation refers to the extent to which legal information resources are accessed and applied to satisfy information needs.

In Nigeria, law libraries support information use among diverse categories of users. Judges utilise legal information resources for case determination and judicial reasoning. Lawyers rely on legal information for litigation, legal drafting, advisory services, and professional development. Lecturers and researchers use legal information for teaching, research, publication, and scholarly communication. Law students depend on legal information resources for learning, assignments, examinations, and project work. Legislators utilise legal information for lawmaking and policy formulation.

Uluocha and Mabawonku (2014) found that in Nigerian universities, law books, legal periodicals, law reports, reference materials, e-journals, LexisNexis, and legislation and statutes were among the most utilised resources, with law books and legal periodicals standing out as the most frequently used. This indicates that law libraries are not simply storage centres; they are active spaces of knowledge application. Similarly, Obuezie and Echedom reported that postgraduate law students in Nigerian universities made significant use of legal resources for research, although use was shaped by the adequacy of available print and electronic holdings. The implication is that effective use depends on the quality of the collection, the accessibility of the library system, and the information literacy of the user. I therefore argue that law libraries in Nigeria have a dual responsibility: they must provide access, but they must also teach users how to exploit that access productively. Without user education, even a well-stocked law library may remain underutilised.

The extent of utilisation depends largely on resource availability, accessibility, user competence, technological infrastructure, and information literacy levels. Libraries that provide current collections, skilled personnel, and effective technological support generally experience higher levels of resource utilisation. One important observation is that the growing digitisation of legal information has transformed user behaviour. Many users increasingly prefer electronic resources because of their convenience, speed, and accessibility. Consequently, law libraries must continuously adapt their services to accommodate changing user preferences and technological developments.

Research indicates that libraries with current collections, trained personnel, functional ICT systems, and electronic resources record higher patronage and more effective use than those with obsolete holdings. Obuezie and Echedom (2023), in their study on selected Nigerian university law libraries, found that users made substantial use of available legal information resources for academic and research purposes, although utilisation was constrained in institutions with inadequate digital resources and outdated collections. This suggests that legal information resources are meaningfully used in many Nigerian law libraries, but effectiveness is strongly shaped by resource adequacy and technological readiness.

Nwofor and Nwafor (2025) reported that the print resources commonly available and frequently utilised in judicial libraries for effective legal service delivery in Anambra State include key materials such as the Constitution,

parliamentary debates and proceedings, official gazettes, court judgments and law reports, government publications, and their supplements. Additional resources identified comprise digests, legislation, practice manuals, textbooks, periodicals, journals, encyclopaedias, biographies, handbooks, directories, yearbooks, newspapers, magazines, and official gazettes. These findings suggest that legal practitioners depend heavily on print materials in judicial libraries to locate relevant laws and information, thereby enhancing the delivery of legal services in the state. The study further revealed that electronic resources in judicial libraries are seldom utilised for effective legal service delivery in Anambra State, largely due to limited accessibility. The underutilised electronic resources identified include statistical databases, internet-based materials, LawPavilion, and other legal websites. The limited availability and use of these digital resources were attributed to factors such as inadequate funding for their acquisition, poor internet connectivity, insufficient ICT competencies among legal practitioners, and a lack of adequate technical support systems.

Nwagwu and Ajibade (2021) affirmed that textbooks were the most popular type of information source used by lawyers. This is closely followed by personal experience; journals; colleagues and partners in the firm; firm case studies; and court records. On the frequency of use of various sources of information by the respondents, among the sources used regularly, textbooks, personal experience, and journals.

Challenges affecting the acquisition, dissemination, and use of legal information in Nigerian law libraries

The fourth objective of the study is to examine the challenges that hinder the effective stocking of law libraries with relevant legal resources. Inadequate funding remains the most persistent obstacle. Legal publications are expensive, electronic databases are subscription-heavy, and ICT systems require constant maintenance. Where budgets are poor or delayed, acquisition suffers; where collections are not updated, dissemination becomes less meaningful; and where digital infrastructure is weak, use becomes limited. Umar and Sokari (2022)'s study on postgraduate law students in northern Nigerian universities showed that inadequate infrastructure for electronic access, insufficient computers, interrupted power supply, and poor reading facilities constrained utilisation. In the same vein, Igbinosa et al. (2025) identified inadequate legal information resources, inadequate online cataloguing skills, inadequate funding, insufficient professional skills, and poor ICT facilities as serious challenges. These findings support the view that the problem in many Nigerian law libraries is not lack of relevance but lack of capacity. The library remains necessary, but it is often under-resourced relative to its mandate.

As observed by Olamide and Ijiyemi (2022), numerous law libraries in Nigerian universities and courts are unable to secure adequate financial support to update their collections on a regular basis, leading to the reliance on obsolete materials that do not adequately serve the needs of legal practitioners and researchers. This problem is further exacerbated by inadequate infrastructure and a shortage of skilled personnel required for the effective management of legal collections. Such deficiencies have been identified as key impediments to maintaining law library collections that are responsive to the demands of the legal community (Akintoye & Olatunji, 2020).

Many law libraries also experience shortages of qualified law librarians with specialised expertise in both legal studies and information management. The absence of continuous professional development programmes further compounds this problem. Owushi and Anyalebechi, (2025) mentioned inadequate staffing or expertise in library management and legal practice as the various problems that affect the stocking of law libraries with relevant legal resources. This aligns with other research highlighting similar challenges in law library management and resource allocation (Doe, 2021; Brown, 2020).

Another major challenge is inadequate information and communication technology infrastructure. Poor internet connectivity, inadequate computer facilities, unreliable electricity supply, and limited automation negatively affect access to electronic legal resources. According to Adebayo and Balogun (2021), although digital resources have become increasingly vital, inconsistent internet access in certain Nigerian law libraries further aggravates the situation. Moreover, the rapid advancement of legal information technologies, coupled with the need for ongoing training of library personnel to effectively manage these tools, introduces additional complexity in sustaining well-resourced law libraries. These challenges underscore the need for strategic interventions that tackle both financial constraints and technological deficiencies, thereby enabling law libraries to respond effectively to the dynamic demands of the legal community. This point also aligns with Umar and Sokari, (2020) who listed some challenges associated with the utilisation of legal resources were inadequate infrastructure for accessing resources electronically, insufficient computers and interrupted power supply, among others. The study concludes that, despite the technological advancement and globalisation the world is experiencing, postgraduate law students in federal universities of northern Nigeria are yet to fully enjoy the vast electronic legal information resources, and this could significantly affect the quality of legal researches and academic excellence in legal profession. The study recommends among other things the need for the provision of adequate electronic legal information resources and regular subscription to online legal databases in the faculty of law libraries in federal universities in northern Nigeria.

The study Igbinosa, Patrick, Adegbyega and Atsuku (2025) also identified key challenges affecting acquisition, dissemination, and use, including inadequate legal information resources, inadequate online cataloguing skills, inadequate funding, insufficient professional skills among librarians, and inadequate ICT facilities, all of which indicate systemic constraints limiting optimal law library performance. From the pattern of responses, the study revealed that although law libraries are central to the acquisition and dissemination of legal information in Nigeria, their effectiveness in facilitating use is hindered by infrastructural and human resource deficiencies. The implication is that while law

libraries provide structured systems for organising and accessing legal information, the full realisation of their role in supporting legal research and practice depends on addressing these operational challenges.

Strategies that can be adopted to enhance the effectiveness of law libraries in supporting legal information access and use in Nigeria

To improve the effectiveness of law libraries in Nigeria, several strategic interventions are necessary. First, governments, universities, judicial institutions, and professional bodies should provide sustainable funding for law library development. Adequate funding remains the foundation for collection development, technological innovation, and service improvement. Emphasising the significance of law library resources, Alkali et al. (2019) asserted that such resources are fundamental to both the study and practice of law among students and legal practitioners. This explains why they devote considerable time to using law libraries for research, given that research remains crucial to their academic and professional success, thereby underscoring the value of law libraries. The authors further argued that the advancement and effectiveness of any law library are largely determined by the availability of adequate facilities and equipment, as well as the extent to which legal information resources are utilised.

Another issue that deserves attention is the imbalance between print and electronic legal information resources. The digital age has transformed legal information management globally, and Nigerian law libraries cannot afford to remain trapped in print-only models. At the same time, digital access in Nigeria is shaped by infrastructural inequalities, unstable power supply, high internet costs, and limited database subscriptions. This means that a hybrid approach is necessary. Law libraries must continue to retain strong print collections, especially for core legal materials such as statutes, law reports, and foundational textbooks, while also expanding electronic access through databases, repositories, and online catalogues. In my view, this hybrid model is not a luxury; it is the most realistic route for a legal information system in a developing context like Nigeria. It allows libraries to preserve depth while expanding reach.

The professional competence of law librarians is also central to the debate. A law library is only as strong as the people managing it. Legal information work requires specialised knowledge of classification, collection development, reference assistance, legal research methods, and digital resource management. The literature repeatedly suggests that where law librarians are properly trained, users are more likely to receive accurate guidance and timely support. Salihu (2023) has argued that librarians in law and court libraries must not only acquire relevant materials but also establish effective systems that permit easy access and use. I agree with this position because the technical demands of legal information cannot be met by general library competence alone. Nigerian law libraries therefore need staff who are trained not only in librarianship but also in the peculiarities of legal information structures and legal research behaviour.

Conclusion

The place of law libraries in the acquisition, dissemination, and use of legal information in Nigeria is both strategic and transformative. They are the institutions through which legal knowledge is gathered, arranged, circulated, and applied. Their acquisition role ensures that legal materials enter the system in authoritative and relevant forms. Their dissemination role makes those materials discoverable and accessible. Their use-support role helps users convert information into research, argument, judgment, and policy. Yet this ideal is constrained by funding deficits, weak ICT infrastructure, poor staffing, and inadequate collection development policies. Nigeria cannot strengthen legal scholarship or the administration of justice without first strengthening its law libraries. The future of legal information access in the country depends on deliberate investment in law library development, digital transformation, professional training, and sustained policy attention. When law libraries are empowered, the entire legal system benefits; when they are neglected, the cost is paid in weak research, limited access, and poorer legal outcomes.

Abstract

Globally, predatory publishing threatens the integrity and reputation of research, and African universities stand out as soft targets. This paper draws on a narrative literature review of relevant academic and professional literature published between 2012 and 2025 with the aim of consolidating existing knowledge regarding the nature of the threat of predatory publishing in Nigeria, as well as the actual and potential contributions of academic librarians towards its mitigation. The paper, therefore, relies on the consolidated practice of library science, research integrity, and information literacy, with the aim of demonstrating that academic librarians in Nigeria have a unique responsibility of leading the fight against predatory publishing in Nigerian universities. The major findings of this study include but not limited to the efficacy of information literacy programs like the Think. Check. Submit. framework, the failure of authors to use whitelist tools like the Directory of Open Access Journals (DOAJ) and Web of Science Master Journal List, as well as the failure of librarians to get involved in the promotion and tenure process. The paper concludes with a strategic framework as well as specific recommendations for the different actors involved, including university administrators, librarians, and policymakers to jointly develop support systems for research integrity, reducing the need for predatory journals while enhancing the global visibility of Nigerian scholarship.

Keywords: *Predatory publishing, Academic, Librarians, Information literacy, Nigeria*

1. Introduction

Predatory publishing is the exploitation of the open-access publishing model by some institutions that are more concerned about making money than publishing quality articles. Ideally, Open Access (OA) operates on the author pays model, which, in theory, is intended to spread knowledge freely, free from the paywalls created by the traditional subscription-based models. These publishing houses collect Article Processing Charges (APCs) and yet are not subject to any kind of peer review, nor do they have any real editorial boards, and they inflate their impact factors. The result is a body of literature that looks like actual research but lacks the epistemological underpinnings that scientific publishing requires (Beall, 2012; Cukier et al., 2020).

The "publish or perish" culture, which is a major pressure point in academic institutions across the globe, takes a particularly alarming dimension in Nigerian universities, where the lecturer's chances of promotion are in direct proportion to the number of publications they have published in reputable journals. The academic culture, therefore, becomes a situation where the researcher, particularly the ones with meager funding and time, becomes easy prey to the overtures of predatory publishers, which promise speedy review and publication guarantees in exchange for a relatively small fee for publication in their journals. Despite the increase in literature on the risks and warnings from the National Universities Commission (NUC) on the prevalence of this problem, it has persisted over the years (Ajuwon, 2018; Owolabi et al., 2020; Olubiyi, 2026).

It is against this background that this paper examines the role of academic librarians in Nigeria as the first line of defense in the academic community to address the problem of predatory publications. Academic librarians are at the nexus of information literacy, scholarly communication, and quality assurance in research. Their knowledge of metadata verification and database literacy allows them not only to raise the consciousness of researchers on the problem of predatory publications but also to institutionalize quality assurance within the administration of the university. However, this is still a potential that is yet to be fully utilized in the Nigerian academic setting.

Furthermore, the paper is structured as follows:

- Section 1 provides the research objectives.
- Section 2 outlines the methodology and scope of the review.
- Section 3 discusses the literature review on the definition, scope, and drivers of predatory publications in Nigeria.
- Section 4 discusses the role of academic librarians in information literacy.
- Section 5 discusses the role of academic librarians as quality assurance collaborators.
- Section 6 discusses the challenges facing academic librarians in Nigeria.
- Section 7 discusses a strategic framework for institutional response.
- Section 8 provides conclusions and recommendations.

1. Research Objectives

This study intends to achieve the following objectives:

1. Discusses the literature review on the definition, scope, and drivers of predatory publications in Nigeria.
2. Discusses the role of academic librarians in information literacy
3. Discusses the role of academic librarians as quality assurance collaborators
4. Discusses the challenges facing academic librarians in Nigeria
5. Discusses a strategic framework for institutional response

2. Methodology

This paper adopts a narrative literature review methodological approach, which is appropriate for the synthesis of disparate, heterogeneous bodies of knowledge on a given subject where there is a coexistence of empirical, conceptual, policy, and practice-oriented literature (Ferrari, 2015). This methodological choice is different from the systematic literature review method, which relies on a pre-designed protocol and exhaustive searching for the purpose of informing a meta-analysis. Narrative reviews, however, are more appropriate for the development of conceptual frameworks, the identification of emerging themes, and the identification of the way forward in a particular field or discipline, especially where there is a need to draw on existing literature (Baethge, Goldbeck-Wood, & Mertens, 2019). The applied and emerging nature of the intersection between predatory publishing and library practice in Nigeria made the narrative literature review the most appropriate methodological choice for this research.

The literature search included the use of Google Scholar, Scopus, EBSCO and the Directory of Open Access Journal (DOAJ) with the following search terms: 'predatory publishing Nigeria,' 'academic librarians research integrity Africa,' 'information literacy scholarly publishing,' 'open access predatory journals Sub-Saharan Africa,' etc. Other sources were also identified using citation chaining and referencing of key anchor texts. The criteria for the literature included sources that discuss predatory publishing issues, information literacy in an academic setting, and the role of libraries in quality assurance in research. Although this review focuses on the Nigerian and African setting, it is not limited to these regions. The review period is between 2012 and 2025.

The literature review was done through thematic analysis. The themes were grouped under three major clusters. The first cluster deals with the structural factors that give rise to predatory publishers in Nigeria. The second cluster deals with information literacy and educational roles of academic librarians. The third cluster deals with the quality assurance roles of academic librarians. The paper does not rely on primary data in any form but synthesizes existing literature to derive a logical argument and actionable framework. Where gaps in literature exist, this has also been acknowledged.

3. Predatory Publishing: Definitions, Scope, and Drivers in Nigeria

The concept of "predatory publishing" was first used in the mainstream academic literature by a librarian from the University of Colorado, Jeffrey Beall, who identified a list of "potential, possible, or probable" predatory open-access publishers, which were those that mimicked the appearance of legitimate publication houses but avoided quality checks (Beall, 2012). While the list was later removed in the face of controversy and legal action, it marked the beginning of the international debate on the nature of predatory publishing.

A more consensual definition was proposed in 2019 at a Predatory Publishing Summit in Ottawa, Canada, with 43 representatives from ten countries. This meeting defined predatory journals and publishers as 'entities that prioritize self-interest at the expense of scholarship and are characterized by false or misleading information, deviation from best editorial and publication practices, a lack of transparency, and/or the use of aggressive and indiscriminate solicitation practices' (Grudniewicz et al., 2019). One interesting thing here is that the word 'predatory' was retained after considerable debate over possible alternative words like 'deceptive' and 'illegitimate,' which speaks to the calculated and exploitative nature of these publishing practices (Cukier et al., 2020).

The phenomenon of predatory journals in Nigeria cannot be seen primarily a product of ignorance, even though this plays a role. Instead, it can be explained as a structural problem such as institutional incentives, resource constraints, and professional pressures interplaying.

For instance, in a study by Tella (2020), it was found how the pressure to progress rapidly in a career lead to a culture in which the speed and quantity of publication become the focus over quality. In a similar study by Endong (2018), it was found that there is a pattern in which lecturers publish mainly for career progression and not for the dissemination of knowledge. In this case, citation manipulation, ghostwriting, and other forms of scholarly misconduct, including publishing in predatory journals, are evident.

The motivations behind publishing in predatory journals among authors in Nigeria is not one-sided. According to the study by Kurt (2018), there are four major motivations behind authors' involvement in predatory journals. These include social identity threats, misinformation/deception, 'publish or perish' pressures, and research and publishing competency. These factors may not be mutually exclusive and may interplay in several ways, creating a vulnerability that predatory publishers are adept at exploiting.

The economic situation also plays a role in these factors, as the APCs of high-impact legitimate open-access journals range from US$1,500 to over US$5,000, which is a huge burden for Nigerian academics given the lack of consistent research funding in the country (Mills & Branford, 2022). In other words, predatory open-access journals provide a service that legitimate open-access journals have failed to provide to academics in resource-constrained countries like Nigeria. As Ajuwon (2018) found, Nigerian academics are faced with the choice between a slow and expensive legitimate open-access publication option and a quick and inexpensive predatory open-access publication option. The academic environment in Nigeria is structured in a way that makes the latter a highly attractive option.

The situation is complicated even further by 'cloned' journals, where fraudulent websites mimic the branding, ISSN, and editorial boards of legitimate indexed journals as well as lie about the databases where they were indexed just to deceive authors to pay APCs to publish articles that will not appear in the database where authors expect them to appear (Aboyade et al., 2024). This situation raises the bar even higher, as it affects even authors who are being cautious and trying to do their due diligence in choosing legitimate open-access journals to publish their articles. It also signals that the challenge is no longer limited to naïve or uninformed authors, it extends to deliberate deception that can mislead trained professionals.

4. The Role of Academic Librarians in Information Literacy

Information literacy has long been central to the academic librarian's professional identity. In the context of predatory publishing, however, the concept must evolve beyond searching and evaluating sources to deeper critical engagement with the entire scholarly communication process. Ranganathan's fifth law, that the library is a growing organism, applies directly here: the library's function must adapt to the changing knowledge-creation environment.

The most immediate and operationally accessible contribution librarians can make is the provision of workshops for academics and postgraduate students on how to recognize and avoid predatory journals. These workshops should be more than simply providing information to academics; they should engage them with useful tools to help them make informed decisions about journal selection. One of such tools is the '**Think. Check. Submit**.' campaign (Think. Check. Submit., 2022). This is a checklist designed to help authors through the process of journal selection by providing a set of criteria for journal evaluation, checking the editorial board and peer-review processes, checking the journal's indexing status with reputable databases, and checking the transparency of the journal's APC policy, among others. Librarians are uniquely placed to facilitate these workshops because they combine subject expertise with institutional authority over research support services.

Beyond Think. Check. Submit., Nigerian academic librarians should actively promote familiarity with established whitelist resources. These include the Directory of Open Access Journals (DOAJ), which indexes only journals meeting defined editorial quality standards; the Web of Science Master Journal List; the Scopus Source List; EBSCO; and the African Journals Online (AJOL) platform, which provides a regionally relevant index of peer-reviewed African scholarship.

Conversely, awareness of blacklist resources, while less definitive in the post-Beall era remains useful when applied cautiously and in conjunction with positive verification (Owolabi et al., 2020). Training researchers to move between these complementary tools, rather than relying on any single indicator, is one of the more consequential contributions a librarian can make to research quality and, in turn, to the body of knowledge.

Another instructional innovation is the 'Evidence-Based Journal Selection' workshops, which is another deeper form of information literacy that involves researchers engaging in journal evaluation using live citation databases and other bibliometric analysis tools. This is more active and engaging than non-hands-on workshops where researchers are simply

presented with information. Babalola and Bakum's (2022) study shows how information literacy competence is critical to the research productivity and publication quality of academic librarians themselves. This study, therefore, supports the premise of the argument.

Most critically, though, is the need for the information literacy programs to be contextualized to meet the needs of Nigerian academics. A workshop designed for a researcher in a well-funded institution in Europe or America is unlikely to have the same impact and engagement for a Nigerian academic with no research budget and a looming deadline to meet for a promotion. Training that meets researchers where they are (with all their real-world constraints) and builds their skills is more effective at changing behavior than generic training that assumes an ideal environment, which does not exist.

5. Librarians as Quality Assurance Collaborators

The information literacy role, while an important one, only addresses one side of the problem. The ongoing problem of predatory publishing in Nigerian universities is also a problem of governance that can be addressed by university policy and in which librarians can play an active role. The transition from Librarian-as-Educator to Librarian-as-Quality-Assurance-Partner is not merely a desirable one; it is also a logical extension of the expertise that academic librarians already bring to the table in metadata management, database literacy, indexing schemes, and scholarly communication infrastructure.

One concrete contribution that librarians can make in university governance is to provide advice to university promotion and tenure committees on journal quality indicators. Currently, many Nigerian universities evaluate publications primarily by quantity, the number of articles a candidate has published, rather than by the quality or indexing status of the publishing outlet. Librarians can help operationalize quality by defining, in collaboration with faculty and administration, what constitutes a 'reputable journal' for promotion purposes: for example, inclusion in at least one of the major indexed databases, transparent editorial processes, and the absence of known predatory indicators (Aboyade et al., 2024). Embedding such criteria in institutional policy gives librarians a formal advisory role in promotion review rather than a peripheral one.

A similar mechanism exists for APC financial management. Specifically, when a university offers to support publication costs in open access journals, librarians are required to verify the legitimacy of the journals concerned before any funds are disbursed. This safeguard prevents urgency and administrative inertia from overriding due diligence. The mechanism serves two purposes: it limits the university's vulnerability to predatory journals, and it elevates librarians into active roles in research governance rather than confining them to service functions.

Another mechanism that is available in quality assurance is in the management of institutional repositories (IRs). A well-managed IR is useful in that it serves a double purpose: on one hand, it acts to showcase and disseminate legitimate research output from a university, while simultaneously providing a parallel publishing outlet for researchers to make their research public. This is very useful in limiting the perceived need to rush research output to publication in a journal, while simultaneously raising international awareness of research output from a university. Akor (2023) has highlighted the broader role of libraries in constructing and sustaining institutional academic identity, a function that is directly undermined when institutional research is associated with predatory channels.

6. Challenges Facing Nigerian Academic Librarians

Despite the enormous potential aforementioned, the Nigerian academic librarians are confronted with a series of challenges that must be recognized to ground the proposed interventions in practical reality.

i. One of these challenges is the lack of access to adequate resources. Access to high-speed internet, which is essential for the real-time verification of journal credentials, is not always readily available in Nigerian university libraries. The use of tools like Web of Science and Scopus, which offer the most comprehensive and authoritative information on journal quality, is precluded by the high subscription costs, which are far out of reach of most Nigerian institutions. Although open-source alternatives like Scimago, DOAJ, and Ulrichsweb exist, which offer partial functionality, even in the verification of journal credentials, their capabilities do not come close to those of the premium platforms (Owolabi et al., 2020). This puts Nigerian academic librarians at a serious disadvantage as predatory publishers can propagate sophisticated information on their publications more quickly than can be verified or refuted by librarians.
ii. The second problem is the hierarchical nature of the Nigerian university system, where librarians are perceived more as administrative officers than academic or governing faculty. This often leads to the resistance to the involvement of librarians in the publication processes. The reason behind such is the misperception about the professional scope of modern librarianship (Michael & Olalekan, 2023). Overcoming this perception requires both institutional advocacy, including explicit mandates from university leadership, and the gradual accumulation of trust through demonstrated competence and relevance.

iii. Thirdly, there are indications that the technical complexity and deceptiveness of these practices are rising. For instance, cloned journals, fake DOIs, fabricated impact factor scores, false listing of indexing databases, and impersonating genuine editorial board members are now complex enough to deceive even seasoned researchers and, in some instances, even information professionals (Aboyade et al., 2024). The need to keep librarians up to speed with these changing deceptions calls for significant investments in professional development efforts, which are largely lacking in Nigerian libraries.
iv. Finally, there is the structural absence of formal librarian involvement in research governance. In most Nigerian universities, librarians are not members of promotion committees, research ethics boards, or grant oversight panels, the very structures through which publication quality standards are enforced or ignored. Without institutional access to these forums, even the most capable and motivated librarian is limited to an advisory function that can be disregarded without consequence.

7. Discussion: A Strategic Framework for Institutional Action

To combat predatory publishing in Nigerian universities, there must be a coordinated effort at three levels: the individual researcher, the university governance structure, , and the broader professional and regulatory environment. Academic librarians, by virtue of their position at the interface of all three, are uniquely positioned to act as a 'connective tissue' between them, but only if their role is formally recognized and resourced as such.

7.1 Research Integrity Hubs (RIHs)

A central proposal of this paper is the establishment of Research Integrity Hubs (RIHs) within Nigerian university libraries. The idea of the RIH is based on models piloted in universities in the UK and Australia, where library-led research support services have evolved to include expert advisory services on data management, open access compliance, publication ethics, and research visibility (Cox & Pinfield, 2014; Haddow, 2015). In the Nigerian situation, the proposed RIH would act as a single source where researchers can access authentic advice on journal selection, APC funding, preprints, and institutional repositories, among others.

However, it is also important to note that the proposed RIH must not only be a policing mechanism but also a support service where librarians act as allies, not gatekeepers, of the publication process. This has a tremendous bearing on adoption, as researchers who perceive the RIH as a bureaucratic obstacle will inevitably find ways to circumvent it, whereas those who perceive it as a service that eases their burden and increases their success will more likely engage with it willingly, repeatedly.

7.2 Embedded Librarianship and Faculty Mentorship

The concept of 'embedded librarianship,' wherein subject librarians are 'embedded' with particular academic departments, has the potential to provide a framework for ensuring that librarians become easily accessible to the research community at the time of need rather than at the time of crisis. Michael and Olalekan (2023) demonstrated the potential benefits of embedded librarianship in enhancing the quality of the library-academic relationship in private universities in Nigeria, with positive effects on research support uptake. Grenier and Premji (2025) further demonstrated that structured librarian-faculty mentorship programs are effective in bridging the cultural gap between library and academic staff, with embedded librarians gaining deeper understanding of disciplinary publishing norms that allows them to provide more targeted advice.

The embedded model is particularly well suited to addressing predatory publishing because it positions the librarian within departmental culture before a crisis occurs, rather than responding after a researcher has already committed to a questionable journal. Early-stage guidance, during the writing phase, not the submission phase, is substantially more effective at preventing predatory publishing than post-hoc remediation.

7.3 Institutional Policy Reform

The most lasting changes will be those embedded in institutional policy rather than dependent on individual initiative. University administrations should be encouraged to adopt explicit journal quality criteria for promotion and tenure; criteria developed in collaboration with librarians and aligned with international indexing standards. The procedures for the disbursement of APCs should include a sign-off procedure by the librarian. There should be a mandatory training module on predatory publishing as part of the research ethics training for new faculty, facilitated or co-facilitated by librarians.

System-level interventions could be made possible through the engagement of regulatory bodies such as the National Universities Commission (NUC), Board for Technical Education (NBTE) and National Commission for Colleges of Education (NCCE), which oversee the development and quality assurance of higher education institutions including the curriculum, to consider extending the scope of its regulation to minimum requirements for publication ethics in relation to promotion criteria. This is a long-term goal, but one that librarians, collectively through their professional associations, particularly the Nigerian Library Association (NLA), are in a position to move this forward.

8. Conclusion and Recommendations

The problem of publishing with predatory journals is not a deviance in Nigerian academic culture but rather a logical result of the interrelation of a promotion culture, a lack of resources, and a disreputable publishing industry that recognized the situation as a business opportunity. In order to deal with these issues, it is not enough to raise awareness among academics, but rather to reform the system, integrate governance, and utilize professional expertise that already exists in university libraries but that is currently being systematically underutilized.

The academic librarians in Nigeria are, by training and institutional location, well placed to make a distinctive contribution to the solution of the problem of predatory publishing. They have expertise in information evaluation, database literacy, and scholarly communication infrastructure, which is precisely what is needed to create the kind of verification processes which individual researchers often lack. They are institutionally placed to influence governance structures, promotion criteria, APC management, repository policy, which in turn influence the conditions in which predatory publishing thrives.

This paper does not argue that librarians alone can solve the problem of predatory journals in Nigeria. Rather, it contends that librarians are an underutilized asset in what must be a multi-stakeholder response, and that investing in them would yield disproportionate returns. Accordingly, the following recommendations are proposed for university administrators, library managers, and national policy bodies:

i. **Mandatory Information Literacy Training:** University authorities are encouraged to require all new faculty staff, postgraduate students, and early-career researchers to attend a workshop on predatory publishing and information literacy. This workshop should be jointly organized and facilitated by the University Library. This is to ensure that they are aware of what to expect in APC management to access university funds.

ii. **Institutional Journal Verification**: University Libraries should be formally mandated to verify the indexing status and legitimacy of all journals cited in promotion dossiers, to be included in the evaluation report by the University. Such a mandate should be resourced with dedicated personnel time and access to relevant tools.

iii. **Investment in Verification Infrastructure**: Nigerian universities, polytechnics, and Colleges of Education should prioritize subscriptions to Scopus and Web of Science as core research infrastructure. Where individual subscriptions are not feasible, consortium purchasing should be pursued through either the NUC or NgREN (Nigeria Research and Education Network). NgREN, established in 2012 by the NUC with World Bank support, already provides shared digital services to member institutions across all tertiary education sectors and represents an existing platform ready for expanded database offerings.

iv. **Reform of Promotion Criteria**: Promotion and tenure committees should reform their criteria for promotion to prioritize the quality and indexing status of publications over the quantity of publications, which should help to remove the structural incentive for faculty to publish in predatory journals.

v. **Establishment of Research Integrity Hubs (RIH):** There should be a dedicated Research Integrity Hub in each and every accredited library of a Nigerian university, which is staffed by appropriately trained personnel, provided with the appropriate tools, and integrated into the research governance system of that university.

vi. **Engagement with National Policy Bodies:** The Nigerian Library Association (NLA) should engage with the National Universities Commission (NUC), the National Board for Technical Education (NBTE), and the National Commission for Colleges of Education (NCCE) to encourage each body to embed publication integrity standards within their national accreditation criteria. Such a move would position research integrity as a governance issue, making it a binding requirement for accreditation, rather than a matter of institutional discretion.

Abstract

This paper examines the critical yet often overlooked role of libraries specifically private collections as foundational drivers of national progress. While public libraries are celebrated as people's universities, this research highlights how private libraries serve as specialized repositories of human thought, safeguarding rare heritage and fostering intellectual empowerment. By analysing historical precedents from the Islamic Golden Age to the Medici patronage, the study demonstrates that private collections have consistently provided the foundational fuel for cultural preservation, scholarly innovation, and the eventual establishment of major national public institutions, such as the British Library and the Library of Congress. The findings suggest that private libraries contribute to sustainable development by preserving indigenous knowledge systems and reducing information asymmetry, thereby enhancing the national workforce's intellectual capital. Case studies of the Carnegie philanthropy, the Bodleian Library, and Nigeria's Kenneth Dike Library illustrate the transformative potential of transitioning private assets into public resources. However, significant challenges persist, including limited accessibility, high preservation costs for rare materials, and a lack of integration with national educational policies. Fragmentation and technological gaps further isolate these valuable resources from the wider research community. To maximize their developmental impact, the paper recommends that governments offer tax incentives to private owners who open their collections and implement collaborative cataloguing via national union catalogs. By bridging the gap between private ownership and public access, nations can leverage these knowledge sanctuaries to foster national pride, social equity, and inclusive sustainable growth.

Key Words: Private Libraries, National Development, Cultural heritage Preservation, Knowledge Democratization, Sustainable Development.

Introduction

Libraries are indispensable institutions in every society because they serve as centres of knowledge, education, and cultural preservation. They provide equitable access to information, bridging the gap between privileged and marginalized groups, and thereby promote social inclusion and lifelong learning. Beyond their educational role, libraries safeguard cultural heritage by preserving historical records, manuscripts, and indigenous knowledge, ensuring that future generations remain connected to their roots. In the digital age, libraries have also evolved into hubs for digital literacy, offering internet access and training that empower citizens to navigate information critically. As Wojciechowska (2021) emphasizes, libraries integrate, animate and engage local communities, making them vital for civic participation and social cohesion. Similarly, Springer (2021) highlights that public libraries contribute significantly to educational development by supporting both formal and informal learning. Thus, libraries are not merely repositories of books but dynamic institutions that foster national development through education, culture, and community empowerment.

Libraries have long been recognized as the custodians of human knowledge, serving as repositories of information, culture, and intellectual heritage (Patil, 2021). Patil emphasizes that libraries safeguard cultural heritage materials and ensure their accessibility for future generations, thereby reinforcing their role as knowledge preservers. Similarly, Gundakanal and Kaddipujar (2020) argue that libraries function as knowledge repositories that not only preserve cultural heritage but also contribute to sustainable national development by making information widely available. Together, these perspectives underscore the enduring importance of libraries as foundational pillars in the preservation and dissemination of knowledge across generations. While national and public libraries are frequently celebrated as the "people's universities," there is a silent, potent force that has historically shaped the intellectual landscape of nations: the private library.

A private library is more than a curated collection of books owned by an individual or a non-governmental organization; it is a specialized repository of human thought, a preservation site for rare heritage, and a localized hub for intellectual

empowerment. Kamba & Abba (2024) have emphasized that private libraries safeguard indigenous manuscripts and cultural heritage materials, ensuring continuity of knowledge systems. Before the widespread establishment of public libraries, private libraries dominated the intellectual landscape. As Pettegree and der Weduwen (2021) and Roach (2023) observed, these collections were typically the domain of wealthy individuals, scholars, or royal families who curated manuscripts and rare documents for personal use. Furthermore, Idiedo et al. (2024) and Muduli et al. (2023) emphasized that religious institutions including Christian monasteries in Europe and waqf-based libraries in the Islamic world served as the primary stewards of knowledge, though access remained strictly limited to select clerical or academic groups.

Private libraries played a crucial role in the preservation of ancient texts, the dissemination of religious doctrines, and the advancement of early scientific inquiry. Roach (2023) noted that the great libraries of monasteries in medieval Europe acted as vital knowledge sanctuaries, safeguarding classical works during periods of social upheaval. Concurrently, private collections during the Islamic Golden Age served as essential hubs for the Translation Movement; as Hasse (2021) and D'Ancona (2022) demonstrated, these libraries preserved and translated Greek philosophy and mathematics into Arabic, which Pettegree and der Weduwen (2021) argue fundamentally catalysed European Renaissance thought. Recent analysis by Al-Hassan (2024) further suggested that these private networks were the primary infrastructure for scientific exchange before the rise of formal state institutions.

Though private libraries were exclusive, their contributions laid the foundation for the modern concept of libraries as centers of learning. They demonstrated the importance of organized knowledge systems, cataloguing, and preservation principles that public libraries later adopted and expanded upon.

Private Libraries and Their Contribution to National Development

Private libraries, despite their exclusivity, have historically contributed to national development in several ways:

• **Preservation of Cultural Heritage:**

Private collections often safeguard manuscripts, artifacts, and rare books that might otherwise have been lost. For example, the Vatican Library, though private, has preserved invaluable religious and historical documents that continue to inform global scholarship. Pellegrin (2020) notes that the Vatican Library has historically acted as a guardian of rare manuscripts and cultural treasures, ensuring their accessibility to scholars worldwide. More recently, Rouse (2022) emphasizes that the Vatican Library remains one of the most significant private repositories of written heritage, playing a crucial role in cultural preservation and scholarly advancement.

• **Promotion of Scholarship and Innovation**:

Wealthy patrons and scholars who maintain private libraries enable research and intellectual discourse. The Medici family in Renaissance Florence, through their private collections, support artists and scientists whose work transformed European culture and science. Kent (2023) explains that the Medici libraries were not simply repositories of books but active centers of intellectual exchange, providing critical resources that fuelled advancements in art, science, and philosophy. More recently, Rossi (2024) highlights that the Medici patronage system, anchored in their private collections, created a fertile environment for innovation, enabling scholars and creatives to access rare manuscripts and knowledge that shaped the trajectory of European cultural and scientific development.

• **Catalysts for Public Institutions:**

Many public libraries originated from private collections donated to the state. The British Library, for instance, evolved from the private collections of Sir Hans Sloane, whose donation of 71,000 items in the 18th century became the foundation of one of the world's greatest libraries. Miller (2023) underscores that Sloane's bequest was pivotal in shaping the British Library as a national institution, transforming private knowledge into a public trust. More recently, Johnson (2024) highlights that the transition of private collections into public repositories, exemplified by Sloane's donation, reflects a broader historical trend in which elite collections became catalysts for democratizing access to knowledge and fostering national identity.

- **Promotion of National Pride and Development.**

Private libraries promote national pride and development by preserving manuscripts, artifacts, and rare books that reinforce cultural identity and connect communities to their history. Patil (2021) stresses that such preservation supports nation-building through scholarship and civic education. Adeyemi (2023) highlights their role in sustaining indigenous knowledge vital for cultural resilience, while Johnson (2024) notes that transitioning private collections into public institutions democratizes access and fosters pride. Clarke (2025) adds that in the digital era, private libraries bridge ownership and accessibility, ensuring heritage empowers communities and strengthens identity.

- **Contribution to Sustainable Development**

Private libraries contribute to sustainable development by preserving cultural heritage, safeguarding indigenous knowledge, and empowering communities through equitable access to information. They strengthen intellectual capital,

foster innovation, and reinforce national identity. Gundakanal and Kaddipujar (2020) affirm that private libraries act as knowledge hubs, while Adeyemi (2023) emphasizes their role in sustaining cultural resilience through indigenous knowledge preservation. Clarke (2025) further underscores that in the digital era, private libraries bridge private ownership and public accessibility, ensuring cultural heritage continues to empower communities and support innovation.

Private Libraries and Their Contribution to Education and Research

Private libraries are vital to education and research because they provide specialized collections, rare materials, and tailored services that complement public institutions. They strengthen research capacity by offering unique resources unavailable elsewhere. Sinha and Das (2024) describe libraries as repositories of knowledge and hubs for intellectual activity, while Sowe (2018) emphasizes their role in fostering information literacy and critical thinking. Adeyemi (2023) highlights that private collections preserve indigenous knowledge crucial for academic growth, and Johnson (2024) adds that transitioning private holdings into public institutions democratizes access. Clarke (2025) further underscores their importance in bridging ownership and accessibility in the digital era.

Furthermore, Private libraries actively support higher education by fostering research skills, information literacy, and critical thinking. They provide specialized collections, guide faculty in curriculum development, and enhance scholarly productivity. Okonkwo (2022) stresses their role in strengthening academic quality, while Bello (2023) highlights their contribution to independent scholarship. Ahmed (2024) emphasizes that private libraries create environments conducive to intellectual engagement, and Clarke (2025) underscores their digital relevance in bridging ownership and accessibility.

Private libraries also serve independent scholars and professionals by offering specialized collections in law, medicine, and business, ensuring access to vital resources for lifelong learning. Nwosu (2022) emphasizes their role in bridging resource gaps, while Ibrahim (2023) highlights their importance for professional development. Musa (2024) underscores their contribution to sustaining scholarly innovation, and Clarke (2025) notes their digital relevance in expanding accessibility.

Digital Transformation and Innovation in Private Libraries

Private libraries are increasingly embracing digitization, artificial intelligence, and cloud-based systems to enhance accessibility and streamline cataloging. As Smith (2022) observed, digital transformation has redefined how private collections are managed, enabling interactive user experiences that make collections dynamic, adaptable, and user-centered. Johnson (2023) similarly argued that smart technologies and personalized services are reshaping knowledge management, positioning private libraries as innovative hubs of information. Brown (2021) noted that cloud integration allows libraries to expand beyond physical boundaries, ensuring broader access to resources and reducing reliance on physical infrastructure. Likewise, Lee (2022) emphasized that collaborative technologies foster innovation and sustainability, reinforcing the role of private libraries in modern society. Collectively, these advancements modernize traditional practices, ensure relevance in the digital age, and highlight the importance of innovation in sustaining private libraries as responsive, future-oriented institutions.

Collaboration and Partnership Opportunities

Multi-sector collaborations between private libraries, universities, and technology firms are essential for modernization and scaling. By partnering with academic institutions, private libraries transform isolated archives into active scholarly assets; as Brown (2021) explained, partnerships between libraries and academic institutions expand access to rare collections.

Furthermore, integrating advanced technologies allows these institutions to redefine their community value. Lee (2022) emphasized that collaborative opportunities strengthen libraries' societal roles, ensuring they remain vital hubs for digital literacy and inclusion.

Finally, pooling resources with tech firms mitigates the high costs of digital infrastructure. Johnson (2023) observed that joint ventures encourage sustainable growth and innovation, enabling private libraries to adopt cutting-edge tools while broadening cultural participation. Ultimately, these strategic alliances allow resource-constrained libraries to overcome limitations of scale, secure long-term digital preservation, and integrate seamlessly into global knowledge networks.

Policy and Legal Issues

Managing policy and legal frameworks is critical as private libraries transition into digital environments. They must balance strict legal obligations with user access across three primary dimensions: copyright compliance, digital rights management (DRM), and user privacy.

First, digitizing rare collections requires rigorous policy frameworks to handle intellectual property. As Miller (2020) explained, effective institutional policies protect libraries from copyright infringement while maximizing the research utility of rare collections. Without these boundaries, digitization risks severe litigation.

Second, digital distribution requires navigating restrictive licensing rather than traditional ownership. This necessitates technical systems to manage publisher constraints; Davis (2021) emphasized that navigating the matrix of digital rights management requires robust technical policies to balance user access with publisher mandates.

Finally, libraries must safeguard the vast amounts of user research data they collect under modern data-privacy laws. Protecting reading history and personal details is fundamental to operational ethics; as Miller (2020) observed, a library's commitment to privacy protection forms the foundation of user trust and intellectual freedom.

Ultimately, constructing adaptable strategies for these interconnected legal issues allows private libraries to protect both creators and researchers while ensuring long-term operational viability.

Examples of Private Libraries That Have Contributed to National Development

1. **Andrew Carnegie's Private Philanthropy**
   Andrew Carnegie, a wealthy industrialist, used his resources to establish nearly 1,700 public libraries across the United States and hundreds more worldwide. Though these began as private philanthropic initiatives, they became public institutions that democratized access to knowledge and contributed to national development by fostering literacy and civic education (Carnegie Corporation of New York, 2025).

2. **The Bodleian Library, Oxford**
   The Bodleian Library originated from the private collections of Sir Thomas Bodley in the early seventeenth century. Over time, it has grown into one of the most important academic libraries in the world, supporting research and scholarship that contribute to both national and global development. Its transformation from a private collection into a public academic resource illustrates how private initiatives can evolve into national assets (Bodleian Libraries, 2026).

3. **Kenneth Dike Library, University of Ibadan (Nigeria)**
   The Kenneth Dike Library, named after historian Kenneth Onwuka Dike, began with private scholarly collections that expanded into a national resource for higher education and research. Today, it serves as a cornerstone of Nigeria's academic development, strengthening intellectual capital and supporting national progress through scholarship and knowledge dissemination (Oladele & Ola, 2018).

4. **Bibliotheca Alexandrina, Egypt**
   Inspired by the ancient Library of Alexandria, the modern Bibliotheca Alexandrina was established with significant private and international support. It has become a hub for cultural preservation, research, and education, contributing to Egypt's national development and reinforcing its role as a center of global knowledge exchange (El-Abd, 2023).

5. **Library of Congress, United States**
   The Library of Congress began with Thomas Jefferson's private collection of over 6,000 volumes, which he sold to the U.S. government in 1815. This private foundation grew into the largest library in the world, serving as a national resource for scholarship, legislation, and cultural preservation (Cole, 2024).

6. **Balme Library, University of Ghana**
   The Balme Library originated from private scholarly collections and has grown into Ghana's premier academic library. It supports national development by empowering higher education, research, and cultural preservation, serving as a vital intellectual hub in West Africa (Mensah, 2022).

Challenges of Private Libraries in National Development

While private libraries have contributed significantly, they face inherent limitations that restrict their impact on broader national development:

1. Limited Accessibility.

Private libraries often remain inaccessible to the wider public, serving primarily owners, select scholars, or elite groups. This exclusivity limits the democratization of knowledge and perpetuates social inequality. Unlike public libraries, which are designed to foster inclusivity and literacy, private collections restrict opportunities for broader educational engagement. Recent scholarship emphasizes that equitable access to information is essential for social development and cultural participation. For example, the American Library Association (2022) highlights that restricted access undermines diversity and outreach, particularly for marginalized communities. Similarly, international debates on copyright limitations for libraries stress the importance of expanding access to archives and collections to ensure knowledge equity (World Intellectual Property Organization [WIPO], 2011). Without reforms, private libraries risk remaining symbols of exclusivity rather than engines of collective intellectual growth. Expanding accessibility is therefore critical to bridging knowledge gaps and promoting inclusive learning

2. Sustainability Issues.

The sustainability of rare book collections presents significant challenges due to the high costs of preservation. Maintaining these materials requires specialized climate control systems and professional archiving, as Feather (2004) noted in his foundational work on book history. Without such measures, rare books are vulnerable to deterioration from humidity, temperature fluctuations, and pests. Ajani et al. (2024) argue that climate change intensifies risks to library collections, necessitating innovative curation strategies and resilient infrastructure. Similarly, Rawayau (2024) highlights that inadequate ICT integration in library environments undermines long-term preservation and access. These findings suggest that sustainability in rare book management must combine traditional conservation practices with modern technological solutions. Without such investment, rare collections risk becoming inaccessible, threatening cultural heritage and scholarly continuity.

3. Lack of Integration with National Policy:

Private libraries rarely integrate with national educational or cultural policies, which restricts their role in structured national development. Unlike public libraries that are embedded in government strategies for literacy, research, and cultural preservation, private collections often function independently, guided by the interests of their patrons rather than national priorities. This disconnect reduces their relevance to broader educational goals and limits their ability to support inclusive knowledge dissemination. Abubakar, Gado, and Kurabau (2022) argue that library education and practice in Nigeria must be contextualized within national cultural and educational frameworks to remain effective. Similarly, Rawayau (2024) highlights that inadequate integration of ICT and policy in library environments undermines their developmental role. Without alignment, private libraries risk remaining isolated repositories rather than engines of national progress.

4. Technological Gaps:

Private libraries face significant technological gaps that undermine their relevance in the digital age. Many struggle to digitize collections or adopt modern information systems, limiting accessibility and long-term preservation. Unlike public institutions that increasingly invest in digital platforms, private libraries often lack the infrastructure, funding, or expertise to implement sustainable digitization strategies. This reduces their ability to contribute to global knowledge networks and hinders integration with educational and research systems. Ajani et al. (2024) highlight that climate change and technological challenges demand innovative curation strategies to sustain library collections. Similarly, Rawayau (2024) notes that inadequate ICT integration in Nigerian libraries weakens their developmental role. Without modernization, private libraries risk becoming obsolete, reinforcing exclusivity rather than serving as inclusive knowledge repositories in the digital era.

5. Fragmentation

Private libraries often suffer from fragmentation because their contents remain inaccessible or unknown to the wider research community. This lack of visibility creates a silo effect, where valuable resources are isolated rather than integrated into collective knowledge systems. Unlike public institutions that emphasize cataloging, networking, and open access, private collections frequently operate independently, guided by the interests of their patrons rather than national or global research priorities. Abubakar, Gado, and Kurabau (2022) argue that library education and practice must align with broader systems to avoid isolation. Similarly, Rawayau (2024) stresses that inadequate ICT integration in libraries exacerbates fragmentation, limiting their developmental role. Addressing these gaps through digitization, policy alignment, and collaborative frameworks is essential to transform private collections into accessible, sustainable research assets.

Recommendations for Strengthening the Role of Libraries in National Development

To fully leverage the power of private libraries, governments should:

1. Offer Tax Incentives:

Offering tax incentives to individuals who open their private collections to the public is a strategic policy tool that encourages broader access to cultural and educational resources. UNESCO (2015) has long advocated for such measures, noting that fiscal benefits can motivate private owners to share rare materials with society. Olatunji and Adebayo (2023) argue that financial incentives are critical for bridging gaps between private ownership and public accessibility in Nigeria's cultural sector. Similarly, the International Federation of Library Associations (IFLA, 2022) highlights that supportive policies, including tax relief, enhance collaboration between private and public institutions, ensuring sustainable knowledge dissemination. By aligning private interests with public good, tax incentives can transform exclusive collections into shared assets, fostering national development and cultural integration.

2. Collaborative Cataloging:

Collaborative cataloging, particularly through national union catalogs, is a powerful strategy to integrate private libraries into broader knowledge networks. A union catalog consolidates bibliographic records from multiple institutions into a single searchable database, allowing researchers and librarians to discover materials across diverse collections. This

approach reduces duplication, enhances resource sharing, and ensures that valuable private holdings are visible to the wider scholarly community. Adeleke (2024) emphasizes that union catalogs in Nigeria improve cataloging efficiency and bibliographic quality, while the International Federation of Library Associations (IFLA, 2022) underscores their role in equitable access and global knowledge exchange. By encouraging private libraries to participate in national union catalogs, countries can strengthen cultural preservation, foster collaboration, and democratize access to information.Grants for Preservation: Provide grants for the digitization of private collections that hold significant national heritage (Veredas do Direito, 2025).

3. Grants for Preservation:

Providing grants for the preservation and digitization of private collections that hold significant national heritage is essential for safeguarding cultural memory. Such collections often contain rare manuscripts, historical documents, and artifacts that are vulnerable to deterioration if not properly archived. Grants can help private owners overcome financial and technical barriers, ensuring that these materials are digitized and made accessible to the wider public. Veredas do Direito (2025) emphasizes that targeted funding policies are critical for bridging the gap between private ownership and public benefit. Ajani et al. (2024). highlights that digitization enhances resilience against climate change and technological obsolescence, while promoting equitable access to knowledge. Furthermore, the International Federation of Library Associations (IFLA, 2022) underscores that preservation grants strengthen collaboration between private and public institutions. By supporting digitization through grants, nations can protect heritage assets and integrate them into structured educational and cultural development.

4. Bridging Technological Gaps in Private Libraries

To address technological gaps in private libraries, a multi-stakeholder strategy is essential. Governments, academic institutions, and technology firms should collaborate to provide targeted funding, training, and infrastructure support for digitization projects. Grants and subsidies can help private libraries acquire modern information systems, while capacity-building initiatives will ensure staff are equipped to manage digital platforms effectively. Partnerships with tech companies can provide access to cloud storage, digitization tools, and cybersecurity frameworks, reducing costs and enhancing sustainability. Rawayau (2024) highlights that ICT integration is critical for libraries to fulfill their developmental role. By bridging technological divides, private libraries can evolve into inclusive repositories, contributing to national education, research, and cultural preservation while remaining relevant in the digital age.

Conclusion

Private libraries have historically acted as vanguards of niche knowledge, sanctuaries for cultural heritage, and accelerators of specialized innovation. Though often limited in accessibility, they laid the groundwork by safeguarding rare materials and supporting scholarship, ensuring that intellectual wealth was preserved even within the quiet studies and private shelves of citizens. For nations seeking sustainable development, investment in public libraries is not optional but imperative. By integrating heritage preservation with inclusive access, libraries shape societies into informed, cohesive, and forward-looking communities, ensuring that knowledge remains the cornerstone of progress.

Abstract

This paper examines the role of professional associations in repositioning librarianship in Nigeria within the framework of the conference theme, "Our Future, Our Hope: The State of Libraries and Librarianship in Nigeria." The study focuses on three major professional bodies: the Nigerian Library Association (NLA), the Librarians' Registration Council of Nigeria (LRCN), and the Nigerian Association of Library and Information Science Educators (NALISE). Using a conceptual and documentary approach, the paper explores the contributions of these associations to professional development, regulation, advocacy, curriculum enhancement, research promotion, and capacity building. Findings indicate that these professional bodies have significantly contributed to the professionalisation and modernization of librarianship through conferences, workshops, continuing professional development programmes, certification, quality assurance mechanisms, and curriculum reforms. Their activities have enhanced librarians' competencies and strengthened the visibility and relevance of the profession in an increasingly digital information environment. Despite these achievements, several challenges continue to hinder their effectiveness, including inadequate funding, low member participation, technological disruptions, weak awareness of regulatory frameworks, limited research support, outdated curricula, and infrastructural deficiencies. These challenges constrain the capacity of professional associations to fully reposition librarianship to meet contemporary demands. The paper concludes that the future sustainability and competitiveness of librarianship in Nigeria depend largely on stronger professional associations, increased investment, technological innovation, stakeholder collaboration, and supportive policy frameworks. Professional associations remain indispensable instruments for advancing the profession and securing its future relevance.

Keywords: Advocacy, Capacity Building, Librarianship, Professional Associations, Professional Development.

Introduction

Professional associations are organisations established to promote the interests, standards, ethics, and professional development of individuals within a particular occupation or field. They provide a platform for networking, continuous education, advocacy, research dissemination, and policy influence. In the realm of librarianship, professional associations play a crucial role in enhancing the skills and recognition of librarians through various means, including conferences, workshops, publications, certifications, and advocacy initiatives. According to Daniel (2025) professional associations serve as organised entities where individuals from the same industry, career field, or academic discipline unite to promote their collective interests. These organisations are responsible for overseeing the integrity of professional

practice within their specific domains. Fundamentally, they act as communities that protect public interests while advocating for the professional practitioners who make up their membership.

Professional bodies, such as the Nigerian Library Association (NLA), Nigerian Association of Library and Information Science Educators (NALISE) and Librarian Registration Council of Nigeria (LRCN) among others provide library professionals with a platform for the exchange of ideas, the cultivation of self-regulation, and a variety of additional benefits. These associations help to create unity among members in librarianship. Banire, (2025) starts that professional associations historically serve as instruments of occupational consolidation, professional identity formation, and regulatory control.

A professional association is an organisation that unites individuals engaged in the same field or industry with the aim of promoting, developing, and safeguarding their profession. Such associations provide a range of benefits, including networking opportunities, educational resources, and advocacy for the interests of their members. Professional associations are founded to further the interests of a particular profession, its practitioners, and the public good. Typically, they operate on a membership basis and may be local, national, or international in scope. Examples of professional associations include Nigeria Library Association, Institute of Chartered Accountants of Nigeria, Chartered Institute of Bankers of Nigeria, Chartered Institute of Taxation of Nigeria, Nigeria Institute of Estate Surveyors & Valuers, Association of General & Private Medical Practitioners of Nigeria, Association of National Accountants of Nigeria among others.

It is regrettable that, despite several decades of library services in Nigeria, numerous objectives have not been fully achieved owing to the existence of particular challenges; such as insufficient funds, ICT infrastructures, adoption of digital transformation, institutional policy, inadequate internet facilities, lassie fair attitude of the government toward library services, etc. According to Nwokocha (1998) these problems seem traceable to neglect by successive governments rather than to an absence of resources.

In this context, the theme *"Our Future, Our Hope: The State of Libraries and Librarianship in Nigeria"* invites a critical reflection on the institutional mechanisms that shape professional identity, competence, and relevance.

Conceptual Clarifications (NLA NALISE and LRCN)

The Nigerian Library Association (NLA) originated as a division of the West African Library Association (WALA), which was founded in 1954 as a result of a UNESCO seminar focused on the development of public libraries in Africa, convened in Ibadan in 1953 (NLA 44th National Conference/AGM Programme). As a professional association, the NLA holds membership in the Commonwealth Library Association, the International Federation of Library Associations (IFLA), and the International Federation of Documentation (FID). Currently, the NLA boasts state chapters in all thirty-six (36) states of Nigeria, in addition to a Federal Capital Territory (FCT) Chapter located in Abuja (Nkebem, 2009). The author further states the objectives of the NLA as follows:

1. To unite individuals with an interest in libraries, librarianship, and information services.

2. To safeguard and advance the professional interests of librarians.

3. To promote the establishment and development of libraries and information centres.

4. To monitor legislation affecting libraries and to support the promotion of necessary legislation for the establishment, regulation, and management of libraries throughout Nigeria.

5. To encourage bibliographical study, research, and library cooperation.

6. To undertake all lawful activities that are incidental and conducive to achieving the aforementioned objectives. The membership of the association has experienced consistent growth, transitioning from national to state chapters of the NLA, with the objective of strengthening the educational system across all levels. This expansion necessitated for a regulatory body which is tasked with defining and distinguishing the role of a librarian. Such a body is essential for the enhancement, promotion, and support of librarianship within the diverse environments it serves.

This expansion brought about the Librarian Registration Council of Nigeria (LRCN) in 1995 through the enactment of Decree 12 in 1995, which established the Librarians' Registration Council of Nigeria (LRCN), it was a pivotal moment for the profession, having been signed into law by General Sani Abacha, the then Head of State. This development marked the formal recognition of librarianship as a profession that significantly contributes to societal advancement, positioning it alongside with other esteemed professions in Nigeria, such as law, teaching, medicine, and engineering, all of which are governed by their respective regulatory councils (Shehu & Kasa, 2019).

The mandate of the LRCN, as delineated in the Decree, encompasses the following objectives:

1. To define the criteria for what constitutes a librarian.

2. To establish the requisite standards of knowledge and skills for individuals aspiring to enter the profession, ensuring that only those who meet these standards are registered and acknowledged as professional librarians.

3. To maintain an official register of librarians.

4. To uphold discipline within the profession, among other responsibilities, (Shehu & Kasa, 2019).

UNESCO played a pivotal role in the establishment of Library and Information Science (LIS) education programmes across Africa, particularly within Anglophone sub-Saharan Africa. This initiative was primarily driven by the demand from public libraries. UNESCO firmly believed that the eradication of illiteracy in sub-Saharan Africa could only be achieved with the active support of libraries. Consequently, a series of regional seminars were conducted between 1953 and 1963 across the African continent to raise awareness among colonial governments regarding the necessity of establishing public libraries in their territories. This initiative aimed to accelerate socio-economic development and led to the establishment of library schools in Africa, thereby ensuring the sustainability of library practices (Otike, cited in Olubiyo, & Olubiyo 2022).

However, the effectiveness of these associations depends on sustained member participation, institutional support, strategic leadership, and adaptive governance structures. Without strong and proactive professional bodies, librarianship risks fragmentation, weakened credibility, and diminished policy influence. Strengthening professional associations is therefore not merely an internal professional concern; it is a strategic imperative for securing the future and hope of libraries in Nigeria.

Professional Association as Catalyst for Repositioning Librarianship in Nigeria

Professional associations are globally recognized as vital instruments for enhancing professional practice, upholding ethical standards, facilitating continuous education, and advocating for the interests of practitioners within a given field. In the domain of librarianship, these associations provide a framework that enables professionals to collaborate, develop their skills, influence policy, and respond effectively to emerging trends in information management. In Nigeria, a re-evaluation of librarianship has become imperative due to rapid technological advancements, a shift towards digital methodologies, and evolving expectations from users. The Nigerian Library Association, the Librarians' Registration Council of Nigeria, and the Nigerian Association of Library and Information Science Educators have all played pivotal roles in advancing this transformation. For professional associations such as NLA, NALISE and LRCN to reposition and make librarianship a profession to look up to in Nigeria, capacity building, training and retraining and as well updating library programme curricula remains the most visible, vital and transformative contributions of professional associations to librarianship.

Professional associations such as NLA, NALISE and LRCN function as institutional engines through which competencies are cultivated and sustained. Nigerian Library Association (NLA) has served and is still serving as a catalyst in institutionalized capacity building through national conferences, zonal workshops, seminars, and collaborative training programmes. These platforms expose practitioners to innovations in digital librarianship, knowledge management, information literacy instruction, and evidence-based service delivery. Empirical evidence from the Nigerian context indicates that association-led Continuous Professional Development (CPD) frequently compensates for limited institutional training budgets, particularly within public and academic libraries (Saleh & Abdullahi, 2023).

Across Africa, professional associations demonstrated their adaptive relevance during the COVID-19 pandemic by organizing webinars, professional briefings, and collaborative learning initiatives that sustained service delivery despite widespread disruption (Akullo et al., 2021). Such responsiveness reinforces the argument that professional associations function as resilience structures within fragile institutional environments.

The Nigerian Library Association (NLA) stands as the foremost professional organisation for librarians in Nigeria. Since its establishment, the association has served as a vital platform for networking among professionals, advocating for issues pertinent to librarianship, disseminating research findings, and fostering capacity building within the profession. Nkebem (2009) articulated that membership in the NLA facilitates professional growth for librarians through access to a variety of opportunities, including conferences, workshops, publications, and collaborative activities designed to enhance job performance. Furthermore, the NLA actively promotes continuous professional development by introducing librarians to emerging trends in areas such as digital librarianship, artificial intelligence, information literacy, open access, and research support services.

In addition to these initiatives, the NLA advocates for improved funding for libraries, more favourable policies, and enhanced working conditions for librarians. The association organises annual conferences and maintains specialised interest groups that encourage the exchange of knowledge and innovation among professionals in the field. Opara (2010) highlighted that professional associations such as the NLA play a crucial role in the professionalisation and recognition of librarianship in Nigeria, as they reinforce the professional identity of librarians and promote adherence to established professional standards.

The Librarians' Registration Council of Nigeria (LRCN) was established by Act No. 12 of 1995 with the primary objective of regulating the practice of librarianship within Nigeria. This council serves as a transformative force in redefining the perception of librarianship by ensuring the implementation of professional regulations, certification, licensing, and quality assurance within the field. Its mandate encompasses the establishment of requisite standards of knowledge and skills for professional practice, the maintenance of a comprehensive register of librarians, and the enforcement of ethical conduct among practitioners. Okojie and Omotoso (2013) highlighted that the LRCN has significantly contributed to the education and training of information professionals by collaborating with both domestic and international organisations aimed at enhancing capacity building and improving professional competence. Similarly, Shehu and Kasa (2019) posited that the inclusion and registration of paraprofessionals by the LRCN would further advance professionalism, facilitate career progression, and enhance service delivery in libraries throughout Nigeria. Recent research highlights that the council's pivotal role in upholding standards and fostering professional development. Igiamoh and Emwanta (2016) found that librarians generally regard the LRCN as crucial for human capital development, the enforcement of professional discipline, and the elevation of library standards in Nigeria.

Furthermore, the Nigerian Association of Library and Information Science Educators (NALISE) plays a strategically significant role in the advancement of librarianship, primarily through its commitment to enhancing the quality of education in Library and Information Science (LIS). This esteemed association unites educators, researchers, and scholars dedicated to improving pedagogical approaches, developing comprehensive curricula, and conducting research within LIS programmes offered by universities throughout Nigeria. NALISE is instrumental in modernising LIS curricula by advocating for the integration of contemporary and emerging disciplines, such as digital librarianship, artificial intelligence, data analytics, information architecture, and research data management. This initiative is crucial, as the future relevance of the librarianship profession is fundamentally linked to the calibre of education and training that upcoming professionals will receive. Oye and Ameh (2019) emphasized that the review of curricula, the cultivation of leadership skills, and the provision of professional training are essential for repositioning libraries and the librarianship field to meet global standards and ensure competitiveness.

Furthermore, Sulyman, Usman, and Badmus (2023) underscored the importance of NALISE, alongside the Nigerian Library Association (NLA) and the Library Registration Council of Nigeria (LRCN), as pivotal professional entities that contribute to the enhancement of librarianship practice and the maintenance of professional standards in Nigeria. This is achieved through a focus on education, training, and the promotion of skills that significantly enhance employability.

The Nigerian Library Association (NLA), the Library Registration Council of Nigeria (LRCN), and the Nigerian Association for Library and Information Science Education (NALISE) constitute the foundational pillars that underpin the advancement of librarianship in Nigeria. The NLA is dedicated to fostering professional development and advocacy, while the LRCN is tasked with providing regulatory oversight and ensuring the maintenance of quality standards. In parallel, NALISE concentrates on enhancing the educational framework of the profession. The synergistic efforts of these organisations have significantly contributed to the professionalisation, modernisation, and sustainability of librarianship in Nigeria and will continue to be. As the information landscape continues to evolve, it is imperative for these professional bodies to enhance their collaboration to foster innovation, elevate professional competence, and improve the global standing of librarianship in Nigeria.

Challenges Facing Professional Associations in Repositioning Librarianship in Nigeria

Professional associations play a crucial role in the advancement and sustainability of librarianship in Nigeria. They uphold professional standards, advocate on behalf of their members, facilitate ongoing education, and foster both research and innovation. Key organisations contributing to the development of librarianship in Nigeria include the Nigerian Library Association (NLA), the Librarians' Registration Council of Nigeria (LRCN), and the Nigerian Association of Library and Information Science Educators (NALISE). Despite their notable achievements, these organisations face various challenges that affect their capacity to redefine librarianship in the context of the digital age.

This study of Anene and Idiedo (2023) identified factors limiting librarians' participation in professional development activities, including lack of time, inadequate awareness, financial constraints, technological challenges, and workload pressures. This uneven engagement weakens collective strength and limits the representativeness of professional voices in national discourse.

Funding constraints constitute a significant limitation to the effectiveness of professional library associations and institutions. Inadequate and unstable funding restricts the implementation of training programmes, technological innovations, research activities, and advocacy initiatives. Financial limitations also hinder long-term planning, staff development, and the capacity of professional bodies to influence policy and national development agendas effectively (Ilori & Onanuga, 2025)

The Nigerian Library Association (NLA) has consistently served as the principal professional organisation for librarians in Nigeria. However, a notable challenge it faces is insufficient funding. Professional associations typically depend on

membership fees, conference charges, and sponsorships, which often fall short of supporting comprehensive professional development programmes and advocacy initiatives. Patrick (2021) revealed that effect of poor funding of public libraries in Asaba are dependents on factors such as; inadequate utilization of library resources, insufficient library materials, inadequate staffing, outdated library resources and insufficient library facilities respectively. This financial limitation adversely affects the association's ability to organize regular capacity-building activities and to effectively promote the discipline of librarianship throughout the nation. Also, Mamman and Nwokedi (2019) reveal among others that there is poor availability of information resources in the libraries, due to inadequate funding; the sources of funding are mainly from the parent institutions of the libraries and grants from TET Fund.

A significant challenge facing professional associations is the decline in member participation and commitment. The efficacy of these associations is largely derived from the active engagement of their members. Nonetheless, numerous librarians encounter obstacles that hinder their full participation in conferences, workshops, and other professional activities, primarily due to financial constraints and institutional limitations. Sulyman, Usman, and Badmus (2022) noted that strengthening librarians' employability and professionalism requires sustained commitment to professional development and active participation in professional associations.

The rapid evolution of technology also presents significant challenges for the NLA. Emerging technologies such as artificial intelligence, big data analytics, digital scholarship, and research data management require continuous retraining of librarians. Recent evidence indicates that many Nigerian libraries are still grappling with infrastructural and skill-related challenges that affect technology adoption (Oton & Kolawole, 2025).

The Library Registration and Certification Network (LRCN) is tasked with the regulation of librarianship practices and the maintenance of professional standards within Nigeria. However, the council encounters various operational challenges, notwithstanding its statutory mandate. A considerable challenge identified is the insufficient awareness among practising librarians regarding the functions of the council and the associated regulatory requirements. Research conducted by Igiamoh and Emwanta in (2016) revealed that many librarians lack adequate knowledge of the stipulations outlined in the LRCN Act. They advocated for enhanced initiatives to disseminate information concerning the council's activities and responsibilities, thereby fostering a greater understanding within the profession. A further challenge lies in ensuring adherence to the stipulations for professional registration and certification. Omotoso and Igiamoh (2016) highlighted that effective professional regulation necessitates robust monitoring, certification, licensing, and enforcement mechanisms. The implementation of these mechanisms can prove to be particularly complex across the diverse library sectors present throughout the country.

The integration of paraprofessionals into the regulatory framework remains a pertinent issue. Shehu and Kasa (2019) posited that paraprofessionals constitute a substantial segment of the library workforce, and their incorporation into the LRCN framework would not only augment professional development but also improve service delivery. Furthermore, the sustenance of professional development programmes and collaborative initiatives necessitates substantial financial investment and robust institutional support. Okojie and Omotoso (2013) highlighted that while partnerships have significantly enhanced capacity building for librarians, the continuity of these collaborations is challenged by the constraints of limited resources.

NALISE has the responsibility of advancing Library and Information Science education and research in Nigeria. However, there are several challenges that affect how effective it is in fulfilling this responsibility. A substantial challenge facing the field is the timely update of the curriculum. The contemporary information scenery necessitates that librarians possess competencies in artificial intelligence, data analytics, digital preservation, and a range of information technologies. However, many Library and Information Science programmes struggle to revise their curricula swiftly enough to align with emerging trends. Abubakar (2021) highlighted that Library and Information Science education in Nigeria faces significant barriers in addressing the requirements of the digital age.

An additional challenge pertains to the insufficient availability of research funding and technological infrastructure. The provision of high-quality education in Library and Information Science is contingent upon robust research activities, access to digital resources, and the presence of modern teaching facilities. Nevertheless, many institutions offering Library and Information Science programmes persistently face funding deficiencies that hinder both innovation and research productivity. NALISE encounters significant challenges pertaining to the integration of technology within teaching and learning environments. Aboh (2024) highlights that while e-learning and digital technologies present considerable opportunities for Library and Information Science (LIS) education, persistent issues such as inadequate infrastructure, restricted access to technology, and a lack of sufficient training continue to pose formidable obstacles to their effective implementation. A notable disparity exists between Library and Information Science (LIS) education and its application in professional practice. In a study conducted by Anike, Ogungbeni, Okonkwo, and Otubelu (2025), it was reported that many LIS students and graduates lack sufficient understanding of emerging trends in librarianship. This finding underscores the urgent need for enhanced collaboration among educators, professional organisations, and practitioners in the field.

The Nigerian Library Association (NLA), the Librarians' Registration Council of Nigeria (LRCN), and the Nigerian Association of Library and Information Science Educators (NALISE) play a crucial role in the advancement of librarianship within Nigeria. However, they face several significant challenges, including insufficient funding, limited member participation, inadequate technological competencies, regulatory issues, a lack of awareness, deficiencies in curriculum development, and insufficient research support, all of which hinder their effectiveness.

To address these challenges, it is imperative to enhance investment in these organisations, foster collaboration among various stakeholders, improve professional development programmes, and better integrate emerging technologies. Implementing these strategies will fortify these associations and enhance their capacity to adapt librarianship in Nigeria to meet future demands. The ongoing relevance and sustainability of the profession are profoundly dependent on the ability of these professional organisations to effectively navigate current challenges and seize emerging opportunities.

However, identifying these limitations is not an indictment of professional associations; rather, it is a prerequisite for reform. If professional associations are to serve as engines of hope, they must evolve structurally and strategically.

Conclusion

Professional associations remain fundamental to the advancement and transformation of librarianship in Nigeria. The Nigerian Library Association (NLA), the Librarians' Registration Council of Nigeria (LRCN), and the Nigerian Association of Library and Information Science Educators (NALISE) have contributed significantly to professional development, regulation, advocacy, curriculum enhancement, and the promotion of professional standards. Through conferences, workshops, certification programmes, curriculum reforms, and collaborative initiatives, these bodies have strengthened the competence, visibility, and relevance of librarianship in a rapidly evolving information environment. Despite these achievements, several challenges continue to limit their effectiveness. Inadequate funding, low member participation, weak technological infrastructure, insufficient awareness of regulatory requirements, curriculum gaps, and limited research support have constrained their ability to respond effectively to the demands of the digital age. These challenges not only affect the operations of the associations but also threaten the growth and sustainability of librarianship in Nigeria.

The future of libraries and librarianship in Nigeria depends largely on the capacity of professional associations to adapt to emerging realities and provide strategic leadership. This requires greater collaboration among practitioners, educators, regulators, government agencies, and other stakeholders. It also demands sustained investment in professional development, technological innovation, research, and advocacy. Ultimately, the theme *"Our Future, Our Hope"* underscores the critical role of professional associations in shaping the future of librarianship in Nigeria. By fostering professional excellence, promoting innovation, strengthening regulatory frameworks, and advocating for supportive policies, NLA, LRCN, and NALISE can continue to serve as catalysts for professional growth and transformation. Strengthening these associations is therefore essential for ensuring the continued relevance, competitiveness, and sustainability of libraries and librarianship in Nigeria.

Abstract

Digital library in academic environment has become indispensable for supporting teaching, learning and research. Effective deliver of these services depends critically on the professional competence of library personnel for professional development. This study explores Professional Competence for Effective Digital Library Services Delivery in University Libraires in Nigeria. The paper reviewed professional competence in librarianship, and Digital Competence as a Core Component of Professional Competence and Relationship of Professional Competence and Quality Library Service Delivery. The paper highlights components of effective digital library services delivery. It challenges, and conclude that university libraries should adopt innovation information and communication technology tools. Continuous staff development, support remote access, and engaged users through proactive outreach and feedback to sustain effective library services delivery and its relevance. And recommended digital and information and communication technology competences, continual professional development and adaptability to ensure library professionals remain resilient among others.

Keywords: Professional Competence, Digital Library Services, University Libraries, Nigeria

Introduction

In the 21st century, libraries are undergoing rapid transformation from traditional repositories of print materials to dynamic digital information hubs that support teaching, learning, research and global collaboration. This transformation has been driven by advancements of Information and communication Technologies (ICTs) and the increasing demand for instant access to electronic resources, online catalogue, virtual reference, digital repositories with complex digital ecosystems that support remote services (Owate, 2024). This shift has redefined the role of library professional who now possess not only traditional librarianship skills but also digital professional competencies to deliver quality information services effectively (Aloogbo, 2024).

Digital libraries now encompass online catalogues, institutional repositories, e-journals, digital archives, and interactive web-based systems that enhance the accessibility and usability of information for diverse user groups (Owate, 2024). However, the successful delivery of these digital library services depends on the professional competence of library personnel. Professional competence refers to the combination of knowledge, skills, attitudes, and abilities to enable information professionals to perform their duties efficiently and achieve the objective of services delivery. These encompass technical proficiently in digital tools, understanding of digital content management, effective communication skills, and the ability to navigate and leverage digital platforms to meet diverse users' needs (Abdullahi & Owotabi, 2024).

Moreover, the growing reliance on digital library services has heightened expectations amongst users in Nigerian university libraries for timely, accurate, and reliable access to information. University library users now demand services that are not only accessible anywhere and anytime but also intuitive and responsive to their information needs. Consequently, professional competence has emerged as a critical component of effective library services delivery, enabling librarians to integrate technology with professional practice and enhance overall service performance (Daramola et al., 2024). Research indicates that inadequacies in professional competence can hinder effective digital library services delivery, leading to poor users' experiences and reduced satisfaction (Owate, 2024). These competences have been identified as key determinants of library services quality and users' satisfaction (Owolabi et al., 2024).

Despite the proliferation of digital services in libraries globally, evidence suggests that there are significant gaps in professional competence among library professional, particularly in developing regions where training opportunities, ICT infrastructure and continuous professional development may be limited. In Nigeria universities, studies have shown that while basic digital skills are present, advanced competencies required for managing and delivering complex digital library services remain moderate and low, highlighting the urgent need for targeted capacity building (Ogunbodede &

Atchrimi, 2024). Therefore, it becomes imperative to explore the professional competencies essential for the delivery of effective digital library services, identifying gaps in current practices, and propose strategies for enhancing the skills and knowledge for library professionals in university libraries in Nigeria. The objective of this study is to examine the professional competence required for effective digital library services delivery in university libraries, with a view to identifying the knowledge, skills, abilities, and technological proficiencies needed by library professionals to manage digital resources and provide quality information services in a rapidly evolving digital environment.

Literature Review

Professional Competence in Librarianship

Professional competence in librarianship refers to the combination of knowledge, skills, attitudes, and behaviours that enable library staff to perform their roles efficiently and effectively. In the context of university libraries, these competencies have expanded beyond traditional cataloguing and reference work to include digital literacy, information technology, user engagement, and service innovation (Owolabi et al., 2024). This expanded competence is essential for meeting the evolving expectations of academic communities and providing digital library services that are timely, reliable, and relevant to users' learning and research needs.

Owning requisite professional competencies significantly influences library service quality and user satisfaction. A recent study in Nigerian colleges of education found that professional competence, including communication skills and academic qualifications, significantly contributed to library service quality and user satisfaction, reinforcing that skilled library personnel are pivotal to service effectiveness (Owolabi et al., 2024). Furthermore, the role of competencies has been explored conceptually to determine the types of skills needed by reference librarians to facilitate high-quality information services. Competencies such as information retrieval, user guidance, and application of information technologies were identified as essential for delivering quality reference services (Gani, 2025). In the era of digital disruption—marked by rapid technological change—library professionals are expected to go beyond traditional skills. Research indicates that librarians must adopt digital mindsets, leadership, communication, and collaboration abilities to remain responsive to global changes and manage digital services effectively (Nada, 2021).

Digital Competence as a Core Component of Professional Competence

Digital competence is the subset of professional competence that directly relates to the effective use and management of digital tools and services. It includes mastery of digital technologies (software, platforms, systems), information retrieval and evaluation in online environments, digital content management, cybersecurity awareness, and user support for digital services (Daramola et al., 2024). Atchrimi and Ogunbodede (2024), asserted that librarians with higher digital competence are better positioned to deliver contemporary digital library services. For example, research in Nigerian university libraries reports that librarians have basic digital competence skills and use various methods to acquire these skills, but face barriers such as inconsistent power supply and inadequate training opportunities, which constrain optimal performance. In academic libraries in Nigeria, professional competence has been shown to significantly influence user satisfaction through improved service quality. Librarians' communication skills, academic qualifications, and attitudes contribute strongly to how users perceive and use library services (Owolabi et al., 2024). Research focused on digital library reference services found that librarians' professional competence (including digital library skills such as internet and social media use) directly enhances the delivery of both synchronous and asynchronous digital reference services. Higher professional competence correlated with better service delivery outcomes.

Professional Competence and Quality Library Services Delivery

Professional competence has become a critical factor in enhancing quality library service delivery in the contemporary information environment. Rapid technological advancements, digital transformation, and evolving user expectations require librarians to continuously update their knowledge and skills through continuing professional development (CPD). Professional competence encompasses information management, digital literacy, communication, research support, and technological expertise, all of which contribute to effective service provision. Studies have shown that CPD enables librarians to adapt to emerging trends, improve service innovation, and respond effectively to the changing needs of library users. As libraries increasingly embrace digital platforms and user-centered services, the acquisition of new competencies becomes essential for maintaining relevance and achieving organizational goals (Graham & Winteringham, 2021; Moonasar, 2024). Furthermore, academic librarians who engage in regular professional development are better positioned to implement innovative services and enhance user satisfaction through efficient information access and knowledge dissemination. (Graham & Winteringham, 2021; Moonasar, 2024).

Quality library service delivery depends significantly on the competence, adaptability, and commitment of library professionals. Recent studies indicate that librarians require continuous training in information and communication technologies, digital resource management, and emerging service models to meet the demands of modern library users. Effective CPD initiatives such as workshops, conferences, e-learning programs, and professional networking opportunities have been found to strengthen librarians' capabilities and improve institutional performance. Moreover, revitalizing professional competence fosters innovation, improves service efficiency, and supports the transformation of libraries into dynamic learning and research hubs. Therefore, library management and professional associations should prioritize sustained investment in staff development to ensure high-quality, user-centered services and long-term organizational effectiveness in the digital age (Oladokun & Mooko, 2023; Chukwusa, 2024; Nakaziba & Ngulube, 2025).

Components of Effective Digital Library Services Delivery

Digital library services have become central to information access, knowledge dissemination, and scholarly communication in the digital age. An effective digital library goes beyond digitized collections; it integrates technology, human expertise, policies, and user-centred services to ensure seamless access to reliable information resources (Xie & Matusiak, 2016). The effectiveness of digital library services delivery depends on several interrelated components, which together support accessibility, usability, sustainability, and impact. The following are the components of effective digital library services delivery:

i. Robust Information and Communication Technology (ICT) Infrastructure

A reliable ICT infrastructure is the foundation of effective digital library service delivery. It includes high-speed internet connectivity, servers, cloud storage facilities, computer hardware, and network systems that support uninterrupted access to digital resources. Effective infrastructure ensures that users can retrieve information quickly and conveniently regardless of their location. Studies have shown that inadequate ICT facilities and poor internet bandwidth significantly hinder digital library performance, while strong technological infrastructure enhances accessibility, efficiency, and user satisfaction in digital library environments.

ii. Digital Library Management Systems (DLMS)

Digital Library Management Systems are software platforms used to organize, store, retrieve, and manage digital collections. These systems provide functionalities such as metadata management, indexing, searching, user authentication, and resource sharing. An effective DLMS enables seamless access to electronic resources and improves information retrieval efficiency. Recent studies indicate that well-designed digital library management systems are essential for the successful development and sustainability of digital libraries because they support efficient collection management and enhanced service delivery.

iii. Quality Digital Collections and Content Management

The availability of relevant, current, and well-organized digital resources is a critical component of digital library services. Digital collections may include e-books, e-journals, theses, dissertations, multimedia resources, institutional repositories, and research datasets. Effective content management ensures that these resources are properly digitized, indexed, preserved, and easily accessible. Research emphasizes that digital libraries must maintain trustworthy and valuable scholarly content through standardized policies and preservation practices to meet users' information needs effectively.

iv. Skilled Human Resources and Continuous Staff Training

Qualified librarians and information professionals play a vital role in managing digital resources and assisting users. Staff members require competencies in digital technologies, metadata creation, database management, information retrieval, and user support services. Continuous professional development enables librarians to adapt to emerging technologies and changing user expectations. Recent evidence suggests that inadequate technical skills among library personnel can negatively affect service quality, while ongoing training enhances digital service effectiveness and innovation.

v. User-Centred Access and Reference Services

Effective digital libraries focus on meeting users' information needs through accessible and responsive services. These include online reference services, remote access facilities, mobile library services, user education programs, and personalized information support. Mobile technologies and virtual reference services have become increasingly important in extending library services beyond physical boundaries. Studies demonstrate that mobile online public access catalogues and mobile reference services significantly improve digital library service delivery by increasing accessibility and user engagement.

vi. Digital Preservation, Policy, and Sustainability Framework

Digital preservation ensures the long-term accessibility and usability of digital resources despite technological changes. Effective service delivery requires policies governing data security, copyright compliance, preservation standards, funding, and institutional governance. Sustainability frameworks help libraries maintain digital collections and services over time through adequate financial support and stakeholder participation. Research has identified organizational policies, financial sustainability, technological standards, and governance structures as essential factors for maintaining trustworthy and efficient digital library services.

Challenges

The major challenges affecting effective delivery of digital library services in university libraries include:

i. Inadequate Digital and ICT Skills

A core challenge is that many professional librarians lack the necessary digital competencies required for effective service delivery in digital environments. Studies indicate that librarians often struggle with basic digital tools, database search techniques, and emerging technologies, reducing their ability to support users effectively and to manage digital collections optimally. This deficit manifests as reluctance to adopt technological tools and an inability to fully take advantage of digital services infrastructure, ultimately slowing service delivery and affecting productivity.

ii. Limited Professional Development Opportunities

Professional competence is dynamic and requires continuous training and learning. Unfortunately, university librarians often have limited access to professional development programs that would enhance their digital skills. The absence of structured training, workshops, and continuous learning opportunities constrains librarians from staying current with technological advancements. Financial constraints within institutions further exacerbate this problem, making it difficult to fund attendance at training or conferences that could improve staff competencies.

iii. Resistance to Change and Adoption of Technology

Resistance to change remains a significant barrier to digital competence. Some librarians exhibit a preference for traditional library practices and may feel threatened by the shift towards digital services. This resistance can stem from fear of obsolescence, lack of confidence, or simple discomfort with evolving technology, which undermines efforts to modernize services and integrate digital platforms that better meet user needs.

iv. Insufficient ICT Infrastructure and Support

Professional competence cannot be developed or demonstrated effectively without an enabling environment. Many university libraries particularly in developing contexts face persistent infrastructure challenges, including unreliable internet connectivity, inconsistent power supply, and outdated hardware or software. These infrastructural limitations not only hamper digital service delivery but also restrict opportunities for staff to practice and refine digital skills in real settings.

v. Financial Constraints Affecting Competence Enhancement

Adequate funding is critical for developing professional competence through training programs, procurement of modern ICT tools, and implementation of digital platforms. However, budgetary limitations in higher education systems often result in insufficient financial support for library development and staff capacity building, constraining librarians' opportunities to acquire and maintain necessary digital skills.

vi. Organizational and Policy Barriers

Effective digital library services require supportive institutional policies that prioritize ICT adoption, continuous learning, and staff development. Many university libraries struggle with the absence of well-defined ICT policies, strategic plans for capacity building, or frameworks that institutionalize training needs assessment. The lack of such policies weakens coordinated efforts to enhance competence, leaving librarians to navigate digital transitions without clear guidance or support structures.

vii. User-Related Challenges and Expectations

Professional competence also encompasses user education and support. As users increasingly demand personalized, seamless digital experiences, librarians must develop skills not only in technology but also in user engagement, instruction, and digital literacy facilitation. A gap in these competencies can lead to suboptimal user support and reduced utilization of digital library services.

Conclusion

Professional competence is a critical factor in the effective delivery of digital library services, as it equips library professionals with the knowledge, technical skills, and adaptive capacities required to manage digital resources, utilize emerging technologies, and meet the evolving information needs of users. For the attainment of effective digital library services delivery in university libraries, professional competence goes beyond possessing technical knowledge and skills, but it involves the consistent and appropriate application of that knowledge in real-world contexts, guided by ethical principles, professional standards, and reflective practice. Furthermore, continuous professional development, training, and capacity-building initiatives are essential for maintaining and improving these competencies in a rapidly changing digital environment. Therefore, libraries and their parent institutions should prioritize investment in staff development and technological proficiency to strengthen digital service delivery and ensure the sustainability, relevance, and effectiveness of modern library operations.

Way Forward

i. Adequate Funding of University Libraries

University management and relevant stakeholders should prioritize increased and sustainable funding for digital library initiatives to enhance professional competence in digital library service delivery. Adequate financial resources are necessary for the acquisition, maintenance, and upgrading of ICT infrastructure, subscription to electronic information resources, procurement of digital library software, and continuous staff training. Libraries should also explore alternative funding sources such as research grants, partnerships, alumni support, and collaborations with governmental and non-

governmental organizations to supplement budgetary allocations and ensure the long-term sustainability of digital library services.

ii. Adequate ICT Infrastructure and Management Support

University authorities should invest in the provision and modernization of ICT infrastructure required for effective digital library operations. This includes reliable internet connectivity, adequate computer systems, servers, power supply, digital repositories, and library management software. Furthermore, library management should demonstrate strong institutional support by formulating strategic plans for digital transformation, providing necessary resources, and creating an enabling environment that encourages innovation and technology adoption among library staff. Such support will strengthen librarians' professional competence and improve the quality of digital library services.

iii. Adequate Digital and ICT Skills

University libraries should implement regular and comprehensive capacity-building programs aimed at enhancing librarians' digital literacy and ICT competencies. Training workshops, seminars, certifications, mentorship programs, and hands-on practical sessions should be organized to equip library professionals with skills in digital resource management, database administration, information retrieval technologies, digital preservation, and emerging technologies. Continuous skills development will enable librarians to effectively manage digital library systems and provide efficient services to users in an increasingly technology-driven academic environment.

iv. Acceptance of Change and Adoption of ICT Facilities

Library management should adopt effective change management strategies to encourage positive attitudes toward the adoption and utilization of ICT facilities among library staff. Awareness programs, sensitization campaigns, staff involvement in decision-making processes, and incentives for embracing technological innovations should be promoted. Management should also provide adequate support and training to reduce anxiety associated with technological changes. Encouraging a culture of innovation and continuous learning will facilitate the successful integration of ICT facilities and enhance professional competence in digital library service delivery.

v. Adequate Organizational and Policy Review

University administrations should review and strengthen institutional policies that support the implementation and effective use of digital library technologies. Clear guidelines, strategic ICT policies, and operational frameworks should be established to promote digital transformation within university libraries. Organizational structures should be streamlined to reduce bureaucratic bottlenecks that hinder technology adoption and innovation. Additionally, collaboration between library management, university leadership, and ICT units should be strengthened to ensure that policies and organizational practices effectively support professional competence and digital library service delivery.

vi. Adequate Professional Development Opportunities

University libraries should establish structured and continuous professional development programs to ensure that librarians remain current with emerging trends and technologies in digital librarianship. Opportunities for attending conferences, workshops, webinars, professional certification programs, and academic exchange initiatives should be regularly provided. Professional associations and university management should also support career development initiatives that encourage lifelong learning and knowledge sharing among library personnel. Expanding access to professional development opportunities will enhance librarians' competencies, confidence, and effectiveness in delivering high-quality digital library services.

Abstract

This study investigates the **professional development interventions and creative service delivery** among academic librarians, focusing on selected institutions across Delta, Abjua, and Kogi states. The objectives of the study were to; identify the available professional development interventions, assess their influence on creative service delivery, examine relationship btw participation and innovative service adoption and identify challenges. Adopting a survey research design, the study population comprised 5,000 librarians in Nigeria. The cluster sample was used to select 3 Nigerian states: Delta, Abuja, and Kogi. Purposive sampling was used to select 60 librarians from 6 selected institutions across the states. Data were collected through validated observation checklists and questionnaires (Cronbach Alpha reliability = 0.83, validated by three Library and Information Science experts). The data was analyzed using the descriptive statistics. **Findings revealed** that workshops and conferences constituted the predominant interventions, though online courses remained underutilised. Professional development significantly enhanced creative service delivery, particularly in digital reference services and user education programs, demonstrating strong positive relationships between training participation and adoption of innovative services like virtual research consultations and makerspace facilitation. Challenges included inadequate funding, irregular program scheduling, and limited internet access hindering online training effectiveness. The study **concludes** that targeted professional development interventions substantially elevate librarians' creative capacities, recommending consistent funding allocation, diversified training formats incorporating e-learning platforms, and institutional partnerships to sustain innovative service delivery essential for modern academic libraries.

Keywords: Academic Librarians, Creative Service Delivery, Professional Development, Innovative Library services

Introduction

Professional development activities, including workshops and training programmes, enhance librarians' capacity to provide innovative services and cultivate creativity in their work. Such initiatives play a crucial role in building new competencies, stimulating creative thinking, and strengthening overall service performance among library staff. For good reasons academic libraries play a pivotal role in supporting teaching, learning and research within higher education institutions, it is vital for such professional development be placed regularly for the librarians to abreast their knowledge for improved professional engagement. In an era characterised by rapid technological advancement, digital transformation and evolving user expectations, librarians are increasingly required to move beyond traditional service models and adopt innovative, user-centred approaches. The findings of Onyeisiijeh and Odede (2025) inferred that the role of librarians has changed, and nowadays they are not just the keepers of books, but highly knowledgeable in navigating through the web, surfing for information for users and as well upgrading themselves. They actually work with both physical and virtual collections because of the use of digital technologies, which they have been exposed to through workshops and conferences. Globally, professional bodies have emphasised on the need for libraries to continually adapt to emerging trends through capacity building and skills development (Brodowicz, 2025). Within the Nigerian context, academic libraries are responding to similar pressures, including the expansion of digital scholarship, open access resources and virtual learning environments.

Professional development interventions, such as workshops, training programmes, conferences and online courses, could be of help and will become essential mechanisms for equipping librarians with contemporary competencies. Continuous professional education enhances technological proficiency, strengthens academic engagement in user education, and as such foster creativity in service design among librarians. Abubakar *et al*. (2025) opined that reports on the state of libraries worldwide highlight that ongoing staff development is central to innovation, resilience and improved service outcomes, just like in educating users through library outreach programmes in rural areas. For Nigerian academic libraries, where infrastructural and funding limitations often constrain service growth, structured and sustained professional development is particularly critical.

Creative service delivery in academic libraries embraces so many services done in libraries/ information centres by professional librarians, to keep their work going and efficient. It involves digital reference services, virtual research consultations, makerspace facilitation and interactive information literacy programmes. These services require librarians to apply creative thinking, leverage digital platforms effectively, and engage proactively with diverse user communities. However, despite the recognised importance of professional development, there remains limited empirical evidence on the extent to which such interventions directly influence innovative service adoption in Nigerian academic libraries.

Statement of the Problem

Academic libraries in Nigeria are increasingly expected to provide innovative, technology-driven and user-centred services that align with global standards in higher education. The emergence of digital scholarship, online learning platforms, virtual research support and makerspaces has transformed the traditional role of librarians from custodians of print collections to dynamic facilitators of knowledge creation and digital engagement. A major concern is the apparent gap between the availability of professional development interventions and the effective translation of acquired skills into creative service delivery. Although librarians participate in workshops, conferences and occasional training programmes, the extent to which these interventions significantly influence innovative practices such as digital reference services, virtual research consultations and interactive user education remains unclear (Umap & Jani, 2024). Besides, online professional development opportunities, which could broaden access to global best practices, appear underutilised due to infrastructural and technological limitations.

Moreover, there is limited empirical evidence examining the relationship between librarians' participation in professional development and their adoption of innovative service models within Nigerian academic libraries, particularly in states such as Delta, Abuja and Kogi. The absence of such data makes it difficult for policy makers and institutional administrators to make informed decisions regarding fund allocation, training design and strategic planning. Therefore, the central problem of this study lies in the insufficient understanding of how professional development interventions influence librarians' creative service delivery in Nigerian academic libraries, and the need to identify the challenges limiting their effectiveness.

Objectives of the Study

The following objectives are stated for the study:

1. Identify available professional development interventions.
2. Assess the influence of professional development interventions on creative service delivery.
3. Examine relationships between participation and innovative service adoption.
4. Identify the challenges **of professional development interventions on librarians' creative service delivery** in Nigerian academic libraries.

Research Questions

The following research questions were postulated for the study:

1. What are the available professional development interventions in Nigerian academic libraries?
2. What is the influence of professional development interventions on creative service delivery in Nigerian academic libraries?
3. What are the relationships between participation and innovative service adoption in Nigerian academic libraries?
4. What are the challenges **of professional development interventions on librarians' creative service delivery** in Nigerian academic libraries?

Literature Review

Available Professional Development Interventions

Professional development has become an indispensable component of contemporary librarianship, particularly in an era characterised by rapid technological innovation, digital transformation and evolving user expectations. Professional development is of huge importance in various aspect for optimum and effective service delivery. Libraries worldwide are redefining their service models to incorporate digital scholarship, data management, artificial intelligence tools and virtual learning support systems. Within this context, structured and continuous professional development interventions are widely acknowledged as critical mechanisms for equipping librarians with relevant competencies. Professional development interventions available to librarians typically include workshops, training programmes, conferences, seminars, mentoring schemes and online courses. Workshops and in-house training programmes often focus on specific competencies such as digital cataloguing systems, research data management, institutional repository development and information literacy instruction. These formats allow for practical, hands-on engagement and are commonly supported by institutional funding structures. Similarly, professional conferences provide opportunities for networking, exposure to global best practices and knowledge exchange. According to Carr (2016), conferences and professional forums play a significant role in disseminating emerging trends and strengthening collaborative professional networks, in form of online conferences, which have become an increasingly well-accepted mode of delivery and interaction for professional development processes.

In recent years, online courses and e-learning platforms have gained prominence as flexible and cost-effective professional development alternatives. Massive Open Online Courses (MOOCs), webinars and virtual certification programmes enable librarians to access international expertise without geographical limitations. Liu *et al*. (2024) note that digital learning platforms have expanded opportunities for workforce upskilling across knowledge-intensive professions, including librarianship, because the role of professional learning community is considered great, where the relationships among digital professional development, professional learning communities, and digital instructional integration positively emerge.

Within the context of Nigeria, workshops and conferences remain the most prevalent forms of professional development for academic librarians. These interventions are often organised by professional bodies, university administrations or national library associations, among others. Their popularity can be attributed to structured organisation, face-to-face engagement and institutional sponsorship. Bryant-Shanklin and Brumage (2011) states that mentoring programmes, collaborative research projects and inter-institutional partnerships are emerging as additional forms of professional development, because mentoring programme includes the acquisition of desired skills for excellence within the working engagement. Mentees were able to secure contacts with individuals mentoring them. These approaches promote and enable librarians to apply theoretical knowledge within practical contexts.

Identifying the range of available professional development interventions is therefore crucial for assessing their adequacy, accessibility and alignment with institutional goals. It provides insight into whether current interventions are sufficiently diversified to address emerging technological competencies and whether they effectively support innovation in service delivery. A comprehensive understanding of these interventions also establishes a foundation for evaluating their impact on librarians' creative and technological readiness in contemporary academic environments.

Assessing the Influence of Professional Development on Creative Service Delivery

The influence of professional development on creative service delivery has become a central focus in contemporary library and information science research. Creative service delivery encompasses innovative approaches that extend beyond traditional library functions, including digital reference services, virtual research consultations, makerspace facilitation, interactive user education programmes, and other technology-driven initiatives that enhance user engagement and satisfaction. International Federation of Library Associations and Institutions [IFLA], (2023) has its findings that the adoption of such services requires librarians not only to possess technical skills but also to apply critical thinking, problem-solving, and adaptive strategies in response to evolving user needs.

Professional development is widely regarded as a catalyst for enhancing librarians' capacity to deliver creative services. As it really matters a lot. Professional development should be something you actively do throughout your career so you can stay up to date in your field, which can include training courses, degree programs, certifications or even connecting with a mentor who can help guide you in your career (Indeed Editorial Team, 2025). Structured interventions such as workshops, training programmes, conferences, mentoring, and online courses provide librarians with opportunities to acquire new competencies, update existing knowledge, and explore innovative service delivery models. Organisation for Economic Co-operation and Development [OECD], 2023) states that by engaging in continuous learning, librarians are better equipped to integrate emerging technologies into daily practice, design user-centric programmes, and respond proactively to technological changes.

Global evidence suggests a strong correlation between professional development and the adoption of innovative library services. The American Library Association ([ALA], 2024) reports that libraries investing in staff development initiatives, particularly those that emphasise digital literacy and technological competency, are more likely to implement transformative services such as AI-driven reference systems, data visualization tools, and interactive learning platforms. These interventions foster an environment that encourages experimentation and the application of creative strategies to improve user experience.

In the Nigerian academic library context, professional development plays a crucial role in enhancing creative service delivery. Ukachi and Onuoha (2013) opined that librarians who participate in targeted training programmes demonstrate increased proficiency in emerging technologies and are more likely to introduce innovative services, including virtual reference platforms, digital repositories, and makerspace activities. Moreover, professional development enhances librarians' confidence in applying new tools, promotes collaboration within library teams, and encourages the adaptation of global best practices to local institutional contexts.

Professional development is not merely a mechanism for skill acquisition but a strategic tool that drives innovation, fosters creative thinking, and enhances librarians' ability to deliver modern, technology-driven services. Empirical assessment of its influence in Nigerian academic libraries provides valuable insights into the effectiveness of existing interventions and informs policy and practice aimed at sustaining innovation and service excellence.

Examining the Relationship Between Participation and Innovative Service Adoption

The relationship between librarians' participation in professional development activities and their adoption of innovative services is a critical area of investigation in contemporary library and information science research. IFLA (2023) reports that professional development provides the platform for librarians to acquire new knowledge, enhance skills, and explore

creative approaches to service delivery. But, the effectiveness of these interventions often depends on the level of active participation, engagement, and application of acquired competencies in practical contexts.

Participation in professional development can take multiple forms, including attending workshops, training programmes, conferences, online courses, mentorship, and collaborative research projects. Literature indicates that higher levels of engagement are often associated with greater adoption of innovative services. American Library Association [ALA], (2024) suggests that librarians who actively participate in training sessions focused on digital tools, AI-driven reference systems, or makerspace facilitation are more likely to implement these technologies within their libraries. This suggests that participation is not merely a formal requirement but a determinant of service innovation, influencing the extent to which theoretical knowledge is translated into practical, user-oriented applications.

Empirical studies highlight the positive impact of sustained professional development engagement on service innovation. Adamu *et al*. (2021) found that Nigerian academic librarians who regularly participated in professional development programmes demonstrated a higher propensity to introduce innovative services such as digital repositories, virtual reference platforms, and interactive user instruction programmes. These findings underscore the importance of consistency and depth of engagement, suggesting that occasional or superficial participation may not yield significant improvements in service delivery.

Moreover, the relationship between participation and innovative service adoption extends beyond individual competencies. Institutional culture, leadership support, and collaborative practices play critical roles in determining whether librarians can implement innovative services. Keenan (2023) suggests that active participation in technological activities, coupled with supportive policies, resource availability, and mentoring significantly enhances creative capacity and facilitates the adoption of novel service models.

The literature suggests a strong but context-dependent relationship between participation in professional development and the adoption of innovative library services. Understanding this relationship is essential for policymakers and library administrators, as it informs strategies for maximising the impact of training initiatives, promoting sustainable innovation, and ensuring that librarians are equipped to meet evolving user needs in an increasingly digital and technology-driven environment.

Implementation Challenges Affecting Professional Development and Service Innovation

There are so many challenges that impede the effective implementation of professional development interventions and their possible subsequent impact on librarians' creative service delivery. While professional development is widely acknowledged as a critical driver of innovation in academic libraries, evidence suggests that multiple structural, institutional, and contextual barriers often limit its effectiveness. Nakaziba and Ngulube (2023) inferred that understanding these challenges is essential for designing strategies that enhance participation, skill application, and overall service innovation, and availing librarians with protected time to engage in learning, and collaborating with external environments.

One of the most frequently cited challenges is inadequate funding. Financial constraints limit the ability of academic libraries to organise workshops, sponsor attendance at national and international conferences, or provide access to online courses and e-learning platforms. According to the American Library Association ([ALA], 2024), libraries that face funding limitations often struggle to maintain regular professional development activities, which in turn affects staff readiness to adopt innovative services. In the Nigerian context, inconsistent budgetary allocations to academic libraries worsen these challenges, restricting opportunities for continuous professional growth.

Infrastructure and technological limitations are also significant barriers. Effective adoption of emerging technologies and innovative service delivery relies heavily on reliable internet access, up-to-date hardware, and access to modern software tools. The Organisation for Economic Co-operation and Development ([OECD], 2023) observes that insufficient infrastructure reduces the effectiveness of training programmes and prevents librarians from applying new skills in practice. Nworie *et al*. (2021) indicate that limited ICT infrastructure in many academic libraries constrains the practical implementation of skills acquired through professional development, which could have been very helpful as such capacity building programmes equip librarians with the skills needed in this digital age.

Institutional and organisational challenges further affect the translation of professional development into service innovation. Azman (2019) is with the opinion that workload pressures, lack of management support, and absence of clear policies or incentives for innovation often reduce librarians' motivation and capacity to implement new practices and have a good knowledge and skill for the development of library. As such, librarians may attend workshops or training programmes but find themselves unable to apply learned skills due to competing administrative duties, insufficient collaboration among staff, or restrictive institutional cultures.

Additionally, socio-cultural and human factors such as limited time actors, resistance to change, inadequate digital literacy, and limited exposure to international best practices can hinder the adoption of innovative services. Uzorka *et al.* (2023) view time as a significant barrier to their professional development, and therefore, they require professional development opportunities that are tailored to their needs, relevant to their application of technology, and delivered by trainers. Without structured mentorship, follow-up support, and reinforcement mechanisms, training alone may be insufficient to drive sustained creative service delivery.

Finally, the scheduling and accessibility of professional development programmes present additional challenges. Irregular training schedules, geographically distant training locations, and limited access to online learning resources

reduce participation rates and engagement levels. This indicates that the availability of professional development interventions alone is not sufficient; the timing, format, and institutional support for these programmes are critical determinants of their effectiveness.

Methodology

A descriptive survey approach was employed in this study. The target population comprised 5,000 academic librarians working in Nigerian universities and tertiary institutions. A multi-stage sampling procedure was utilised. Cluster sampling was first employed to select three states: Delta, Abuja (Federal Capital Territory), and Kogi. These clusters were chosen to ensure geographical representation. Purposive sampling was then used to select six academic institutions across the three states based on the availability of structured professional development programmes and active library services. From these institutions, a total of 60 librarians were selected as respondents for the study. Structured questionnaires and Observation checklists were the instruments used for data collection for the study. The instruments were validated by three experts in Library and Information Science to ensure content validity and clarity. Reliability of the questionnaire was determined using the Cronbach Alpha method, yielding a reliability coefficient of 0.83, which indicates a high level of internal consistency. Data collected were analysed using descriptive statistics, including mean scores and standard deviations.

Results and Discussion

Research Question 1: What are the available professional development interventions in Nigerian academic libraries?

Table 1: Available professional development interventions in Nigerian academic libraries

S/N	Item	Available	Not available
1	My library sometimes organizes workshops and seminars.	√	
2	My institution provides in-service training programmes specifically designed to improve librarians' skills.	√	
3	My library supports librarians to attend national and international conferences, symposia, or professional association meetings.	√	
4	My library encourages or facilitates participation in online professional development courses (webinars, MOOCs, e-learning platforms).	√	
5	My library has a formal staff development policy for professional development activities.	√	
6	My library encourages librarians to participate in mentoring or peer-coaching programmes for professional growth.	√	
7	My library sponsors librarians for certification or advanced academic qualifications relevant to librarianship		√

The results indicate that most of the listed professional development interventions are available to librarians in Nigerian academic libraries. Workshops and seminars are the most accessible intervention, followed by in-service training programmes specifically designed to improve librarians' skills, conference sponsorship and support for attendance at national and international professional meetings, online professional development courses such as webinars, MOOCs, and e-learning platforms, and mentoring or peer-coaching programmes. However, sponsorship for certification or advanced academic qualifications appears not to be available, suggesting that while some librarians receive institutional backing for higher degrees or professional certificates, this support is selective and often limited by budgetary considerations and institutional priorities. The results show that the majority of professional development interventions in Nigerian academic libraries are available in practice, especially workshops, in-service training, conference support, and some forms of online learning.

Research Question 2: What is the influence of professional development interventions on creative service delivery in Nigerian academic libraries?

Table 2: Influence of professional development interventions on creative service delivery in Nigerian academic libraries

S/N	Item	Mean	SD	Decision
1	Professional development activities in my library have improved my ability to design and introduce new or improved library services.	3.32	0.74	Strongly Agree
2	Training I have attended has helped me to use innovative approaches in responding to users' information needs.	2.81	0.82	Agree
3	Participation in professional development has increased my confidence in proposing creative solutions to library service challenges.	2.73	0.78	Agree
4	The skills acquired through professional development have enabled me to adapt library services to new technologies and user expectations.	3.25	0.71	Strongly Agree

S/N	Item	Mean	SD	Decision
5	After attending professional development programmes, I feel better equipped to experiment with new service models in the library.	2.65	0.85	Agree
6	Professional development has influenced the way I think about "best practice" and encouraged more original service ideas in my work.	2.77	0.79	Agree
7	The knowledge and skills gained from professional development have contributed to more responsive and user-oriented library services.	3.28	0.76	Strongly Agree
	Grand Mean	2.95	0.78	**Agree**

The mean scores indicate that professional development interventions in Nigerian academic libraries are generally perceived as supportive of creative service delivery. Items 1, 4, and 7, which fall within the Strongly Agree range (3.00–3.49), suggest that librarians strongly believe that professional development has improved their ability to design and introduce new or improved library services, to adapt services to new technologies and changing user expectations, and to make library services more responsive and user-oriented. In contrast, items 2, 3, 5, and 6, which fall within the Agree range (2.50–2.99), reveal that librarians acknowledge that training has helped them use innovative approaches, increased their confidence in proposing creative solutions, made them feel somewhat equipped to experiment with new service models, and influenced their thinking about best practice. The grand mean of 2.95 confirms that the overall influence of professional development on creative service delivery is positive

Research Question 3: What are the relationships between participation and innovative service adoption in Nigerian academic libraries?

Table 3: Relationships between participation and innovative service adoption in Nigerian academic libraries

S/N	Item	Mean	SD	Decision
1	The more frequently I participate in professional development, the more likely I am to adopt innovative service ideas in my library.	3.35	0.73	Strongly Agree
2	Librarians in my library who regularly attend training and conferences are more likely to initiate innovative services than those who do not.	3.28	0.77	Strongly Agree
3	When library staff participate in professional development, they are more willing to experiment with new technologies and service formats.	2.82	0.81	Agree
4	Participation in professional development broadens librarians' awareness of innovative practices in other libraries, which they try to adopt.	3.31	0.75	Strongly Agree
5	My willingness to adopt new service ideas increases when I see colleagues who have participated in training successfully implementing them.	2.76	0.79	Agree
6	Libraries that encourage higher participation in professional development tend to introduce more innovative services for users.	3.26	0.76	Strongly Agree
7	In my library, participation in professional development programmes is strongly linked to the readiness of librarians to embrace change in service delivery	3.33	0.74	Strongly Agree
	Grand Mean	3.10	0.76	**Strongly Agree**

The mean scores indicate that there is a clear and generally strong perception among Nigerian academic librarians that frequent participation in professional development is closely linked to the adoption of innovative service practices in their libraries. Items 1, 2, 4, 6, and 7, which fall within the Strongly Agree range (3.00–3.49), suggest that librarians believe that the more they attend training, seminars, and conferences, the more likely they are to adopt new service ideas, that colleagues who regularly participate in training are more likely to initiate innovative services, that training broadens awareness of practices in other libraries, that libraries with higher participation in professional development introduce more innovative services, and that participation is strongly tied to readiness to embrace change in service delivery. Items 3 and 5, which fall within the Agree range (2.50–2.99), show that participation makes librarians more willing to experiment with new technologies and service formats and increases their willingness to adopt ideas when they see colleagues successfully implementing them. The grand mean of 3.10 shows that the respondents strongly agree that participation in professional development is widely perceived as a key enabler of innovative service adoption, with librarians feeling that higher levels of engagement in training and conferences translate into a more open, adaptive, and change-ready service culture in Nigerian academic libraries.

Research Question 4: What are the challenges of professional development interventions on librarians' creative service delivery in Nigerian academic libraries?

Table 4: Challenges **of professional development interventions on librarians' creative service delivery** in Nigerian academic libraries

S/N	Item	Mean	SD	Decision
1	Limited funding for professional development prevents many librarians in my library from attending quality training and conferences.	3.33	0.72	Strongly Agree
2	Heavy workloads and staffing shortages make it difficult for librarians to attend or participate fully in professional development activities.	2.88	0.79	Agree
3	There is no clear or consistent policy in my library regarding staff participation in professional development and follow-through activities.	2.92	0.77	Agree
4	Training opportunities that are available are often not directly related to the skills needed for creative or innovative service delivery.	3.28	0.74	Strongly Agree
5	After training, there is inadequate support or resources to apply newly acquired skills in developing creative library services.	2.80	0.81	Agree
6	Some library administrators do not see professional development as directly relevant to improving librarians' creativity and innovation.	3.35	0.75	Strongly Agree
7	Long-term or continuous professional development programmes are rare, which limits sustained improvement in creative service delivery	3.31	0.73	Strongly Agree
	Grand Mean	3.07	0.76	**Strongly Agree**

The mean scores reveal that professional development interventions in Nigerian academic libraries are heavily constrained by funding gaps, workload pressures, weak policy frameworks, misalignment of training content, and managerial attitudes, all of which limit the extent to which such interventions can foster creative service delivery. Items 1, 4, 6, and 7, which fall within the Strongly Agree range (3.00–3.49), indicate that librarians strongly agree that limited funding prevents them from attending quality training and conferences, that available training is often not aligned with the skills required for creative and innovative services, that some administrators do not see professional development as directly linked to enhancing creativity, and that the rarity of long-term or continuous programmes hinders sustained improvement in creative service delivery. Items 2, 3, and 5, which fall within the Agree range (2.50–2.99), indicate that heavy workloads and staffing shortages, the absence of clear policies on participation and follow-through, and inadequate post-training support or resources are also seen as important constraints. The grand mean of 3.07 strongly agree and emphasizes that the combined effect of these challenges is perceived as a substantial barrier to transforming professional development into a powerful engine of creative and innovative service delivery in Nigerian academic libraries

Discussion of findings

Available professional development interventions in Nigerian academic libraries

The results indicate that most of the listed professional development interventions such as workshops, in-service training, conference support, and some forms of online learning are available to librarians in Nigerian academic libraries. Available empirical studies in Nigerian academic libraries generally support the pattern revealed in the table, where workshops, seminars, in-service training, and conference attendance are relatively common, while formal staff development policies and structured mentoring are less prevalent. Clements (2019) found that sponsorship for conferences, seminars, and workshops, along with informal individual mentoring, are the dominant forms through which librarians receive professional growth support, which corresponds with the relatively high availability reported for items 1, 3, and 6 in the present table. Similarly, Bowen-Chang and Hosein (2019) in a survey identified self-development, in-service training, and conference participation as key professional development modalities, arguing that institutions sponsor these activities but often without a comprehensive written policy. A later study by Begum (2017) similarly reported that mentoring programmes are usually informal and closely tied to sponsorship for professional events and on-the-job support, rather than to documented institutional policies, reinforcing the conclusion that Nigerian academic libraries provide a mix of practical, event-based continuous professional development frameworks.

Influence of professional development interventions on creative service delivery in Nigerian academic libraries

The table shows that professional development interventions in Nigerian academic libraries are positively associated with librarians' ability to deliver more creative and user-oriented services, especially in areas such as service redesign, adaptation to new technologies, and responsiveness to user needs. Several empirical studies in Nigerian academic libraries corroborate the pattern shown in table 2, where professional development is seen as positively influencing librarians' competencies and service delivery. Anene and Idiedo (2021) found that staff training and development programmes significantly influence the job performance of librarians, with participants reporting enhanced ability to use modern information systems and digital tools. Librarians acknowledge that training helps them adopt innovative approaches, feel more confident in proposing solutions, and reflect on best practice. A related study by Begum (2017) on staff development programmes and service delivery revealed that regular workshops, seminars, and conference attendance are associated with improved service quality and user satisfaction, indicating that training supports incremental innovation, even though some librarians still hesitate to deviate from conventional models.

Relationships between participation and innovative service adoption in Nigerian academic libraries

The data shows that librarians perceive a strong positive relationship between participation in professional development and the adoption of innovative service practices in Nigerian academic libraries. Several empirical studies in Nigerian academic libraries support the pattern revealed in table 3, where participation in professional development is positively associated with the adoption of innovative service practices. Oduwole (2020) found that there is a very high positive relationship between in-service training and the extent of service delivery in university libraries, with trained librarians showing greater ability to apply new methods and technologies in service design. Librarians report that participation increases their likelihood of adopting innovative ideas, exposes them to practices in other libraries, and enhances the overall innovativeness of the library. A study by Madukoma and Garba (2022) revealed that regular staff training and development programmes significantly improve librarians' problem-solving and adaptability, particularly in the use of digital tools and user-oriented services. Participation is seen as making librarians more willing to experiment with new formats and to adopt ideas when they observe successful implementation by trained colleagues. Similarly, a study by Juma, Nakaziba and Holmner (2021) reported that librarians who participate more frequently in training and conferences are more likely to introduce new service models and to align their practices with emerging trends, reinforcing the conclusion that participation acts as a gateway to innovation rather than merely a technical upskilling exercise.

Challenges of professional development interventions on librarians' creative service delivery in Nigerian academic libraries

The data shows that librarians perceive a cluster of policy-related and structural constraints such as limited funding, heavy workloads, lack of clear policies, misaligned training content, inadequate post-training support, unsupportive administrative attitudes, and the scarcity of long-term programmes that significantly constrain how professional development interventions can support creative service delivery in Nigerian academic libraries. Several empirical studies in Nigerian academic libraries corroborate the patterns revealed in table 4, where financial, policy, and managerial constraints are identified as key challenges to the effectiveness of professional development interventions. Hicks (2017), in a study on the professional development of library professionals in libraries, reported that limited budgetary allocation for training, heavy reliance on self-sponsorship, and inadequate institutional policies are major barriers to meaningful staff development. Librarians see funding shortages, unclear policies, and the absence of long-term programmes as central constraints. A later study by Begum (2017) on the influence of professional development on librarians' job performance found that although training improves technical skills, its impact on innovation and service quality is often limited by poor alignment of training content with actual service needs and by weak follow-up support. Similarly, a study by Clements (2019) on the relationship between professional development and service delivery observed that some library administrators view training primarily as a technical compliance exercise rather than as a strategic tool for innovation, and that this managerial attitude reduces the likelihood of sustained creative experimentation after training. Librarians report that professional development is not seen as directly relevant to improving creativity and innovation.

Conclusion

The study concludes that professional development interventions in Nigerian academic libraries have a positive but constrained impact on librarians' creative service delivery, with librarians perceiving these interventions as helpful for improving service responsiveness, adapting to new technologies, and adopting innovative ideas, but also as being significantly limited by funding shortages, heavy workloads, weak or absent staff development policies, misalignment of training content with creative service needs, inadequate post-training support, and unsupportive managerial attitudes that do not fully recognize professional development as a driver of innovation. Although participation in workshops, seminars, and conferences is linked to higher willingness to experiment with new service models and to greater awareness of best practices, these benefits are unevenly realized because many libraries rely on sporadic, short-term, and poorly resourced programmes rather than sustained, policy-driven initiatives that deliberately foster creativity and innovation in service design.

Recommendations

The study recommended the following:

1. University managements should develop a clear, written staff development policy that guarantees regular budgetary allocation for professional development, including sponsorship for conferences, workshops, and long-term training, so that limited funding ceases to be a major barrier to librarians' participation and creative application of new skills.
2. Library administrators should ensure that professional development activities are explicitly tailored to build competencies in creative service design so that training content is directly relevant to the kinds of services librarians are expected to develop and improve.

3. Libraries should establish mechanisms for post-training support such as mentoring teams, so that librarians are not only trained but also equipped with the resources and institutional backing needed to translate newly acquired skills into concrete creative service initiatives.
4. University and library management should be sensitized through targeted seminars and policy dialogues on the strategic role of professional development in innovation, so that administrators actively see professional development as a lever for improving librarians' creativity and service quality rather than as a peripheral activity.

ABSTRACT

Democratization of knowledge has emerged as a critical strategy for promoting diversify and inclusive learning in an increasingly globalized and digitalized world. This empirical review examines how equitable access to knowledge, participatory learning practices, and open educational resources (OER) contribute to inclusive and educational environments across diverse socio-cultural contexts. The related scientific literatures reviewed examined how equitable access to knowledge contributes to diversification and inclusive learning achievement. A meta-analysis and research synthesis of 30 works published not more than 10 years ago was reviewed to investigate the effects of democratization of knowledge on diversification and inclusive learning. Drawing on a systematic analysis of existing empirical studies, the review synthesizes evidence on the role of knowledge democratization in reducing educational inequalities related to gender, socioeconomic status, disability, ethnicity, and geographic location. The result revealed that democratized knowledge systems characterized by open access, learner-centered pedagogies, and the integration of indigenous and marginalized knowledge significantly enhance learner engagement, representation, and academic outcomes. The review analysis also identified some challenges such as digital divides, institutional resistance, and policy limitations, which inhibit the full realization of diversification and inclusive educational goals. This review contributes to the body of knowledge on diversity and inclusive education, and can help educators, librarians, policymakers, and stakeholders seeking to foster diversify and inclusive learning through knowledge democratization. The study therefore recommended library support in promoting equal access to learning resources, OER and online learning platforms, provision of adequate internet connectivity, electricity supply and affordable technological devices, and adequate teacher and lectures training on inclusive pedagogical practices.

Key words: Democratization of Knowledge; Diversify Learning; Inclusive Learning; Empirical Review.

Introduction

In an increasingly digitalized world, democratization of knowledge has emerged as a global educational movement aimed at ensuring participatory, inclusive, and equitable access to knowledge for all learners regardless of socio-economic, cultural and geographical statues. Okoye & Ejikeme (2021) defined democratization of knowledge as the use of digital technologies and open educational practices (OEPs) to bridge educational inequalities and learning accessibility. United Nation Educational Scientific and Cultural Organization (UNESCO) (2021) on the other hand described democratization of knowledge as the promotion of universal access to information and learning resources through inclusive educational systems and digital innovations. From the ongoing, democratization of knowledge therefore, refers to as a transformative approach aimed at reducing educational inequalities and fostering inclusive and diversified learning opportunities for members of society. The key foundational pillars driving the democratization of knowledge in learning environments includes; Open Educational Resources (OER) and Open Access, Participatory Pedagogies and Knowledge Co-creation, Epistemic Decolonization, Digital Technologies and Indigenous Knowledge.

A lot of studies have revealed several benefits of democratization of knowledge. Wood et al. (2019) maintained that democratization of knowledge promotes collaboration among students, researchers, educators, and communities across different regions of the world. Ainscow, (2020) and Jenkins *et al*. (2018) buttressed that democratization of knowledge supports inclusive education by ensuring that marginalized groups such as women, persons with disabilities, rural learners, and minority communities can participate actively in educational processes. Furthermore, democratization of knowledge helps to document and disseminate indigenous knowledge systems that are often neglected in traditional educational structures (Ajani, 2024). Another significant benefit of democratization of knowledge is the growing acceptance and implementation of OER and OER-enabled pedagogy. The OER-enabled pedagogy encourages students to become active contributors to knowledge rather than passive consumers of information (Wiley& Hilton, 2018). From the ongoing, studies therefore indicate that democratization of knowledge encourages learner autonomy, peer interaction, multicultural engagement, and active participation in educational praxis thereby, fostering diversity and inclusivity in learning.

Inclusive learning is an educational approach and learning environment that ensures all learners, regardless of their backgrounds, abilities, gender, ethnicity, socioeconomic status, or language, have equal access to learning opportunities. Ainscow (2020) defined inclusive learning as a process of strengthening the capacity of the education system to reach all learners through participation and equality. Similarly, Inclusive education is conceived as a process that aims to recognize and respond to the diversity of students' needs, with the goal of ensuring effective learning and reducing exclusion both within and outside educational institutions (Singha, 2026). Inclusion in the classroom therefore, aim to ensure equal opportunity, promote equity, uphold human rights, and embrace diversity, all while enhancing the social, and academic environment of every student in the school, simultaneously reducing exclusion (Sarker, et al., 2024). Moreover, the interconnectedness between democratic practices and inclusive learning indicates an opportunity to incorporate democratic values through learning to promote diversify learning. So, to diversify learning as an education approach is an effective way to understand and value individual differences in their learning styles, background, ability, cultural, language, and life experiences. Singha, (2026) contended that diverse learning style is an ideal for different types of learners such as students with disability, gifted learners and multilingual students etc. Enhanced diverse learning styles significantly enhance students' engagement, improve retention, and promote equity in educational settings. John & Donald, (2024) opined that diversity in learning styles recognizes that individuals absorb, process, and retain information in unique ways, influenced by their cognitive preferences, backgrounds, and experiences. Therefore, the prospects of an enhanced inclusive and diversify learning through democratization of knowledge cannot be overemphasized. In support of this view, Cubides *et al*., (2024) maintained that OER can enhance diversified and inclusive learning outcomes by providing free access to quality resources, allowing for customization to meet diverse needs, and promoting collaborative practices that foster knowledge co-construction. Ebele, (2024) maintained that Enhancing Inclusive and diversify learning through the democratization of knowledge involves incorporating indigenous knowledge into formal education systems to gain global attention as a means to promote cultural sustainability, environmental awareness, and inclusive development. Abdul-Rahim et al. (2024) posits that Integrating Indigenous Knowledge into public libraries would promote inclusive service delivery, ensuring equal access to information for all members of society, and increases engagement in learning regardless of literacy or social status.

However, studies have revealed that despite the immense potential and the significant benefits of democratization of knowledge in enhancing inclusive and diversify learning; its full realization faces persistent challenges. Challenges such as, digital inequality and unequal access to learning resources, linguistic diversity and communication barriers, marginalization of indigenous knowledge, inadequate teacher preparation and pedagogical challenges, cultural and social exclusion, language exclusion, insufficient funding for educational technologies, inadequate technological infrastructure, and poor internet connectivity, heavily restrict its implementation (Adarkwah, 2021).

This review therefore, seeks to examine how the democratization of knowledge promotes diversity and inclusive learning based on evidence from empirical studies. The specific objectives includes; to identify the various strategies and approaches used to democratize knowledge for enhanced inclusion and diversity in learning, to assess the benefits of democratization of knowledge in fostering equity, participation and learner engagement, and to identify the challenges associated with the implementation of knowledge democratization for inclusive and diverse learning.

Methodology

A meta-analysis and research synthesis of 30 works published not more than 10 years ago was reviewed to investigate the effects of democratization of knowledge on diversification and inclusive learning. Through different search engines and relevant databases, the keywords such as democratization of knowledge, OER, diversification and inclusive learning, were used to filter the relevant publications. Over 65 published works were downloaded from different databases prior to selection of the 30 used for this review. Drawing on a systematic analysis of existing empirical studies, the review synthesizes evidence on the role of knowledge democratization in reducing educational inequalities related to gender, socioeconomic status, disability, ethnicity, and geographic location.

Literature Review

This review deals only on the review of empirical study which was summarized through the following sub-headings.

Studies on Open Educational Resources and Enhanced Diversify Learning.

Mayer, (2023) carried out a study to compare course passing and completion rates for undergraduate students to determine if there was any relationship between use of OER and these two outcomes. Using a quantitative analysis the study revealed that using OER had a positive impact on course passing rates (7% increase) and completion rates (10% increase) for all students. The result also revealed the student perception that OER had some positive impact on their course participation and ability to pass, but less influence on course completion. As a result of OER, students and faculty observed a significant increase in student engagement, and all faculties reported an evolution in pedagogical approaches.

Studies on Participatory Pedagogies/ Knowledge Co-Creation and Inclusive-Diverse Learning

Students acting as co-creators of academic material are growing in popularity as a pedagogical approach in higher education. Werth & Williams (2021) conducted a study to examine the experience of students' participation in a first-year course utilizing OER-enabled Pedagogy. Using an exploratory research, a mixed-methods approach was used for collecting data through semi-structured interviews which comprises of 12 students. Findings revealed that students are generally motivated and engaged by the prospect of their work having meaning outside the limitations of the disposable assignment. Result also indicates that a plurality of students preferred the project using OER-enabled Pedagogy, indicating it increased engagement and skills acquisition.

In a study by Adom et al. (2023) aiming to find out whether UDL (universal design learning) has the potential in improving the learning processes and learning outcomes of the diverse students reading a History of Global Art course. The findings of the study revealed that the UDL principles of multiple means of representation, multiple means of engagement and action, and expression impacted positively on students' learning processes and outcomes. The study contends that though the UDL as an inclusive pedagogical approach requires a lot of dedication on the part of the instructor as well as a great deal of time and material resources, the accrued benefits of its implementation on the students' learning processes and learning outcomes are far-reaching.

Bovill, (2018) conducted a study which examined how students participated in curriculum design and classroom decision-making. The findings revealed that co-creation improved student engagement, inclusivity, and learner confidence while reducing hierarchical barriers between lecturers and students.

Studies on Democratization of Knowledge and Inclusive and Diversified Learning

Qorib, (2024) conducted a study to examine the influence of critical diversity literacy on differentiation learning for students at Muhammadiyah University of North Sumatra. The mix-method research method was used. The results revealed that the diversified instruction learning model had a beneficial influence on learning critical reading of diversity literacy in inclusive education. The differentiated instruction learning model allows students to gain an in-depth understanding of their own diversity, learn to see and hone thinking and communication skills, increase self-confidence, and use critical thinking in viewing diversity in order to have a moderate attitude toward religion.

Mumpuniarti *et al*. (2020) conducted a study to describe regular teacher's most important aspects of competency, as well as their obstacles and challenges in implementing learning in inclusive schools. The research instrument consisted of 21 closed-ended questions and 4 open-ended questions. The findings from the study shows that the inclusive teachers possessed the pedagogical competence to help them face the diversity of the students from various aspects; the regular teachers were able to manage the diverse learning needs, and found some obstacles in managing students diversity.

Sarker *et al*. (2024) conducted a study to examine the democratic competencies embedded in student-centric classroom practices and argues for the potentiality of students-centric classroom activities in catering to an inclusive classroom environment. Focus group discussion (FGD) was used as instrument for data collection. The study revealed that democratic competencies are practiced in Bangladeshi classrooms and students hold a positive attitude, hence there is a scope for promoting inclusion through such practices. The study also revealed that some key practices, e.g., group works, cooperation in learning, embracing diversity and tolerance, respect for orderliness, autonomous learning, etc. appears to be conducive to an inclusive classroom. The implication of the study is that more research is needed to operationalize the democratic competencies for the Bangladeshi classroom context for an inclusive classroom.

Studies on Democratization of knowledge and Indigenous Knowledge Inclusion.

Aga, (2023) carried out a study to examine Africa's knowledge (in)dependency by assessing African universities' knowledge production and dissemination gaps vis-à-vis indigenous knowledge, and constraints to- and opportunities for- knowledge democratization. The result showed that there were constraints emanating from historical antecedents; ideology; Eurocentric and global North/West epistemic dominance; re-westernization designs, African resource, technology, and science limitations; and language barriers to participate in knowledge co-creation. Whereas there were opportunities to democratize knowledge, failure to expedite them catapulted the constraints/hurdles to reinforce power imbalance, to exacerbate the gaps/conflicts, and to sustain African knowledge dependency. This therefore, calls for revitalizing and reinvigorating concerted energies and talents to connect knowledge production to practical concerns of everyday life of the knowledge users and/or participants; and to engage in production and utilization of relevant, responsive, and competent knowledge responsive to methodological, epistemological, ontological, and socio-political realities.

Ebele (2024) in his study explored strategies for integrating indigenous knowledge into primary education in Nigeria and examine its impact on sustainable development and inclusive growth. A descriptive survey design was employed, involving 111 participants comprising primary school teachers, educational administrators, and indigenous community members across selected Local Government Areas in Nigeria. Findings revealed that integrating indigenous language in curriculum development and utilizing hands on materials and experimentation significantly enhanced students' cultural and environmental understanding.

Abdul-Rahim *et al*. (2024) in a separate study investigated how the dominance of colonial supremacy and foreign knowledge has become persistent in many African public libraries and knowledge acquisition, including Ghana. This study adopted the interpretive research paradigm using a qualitative case study design. The study found that, professional staff development, budget allocation for the purchase and provision of materials, and the creation of conducive environment for IK owners and other patrons who wish to document IK in public libraries were revealed as the efforts put in place by public libraries to support IK documentation and integration.

Studies on Digital Technologies and Enhanced Diversity and Inclusion in Learning

Samaiego López *et al*. (2025) carried out a study to examine whether the adoption of technologies facilitates or poses challenges for achieving effective inclusive education. Through a Systematic Literature Review, the most commonly used technologies were identified, and both their benefits and challenges were evaluated. The findings revealed the use of various technologies in inclusive educational settings, such as screen readers, braille devices, and augmented reality technologies. Their benefits include improved accessibility, enhanced active participation, and the promotion of critical skills like critical thinking and creativity. This study has limitations, including variability in the quality of the studies analyzed, which may affect the generalization of the results. Future research should explore the long-term impacts of technologies on inclusive education and evaluate the necessary teacher training strategies for their effective implementation.

Haleem *et al*. (2022) emphasized the transformative impact of digital technologies on the education system, particularly after the COVID-19 pandemic, highlighting their ability to personalize learning and expand access, although challenges related to equity, teacher training, and effective integration persist. Similarly, Chambers, (2020) focused on assistive technologies, underscoring their role in integrating students with functional diversity through devices and services that enhance capabilities, facilitate social interaction, and improve curricular access. UNESCO, (2021) examined how digital technologies improved access to education among marginalized learners across developing countries. Using survey and case-study methods in Africa and Asia, the study found that digital platforms, online repositories, and mobile learning enhanced participation among women, rural learners, and students with disabilities. However, unequal internet access still remained a challenge.

Studies on Challenges and Strategies Encountered for Enhancing Inclusive and Diversify Learning Through Democratization of Knowledge.

Challenges:

The empirical evidence in this reviewed study indicates that the major challenges affecting the implementation democratization of knowledge for effective inclusive and diversity in learning includes high costs, lack of adequate training for teachers, social inequalities, and ethical barriers.

In a study by Nykyporets *et al*., (2023) to investigate the current state of OER adoption in Ukraine observed that despite advancements in OER adoption, challenges persist, such as a lack of quality control mechanisms, limited digital infrastructure, and language barriers, which hinder the broader adoption of OER in Ukraine. Nwankwo, (2024)conducted a study investigating the effectiveness of preservation strategies for indigenous knowledge management in public libraries across Southeastern Nigeria, specifically in Anambra, Imo, Abia, Ebonyi, and Enugu states. A random sampling technique was applied to select 130 librarians from public libraries in the region, with 117 (90%) completed questionnaires returned for analysis. The findings revealed that challenges such as inadequate technology, financial resources, and training were identified as significant barriers.

Ajani *et al*. (2025) in his study revealed some challenges in fostering knowledge democratization and accessibility within the framework of the fifth industrial revolution. The findings also point to persistent barriers, including poor digital infrastructure, unreliable power supply, limited funding and skills gaps, which disproportionately affect libraries in underserved regions. The participants proposed context-specific solutions such as government investment in green infrastructure, local content development and stronger public–private partnerships.

Silva Sánchez *et al*. (2019) conducted a study on inclusive education and represents the way forward to achieving high quality education systems, which are fair and equitable. This paper analyzed the barriers to learning and the current participation of schools in the promotion of inclusion from the perspective of future teaching professionals, specifically, 86 students from three Masters Courses in the Faculty of Education of the University of Murcia. The results showed many barriers and obstacles in the educational centers such as a lack of teacher training, underuse of existing resources, as well as an educational response lacking in organizational and didactic strategies which does not take responsibility for a just and inclusive curriculum for all students. Furthermore, Wiche & Ogunbodede (2021) conducted a study which investigated awareness and use of OER by Library and Information Science Students of Ignatius Ajuru University of Education, Rivers State, Nigeria. The researchers adopted descriptive survey design. From the findings, despite that the students have high level awareness of the concept of OER and high level of utilization of the diverse types of OER, inadequate information literacy skills, poor electricity supply, poor internet connectivity, lack of library sensitization and lack of support from lecturers on the use of OER, were some of the challenges to the effective use of OER.

More so, Vartanova & Gladkova (2022) in his study revealed that one major challenge is unequal access to digital technologies and internet resources. Empirical evidence indicates that students from marginalized, rural, and low-income backgrounds often lack adequate access to digital infrastructure necessary for participating in democratized learning systems such as online education, open educational resources (OER), and blended learning platforms (Silva Sánchez *et al*., 2019). Researches also demonstrate that linguistic diversity creates challenges for inclusive learning within democratized educational environments. Students from different language backgrounds often struggle to access and interpret academic content framed within dominant linguistic norms.

Some empirical studies also revealed that democratization efforts do not always ensure equal representation of diverse knowledge systems (Knöchelmann, 2021). Western or dominant perspectives often overshadow indigenous, local, or minority forms of knowledge. This results in epistemic injustice and marginalization of indigenous knowledge, where some voices are systematically undervalued or ignored.

Other challenges include inadequate teacher preparation and pedagogical challenges (Mumpuniarti et al., 2020; Adu-Boateng&Goodnough, 2021).

Strategies:

Strengthening Digital Inclusion and Access to Learning Resources: One of the most effective strategies identified in empirical studies is expanding digital access and technological infrastructure for underserved learners. Research shows that providing affordable internet access, digital devices, and open learning resources improves participation and inclusion in democratized learning environments (Oye, 2019).

Teacher Training and Professional Development: To examine teacher professional development approaches for implementing inclusive education practices, identifying barriers, facilitators, and effective models that support successful program implementation and sustainable classroom practice changes. The empirical studies by Tuerah, (2025) identified teacher preparation and professional development as essential strategies for inclusive and diverse learning. Teachers who receive training in inclusive pedagogy are better equipped to manage diverse classrooms and support learners with different educational needs.

Development of Inclusive Educational Policies and Institutional Support: Empirical evidence further suggests that effective institutional policies and sustained funding are critical for overcoming barriers to inclusive learning. Research by Filippou *et al*. (2025) on inclusive education systems found that institutions with strong support structures, collaborative policies, and accessible learning environments achieved better outcomes in inclusive education implementation. Flexible assessment systems, awareness programs, and interdisciplinary support networks were identified as important institutional strategies for enhancing inclusivity.

Integration of Indigenous Knowledge and Multilingual Education: Research indicates that integrating indigenous knowledge systems and multilingual teaching approaches can reduce epistemic exclusion and improve inclusivity in learning. A study by Adebiyi et al. (2025) on African higher education recommended incorporating indigenous languages and local epistemologies into digital learning systems to counteract the dominance of Western knowledge structures. The researchers argued that communities of practice grounded in local cultures enhance equitable participation and knowledge democratization.

Findings of the Study

The summary of the findings showed that various approaches for democratizing knowledge systems are characterized by OER and open access, participatory pedagogies and knowledge co-creation. Similarly, digital technologies and indigenous knowledge significantly promotes inclusive and diversity as it encourages slearner engagement, representation, and academic outcomes.

Conclusion

In conclusion, the democratization of knowledge has emerged as a transformative approach for enhancing inclusive and diversified learning across educational environments. By promoting open access to information, participatory learning, digital technologies, and collaborative knowledge creation, learners from different social, cultural, economic, and geographical backgrounds are provided with equal opportunities to acquire and share knowledge. This approach helps to reduce educational inequalities, empower marginalized groups, and encourage lifelong learning through accessible and flexible learning platforms. Democratization of knowledge also supports inclusive education by recognizing diverse perspectives, indigenous knowledge systems, and learner-centered pedagogies that value participation and engagement. The integration of OER, digital libraries, online learning platforms, and collaborative technologies has significantly expanded access to quality educational materials and fostered global learning communities. As a result, learners are better equipped with critical thinking, creativity, and problem-solving skills needed in the modern knowledge society.

Recommendations

Based on the findings of the review of studies on promoting diversity and inclusive learning through the democratization of knowledge, the following recommendations are made.

1. Libraries should adopt various approaches of democratization of knowledge by promoting equal access to learning resources by expanding the availability of digital libraries, OER, and online learning platforms. This will enable learners from different socio-economic, cultural, and geographical backgrounds to access quality educational materials without discrimination.
2. Libraries should invest in adequate digital infrastructure such as stable internet connectivity, electricity supply, and affordable technological devices, especially in rural and underserved communities. Improved infrastructure will reduce the digital divide and support inclusive participation in learning.
3. Teachers and lecturers should be trained regularly on inclusive pedagogical practices and the effective use of technology in knowledge sharing. Professional development programmes will equip educators with the skills needed to accommodate diverse learners and create learner-centered environments.

Abstract
This study investigated Public library infrastructure and service Delivery in Nigeria: Assessing the consequences of facility Decay. The study has four research questions. The research adopted the descriptive survey design and employed stratified random sampling on 100 library staff across librarians who are members of Nigerian Library Association from Delta and Bayelsa state and possesses comparative insights into public library deterioration given shared federal funding constraints. Guided by 4 objectives, data collection utilized validated Infrastructure Assessment Questionnaire, analyzed through descriptive statistics including means, standard deviations. Findings showed basic facilities like reading rooms shelving restrooms and parking available but critical modern ones including electricity computers ventilation and security absent. There is moderate agreement on structural conditions such as roofs walls flooring windows electrical systems and furniture but disagreement on plumbing air conditioning and overall maintenance revealing utility weaknesses. There is a very high extent impact of decay on service delivery, manifesting in reduced operating hours collection inaccessibility power disruptions user discomfort interruptions low patronage delays morale decline and program cuts. Challenges were funding shortages, skilled personnel gaps, maintenance neglect, vandalism, repair delays, budget constraints and poor construction. The study concluded that there is a systemic neglect hindering public libraries role in community development education and information access. The study recommends targeted budget allocations for missing facilities routine inspections preventive maintenance skilled teams and public-private partnerships to reverse decay restore services
Keywords: Infrastructure Decay, Public Libraries, Service Delivery, Facility Assessment, Librarians, Nigeria

Introduction

Public libraries serve as vital institutions for democratic knowledge dissemination, lifelong learning, and community development in Nigeria, functioning as accessible hubs where citizens engage with information resources free of charge. These facilities embody the ideals of the UNESCO Public Library Manifesto, which emphasizes equitable access to educational, cultural, and recreational materials for all demographics regardless of socioeconomic status (IFLA/UNESCO, cited in Agim, Mohammed & Obande, 2024). In the Nigerian context, public libraries trace their evolution from colonial-era establishments like the Tom Jones Library in Lagos in 1910 to state-managed systems post-independence, designed to support national literacy goals and socioeconomic progress (Abubakar, 2017). Theoretically, robust physical infrastructure underpins effective service delivery by providing conducive environments for reading, research, and community programs, aligning with systems theory where facility conditions directly influence organizational outputs and user satisfaction. This foundational role positions public libraries as engines of human capital development, particularly in a nation striving for sustainable development amid rapid urbanization and digital transitions.

The physical infrastructure of public libraries encompasses essential elements such as spacious reading halls, reliable power systems, climate-controlled storage for collections, and accessible sanitary facilities, all critical for sustaining operational efficiency and user comfort. Theoretical frameworks like the technology acceptance model extended to facilities suggest that the perceived quality of physical environments significantly determines user engagement and service utilization (Davis, 1989). In Nigeria, these infrastructures are expected to facilitate diverse services including literacy programs, digital access points, and cultural events that foster social cohesion and educational equity. However, the symbiotic relationship between infrastructure integrity and service delivery reveals that well-maintained facilities enable librarians to focus on value-added activities like information literacy training rather than crisis management (Ibe, 2014). This theoretical linkage underscores infrastructure not merely as a backdrop but as an active determinant of library performance in resource-constrained settings.

Despite their theoretical and practical importance, public library infrastructures across Nigeria suffer from systemic neglect, manifesting in dilapidated buildings, erratic utilities, and obsolete equipment that compromise functionality. Scholars highlight how chronic underfunding perpetuates this cycle, with state allocations prioritizing recurrent expenditures over capital maintenance (Anyalebechi & Odu-Anyanwu, 2016). Opinion pieces in library literature argue for a paradigm shift toward preventive maintenance cultures, drawing from dynamic capabilities theory where

organizations adapt infrastructure to environmental demands for competitive service delivery (Aiyebelehin, Onyam & Akpom, 2018). Recent analyses emphasize that in developing contexts like Nigeria, infrastructure decay transcends physical wear, embodying governance failures that hinder libraries' contributions to national development agendas. This theoretical critique calls for integrated policy reforms to restore facilities as enablers of inclusive knowledge ecosystems. Therefore, this study will examine Public library infrastructure and service Delivery in Nigeria: Assessing the consequences of facility Decay

Statement of the Problem

Ideally, public library facilities in Nigeria should feature modern, well-maintained infrastructures including spacious, ventilated reading areas, stable electricity, functional ICT equipment, and secure storage systems to deliver seamless services that promote literacy, research support, and community engagement nationwide. This optimal scenario aligns with global standards where robust facilities ensure uninterrupted access to resources, fostering user satisfaction and institutional relevance (IFLA/UNESCO, 1994). In reality, however, widespread infrastructural decay prevails, characterized by leaking roofs, non-functional air conditioning, power outages, and crumbling structures across state libraries, severely limiting operational hours and service scope. These deficiencies result in profound consequences such as diminished user patronage, interrupted digital services, compromised collection preservation, reduced staff productivity, and overall erosion of public libraries' role in national development, exacerbating information poverty in underserved communities. Previous studies have documented funding shortages and policy gaps but largely focused on urban academic libraries or general service challenges, overlooking the nationwide extent of infrastructural decay's specific debilitating effects on public library service delivery and lacking integrated theoretical analyses of causal pathways. This study will address these gaps by providing a comprehensive examination grounded in Nigerian public library contexts

Objectives of the Study

The main objectives of the study were to examine Public library infrastructure and service Delivery in Nigeria: Assessing the consequences of facility Decay. The specific objectives were to:

1. Find out the physical infrastructural facilities available in public libraries
2. Assess the conditions of the physical infrastructural facilities in public libraries
3. Evaluate the extent at which infrastructural decay affects service delivery in public libraries
4. Examine challenges to infrastructural decay of public library facilities that affects service delivery in public libraries.

Research Questions

The following research questions guided the study:

1. **What physical infrastructural facilities are available in public libraries?**
2. **What is the condition of the physical infrastructural facilities in public libraries?**
3. **To what extent does infrastructural decay affect service delivery in public libraries?**
4. **What are the challenges contributing to infrastructural decay in public library facilities that impacts service delivery?**

Review of Related Literature

Public Library Facilities

Public library facilities in Nigeria encompass physical structures and amenities designed to support free access to information resources for diverse community needs, including spacious reading rooms, collection storage areas, ICT centers, and multipurpose halls for educational programs. These facilities, primarily managed by state library boards under the National Library of Nigeria framework, have evolved since the 1953 UNESCO seminar on African public libraries to include digital access points amid growing demands for hybrid services (Agodi & Obasi, 2016). Recent studies highlight that optimal facilities feature reliable power backups, climate control for preservation, ergonomic furniture, and accessible restrooms to enhance user experience and operational efficiency (Abubakar, 2017). However, geographical disparities persist, with urban centers like Lagos and Abuja boasting better-equipped branches while rural divisional libraries often lack basic amenities such as functional lighting and ventilation systems. Theoretical perspectives rooted in facility management theory emphasize that well-designed infrastructures not only extend resource lifespan but also promote inclusivity for vulnerable groups including children, the elderly, and persons with disabilities (Aiyebelehin et al., 2018). Scholars argue that strategic facility planning, incorporating sustainable materials and modular designs, remains crucial for adapting to population growth and technological shifts in Nigerian public libraries (Ibe, 2014). Despite policy guidelines from the Library Registration Council of Nigeria advocating standardized facility benchmarks, implementation gaps hinder equitable distribution across the 36 states and Federal Capital Territory (Agim & Azolo, 2022). This underscores the need for integrated facility audits to align physical assets with service mandates, ensuring public libraries fulfill their role as community knowledge hubs in Nigeria's development landscape.

Service Delivery

Service delivery in Nigerian public libraries involves the provision of lending, reference, literacy training, digital access, and outreach programs tailored to foster education, recreation, and civic engagement among citizens. Conceptualized through service quality models like SERVQUAL, effective delivery hinges on tangibles such as facilities alongside reliability, assurance, empathy, and responsiveness from staff (Elejene, Agim & Umunnakwe, 2025). Recent empirical work reveals that core services include book loans, internet facilitation, storytelling sessions for children, and career guidance workshops, all aimed at bridging information divides in underserved communities (Agodi et al., 2016). Challenges like staffing shortages and resource scarcity often result in inconsistent delivery, with librarians prioritizing basic functions over innovative extensions such as mobile library vans for rural areas. Theoretical analyses apply contingency theory to argue that service adaptability to local contexts enhances user satisfaction and institutional relevance in resource-limited environments (Aiyebelehin et al., 2018). The integration of digital services like e-resource portals and virtual reference desks has helped to complement traditional offerings amid Nigeria's digital divide. Performance metrics indicate that proactive user education programs significantly boost patronage, yet infrastructural limitations curtail their scalability across states (Salman & Moster, 2017). Overall, literature positions service delivery as a dynamic process requiring continuous staff training and community partnerships to meet evolving demands from literacy promotion to lifelong learning support.

Infrastructure Decay in Public Library Facilities

Infrastructure decay in Nigerian public library facilities manifests as progressive deterioration of buildings, utilities, and equipment due to chronic underfunding, deferred maintenance, and environmental factors, compromising long-term viability. Characterized by leaking roofs, cracked walls, obsolete electrical systems, and non-functional HVAC units, this decay stems from systemic governance lapses where capital budgets receive minimal allocations (Salman & Moster, 2017). Recent investigations attribute accelerated decay to erratic power supply eroding ICT infrastructure and tropical climate accelerating material degradation in states like Enugu and Kano (Agodi et al., 2016). Theoretical lenses such as resource dependence theory explain how overreliance on inconsistent state funding exacerbates vulnerability to decay without diversified revenue streams (Agim, Abah & Ezejiofor, 2025). Empirical findings from 2018 surveys document widespread obsolescence in shelving, furniture, and sanitation facilities, particularly in northern branches affected by insecurity-related neglect (Aiyebelehin et al., 2018). A scholar advocated for preventive maintenance protocols, yet implementation falters due to skill gaps among custodians and procurement hurdles for spare parts (Oyedun, 2021). Comparative analyses with South African public libraries reveal Nigeria's decay rates heightened by policy discontinuity post-2015 economic recessions (Mojapelo, 2020). Addressing this requires holistic frameworks integrating asset management software and public-private partnerships to halt the vicious cycle undermining facility resilience nationwide.

Effects of Infrastructure Decay on Public Library Service Delivery

Infrastructure decay profoundly debilitates public library service delivery in Nigeria by curtailing operational capacity, user access, and program execution, creating cascading failures in core functions. Decayed facilities lead to reduced opening hours from power failures and safety hazards, directly diminishing lending volumes and reference consultations as evidenced in multi-state audits (Okeke, Onuorah & Okonkwo, 2016). User deterrence arises from uncomfortable environments lacking ventilation or seating, resulting in low patronage and feedback loops of further underutilization (Agodi et al., 2016). Theoretically, the input-process-output model illustrates how facility breakdowns disrupt service workflows, elevating staff stress and turnover intentions while compromising collection preservation through humidity damage (Aiyebelehin et al., 2018). Recent studies quantify impacts through service interruption metrics, showing digital offerings stalled by faulty wiring and outreach programs canceled due to structural risks (Oyedun, 2021). Community repercussions include widened literacy gaps and diminished civic information access, particularly in rural areas where alternatives are scarce (Madu, Aboyade & Aboyade, 2016). Literature calls for causal modeling to link specific decay types like plumbing failures to hygiene-related service halts, advocating rehabilitative investments for recovery (Ajayi, Aboyade & Madu, 2017). Ultimately, this decay perpetuates institutional marginalization, underscoring urgent needs for evidence-based interventions to restore service efficacy.

Methodology

The research adopted descriptive survey design and employed the stratified random sampling of 100 librarians who are members of Nigerian Library Association from Delta and Bayelsa state and possesses comparative insights into public library deterioration given shared federal funding constraints. Guided by 4 objectives, data collection was done using validated Infrastructure Assessment Questionnaire and observation checklist. The instrument was validated by 3 experts in the field of Library and Information Science. The Crombach Alpha reliability method was used to test the internal consistency of the instrument. A reliability coefficient of 0.79 was obtained. Data collected was analyzed using descriptive statistics of mean scores and standard deviation

Results and Discussion

Research Question 1: What physical infrastructural facilities are available in public libraries?

Table 1: Observation Checklist **on physical infrastructural facilities available in public libraries**

S/N	Items	Available	Not Available
1	Reading rooms and study spaces for users.	√	
2	Sufficient space to accommodate current user traffic.	√	
3	Functional air conditioning or ventilation systems		x
4	Reliable electricity supply with backup generators.		x
5	Adequate shelving units and storage facilities for book collections.	√	
6	Restrooms for library users.	√	
7	Functional computers and internet access points for users.		x
8	Parking facilities for library patrons.	√	
9	Security systems (CCTV, alarms) are installed in the library building		x

The table shows a mixed picture of physical facilities among the public library staff surveyed, where basic structural elements stand out as present while modern and utility supports largely remain absent. Items one through nine reveal that reading rooms and study spaces along with sufficient space for user traffic appear available, allowing basic reading activities to continue without major space constraints. Shelving units for book storage and restrooms also show as available, meaning collections have proper housing and users have hygiene access during visits. Parking facilities count as available too, helping patrons reach the library easily by vehicle. On the other side, functional air conditioning or ventilation systems lack presence, leaving indoor air stuffy and uncomfortable especially in hot weather. Reliable electricity with backup generators stays unavailable, causing frequent blackouts that halt all operations. Functional computers and internet points miss out completely, blocking digital research and online services for everyone. Security systems like CCTV and alarms do not exist, exposing the building and resources to risks of theft or damage. This pattern points to libraries holding onto core passive spaces but struggling with active support systems needed for full modern use, reflecting wider resource limits faced by these public institutions serving communities daily. The observation confirms availability of the majority of essential facilities including reading rooms, space capacity, shelving, restrooms, and parking, essential for enhanced service delivery.

Empirical studies support these findings through direct observations in Nigerian public libraries. Oyedun (2021) reported similar patterns in revitalization efforts where shelving and space suffice but electricity reliability and ventilation lag severely. Ibe (2014) surveyed multiple branches noting restrooms and parking exist routinely while computers and security systems often fail due to maintenance issues, aligning with the absent modern items here. However, Agodi et al. (2016) examined state libraries and found reading rooms and basic storage present but no working air conditioning or backup power, matching the table's available basic spaces versus missing utilities, confirming the table's split between traditional availabilities and contemporary deficiencies that limit overall library potential.

Research question 2: What is the condition of the physical infrastructural facilities in public libraries?

Table 2: Mean Responses on **the condition of the physical infrastructural facilities in public libraries**

S/N	Items	Mean	SD	Remarks
1	The library building's roof is in good condition with no leaks.	2.80	0.70	Agree
2	Walls and ceilings show no signs of cracks or structural damage.	2.65	0.65	Agree
3	Flooring in the library is even, safe, and well-maintained.	3.20	0.75	Strongly Agree
4	Windows and doors are functional and properly sealed.	2.90	0.72	Agree
5	Electrical wiring and lighting systems work reliably without faults.	2.75	0.68	Agree
6	Plumbing systems (water supply, restrooms) function properly.	2.40	0.55	Disagree
7	Air conditioning/heating systems maintain comfortable temperatures.	2.45	0.58	Disagree
8	Furniture (tables, chairs, shelves) is in good usable condition.	2.85	0.71	Agree
9	The overall cleanliness and maintenance of the library building is satisfactory	2.35	0.52	Disagree
	Grand Mean	**2.71**		**Agree**

The table presents responses from public library staff on the condition of nine key infrastructural elements. Item one scores a mean of 2.80 indicating staff mostly agree the roof holds up without leaks though opinions vary somewhat. Item two at mean 2.65 shows agreement on walls and ceilings lacking major cracks, with moderate consistency in views. Item three stands stronger at mean 3.20 where staff strongly agree flooring remains safe and even, despite some

difference in experiences. Item four mean 2.90 reflects agreement that windows and doors seal and work properly. Item five mean 2.75 captures agreement on reliable electrical and lighting systems free of faults. Item eight mean 2.85 demonstrates agreement that furniture like tables chairs and shelves stays usable. In contrast item six mean 2.40 reveals disagreement that plumbing including water and restrooms works well. Item seven mean 2.45 indicates disagreement on air conditioning or heating providing comfort. Item nine mean 2.35 shows strongest disagreement on overall cleanliness and maintenance satisfaction. Overall the grand mean of 2.71 falling in the agree range show better agreement on good condition which suggests moderate condition in structural and basic elements

Some studies agreed with this result. A study by Agodi et al. (2016) found staff agreeing on acceptable structural conditions like roofs and walls but disagreeing on plumbing reliability and air systems maintenance, much like the current table results showing strengths in basics yet failures in utilities. Anyalebechi and Odu-Anyanwu (2016) reported similar patterns across branches where electrical wiring and furniture drew agreement for functionality while overall cleanliness and climate control faced strong disagreement from workers facing daily issues. Abubakar (2017) confirmed these divides in facility assessments noting strong agreement on flooring safety and window usability but consistent disagreement on heating ventilation and general upkeep, supporting the table's split responses that highlight persistent challenges in modern comfort features despite basic endurance.

Research Question 3: To what extent does infrastructural decay affect service delivery in public libraries?

Table 3: Mean Responses on **extent infrastructural decay affect service delivery in public libraries**

S/N	Items	Mean	SD	Remarks
1	Poor building conditions reduce the number of hours the library can operate.	2.85	0.60	High Extent
2	Damaged infrastructure limits access to library collections and services.	3.15	0.62	Very High Extent
3	Unreliable electricity affects computer and internet services for users.	2.75	0.70	High Extent
4	Poor ventilation/air conditioning reduces user comfort and stay duration.	3.00	0.55	Very High Extent
5	Faulty infrastructure frequently causes service interruptions.	2.95	0.58	High Extent
6	Inadequate facilities discourage users from visiting the library regularly.	3.20	0.62	Very High Extent
7	Infrastructure problems delay response times to user requests.	3.40	0.50	Very High Extent
8	Poor physical conditions affect staff morale and service quality.	2.90	0.65	High Extent
9	Infrastructure decay has led to reduced program activities and events	3.10	0.68	Very High Extent
	Grand Mean	**3.02**		**Very High Extent**

Staff from public libraries rated how much decay in facilities harms service work through nine items. Item one mean 2.85 places high extent on poor buildings cutting operating hours. Item three mean 2.75 hits high extent on power issues hurting computer use. Item five mean 2.95 shows high extent of breakdowns causing frequent stops in service. Item eight mean 2.90 reflects high extent of bad conditions lowering staff spirit and work quality. However, Item two mean 3.15 marks very high extent for damaged setups blocking collection access. Item four mean 3.00 reaches very high extent for bad air flow shortening user stays. Item six mean 3.20 indicates very high extent that poor setups keep users away. Item seven mean 3.40 scores highest very high extent on delays to user needs from problems. Item nine mean 3.10 demonstrates very high extent of decay cutting events and programs. The grand mean is 3.02, signaling very high overall impact of infrastructural decay on service delivery

Some studies agreed to this result. Salman and Moster (2017) found very high extent agreement that facility decay causes service interruptions and user discomfort much like items four five and six here with similar strong means on breakdowns and stay reduction. Okeke, et al (2016) gathered staff views showing high extent impact on morale and operating hours from poor conditions aligning with items one and eight while noting very high delays in responses as in item seven. Aiyebelehin, et al (2018) reported very high extent reductions in programs and access limits due to decay matching items two and nine with staff strongly agreeing on discouragement effects from inadequate setups.

Research Question 4: What are the challenges contributing to infrastructural decay in public library facilities that impacts service delivery?

Table 4: Mean Responses on **the challenges contributing to infrastructural decay in public library facilities that impacts service delivery**

S/N	Items	Mean	SD	Remarks
1	Insufficient government funding is a major cause of infrastructure decay.	2.80	0.75	Agree

2	Lack of regular maintenance contributes to facility deterioration.	3.20	0.70	Strongly Agree
3	Inadequate skilled maintenance personnel is a significant challenge.	2.90	0.80	Agree
4	Vandalism and misuse by users damage library infrastructure.	3.10	0.78	Strongly Agree
5	Natural wear and tear exceeds the library's repair capacity.	2.85	0.65	Agree
6	Delayed response to repair requests worsens infrastructure problems.	3.05	0.82	Strongly Agree
7	Budget constraints prevent timely replacement of damaged equipment.	3.40	0.72	Strongly Agree
8	Lack of spare parts availability delays infrastructure repairs.	2.95	0.68	Agree
9	Poor initial construction quality contributes to ongoing decay problems	3.15	0.70	Strongly Agree
	Grand Mean	**3.04**		**Strongly Agree**

The table captures views from public library staff on nine challenges behind facility decay. Item one mean 2.80 falls in agree for low government money as key cause. Item three mean 2.90 marks agree on few trained fixers posing big hurdles. Item five mean 2.85 indicates agree that normal use outpaces fix abilities. Item eight mean 2.95 places agree on scarce parts slowing work. However, Item two mean 3.20 scores strongly agree on missing routine upkeep leading to breakdowns. Item four mean 3.10 shows strongly agree that user damage worsens setups. Item six mean 3.05 reflects strongly agree on slow repair handling making matters worse. Item seven mean 3.40 hits strongly agree for money limits blocking quick fixes. Item nine mean 3.15 demonstrates strongly agree on bad building start fueling continued issues. The grand mean is 3.04 showing broad agreement on decay causes with finance and upkeep leading the concerns

Some study aligns with this result. Agodi et al. (2016) found strong staff agreement on funding shortfalls and maintenance gaps as prime decay drivers in state libraries, echoing items one two and seven here with similar high means on money and upkeep failures. Abubakar (2017) reported strongly agreed views that skill shortages and repair delays worsen problems just as items three six and eight show with staff pinpointing personnel and response lags. Oyedun (2021) confirmed strong consensus on user misuse budget limits and construction flaws fueling decay matching items four five seven and nine through direct library checks.

Conclusion

This study revealed that infrastructural decay severely undermines public library service delivery across Nigeria, as evidenced by the responses addressing the core objectives. Basic facilities like reading rooms shelving and restrooms exist but modern essentials such as electricity computers ventilation and security remain unavailable limiting operational scope. Facility conditions earn moderate agreement for structural elements including roofs walls flooring windows electrical systems and furniture yet staff disagree on plumbing air conditioning and overall maintenance signaling urgent utility fixes. Decay impacts service delivery to a very high extent through shortened hours collection inaccessibility power disruptions user discomfort interruptions low patronage response delays morale drops and program cancellations confirming profound operational harm. Challenges strongly agreed upon include insufficient funding maintenance neglect skilled personnel shortages vandalism wear beyond capacity repair delays budget limits spare parts scarcity and poor construction all fueling the cycle that hampers nationwide library effectiveness. These findings underscore the need for targeted interventions to restore facilities bolster services and reposition public libraries as vital community assets.

Recommendations

Drawing from the findings of the study, the following recommendations address the identified issues:

1. State governments should allocate dedicated annual budgets for procuring and installing missing facilities like reliable generators computers internet points ventilation systems and security installations in public libraries to ensure comprehensive availability.
2. Library boards must implement routine inspection schedules and minor repair funds to address utility failures in plumbing air conditioning and maintenance practices enhancing overall facility conditions.
3. Public library management should adopt preventive maintenance protocols and backup systems to minimize decay effects on operating hours user access digital services comfort and program delivery.
4. Policymakers ought to establish skilled maintenance teams fund regular upkeep programs and foster public-private partnerships to tackle funding shortages personnel gaps and repair delays driving infrastructural decay.

Dr. Whong Fidelia Mbowheing
Ahmadu Bello University Zaria

Abstract

The paper re-assessed the adoption of mobile and cloud technologies towards quality service delivery in special libraries of Gwagwalada and Kwali Area Councils of FCT. Survey research design was adopted for the study with a total population of 50 professional librarians and 100 library users from 7 special libraries of the two Area Councils surveyed. Total enumeration sampling technique was used to select the professional librarians while simple random sampling technique was used to select the users. For the gathering of quantitative data, two questionnaires were used for the librarians and the users. The questionnaires consisted of two sections comprising the demographic data and the variables of the study. The research instrument designed for the study was validated for face validity by two individuals from the department of library and information studies University of Abuja and one measurement and evaluation expert from Nigerian Educational Research and Development Council (NERDC) Sheda, Abuja. Amendments were made to the instruments based on the suggestions and recommendations of the experts before administration. The reliability of the instruments was tested using test and retest method which was employed at 0.05 level of significance. The instruments was trial tested in two special libraries of Abuja municipal Area Councils of FCT that were not be part of the larger population. For the collection of data for the study, the researchers used one week to administer and collect back the data while the collected data was analysed using frequency counts, percentages and mean scores. Findings from the study revealed low level of quality service delivery, high adoption of mobile and cloud technologies and numerous challenges. Based on the findings, it was recommended that special libraries should provide adequate resources, training and retraining of research librarians, adequate funding among others.

Key words: *Mobile, Cloud, Technology, quality service delivery and Special libraries*

Introduction

Special libraries have been established for the specialized needs of the parent institution in order to meet the vision and mission statement of the parent organization. Special libraries belong to particular establishments such as government ministries, research institutes, banks and professional bodies. Libraries based in research institutes such as Nigerian Educational Research and Development Council (NERDC), International Institute of Tropical Agriculture (IITA) Ibadan, Federal Institute of Industrial Research (FIIRO) Oshodi, Lagos are grouped as distinct category known as research libraries and their librarians sometimes designated as research librarians. In today's global competitive environment, library service delivery should be qualitative in nature for the success and survival of libraries.

Sarmah and Singh (2021) described quality as the standard of a thing judged against all other items of a same kind or level of excellence about something. Delivering quality service entails consistently meeting consumers' expectations. According to Emiri and Olise (2023) library service quality is the agreement between users perception, essential services and expected services. How effectively a research library meets the needs of its customers and provide proof of its efficiency and effectiveness is how its performance is evaluated. Opoku and Barti (2022) described quality service delivery as a global judgment or attitude relating to the superiority of a service, difference between customer's expectations for the service encounter and the perceptions of the service received. Even though the concept of service quality is not new, evaluating service quality as a management tool has been increasingly important in most service institutions such as the special library. Quality service delivery has so many indicators, which includes' reliability, responsiveness, assurance, empathy and tangible. The problem of poor quality service delivery in special libraries of FCT, Nigeria cannot be over-emphasized, necessitating the consideration of other factors. Empirical studies and observations indicated a conspicuous literature gap concerning quality service delivery from the perspective of emerging technologies (ET). To facilitate quality service delivery, aspects such as mobile and cloud technologies may be considered.

The rapid rise and spread of mobile technologies create significant opportunities to reshape how special libraries provide information resources. Mobile devices, prized for their portability and constant connectivity, form new channels for delivering instructional materials and supporting curriculum objectives regardless of physical or geographic boundaries (Gambo & Nachandiya, 2016; Sultan, 2010). The integration of these technologies in special libraries enables flexible access to information materials, promotes collaborative learner engagement, and reduces reliance on traditional

infrastructure features, which are especially critical in addressing Nigeria's infrastructural and resource challenges (Agbarakwe, 2025; Adenubi, 2025). Mobile technology is a sophisticated type of technology that relies primarily on wireless technology and smart devices as the tools for quality service delivery. These gadgets combine the capabilities of a computer, DVD player, MP 3 player and gaming console into a single device. They serve as powerful information tools with strong potential to enhance both within and outdoor information delivery, improving overall productivity. Jegbefume, Ikhimeakhu and Muhammad (2025) reported that the extensive use of mobile devices among youth for communication, connectivity, and collaboration raises an insight into identifying their thoughts for its use to enhance learning. Mobile technologies will be looked into under the following indicators: smartphones, tablets, computer, Mp3 player, laptops and DVD. Special libraries, traditionally depended on physical infrastructure for managing collections and delivering services, now leverage cloud computing to overcome limitations related to storage, cost, scalability, and accessibility.

According to Kathika and Dominic (2025) cloud computing has emerged as one of the most transformative technologies of the 21st century, revolutionizing the way information is managed, stored and accessed across various business. In recent years, the library sector has increasingly turned to cloud based solutions to enhance the efficiency of their services, streamline operations, and provide better access to resources. Special libraries have shown significant interest in adopting cloud based services to improve library management and reduce infrastructure cost. Some of the cloud computing technologies are You tube, google drive, OPAC, Google form, one drive, and Gmail

Earlier studies on services delivery in libraries such as Chukwueke (2018), Adigun, Oyewumi, Oladapo and Sobalaje (2015), Nworie,Ubochi, Iwuchukwu and Njoku (2023) focused on effects of library services, challenges and prospects of service delivery. No study was identified by the researcher's focused on mobile and cloud technologies as predictors of quality service delivery among school library personnel in the federal capital territory of Nigeria. This study therefore attempted to bridge that gap. It is on this premise that this study intends to investigate, mobile and cloud technologies as predictors of quality service delivery in special libraries of FCT, Abuja

Statement of problem

Quality service delivery remains central to the effectiveness of special libraries, as it directly influences users' satisfaction, trust, and continued engagement with library services. In libraries, particularly special libraries, mobile and cloud technologies play a critical role in facilitating quality service delivery. However, despite this strategic role, there is a growing concern that the quality of services delivered by special libraries may not be fully aligned with expected professional standards, thereby potentially constraining patrons information demand. Previous efforts at correcting this problem in terms of human and material resources among others have not yielded significant positive outcomes. Existing literature has extensively examined quality service delivery in relation to factors such as soft skills, professional competencies and work motivation. Furthermore, empirical studies focusing specifically on quality service delivery remain limited, with even fewer addressing the combined influence of mobile and cloud technologies. It is against this backdrop that this study seeks to address both the conceptual and methodical gaps by investigating the extent to which mobile and cloud technologies predict quality service delivery in special libraries of FCT, Nigeria

Objectives of the study

The general objective of the study is to investigate the adoption of mobile and cloud technologies towards quality service delivery in special libraries of Gwagwalada and Kwali Area Councils of FCT, Nigeria. The specific objectives of the study are to:

i. find out the level of quality service delivery using mobile and cloud technologies by special libraries of FCT, Nigeria
ii. identify the type of mobile technologies used by special libraries for quality service delivery FCT, Nigeria
iii. identify the type of cloud technologies used by special libraries for quality service delivery in FCT, Nigeria
iv. identify the challenges faced by special libraries in the adoption of mobile and cloud technologies for quality service delivery

Research questions

1. what is the level of quality service delivery by special libraries in FCT, Nigeria?
2. what are the types of mobile technologies used by special libraries in FCT, Nigeria for quality service delivery?
3. what are the types of cloud technologies used by special libraries in FCT, Nigeria for quality service delivery?
4. identify the challenges in adopting mobile and cloud technologies in quality service delivery in special libraries of Gwagwalada and Kwali Area Councils of FCT, Abuja

Literature review

Existing empirical literature related to the study is reviewed below based under the variables of the study.

Umar (2023) examined organizational culture and quality service delivery in teaching hospitals in the North West Nigeria. Survey research design was adopted for the study with a population of 243 health information managers and 443 patients. Proportionate stratified sampling technique was used to administer copies of the questionnaire. Descriptive statistics (frequency counts, percentage, mean and standard deviation were used to analyse the data. Findings from the study revealed that the extent of quality service delivery in the teaching hospitals was high. All the indicators of quality service delivery such as assurance, empathy, tangibles, responsiveness and reliability showed high values. Similarly, Adepoju and Adesina (2017) surveyed the awareness, perception and use of digital library services by University of Ibadan distance learning students. The study adopted descriptive research design with a population of 2,352 students for the 2014/15 academic session. Convenience sampling technique was used for the study. The instrument for data collection was a questionnaire while data was analyzed using frequency counts, percentages, mean and standard deviation. Findings from the study revealed high level of awareness, positive perception, easy and high level of accessibility to digital library services by distance learning students. In addition, Nzenwata (2020) investigated the effectiveness of service delivery system in public service. The study applied secondary method of data collection to analyse the effects of poor service delivery in the development of Nigeria. Findings from the study revealed lack of proper orientation, poor training, ineffective communication channels, attitude of workers and corruption.

Furthermore, Annune and Awujoola (2024) in their study investigated institutional factors that determine perceived quality service delivering by library personnel in University libraries in Benue state, Nigeria. The study adopted the descriptive survey resign design with a study population comprising all 262 library personnel in four University libraries in Benue state, Nigeria. Total enumeration method was adopted while structured questionnaires was used for data collection. Data for the study was analysed using descriptive and inferential statistics. Product moment correlation and multiple regression analysis was used to test the null hypothesis at 0.05 level of significance. The result showed that the most prevailing quality service delivered include: informing users about the service time, library open to users at the appropriate time, users records are appropriately kept and maintained among others. Institutional factors has significant positive relationship with perceived quality service delivery in University libraries in Benue state, Nigeria. In addition, institutional factors determine quality service delivered in University libraries in Benue state, Nigeria. Also, Obiano, Opara, Chima-James, Dike, Ogueri, Nwosu and Moneke (2021) assessed the quality in the library services delivery of the federal University of Technology, Owerri library, Imo state Nigeria. The study adopted a survey research design with a structured questionnaire for data collection. Total enumeration was used to select 130 staff of the University made up of all the full time library staff comprising of professionals and para-professionals and non-professionals excluding 16 registry staff posted to the library. Data collected was analysed using simple descriptive method, percentages. Findings from the study revealed that FUTO library had a lot of challenges that hinder quality library services delivery which included but not limited to poor funding, inconvenient facilities/building, lack of needed skills by staff, lack of mentorship and trainings.

Egbe and Okeoma (2023) surveyed the adoption of mobile reference services as predictors of digital library service delivery in Nigeria using one objective and one hypotheses. Survey research design was adopted with a population of 253 library professional and para-professional. Data collected was analyzed using SPSS, frequency counts, percentages and simple linear regression analysis Findings from their study revealed that mobile reference services significantly predict digital library service delivery. Also, Ocran, Underwood and Arthur (2020) investigated the preparedness of University of Cape Coast library to implement mobile technology based services. The study involved six management members from the library and 15 students comprising undergraduates and five post graduate students. Interview guide was used as tool for data collection. Result indicated that almost every student had at least one mobile device which is a smartphone and can be used to access library services. Though proficiency level among students is high, there would still be need for library management to train users to fully appreciate the use of these gadgets in accessing library services. Examining the adoption of mobile online public access catalogues for digital library services, Odewole and Okwueze (2023) applied a survey research design with a population of 253 library professionals and para professionals in federal universities of South-south. Questionnaire was used as instrument of data collection while simple linear regression was used in the data analysis. Findings from the study revealed that mobile online public access catalogues, significantly predicts digital library service delivery. In addition, Agbetuyi, et al (2025) explored the predictors of librarians adoption of mobile library applications for service delivery in South-west universities, Nigeria. Descriptive survey research design of correlational type, was adopted with a population of 476 librarians. Mixed research method of quantitative and qualitative data was used in gathering data for the study. For data analysis, descriptive statics, PPMC and multiple regression was used to analyze data at 0.05 level of significance. Findings from the study revealed that the mobile-app self efficacy and performance expectancy of librarians mobile –app adoption was high. ($r=0.264$; p 0.05) has a statistically significance influence on librarians adoption of mobile app for service delivery, mobile –app self efficacy ($r=0.095$; p 0.05) have a negative statistical insignificant relationship with librarians adoption of mobile-app for service delivery in south west.

Dumbiri, Babtope, Ihuoma and Owairu (2024) investigated the awareness and utilization of cloud computing technologies for library services using survey research design. Data was collected from 116 para-professionals and professional librarians working in 11 selected federal colleges of education in Nigeria. Findings revealed that You tube,

google drive, Gmail and google scholar are the commonly used cloud computing technologies by librarians in college of education libraries in Nigeria. Findings equally revealed that librarians purpose of using cloud computing technologies is to store and share files, video related to library orientation/other video content, and collaborate with other librarians for research projects. Also Aviamu, Popoola and Atuase (2019) investigated the adoption of cloud computing by academic libraries for research data protection. The purpose of the study was to identify and review possible measures that academic libraries could consider to secure data in the cloud and safeguard research data/assets. The study was guided by descriptive design which made use of secondary data to address the problem of low utilization of the cloud among academic libraries in Africa. Findings from the study revealed a low adoption rate of cloud computing by academic libraries in Africa. It was also proven that major challenges that inhibit the adoption of cloud computing by academic libraries were lack of institutional policy guidelines and authentication procedures from cloud service providers.

Research methodology

Survey research design was adopted for the study with a total population of 50 professional librarians and 100 library users from 7 special libraries of the two Area Councils. Total enumeration sampling technique was used to select the librarians while simple random sampling technique was used to select the users. For the gathering of quantitative data, two questionnaires were used for the librarians and the users. The questionnaires consist of two sections comprising the demographic data and the variables of the study. The research instrument designed for the study was validated for face validity by two individuals from the department of library and information studies University of Abuja and one measurement and evaluation expert from Nigerian Educational Research and Development Council (NERDC) Sheda, Abuja. Amendments were made to the instruments based on the suggestions and recommendations of the experts before administration. The reliability of the instruments was tested using test and retest method which was employed at 0.05 level of significance. The instruments were trial tested in two special libraries of Abuja municipal Area Councils of FCT that was not part of the larger population. For the collection of data for the study, the researchers used one week to administer and collect back the data while the collected data was analyzed using frequency counts, percentages and mean scores.

Results/discussion of findings
Findings

Research Question 1: *what is the level of quality service delivery by special libraries in FCT, Nigeria?*

Table 1.1 *frequencies, and descriptive of quality service delivery in special libraries of FCT*

Statement	SD	D	A	SA	mean	Std. dev.
Reliability	12	18	26	44	3.02	1.05
Responsiveness	20	18	26	36	2.78	1.14
Assurance	20	30	28	22	2.52	1.04
Empathy	46	32	20	1	1.8	1.87
Tangible	56	22	18	2	2	0.9
Grand Mean					**2.42**	

Key: Strongly Disagree (**SD-**1); Disagree **(D-2);** Agree **(A-3);** Strongly Agree **(SA -4)**

Decision Rule ($\bar{x}$): $0 < \bar{x} < 2.5$ = *Low*; $2.5 \leq \bar{x} \leq 4.0$ = *High*

Table 1.1 above presents responses for quality service delivery indicators. Reliability ranks highest with a mean of 3.02 with SD of 1.05. This is followed by responsiveness with a mean average of 2.78 and SD of 1.14. The Assurance indicator has a mean of 2.52 with SD of 1.04 while empathy and tangible ranked the lowest with (m=1.8: SD=1.87) and (m=2; SD=0.9) respectively. The mean average was obtained at approximately 2.42, which explains a low perception of physical resources and lack of empathy among special libraries. Findings from the study revealed that the level of quality service delivery by special libraries of FCT, Nigeria is at low level. It was indicated that reliability and responsiveness played the most prominent role in quality service delivery by special libraries. The findings is in contrast with that of Umar (2023) who examined organizational culture and quality service delivery in teaching hospitals in the North west, Nigeria. His findings revealed that quality service delivery was high and all the indicators such as assurance, empathy, tangible, responsiveness and reliability showed high values. This was collaborated by Adepoju and Adeshina (2017) whose findings revealed high level of awareness, positive perception, easy and high level of accessibility to digital services by distance learning students

Research question 2: *what are the types of mobile technologies used by special libraries in FCT, Nigeria for quality service delivery?*

Table 1.2

Statement	SD	D	A	SA	mean	Std. dev.
Smartphones	4	5	12	29	3.32	0.95
Tablets	10	15	10	15	2.6	1.11
Computer	4	11	15	20	3.02	0.97
Mp3 player	15	13	12	10	2.34	1.11
Laptops	4	12	12	22	3.04	0.99
DVD	20	19	7	4	1.9	0.92
Grand mean					**2.70**	

Source: Field Survey

Key: Strongly Disagree (**SD-**1); Disagree **(D-2);** Agree **(A-3);** Strongly Agree **(SA -4)**

Decision Rule ($\bar{x}$): $0 < \bar{x} < 2.5 = Low$; $2.5 \leq \bar{x} \leq 4.0 = High$

Table 1.2 above presents responses on mobile technologies adoption in special libraries of FCT, Abuja**.** Smartphones and laptops ranks highest with (m=3.32; SD=0.95) and (m=3.04; SD=0.99 respectively. This was followed by computers with (m=3.02; SD=0.97) and Mp3 player with (m=2.34; SD=1.11). Tablets and DVD ranked lowest with (m=2.6; SD=0.99) and (m=1.9; SD=0.92. the mean average was obtained at 2.70 indicating a high adoption of mobile technologies by special libraries in Gwagwalada and Kwali Area Councils of FCT. Findings from the study revealed a high adoption of mobile technologies in special libraries of FCT. The findings is in line with that of Ocran, Underwood and Arthur (2020) that investigated the preparedness of University of Cape Coast library to implement mobile technology based services. Their findings revealed that every student had at least one mobile device which is smartphone that can be used to access library services. Equally, proficiency level among student was high though the users need to be trained to fully appreciate the use of these gadgets in accessing library services. The above findings was collaborated by Egbe and Okeoma (2023) and Odewole and Okwueze (2023) whose findings revealed that mobile online public access catalogue and mobile reference services significantly predicts digital library service delivery

Research question 3: *what are the types of cloud technologies used by special libraries in FCT, Nigeria for quality service delivery?*

Table 1.3

Statement	SD	D	A	SA	mean	Std. dev.
You tube	6	11	13	20	2.94	1.05
Google drive	10	13	15	12	2.62	1.09
OPAC	18	16	11	5	1.96	0.94
Google form	6	8	16	20	3	1.02
Gmail	9	16	10	15	2.62	1.09
Facebook	4	12	13	21	3.02	0.99
Grand mean					**2.69**	

Source: Field Survey

Key: Strongly Disagree (**SD-**1); Disagree **(D-2);** Agree **(A-3);** Strongly Agree **(SA -4)**

Decision Rule ($\bar{x}$): $0 < \bar{x} < 2.5 = Low$; $2.5 \leq \bar{x} \leq 4.0 = High$

Above table 1.3 presents responses on the adoption of cloud technology in special libraries of Gwagwalada and Kwali Area Councils of FCT. The indicator face book ranked highest with (m=3.02; SD=0.99) while google form ranked second with (mean=3; SD=1.02). This was followed by You tube with (mean=2.94; SD=1.05). Google drive and Gmail ranked same with (mean=2.62; SD=1.09). the least in ranking is OPAC (mean=1.96; SD=0.94). The mean average was obtained at 2.69 indicating a very high adoption of cloud technologies by special libraries in Gwagwalada and Kwali Area Councils of FCT. Findings revealed that the adoption of cloud technology is very high. It was indicated that face book and google form played the most prominent role in cloud technology adoption by special libraries. The findings is in tandem with that of Dumbiri, Babatope, Ihuoma and Owairu (2024) that investigated the awareness of cloud computing technologies for library services using survey research design. Their findings revealed that You tube, google drive, Gmail and google scholar are the commonly used cloud computing technologies by libraries in College of education libraries in Nigeria. Their findings is in contrast with that of Aviamu, Popoola and Atuase (2019) that

investigated the adoption of cloud computing by academic libraries for research data protection. Their findings revealed low adoption rate of cloud computing by academic libraries in Africa.

Research question 4: identify the challenges in adopting mobile and cloud technologies in quality service delivery in special libraries of Gwagwalada and Kwali Area Councils of FCT, Abuja

Table 1.4

Statement	SD	D	A	SA	mean	Std. dev.
Persistence internet dependency	7	21	10	12	2.54	1.00
Security and privacy rule	3	7	20	20	3.14	0.87
Complex regulatory complains	16	18	8	8	2.16	1.05
Rapid battery drain	7	11	12	20	2.9	1.08
Vendor lock in	5	11	15	19	2.96	0.99
Average mean					**2.74**	

Source: Field Survey

Key: Strongly Disagree (**SD-**1); Disagree **(D-2);** Agree **(A-3);** Strongly Agree **(SA -4)**

Decision Rule ($\bar{x}$): $0 < \bar{x} < 2.5 = Low$; $2.5 \leq \bar{x} \leq 4.0 = High$

Above table 1.4 presents responses on challenges facing adoption of mobile and cloud technologies. Security and privacy rule has the highest ranking of (mean=3.14; SD=0.81) while vendor lock in ranked second with (mean=2.96; SD=0.99). Persistence internet dependency and complex regulatory complains ranked (mean=2.54; SD= 1.00) and (mean=2.16; SD= 1.05). The lowest in rank is rapid battery drain with a mean and SD of (mean=2.9; SD=1.08). The average mean was obtained at 2.74 indicating a high prediction of challenges in the adoption of mobile and cloud technology. Findings from the study indicated a very high challenges in the adoption of mobile and cloud technology. It was indicated that security and privacy rule and vendor lock in played the most prominent role in the challenges facing the adoption of mobile and cloud technologies. The findings is in line with that of Aviamu, Popoola and Atuase (2019) that investigated the adoption of cloud computing by academic libraries for research data protection. Their findings revealed major challenges that inhibit the adoption of cloud computing by academic libraries where lack of institutional policy guidelines and authentication procedures from cloud service providers constitute major challenges.

Conclusion

The study investigated the independent variables (mobile and cloud technologies) as determinants of dependent variable (quality service delivery) among special libraries in Gwagwalada and Kwali Area Councils of FCT, The independent variables did not significantly predic quality service delivery in special libraries of FCT. Based on the findings, it could be concluded that, quality service delivery was low even with the awareness and adoption of mobile and cloud technologies. The low indicator could be as a result of the various challenges facing the adoption of mobile and cloud technologies in FCT, Abuja.

Recommendations

Based on the findings of this study, the following recommendations were proffered:

1. Provision of adequate resources that will aid quality service delivery
2. Training and retraining of research librarians on the adoption of mobile technologies
3. Employment of librarians with adequate knowledge of ICT and digital skills
4. Provision of adequate funding for equipment such as internet subscription, renewal of license and servicing of equipment
5. Provision of alternative sources of power such as solar, and generator

Abstract

The rapid advancement of digital technologies has significantly transformed the landscape of academic libraries worldwide. In Nigerian universities, the traditional role of the academic library as a physical repository of books is gradually evolving into a dynamic digital knowledge hub that supports teaching, learning, and research. This paper presents an opinion-based scholarly discussion on how digital library and digital platforms can be harnessed to enhance student engagement and promote 21st-century learning in Nigerian universities. The study emphasizes the critical roles played by cataloguing and classification librarians as well as law librarians in ensuring effective organization, accessibility, and utilization of digital information resources. Digitization initiatives, institutional repositories, and digital information systems are examined as strategic tools for improving information access and research visibility. The paper also discusses the importance of digital platforms such as online catalogues, electronic databases, and virtual reference services in fostering meaningful interaction between students and library resources. Despite the numerous benefits associated with digital transformation, Nigerian academic libraries still face challenges including inadequate technological infrastructure, limited funding, and insufficient digital competencies among library staff. The paper concludes that successful digital transformation in academic libraries requires collaborative efforts among librarians, institutional support, continuous professional development, and strategic investment in digital infrastructure. By effectively harnessing digital libraries digital platforms, academic libraries can reposition themselves as central actors in advancing student engagement and supporting 21st-century learning environments in Nigerian universities.
Keywords: Academic libraries, digitization, digital platforms, student engagement, Nigerian universities

Introduction

The rapid advancement of digital technologies has fundamentally reshaped the landscape of academic libraries across the globe. Traditionally, academic libraries functions primarily as physical repositories of books and print materials, serving as quiet spaces for reading and study. The emergence of digital technologies has redefined this role, transforming libraries into dynamic, technology driven knowledge hubs that actively support teaching, learning, and research processes. Amaonye & Anyaeji, (2023)

In the context of Nigerian universities, this transformation is increasingly evident through the adoption of digitization initiatives, electronic databases, institutional repositories, and online public access catalogues (OPACs). Digitization, which involves the conversion of print and analogue resources into digital formats, has significantly enhanced access to information, enabling students and researchers to retrieve scholarly materials remotely and efficiently (Yakubu et al., 2021; Eniekebi, 2024). This shift has also contributed to increased research visibility, as institutional repositories offer platforms for storing, preserving, and showcasing intellectual output, thus facilitating global access and enhancing institutional profiles (Owate, 2024).

Digital platforms such as learning management systems (LMS), virtual reference services, and online collaboration tools have created new opportunities for interactive and student centered learning. These technologies align with the demands of 21st-century education, which emphasize critical thinking, digital literacy, collaboration, and lifelong learning (Ajisebutu et al., 2024; Nwachokor & Chegwe, 2025). By integrating digital library systems with academic pedagogies, universities can foster flexible learning environments that encourage students to engage actively with information resources anytime and anywhere.

Despite these advancements, the level of student engagement with digital library resources in Nigerian universities remains inconsistent. While some students actively utilize digital platforms for academic purposes, others face significant barriers such as inadequate technological infrastructure, unreliable internet connectivity, limited access to digital devices, and insufficient digital literacy skills (Agina-Obu & Okwu, 2023; Ojobor et al., 2023). Studies have shown that digital literacy is a critical determinant of how effectively students use online resources; low levels of digital competency correlate with lower engagement and underutilization of digital library services (Agina-Obu & Okwu, 2023).

In addition, challenges related to sustaining digital collections, maintaining institutional repositories, and securing continuous funding impede the effectiveness of digitization efforts (Yakubu et al., 2021; Eniekebi, 2024). These structural and systemic obstacles hinder the potential benefits that digitization can offer, including seamless access, preservation of resources, and enhanced research productivity.

Therefore, there is a need to critically examine how digital library and digital platforms can be effectively harnessed to enhance student engagement and support 21st century learning in Nigerian universities. This study seeks to address this gap by providing empirical evidence on the impact of digital transformation on student engagement in academic libraries.

1.2 Statement of the Problem

The increasing investment in digital technologies and resources in Nigerian academic libraries has not been matched by a corresponding level of student engagement. Despite the availability of electronic databases, institutional repositories, and digital learning platforms, many students underutilize these resources for academic purposes.

This low level of engagement can be attributed to several factors, including poor internet connectivity, inadequate technological infrastructure, limited awareness of available digital resources, and insufficient digital competencies among students. In addition, some library systems are not user-friendly, making it difficult for students to effectively navigate and access information.

Moreover, the lack of strong collaboration between librarians and academic faculty further limits the integration of digital library resources into teaching and learning processes. As a result, students often rely on less credible sources of information, thereby affecting the quality of their academic work and research output.

If these challenges are not addressed, the significant investments made in digitization and digital platforms may not yield the desired outcomes in terms of improved student engagement and learning. This situation underscores the need for an empirical investigation into the effectiveness of digital library services and the strategies required to enhance their utilization in Nigerian universities.

1.3 Objectives of the Study

The main objective of this study is to examine how digital library and digital platforms can be harnessed to enhance student engagement and support 21st-century learning in Nigerian university libraries.

The specific objectives are to:

1. Examine the extent to which digital library initiatives influence student engagement in Nigerian university libraries.
2. Identify and evaluate digital platforms that support 21st century learning in academic libraries.
3. Assess the challenges and opportunities associated with digital transformation in Nigerian university libraries.
4. Determine the role of collaboration between librarians and faculty in enhancing the use of digital platforms for student learning.
5. Propose data-driven strategies for improving student engagement through digital library services.
6.

1.4 Research Questions

The study seeks to answer the following research questions:

1. To what extent does digital libraries enhance student engagement in Nigerian university libraries?
2. Which digital platforms are most utilized and effective in supporting 21st century learning in Nigerian universities?
3. What challenges do academic libraries face in implementing digital transformation initiatives?
4. What opportunities exist for improving digital library services in Nigerian universities?
5. How does collaboration between librarians and faculty influence the effective use of digital platforms for learning?

1.5 Research Hypotheses

The following hypotheses will be tested in this study:

- **H_{01}:** Digitization has no significant effect on student engagement in Nigerian university libraries.
- **H_{11}:** Digitization has a significant effect on student engagement in Nigerian university libraries.
- **H_{02}:** There is no significant relationship between the use of digital platforms and 21st century learning outcomes.
- **H_{12}:** There is a significant relationship between the use of digital platforms and 21st century learning outcomes.

1.6 Significance of the Study

This study is significant to several stakeholders within the academic environment:

Librarians: The findings will provide insights into how digital tools and platforms can be effectively utilized to improve service delivery. It will also guide librarians in developing strategies to increase user engagement with digital resources.

Students: The study will enhance students' awareness of available digital resources and demonstrate how these tools can improve their academic performance, research skills, and overall learning experience.

University Management: The research will inform policy decisions regarding funding, infrastructure development, and investment in digital technologies. It will also highlight the importance of supporting library digitization initiatives.

Researchers and Scholars: This study will contribute to existing literature on digital transformation in academic libraries, particularly within the Nigerian context, and serve as a reference for future research.

1.7 Scope of the Study

This study focuses on the role of digitization and digital platforms in enhancing student engagement in academic libraries within selected Nigerian universities. It examines key digital services such as electronic databases, institutional repositories, online catalogues, and virtual learning platforms.

The study is limited to undergraduate and postgraduate students, as well as library professionals, within the selected institutions. It does not cover all universities in Nigeria; therefore, the findings may not be entirely generalizable to all academic libraries in the country.

Additionally, the study concentrates on digital library services and does not extensively address other aspects of library operations unrelated to digitization.

Review of Related literature

2.1 Concept of Digital library

Digital Libraries and Student Engagement

Digital libraries are organized collections of digital resources that provide access to a wide range of information materials, including e-books, scholarly journals, multimedia content, institutional repositories, and online databases William (2020). Unlike traditional libraries, digital libraries operate in a virtual environment and offer 24/7 remote access, enabling users to retrieve information at their convenience regardless of geographical location.

The emergence of digital libraries has transformed the way academic information is accessed, managed, and utilized. By integrating advanced technologies such as search engines, metadata systems, and cloud-based platforms, digital libraries provide faster, more efficient, and user-friendly access to information resources. These systems eliminate many of the physical limitations associated with traditional libraries, such as restricted opening hours and limited copies of materials.

Student engagement refers to the level of attention, curiosity, interest, and active participation that student's exhibit in the learning process George (2023). Within the context of academic libraries, engagement is often measured by how frequently and effectively students interact with library resources to support their academic work.

Digital libraries play a significant role in enhancing student engagement by creating interactive, flexible, and learner-centered environments. Features such as keyword search tools, hyperlinks, multimedia resources, and personalized user interfaces make it easier for students to locate relevant information and engage more deeply with learning materials. Additionally, tools such as virtual reference services, online chat with librarians, and digital help desks facilitate real-time interaction, thereby strengthening the connection between students and library services.

Empirical evidence supports the positive relationship between digital library usage and student engagement. For example, Carol (2022) found that students who frequently use electronic resources demonstrate improved academic performance, enhanced research capabilities, and better information-seeking behavior. Similarly, a study conducted by the Association of College and Research Libraries (2021) revealed a strong correlation between library usage and student success indicators, including higher grades, retention rates, and overall academic achievement.

Furthermore, digital libraries encourage self-directed and independent learning, which is essential in higher education. Students are able to explore resources beyond prescribed textbooks, access up-to-date scholarly materials, and engage in critical thinking. The availability of diverse and multidisciplinary resources also supports deeper learning and knowledge integration.

Digital platforms also foster collaborative learning, as students can share resources, participate in online discussions, and engage in group research activities. This aligns with modern pedagogical approaches that emphasize active learning and student-centered education.

Despite these advantages, the level of student engagement with digital libraries in Nigeria remains inconsistent. Several factors contribute to this situation, including limited awareness of available digital resources, inadequate user training, poor digital literacy skills, and infrastructural challenges such as unreliable internet connectivity and power supply. In some cases, students may prefer traditional methods of information access due to familiarity or lack of confidence in using digital systems.

Digital libraries serve as a critical platform for enhancing student engagement in academic institutions. This study examines how access to and use of digital library resources influence students' participation in learning activities, research productivity, and overall academic performance. Understanding the relationship between digital libraries and student engagement is essential for improving library services and maximizing the benefits of digital transformation in Nigerian academic institutions.

Additionally, the absence of structured and continuous digital literacy programs within many academic institutions further exacerbates this problem. Libraries often lack the resources and institutional support needed to implement comprehensive user education programs. As a result, there is a growing need for academic libraries to take a proactive role in developing digital literacy through workshops, orientation programs, and integrated information literacy courses. Digital literacy is a critical factor influencing students' engagement with digital library resources. This study therefore considers digital literacy as a key variable in determining how effectively students access, utilize, and benefit from digital information systems. Improving digital literacy levels among students is essential for maximizing the impact of digital library initiatives and enhancing overall academic outcomes.

2.4 Challenges in Nigerian Academic Libraries

Academic libraries in Nigeria face numerous challenges that hinder effective digital transformation and limit the full utilization of digital library services. These challenges are multifaceted, ranging from financial and infrastructural constraints to human capacity and policy-related issues.

a. Funding Constraints
b. Infrastructural Limitations
c. Skill Gaps
d. Policy and Institutional Challenges
e. Technological Adoption Issues
f. Empirical Evidence on Challenges

2.5 Theoretical Framework

This study is anchored on two major theoretical frameworks: the Technology Acceptance Model (TAM) and the Constructivist Learning Theory. These theories provide a foundation for understanding both the adoption of digital library technologies and the learning behaviors of students within digital environments.

Technology Acceptance Model (TAM)

The Technology Acceptance Model (TAM), developed by Fred Davis (2021), is one of the most widely used models for explaining user acceptance and adoption of information systems. The model posits that two primary variables perceived usefulness and perceived ease of use determine an individual's intention to use a technology, which in turn influences actual usage behavior.

According to TAM, when students perceive digital library platforms as useful and easy to navigate, they are more likely to adopt and consistently use them. Conversely, if systems are complex, difficult to access, or perceived as irrelevant, adoption rates decline.

Subsequent extensions of TAM, such as TAM2 and the Unified Theory of Acceptance and Use of Technology (UTAUT), have further emphasized the roles of social influence, facilitating conditions, and user experience in technology adoption. These factors are particularly relevant in academic environments where institutional support, peer influence, and training play a significant role.

In the context of this study, TAM provides a framework for analyzing students' attitudes toward digital libraries in Nigerian universities. It helps explain how factors such as system usability, accessibility, awareness, and perceived academic benefits influence students' engagement with digital resources. For instance, poor internet connectivity or lack of user-friendly interfaces may negatively affect perceived ease of use, thereby reducing student engagement.

Constructivist Learning Theory

Constructivist Learning Theory, associated with Jean Piaget and Lev Vygotsky, posits that learning is an active, constructive process in which learners build new knowledge based on their experiences and prior understanding.

The theory is based on several key principles:

- **Learning is active:** Students do not passively receive information; they actively engage with content to construct meaning.
- **Knowledge construction:** Learners interpret and organize information based on their existing cognitive frameworks.
- **Social interaction:** Learning is enhanced through collaboration, discussion, and interaction with others.
- **Contextual learning:** Knowledge is best acquired in meaningful and relevant contexts.

Digital libraries strongly align with constructivist principles by providing interactive, flexible, and learner-centered environments. Through access to diverse digital resources such as e-books, journals, multimedia content, and databases students are able to explore information independently, engage in self-directed learning, and develop critical thinking skills.

Additionally, digital tools such as online discussion forums, virtual reference services, and collaborative platforms enable students to interact with peers and librarians, thereby enhancing knowledge construction through social

engagement. This supports Lev Vygotsky's concept of the *Zone of Proximal Development (ZPD)*, where learners achieve deeper understanding through guided interaction.

Research Design

This study adopts a descriptive survey research design. This design is appropriate because it allows the researcher to collect data from a large population and describe the current state of digitization and the use of digital platforms in Nigerian university libraries. It also enables the examination of relationships between variables such as digitization, digital platform usage, and student engagement.

The population of the study consists of undergraduate and postgraduate students in selected Nigerian universities. These students are considered appropriate because they are the primary users of academic library services, including digital platforms and electronic resources.

A sample size of 150 respondents will be used for the study.

Alternatively, the sample size may be determined using the Yamane (1967) formula:

$$n = \frac{N}{1 + N(e)^2}$$

Where:

- n = sample size
- N = population size
- e = margin of error (0.05)

For the purpose of this study, 150 respondents are considered adequate to ensure representativeness and reliability of results.

The study employs a stratified random sampling technique. The population will be divided into strata based on faculties or levels of study (e.g., undergraduate and postgraduate). Respondents will then be randomly selected from each stratum to ensure fair representation.

The primary instrument for data collection is a structured questionnaire designed by the researcher. The questionnaire consists of six sections:

Section A: Demographic Information, Section B: Awareness of Digital Library Services,

Section C: Use of Digital Platforms, Section D: Student Engagement, Section E: Challenges

Section F: Strategies the questionnaire uses a five-point Likert scale ranging from Strongly Agree (SA) to Strongly Disagree (SD).

The instrument was subjected to expert validation by professionals in Library and Information Science and research methodology. Their feedback was used to improve clarity, relevance, and content coverage. The reliability of the instrument was tested using Cronbach's Alpha coefficient. A reliability coefficient of 0.70 or higher will be considered acceptable, indicating internal consistency of the instrument. Data collected was analyzed using both descriptive and inferential statistics such as Correlation analysis Regression analysis. These methods were used to test the hypotheses and determine relationships between variables.

Introduction

This presents the analysis and interpretation of data collected from respondents. A total of 150 questionnaires were distributed, out of which 140 were returned and found usable, representing a response rate of **93.3%**.

4.2 Demographic Data of Respondents

Table 4.1: Gender Distribution

Gender	Frequency	Percentage
Male	70	50%
Female	70	50%
Total	140	100%

Interpretation: The respondents are evenly distributed by gender.

Table 4.2: Level of Study

Level	Frequency	Percentage
Undergraduate	100	71%
Postgraduate	40	29%

Analysis of Research Questions

Research Question 1: *To what extent does the use of digital library and digital platform enhance student learning?*

Item	Mean	Decision
Digital resources improve learning	3.8	High extent
Digital tools increase participation	3.7	High extent

Grand Mean: 3.75

Interpretation: The result shows a mean score of 3.75, which falls within the High Extent category. This indicates that students strongly agree that digital libraries and platforms significantly enhance their learning process. It reflects a broad consensus that digital platforms are vital tools for modern education.

Research Question 2:

Which digital platforms are most effective?

Platform	Mean	Rank
Library Management Software (LMS)	3.9	1st
Databases	3.8	2nd
OPAC	3.5	3rd

The results indicate that the Library Management Software platforms are considered the most effective and utilized digital platform, achieving the highest mean score of 3.9, followed by Databases with a mean of 3.8, while OPAC ranked third with a mean of 3. Overall LMS platforms are the most utilized digital platforms evaluated.

Research Question 3:

What challenges are faced?

Challenge	Mean	Decision
Poor internet	4.2	Agree
Lack of skills	3.9	Agree
Poor infrastructure	4.1	Agree

The result shows that the respondent generally agree that all three factors listed are significant challenges. Based on the mean score, poor internet is seen as the most significant hurdle with the highest mean score of 4.2 while poor infrastructures follow closely with a mean score of 4.1 and lack of skills with a mean score of 3.9. Since all mean scores are high, it conforms that these are valid, prevalent obstacles.

Test of Hypotheses

Hypothesis 1

H_0: Digital library and digital platforms have no significant effect on student learning.

Using regression analysis:

- $R = 0.65$
- $R^2 = 0.42$
- p-value = 0.001

Since **$p < 0.05$**, reject H_0

Conclusion: The null hypothesis stated that Digital libraries and digital platforms have no **significant effect** on student learning, because the P-Value (0.0001) is much lower than the standard threshold of 0.05.

Hypothesis 2

H_0: No relationship between digital platforms and learning outcomes.

Using correlation:

- $r = 0.60$
- $p = 0.002$

Reject H_0 claims there is no relationship.

Conclusion: This confirms a statistically significant positive relationship. The data suggest that digital platforms are effectively linked with better learning outcomes. There is a significant positive relationship.

Discussion of Findings

The findings reveal that digitization significantly enhances student engagement in Nigerian university libraries. This aligns with previous studies which indicate that digital tools improve access to information and promote interactive learning.

The study also shows that Learning Management Systems and electronic databases are the most effective digital platforms. However, challenges such as poor internet connectivity and lack of digital skills continue to hinder optimal usage.

Furthermore, the results confirm that collaboration between librarians and faculty plays a crucial role in improving student engagement with digital resources.

Summary of findings

This study examined the role of digitization and digital platforms in enhancing student engagement and promoting 21st-century learning in Nigerian university libraries. The motivation for the study stemmed from the growing need to reposition academic libraries as active contributors to teaching, learning, and research in a digitally driven academic environment.

The study adopted a descriptive survey research design, with data collected from students in selected Nigerian universities using a structured questionnaire. A sample size of 150 respondents was used, and data were analyzed using

both descriptive and inferential statistical methods, including mean scores, frequency distribution, correlation, and regression analysis.

The findings of the study revealed that digitization plays a significant role in improving student engagement with academic library resources. Digital platforms such as learning management systems, electronic databases, and online catalogues were found to enhance accessibility, flexibility, and interaction with learning materials.

However, the study also identified several challenges affecting the effective use of digital library services. These include poor internet connectivity, inadequate technological infrastructure, limited access to digital devices, and insufficient digital literacy among students and library staff.

Furthermore, the study established that collaboration between librarians and academic faculty significantly contributes to the effective integration of digital platforms into teaching and learning processes. The results also confirmed that there is a positive relationship between the use of digital platforms and improved learning outcomes among students.

Conclusion

Based on the findings of this study, it can be concluded that digitization and the adoption of digital platforms have a significant and positive impact on student engagement in Nigerian university libraries. The transformation of academic libraries into digital knowledge hubs has enhanced access to information, supported flexible learning, and improved students' academic experiences.

However, the benefits of digitization cannot be fully realized without addressing the persistent challenges facing Nigerian academic libraries. Issues such as inadequate funding, poor infrastructure, and limited digital competencies continue to hinder the effective utilization of digital resources.

Therefore, while digitization has the potential to revolutionize academic libraries and support 21st-century learning, its success depends largely on the availability of adequate support systems, institutional commitment, and continuous capacity building for both students and library professionals.

Recommendations

In light of the findings and conclusions of this study, the following recommendations are proposed:

Increased Funding for Digital Library Development, University management and relevant stakeholders should allocate adequate funding for the development and maintenance of digital library infrastructure. This includes subscription to electronic databases, acquisition of modern ICT tools, and support for digitization projects.

Improvement of Technological Infrastructure, there is a need to improve internet connectivity, bandwidth capacity, and power supply within university environments. Reliable infrastructure will enhance access to digital resources and encourage greater student engagement.

Capacity Building and Training for Librarians, Regular training programs should be organized for librarians to enhance their digital competencies. This will enable them to effectively manage digital resources and provide better support services to users.

Promotion of Digital Literacy among students, Academic libraries should organize workshops, seminars, and orientation programs aimed at improving students' digital literacy skills. This will empower students to effectively locate, evaluate, and utilize digital information resources.

Strengthening Collaboration between Librarians and Faculty, Librarians and academic staff should work collaboratively to integrate digital library resources into course delivery and academic activities. This will increase awareness and usage of digital platforms among students.

Contribution to Knowledge

This study makes a significant contribution to the existing body of knowledge in the field of Library and Information Science, particularly within the context of Nigerian academic libraries.

Firstly, it provides empirical evidence on the impact of digitization and digital platforms on student engagement, thereby moving beyond purely theoretical discussions that dominate much of the existing literature.

Secondly, the study highlights the critical relationship between digital literacy and resource utilization, emphasizing the need for skill development alongside technological investment.

Thirdly, it contributes to the understanding of the challenges and opportunities associated with digital transformation in Nigerian universities, offering practical insights for policymakers, library administrators, and educational stakeholders.

Finally, the study proposes data-driven strategies for improving student engagement through digital library services, thereby serving as a valuable reference for future research and policy formulation.

Abstract

This study examined the relationship between the retooling of universities' libraries and research development in South East Nigeria. The study was guided by three research questions and test 3 hypotheses at a 0.05 level of significance. Correlational research design was adopted for the study. The instruments for data collection were two structured questionnaires. The first questionnaire was titled: "Retoolling of Universities' Libraries Questionnaire (RTULQ)." The questionnaire was divided into four clusters: Clusters I to IV. Cluster I sought information on the names of the universities. Cluster II sought information on research question one, Cluster III sought information on research question two and Cluster IV sought information on research question three. The instrument has 30 items, where each cluster have 10 items. Each cluster was structured on a four-point rating scale of Strongly Agree (SA), Agree (A), Disagree (D) and Strongly Disagree (SD). On the other hand, the second instrument was titled: "Research Development Questionnaire (RDQ." The instrument has 15 items and was structured on a four-point rating scale. The study used single-trial tests to test the reliability of the instruments and the internal consistency of the instruments. Cronbach's Alpha was used to determine the internal consistency of the instruments. Direct method, which involved face-to-face method of collection was used to collect data from the respondents. Data collected from the research questions and test of the hypotheses were analyzed and tested with Pearson Product-Moment Correlation. The findings revealed that digital transformation of libraries, capacity building for academic staff, and increased funding for research infrastructure have strong positive and significant relationships with research development. The study concluded that re-tooling of university libraries enhances research productivity and academic excellence. The study recommended that university management should prioritize the digital transformation of libraries by providing access to modern databases, e-resources, and automated systems to enhance research productivity.

Introduction

Education remains a fundamental instrument for individual empowerment and national transformation because it equips learners with knowledge, skills, values, and competencies necessary for productive living and societal advancement. It enhances critical thinking, innovation, and adaptability, which are essential for addressing contemporary global challenges. At the individual level, education improves employability and social mobility, while at the national level it drives economic growth, political stability, and technological development. Furthermore, education fosters civic responsibility and national integration by promoting shared values and cultural understanding. As societies become increasingly knowledge-driven, the demand for advanced learning intensifies, thereby positioning higher education institutions as central drivers of development, particularly the university.

Universities play a strategic role in achieving the broad goals of education by serving as centers for advanced knowledge creation, dissemination, and application. They provide specialized training, foster intellectual inquiry, and promote innovation through teaching, research, and community service. In addition, Kelechi (2023) explained that universities contribute to manpower development by producing skilled graduates capable of driving economic and social progress. They also serve as hubs for policy formulation and societal transformation through evidence-based research. Moreover, universities facilitate interdisciplinary collaboration, which is essential for solving complex societal problems. However, the effectiveness of universities in achieving these roles depends largely on the availability of adequate academic resources and support systems, particularly well-equipped and functional libraries.

Libraries constitute a critical component of the university system because they provide access to information resources necessary for teaching, learning, and research activities. They support academic excellence by offering diverse materials such as books, journals, databases, and digital resources that enhance knowledge acquisition. In addition, Agada (2025) stated that libraries promote independent learning and critical inquiry by enabling students and researchers to explore various perspectives. They also facilitate information literacy skills, which are essential in navigating the modern information landscape. Furthermore, Opara, Chima, Ekwebelem and Nwanaekezie (2025) posited that libraries serve as repositories of knowledge, preserving scholarly works for future generations. Through these functions, libraries significantly contribute to academic productivity and innovation, thereby strengthening the capacity of universities to achieve their mandates, especially in relation to research development.

Research development has been conceptualized in various ways by scholars. According Igwe Igbokwe and Mokwe (2026), research development is the systematic process of enhancing research capacity through the provision of infrastructure, funding, training, and institutional support aimed at improving the quality and quantity of scholarly output. This definition emphasizes capacity building and institutional commitment to research excellence. Similarly, Ekpo, Nnaji, Onabe and Ovat (2023) defines research development as the continuous advancement of knowledge through structured inquiry, innovation, and the effective dissemination of research findings to address societal challenges. This perspective highlights the dynamic and problem-solving nature of research activities. Both definitions underscore the importance of deliberate investment in research systems to foster innovation and sustainable development.

Research development plays a pivotal role in assisting universities to achieve the fundamental goals of education by promoting knowledge creation and innovation. It enhances the quality of teaching by integrating current research findings into the curriculum, thereby ensuring that students receive relevant and up-to-date knowledge. In addition, research development fosters critical thinking and problem-solving skills among students and faculty members. It also contributes to national development by generating solutions to socio-economic challenges and informing public policy decisions. Furthermore, strong research development attracts funding, partnerships, and global recognition, which enhance institutional reputation. Consequently, universities with robust research development frameworks are better positioned to fulfill their mandates effectively.

When research development is weak or neglected in Nigeria, several challenges emerge that hinder the progress of universities and national development. Poor research funding leads to inadequate infrastructure and limited access to modern research tools, which reduces the quality of scholarly output. In addition, the lack of research incentives discourages academic staff from engaging in meaningful research activities. This situation often results in brain drain, as talented researchers seek better opportunities abroad. Furthermore, weak research culture limits innovation and reduces the country's competitiveness in the global knowledge economy. Consequently, universities struggle to fulfill their roles in knowledge creation and societal development, thereby undermining the broader goals of education (Ullah, Khalil & Ahmad, 2026).

In South East Nigeria, the challenges associated with poor research development are particularly pronounced due to infrastructural deficits and limited institutional support. Many universities in the region face inadequate funding, outdated library resources, and insufficient digital infrastructure, which hinder effective research activities. In addition, there is often limited collaboration between institutions, which restricts knowledge sharing and innovation. The absence of strong research policies further exacerbates the situation by creating inconsistencies in research priorities and outputs. As a result, academic productivity declines, and universities struggle to contribute meaningfully to regional development. These challenges underscore the need for strategic interventions to strengthen research development in the region (Udoyiu, Emerole, Okebaram & Ikoro, 2024).

University managements in South East Nigeria have made several efforts to address the challenges of poor research development through policy reforms and resource allocation. These efforts include increased investment in digital libraries, staff training programs, and research grants aimed at enhancing academic productivity. In addition, Mbachu, Ezema and Onwumbikoc (2024) asserted that some universities have established research centers and partnerships with international institutions to improve research capacity. Furthermore, there has been a growing emphasis on adopting modern technologies to support teaching and research activities. Despite these efforts, challenges persist due to limited resources and implementation gaps, thereby necessitating more comprehensive strategies such as the retooling of universities.

Retooling of universities refers to the process of restructuring and upgrading institutional systems, resources, and capacities to enhance performance and meet contemporary educational demands. It involves the integration of modern technologies, improved infrastructure, and innovative management practices to support teaching and research activities. This process is essential for aligning universities with global standards and improving their competitiveness. Moreover,

Ngwacho (2024) posited that retooling focuses on strengthening institutional frameworks to support sustainable development. Effective re-tooling requires a holistic approach that addresses both human and material resources. Therefore, key strategies for retooling universities include digital transformation of libraries, capacity building for academic staff, and increased funding for research infrastructure.

Digital transformation of libraries refers to the integration of information and communication technologies into library operations to enhance access to information resources. According to Isiaka, et. al., (2024), it involves the digitization of library materials and the provision of online databases to support remote access. This approach improves information accessibility and supports modern research practices. It also enhances efficiency in information retrieval and management. By adopting digital technologies, libraries can meet the evolving needs of researchers and students. Consequently, digital transformation is a critical component of university retooling aimed at improving research development.

Capacity building for academic staff involves the continuous training and development of lecturers and researchers to enhance their skills and competencies. Ekpo, et. al., (2023) defined it as the process of equipping academic staff with the knowledge and skills necessary for effective teaching and research. This includes workshops, seminars, and professional development programs. Such initiatives improve research productivity and innovation. In addition, capacity building fosters collaboration and knowledge sharing among academics. Therefore, it is an essential strategy for strengthening research development in universities.

Increased funding for research infrastructure refers to the provision of adequate financial resources for the development of research facilities and equipment. According to Agbonna, et. al., (2022), it involves investment in laboratories, libraries, and digital tools necessary for conducting high-quality research. Adequate funding ensures that researchers have access to modern tools and resources. It also supports the implementation of innovative research projects. Consequently, increased funding is crucial for enhancing research capacity and productivity in universities.

These retooling strategies collectively contribute to research development by addressing critical gaps in infrastructure, skills, and resources. Digital transformation enhances access to information, thereby facilitating research activities. Capacity building improves the competencies of academic staff, leading to increased research output. Increased funding ensures the availability of necessary tools and resources for conducting research. Together, these strategies create an enabling environment for innovation and knowledge creation. As a result, universities become more effective in achieving their educational goals and contributing to national development.

Furthermore, the integration of these strategies promotes collaboration, efficiency, and sustainability in research activities. Digital platforms enable global partnerships and knowledge exchange. Skilled academics drive innovative research that addresses societal challenges. Adequate funding supports long-term research projects and institutional growth. As a result, re-tooling enhances the overall quality of education and research in universities. This underscores the importance of adopting comprehensive strategies for improving research development in higher education institutions (Ramachandran, Arulmozhi & Gurupandi, 2025).

However, when retooling of universities is ignored, several adverse consequences arise that hinder research development. Universities may continue to rely on outdated systems and inadequate resources, which limit innovation and academic productivity. In addition, the lack of investment in staff development reduces research capacity and effectiveness. This situation leads to poor research output and diminished global competitiveness. Consequently, there is a need to investigate the relationship between re-tooling of universities' libraries and research development in South East Nigeria to provide empirical evidence for policy and practice (Ifeanyi, 2022; Musa, 2024).

Statement of the Problem

Universities in South East Nigeria in ideal situations are expected to maintain well retooled libraries equipped with modern digital resources, skilled personnel, and adequate infrastructure to support effective research development and academic excellence (Ezeani, 2025). However, when the re-tooling of university libraries is ignored, these libraries become outdated, poorly resourced, and unable to meet contemporary research demands. Consequently, access to current information becomes limited, thereby weakening research quality and academic productivity among scholars. This situation leads to low innovation capacity, reduced global competitiveness, and diminished institutional relevance. Therefore, there is a compelling need to investigate the relationship between retooling of universities' libraries and research development in South East Nigeria.

Research Questions

1. What is the relationship between the digital transformation of libraries and research development in federal universities in South-East Nigeria?

2. What is the relationship between capacity building for academic staff and research development in federal universities in South-East Nigeria?
3. What is the relationship between increased funding for research infrastructure and research development in federal universities in South-East Nigeria?

Hypotheses

H0: There is no significant relationship between the digital transformation of libraries and research development in federal universities in South-East Nigeria

H0: There is no significant relationship between capacity building for academic staff and research development in federal universities in South-East Nigeria

H0: There is no significant relationship between increased funding for research infrastructure and research development in federal universities in South-East Nigeria

METHODS

This study adopted a correlational research design to examine the relationship between retooling of universities' libraries and research development in federal universities in South-East Nigeria. The population of the study comprised 213 academic librarians in university libraries in South East Nigeria. This population is considered appropriate because they are directly involved in research activities and are primary users and managers of university library resources. The sample size for the study was 213 academic librarians, representing the entire population. Due to the relatively small and manageable size of the population, the total enumeration sampling technique was employed. Two structured questionnaires were used for data collection. The first instrument was titled *Retooling of Universities' Libraries Questionnaire (RTULQ)*. It consisted of 30 items and was divided into four clusters. Cluster I sought information on the names of the universities, while Clusters II, III, and IV addressed research questions one, two, and three respectively, with each cluster containing 10 items. The items were structured on a four-point rating scale of Strongly Agree (SA), Agree (A), Disagree (D), and Strongly Disagree (SD). The second instrument was titled *Research Development Questionnaire (RDQ)*. It consisted of 15 items designed to measure research development. Like the RTULQ, it was structured on a four-point rating scale of Strongly Agree (SA), Agree (A), Disagree (D), and Strongly Disagree (SD). Both instruments were designed to elicit responses that reflect the relationship between library re-tooling variables and research development. The instruments were subjected to face and content validation by experts in educational management and measurement and evaluation. These experts examined the items for clarity, relevance, and adequacy in measuring the variables under study. Their suggestions and corrections were incorporated to improve the quality and validity of the instruments. The reliability of the instruments was established through a single-trial administration to a sample of respondents similar to those used for the main study. The internal consistency of the items in the *Retooling of Universities' Libraries Questionnaire (RTULQ)* and the *Research Development Questionnaire (RDQ)* was determined using Cronbach's Alpha statistics. The analysis yielded coefficient alpha values of 0.84 for Cluster II (digital transformation of libraries), 0.81 for Cluster III (capacity building for academic staff), and 0.86 for Cluster IV (increased funding for research infrastructure). The average reliability coefficient across the three clusters was 0.84, indicating a high level of internal consistency; while the second instrument had a reliability coefficient of 0.81, indicating that the instrument was reliable. These values exceeded the acceptable benchmark of 0.70, thus confirming that the instruments were reliable for the study. Data were collected using the direct (face-to-face) method. The researcher administered copies of the questionnaires personally to the respondents in the selected universities. This approach ensured a high response rate and allowed the researcher to provide necessary clarifications where needed. Completed questionnaires were retrieved immediately or at an agreed time to minimize loss and ensure accuracy of responses. Data collected for the research questions and hypotheses were analyzed using the Pearson Product-Moment Correlation Coefficient (PPMC). This statistical tool was used to determine the strength and direction of the relationship between variables. The hypotheses were tested at a 0.05 level of significance. Decisions were made by comparing the calculated correlation values with the critical values; where the calculated value was greater than the critical value, the null hypothesis was rejected, otherwise it was not rejected.

RESULTS

Research Question One

What is the relationship between the digital transformation of libraries and research development in federal universities in South East Nigeria?

Table 4.1: Pearson Correlation Analysis of Digital Transformation and Research Development (n = 240)

Variables	N	r	Sig. (2-tailed)
Digital Transformation	240		
Research Development	240	0.68	0.000

The result reveals a strong positive relationship between digital transformation and research development. The correlation coefficient of 0.68 indicates that improved digital systems significantly enhance research productivity and access.

Research Question Two

What is the relationship between capacity building for academic staff and research development in federal universities in South East Nigeria?

Table 4.2: Pearson Correlation Analysis of Capacity Building and Research Development (n = 240)

Variables	N	r	Sig. (2-tailed)
Capacity Building	240		
Research Development	240	0.72	0.000

The findings show a strong positive relationship between capacity building and research development. The correlation coefficient of 0.72 implies that staff training significantly improves research competence and output.

Research Question Three

What is the relationship between increased funding for research infrastructure and research development in federal universities in South East Nigeria?

Table 4.3: Pearson Correlation Analysis of Funding and Research Development (n = 240)

Variables	N	r	Sig. (2-tailed)
Research Funding	240		
Research Development	240	0.75	0.000

The result indicates a very strong positive relationship between funding and research development. The correlation coefficient of 0.75 shows that increased funding significantly enhances research capacity, innovation, and productivity.

Test of Hypotheses

Hypothesis One

H_{01}: There is no significant relationship between the digital transformation of libraries and research development in federal universities in South East Nigeria.

Table 4.4: Test of Relationship between Digital Transformation and Research Development

Variables	N	r	Sig. (2-tailed)	Decision
Digital Transformation & Research Development	240	0.68	0.000	Significant

Since the p-value is less than 0.05, the null hypothesis is rejected. This indicates a statistically significant relationship between digital transformation and research development in federal universities studied.

Hypothesis Two

H_{02}: There is no significant relationship between capacity building for academic staff and research development in federal universities in South East Nigeria.

Table 4.5: Test of Relationship between Capacity Building and Research Development

Variables	N	r	Sig. (2-tailed)	Decision
Capacity Building & Research Development	240	0.72	0.000	Significant

The p-value is below 0.05; therefore, the null hypothesis is rejected. This confirms a statistically significant relationship between capacity building and research development in the selected universities.

Hypothesis Three

H_{03}: There is no significant relationship between increased funding for research infrastructure and research development in federal universities in South East Nigeria.

Table 4.6: Test of Relationship between Funding and Research Development

Variables	N	r	Sig. (2-tailed)	Decision
Funding & Research Development	240	0.75	0.000	Significant

Given that the p-value is less than 0.05, the null hypothesis is rejected. This demonstrates a statistically significant relationship between funding for research infrastructure and research development outcomes.

Discussion of the Findings

The finding on research question one revealed a strong positive and significant relationship between digital transformation of libraries and research development in federal universities in South East Nigeria. This implies that improved access to digital databases, e-resources, and automated library systems enhances research productivity and scholarly output. This finding aligns with the position of Agbonna, et. al., (2022), who asserted that digital libraries improve accessibility to current information and facilitate high-quality research. Similarly, Isiaka, et. al., (2024) maintained that technology-driven library services significantly influence knowledge creation and dissemination. Therefore, the integration of digital technologies in university libraries strengthens research capacity and supports innovation among academic staff and students.

The finding on research question two indicated a strong positive and significant relationship between capacity building for academic staff and research development. This suggests that training, workshops, and professional development programmes enhance research competencies and output. This result is consistent with Ekpo, et. al., (2023), who emphasized that continuous staff development improves research skills and academic productivity. In the same vein, Ngwacho (2024) noted that well-trained academics are more likely to engage in meaningful research and contribute to knowledge advancement. Thus, investment in capacity building remains a critical factor in improving research development in universities.

The finding on research question three showed a very strong positive and significant relationship between increased funding for research infrastructure and research development. This indicates that adequate funding provides the necessary tools, facilities, and resources required for effective research activities. This finding corroborates Ullah, et. al., (2026), who argued that sufficient funding enhances access to modern research facilities and promotes innovation. Similarly, Opara, et. al., (2025) observed that financial investment in research infrastructure significantly improves the quality and quantity of research output. Hence, increased funding is essential for strengthening research development in higher education institutions.

Conclusion

This study examined the relationship between retooling of universities' libraries and research development in federal universities in South East Nigeria. The findings established that digital transformation of libraries, capacity building for academic staff, and increased funding for research infrastructure significantly and positively influence research development. These results highlight the importance of modernizing library systems, enhancing staff competencies, and providing adequate financial support for research activities. Consequently, universities that invest in these areas are more likely to achieve improved research productivity and academic excellence. Therefore, re-tooling of university libraries remains a critical strategy for advancing research development and institutional effectiveness in Nigeria.

Recommendations

34. University management should prioritize the digital transformation of libraries by providing access to modern databases, e-resources, and automated systems to enhance research productivity.
35. Library management should organize regular capacity building programmes such as workshops, seminars, and training for academic staff to improve their research skills and competencies.
36. Government and institutional authorities should increase funding for research infrastructure to ensure the availability of modern facilities and tools necessary for effective research development.

Abstract

Libraries and librarianship play a strategic role in national development by promoting education, research, innovation, and an informed citizenry. In Nigeria, however, libraries face persistent challenges, including inadequate funding, dilapidated infrastructure, limited technological capacity, and a perceived decline in professional relevance. Within the context of the conference theme, "Our Future, Our Hope," this paper examines the current state of Nigerian libraries and their evolving role in the national landscape. This study adopts a qualitative, document-based research design, the study analyses libraries' contributions to national growth, assesses systemic bottlenecks confronting the profession, and explores emerging trends shaping the future of information services. Emphasis is placed on digital transformation, human capacity building, policy reform, and strategic partnerships as essential pathways for repositioning the profession for long-term sustainability. This paper argues that, despite existing constraints, Nigerian libraries remain vital institutions of hope; their effective revitalisation is a prerequisite for achieving sustainable national development. The study concludes with practical recommendations for modernising library infrastructure and empowering librarians to proactively meet the evolving information needs of the 21st century.

Keywords: Libraries, Librarianship, Digital Transformation, Sustainable Development, Nigeria, Professional Revitalisation.

Introduction

Libraries have long been recognised as custodians of knowledge and as essential institutions for education, research, and societal development. In contemporary societies, their role has expanded beyond the preservation of print materials to include the management of digital information, knowledge dissemination, and support for lifelong learning. In Nigeria, libraries are expected to make meaningful contributions to national aspirations, including quality education, technological advancement, good governance, and sustainable development.

However, the current state of Nigerian librarianship presents a paradox. While the global community is transitioning into the 5th Industrial Revolution (5IR), characterised by the combination of human intelligence and cognitive computing, many Nigerian libraries remain hampered by systemic challenges (Ajani & Oladokun, 2024). These include inadequate funding, outdated collections, limited information and communication technology (ICT) infrastructure, and insufficient professional development opportunities for librarians (Osinulu, 2021). These challenges have raised concerns about the relevance and future of libraries in an increasingly digital and information-driven world. Within the context of the conference theme, "Our Future, Our Hope," this paper argues that the survival of the Nigerian state is inextricably linked to the vitality of its information systems (Anasi, 2010).

"While the transition to modern, knowledge-driven hubs represents a critical pillar for Nigeria's national development, the sector continues to grapple with severe infrastructural deficits. Scholars note that inadequate budgetary allocations, coupled with systemic electricity and bandwidth constraints, severely limit technological readiness across academic, public, and school libraries (Abubakar, 2026; Dada, 2023). This problem is compounded by a profound digital skills gap, with research indicating that nearly 78% of the information workforce lacks the advanced digital competencies required to sustain complex virtual library operations (Adetunla & Chowdhury, 2025).

Nevertheless, a strategic roadmap for transformation is emerging through the proactive adoption of low-cost, open-source software like Koha, paired with institutional open-access mandates championed by regulatory bodies like the National Universities Commission (Adetunla & Chowdhury, 2025; Suleiman, 2024).

Statement of the Problem

Despite the global recognition of libraries as indispensable pillars of the knowledge economy, the Nigerian library landscape remains trapped in a cycle of systemic underfunding and neglect. While the nation aspires to achieve the United Nations Sustainable Development Goals (SDGs) by 2030, the institutions designed to serve as their foundational information bedrock are struggling to survive. This creates a critical paradox: while the National Universities Commission's Core Curriculum and Minimum Academic Standards (CCMAS) has modernised professional training by integrating digital librarianship, database management, and infopreneurship, graduates face a stark reality on the ground.

They are entering a broken ecosystem defined by a widening digital divide, obsolete physical collections, and deteriorating infrastructure. Without urgent policy reform and matching financial investments to align physical infrastructure with these modern academic benchmarks, Nigeria's libraries risk becoming archival relics rather than active catalysts for national development.

Research Questions

The study aims to answer the following questions:

1. What is the current state of infrastructure and service delivery across the various library sectors in Nigeria?

2. What are the fundamental challenges, including funding, policy, and skills gaps, that affect the relevance of Nigerian libraries?

3. How are emerging technologies, such as automation and digital repositories, transforming the landscape of Nigerian librarianship?

4. In what ways can repositioning libraries contribute to sustainable national development in Nigeria?

Literature Review

The literature review for this study is organised into four thematic areas that reflect the evolving intersection of librarianship and national development in the Nigerian context. These themes progress from the historical foundations of libraries to their contemporary roles as drivers of global sustainability and technological innovation.

Historically, libraries in Nigeria were established primarily as appendages to educational institutions. However, contemporary scholarship has significantly reframed this perception. Friday and Ekeruche (2023) argue that the library's role has expanded far beyond traditional education, becoming a critical driver of economic and political stability. In the 21st century, libraries are increasingly viewed as "gateways" to global information rather than mere custodians of local print collections. According to recent IFLA reports (2025), although Nigeria has the largest network of academic libraries in Africa, its potential impact on national development remains constrained by limited integration into the broader national "knowledge economy" framework.

This lack of integration is being addressed by aligning library services directly with the United Nations 2030 Agenda. The literature shows that libraries are indispensable to achieving specific Sustainable Development Goals (SDGs). For instance, under SDG 4 (Quality Education), libraries facilitate lifelong learning and the use of "Open Education Resources" (OER), which Ekong et al. (2024) identify as vital for reducing the rising costs of tertiary education in Nigeria. This educational role extends into SDG 9 (Industry & Innovation), where modern libraries are being repositioned as "Innovation Hubs" or "Makerspaces" that provide the digital tools necessary for local entrepreneurship. Furthermore, the profession is expanding into environmental advocacy; Ajani et al. (2024) highlight the "Green Library" concept, in which Nigerian institutions are adopting eco-friendly practices to lead community education on climate resilience (SDG 13).

As libraries align with global sustainability goals, they are also being reshaped by the transition from the 4th to the 5th Industrial Revolution (5IR). While the 4th revolution focused primarily on automation, the 5IR emphasises synergistic human-machine collaboration (Santhi & Muthuswamy, 2023). This technological shift presents both opportunities and challenges for Nigerian librarianship. Research by Njoku (2025) indicates that although awareness of technologies such as AI, IoT, and Big Data is high, a significant "preparedness gap" persists in their practical implementation. To bridge this gap, literature such as Okwu et al. (2025) explores integrating AI-driven reference services and chatbots as essential tools for remaining relevant to "Gen Z" undergraduates who demand instant, digital first information.

Despite the profession's hopes and technological potential, the literature consistently highlights persistent "bottlenecks" impeding progress. Masenya (2020) and subsequent studies in 2025 identify insufficient ICT funding as the primary obstacle to modernisation. These financial constraints exacerbate the existing infrastructure gap; Ukaegbu and Okwu (2022) note that Nigeria's "Digital Divide" is worsened by unreliable power and high bandwidth costs. As a result, many digital projects in Nigerian libraries remain limited or stuck in the "pilot phase," unable to scale to the level required for genuine national sustainability.

Methodology

This study adopts a qualitative, document-based research design. This approach is highly suited for analysing professional paradigms and developing strategic frameworks (Creswell & Poth, 2018). Moving beyond the statistical counts typical of quantitative surveys, this method allows for a deeper diagnostic exploration of systemic shifts within institutional structures. By leveraging this qualitative, exploratory lens, the paper evaluates the current vulnerabilities of Nigerian libraries and proposes actionable pathways to ensure their future relevance.

This exploration is based on a systematic review of secondary data from authoritative and contemporary sources. These include institutional reports from the National Library of Nigeria (NLN) and the Nigerian Library Association (NLA), as well as critical policy documents such as the TETFund Library Intervention guidelines. Furthermore, scholarly insights were drawn from peer-reviewed databases, including Google Scholar and Emerald Insight, with a strict focus

on LIS trends documented between 2020 and 2026 to ensure the study reflects the most recent technological advancements.

The reliability of this study relies on a rigorous data collection process driven by domain-specific keyword combinations. The search strategy explicitly cross-referenced "libraries and librarianship" with thematic pillars such as "institutional repositioning," "sustainable development," and the "5th Industrial Revolution." This targeted approach filtered out generic literature, securing data that speaks directly to the socio-economic and digital realities of Nigerian libraries. Aligning these local insights with global benchmarks, including the UN SDGs and IFLA's Global Vision reports, allows the study to offer solutions that are locally viable yet globally aligned.

Finally, the gathered data were processed using Thematic Content Analysis to translate raw information into a strategic roadmap. This involved a three-stage analytical process: first, it identifies and clusters professional challenges into core themes like funding and the tech gap; second, it synthesises these Nigerian realities with global best practices; and third, it prescribes an actionable "Repositioning Framework." This structured approach ensures the paper's conclusions move beyond mere observation, offering insights derived from a rigorous synthesis of policy, theory, and professional practice.

The Current State of Libraries and Librarianship in Nigeria

The Nigerian library system is characterised by a significant digital divide, with academic libraries making substantial progress in modernisation while public and school libraries continue to face serious challenges. The major sectors include academic, public, school, and special libraries.

Academic Libraries: The Most Advanced Sector

Academic libraries in universities, polytechnics, and colleges of education remain the most developed segment of the Nigerian library system. They play a central role in supporting teaching, learning, research, and innovation through access to information resources, research support, information literacy programmes, and modern learning spaces.

Recent developments show a transition toward hybrid library models that combine physical and digital services. Significant investments from TETFund have improved library infrastructure, ICT facilities, and access to digital resources through initiatives such as the Nigerian Research and Education Network (NgREN). Open-source Integrated Library Management Systems, particularly Koha, are increasingly being adopted to automate library operations. Furthermore, academic libraries are beginning to explore artificial intelligence (AI) applications for research support, metadata generation, and AI literacy training. Despite these advances, challenges such as unreliable electricity supply and gaps in staff digital competencies remain.

Public Libraries: A Sector in Decline

Public libraries, managed by State Library Boards, represent the most neglected sector of librarianship in Nigeria. Many suffer from chronic underfunding, deteriorating buildings, obsolete furniture, inadequate ICT infrastructure, and outdated collections. Limited internet connectivity and poor technological facilities have reduced many public libraries to repositories of old materials rather than active community information centres. This situation restricts access to information, weakens reading culture, and widens educational inequalities, particularly among disadvantaged populations.

School Libraries: Policy Without Effective Implementation

Although the National Policy on Education mandates functional libraries in schools, implementation remains weak. Many public primary and secondary schools lack dedicated library facilities, while existing libraries are often poorly equipped and stocked with outdated resources. A major challenge is the shortage of professionally trained librarians, with many schools relying on teacher-librarians who lack formal Library and Information Science (LIS) training. Consequently, students receive limited information literacy instruction and have fewer opportunities to develop research and critical-thinking skills.

Special Libraries: Highly Specialised but Vulnerable

Special libraries operate within research institutes, government agencies, corporations, and professional organisations. They provide specialised information services such as selective dissemination of information, current awareness services, indexing, abstracting, and database management to support research, policy development, and decision-making. Despite their strategic importance, these libraries remain vulnerable because their funding depends largely on parent organisations. Economic challenges, budget cuts, and institutional restructuring can significantly affect their operations and sustainability.

Major Threats to the Relevance of Nigerian Libraries

Nigerian libraries are struggling to stay impactful and adapt to the digital age due to three deeply interconnected issues:

Financial Instability: Due to an over-reliance on inadequate and unpredictable government and institutional funding, libraries, particularly public and school branches, cannot afford modern digital resources, stable internet connectivity, or necessary infrastructure upgrades. They remain stuck with outdated print collections.

Outdated Policies & Poor Enforcement: Existing regulations are poorly enforced, and current policies fail to address modern digital realities. Because regulatory bodies lack the teeth to implement, libraries are routinely left out of national digital initiatives and ignored as vital pieces of knowledge infrastructure.

Technological Skills Gaps: Many library professionals lack training in modern essentials like digital librarianship, systems management, metadata creation, and data curation. This shortage of expertise leads to underutilised digital systems, unsustainable tech adoption, and a general resistance to institutional innovation.

Challenges and Emerging Trends in Nigerian Librarianship

The path toward "Our Future, Our Hope" is marked by a dual reality: a struggle against systemic constraints and a rapid evolution toward intelligent, user-centric technologies. To understand how to reposition the profession, we must first analyse these two opposing forces.

Critical Challenges Hindering Sustainability

The study identifies four foundational challenges that impede the "Hope" of national development, including the Funding Desert and Resource Scarcity. Beyond simple budget cuts, the core challenge is the lack of sustainable funding models. Most public libraries face "stagnant budgets", with 90% of allocations going to staff salaries, leaving almost nothing for collection development or digital subscriptions (Aina, 2014; Njoku, 2025).

Infrastructural "Fragility": The digital divide in Nigeria is driven by more than a lack of computers. Inconsistent power and the high cost of bandwidth limit high-tech projects to pilot phases. For many rural libraries, the 5th Industrial Revolution (5IR) remains a theoretical concept due to basic electricity deficits (Ukaegbu & Okwu, 2022).

The Professional Preparedness Gap: Despite high awareness of digital tools, proficiency in their use remains low. Many librarians struggle with metadata management for e-resources, database troubleshooting, and the ethical use of AI (Njoku, 2025; Okwu et al., 2025).

Weak Policy Implementation: Although the Librarians' Registration Council of Nigeria (LRCN) has established robust standards, there is a lack of "legislative bite." Non-professionals are often employed to run libraries, and the 10% library component of the TETFund intervention is frequently diverted to other institutional needs.

Emerging Trends: Signals of Transformation

Despite the constraints, Nigerian librarianship is witnessing a "quiet revolution" driven by global trends adapted to local needs: Library 4.0 and 5.0 (Intelligence & Personalisation): transitioning from the 4th Revolution (Automation) to the 5th Revolution (Human-Machine Partnership). We see the emergence of Smart Libraries, where AI-driven chatbots provide 24/7 reference support to "Gen Z" students who prefer instant, mobile-first information (Okwu et al., 2025).

The "Makerspace" Movement: Libraries are being repositioned as innovation hubs. Rather than quiet reading rooms, academic libraries increasingly feature 3D printers, coding labs, and collaboration zones, supporting SDG 9 (Industry & Innovation) (Ekong et al., 2024).

Open Science and Global Visibility: There is a surge in the use of Institutional Repositories (IRs) built on DSpace and Koha. This shift ensures that Nigerian research is no longer "hidden" and is part of the global open access movement, thereby enhancing the nation's research visibility.

Green Librarianship: Emerging between 2024 and 2026, the "Green Library" concept emphasises sustainable building practices and community education on climate resilience, aligning with SDG 13 (Climate Action) (Ajani et al., 2024).

Repositioning Libraries' Contribution to Sustainable National Development in Nigeria

In the context of the United Nations Sustainable Development Goals (SDGs) and Nigeria's own national development agendas, a repositioned library serves as critical infrastructure for human capital development.

Driving Quality Education and Lifelong Learning (SDG 4)

Repositioning Nigerian libraries from passive storehouses to dynamic digital resource centres directly advances sustainable development by democratizing access to quality education. In a country where premium academic journals and textbooks are financially out of reach for most students and researchers, a modernised library ecosystem acts as a critical equaliser. By establishing robust open-access institutional repositories and consortia-based access to global databases, libraries eliminate geographic and financial barriers to knowledge. Furthermore, public libraries that are repositioned as community learning centres provide out-of-school youths and adult learners with free access to literacy programs and educational materials, building the foundational human capital required to sustain a developing economy.

Fostering Digital Literacy and the Information Economy (SDG 8 & 9)

As Nigeria aggressively pursues a transition toward a digital economy, a repositioned library system serves as the primary gateway for digital inclusion. By equipping libraries with reliable internet connectivity, modern hardware, and spaces for tech collaboration, these institutions become community ICT hubs. Librarians, acting as information literacy experts, can bridge the severe digital divide by training citizens, particularly MSME operators, women, and unemployed

youth in critical skills ranging from basic computer literacy to advanced data management. This directly fuels sustainable economic growth and industrial innovation by providing a tech-savvy workforce capable of participating in the global digital marketplace.

Promoting Equitable Access to Information and Good Governance (SDG 16)

Sustainable national development is impossible without an informed citizenry and transparent governance. Repositioning the National Library of Nigeria and various state public libraries ensures that public policies, health guidelines, agricultural data, and legal frameworks are organised, preserved, and made easily accessible to the general public. When libraries actively curate and disseminate information on civic rights, public health (such as epidemic prevention), and modern agricultural practices to rural farmers, they empower communities to make informed decisions. This open access to information mitigates misinformation, fosters civic engagement, and builds accountability, which are the cornerstones of peace, justice, and strong institutions.

Preserving Indigenous Knowledge for Cultural Sustainability (SDG 11)

National development is not merely economic; it is deeply cultural. Nigeria possesses a rich heritage of indigenous knowledge systems in agriculture, medicine, history, and the arts that are currently at risk of disappearing due to a reliance on oral tradition. Repositioned libraries utilise modern digital preservation technologies such as audio-visual archiving, cloud storage, and metadata tagging to capture, document, and protect this indigenous knowledge. By transforming this localised data into searchable digital formats, libraries preserve Nigeria's cultural identity while providing a unique baseline of local data for sustainable research and development in indigenous pharmaceuticals and sustainable farming.

Discussion of Findings

The findings on the current state of Nigerian libraries reveal significant disparities across library sectors. While academic libraries have benefited from interventions such as the Tertiary Education Trust Fund, public and school libraries continue to face infrastructural decay, outdated collections, inadequate digital facilities, and unreliable power supply. These challenges justify the framework's Sectoral Infrastructure Standardisation pillar, which advocates for modernised learning spaces, digital facilities, and alternative energy solutions to improve service delivery.

The study also identifies persistent challenges related to funding, policy implementation, and professional skills development. Libraries remain heavily dependent on limited government funding, with minimal adoption of innovative financing models such as public-private partnerships. Additionally, many librarians lack competencies in digital librarianship, data management, and virtual service delivery. These findings support the framework's Capacity Building and Policy Advocacy pillar, which emphasises curriculum reform, continuous professional development, and stronger policies that prioritise digital literacy and technological competence.

Findings on the adoption of emerging technologies reveal a substantial gap between awareness and practical implementation. Although technologies such as Koha and DSpace are widely recognised for their benefits, their effective deployment is constrained by high bandwidth costs, inadequate technical support, and fragmented implementation efforts. In response, the framework's Digital Integration Blueprint proposes cloud-based systems and collaborative digital repositories that enable resource sharing and reduce technical and financial barriers, particularly for smaller libraries.

Finally, the study demonstrates that libraries remain an underutilised resource for national development. When effectively repositioned as information and innovation hubs, libraries can contribute significantly to educational advancement and economic growth. To maximise this potential, the framework's Socio-Economic Realignment pillar recommends aligning library services with national development priorities, particularly the National Digital Economy Policy and Strategy, thereby ensuring libraries become central contributors to sustainable development and national prosperity.

Conclusion

The theme "Our Future, Our Hope" is not merely a slogan; it is a call to action for the Nigerian library community. This paper demonstrates that, despite significant systemic challenges, including the digital divide and funding deficits, libraries in Nigeria remain the most critical infrastructure for sustainable national development. The "hope" for Nigeria lies in an informed citizenry, and that information can only be systematically provided through a repositioned library system.

Repositioning is no longer optional but a survival strategy. It demands a radical shift from traditional custodianship to active information leadership. If Nigerian libraries embrace digital transformation, prioritise human capital development, and forge strategic partnerships, they will cease to be seen as passive storehouses and instead emerge as dynamic engines of innovation. Ultimately, successful repositioning will empower Nigeria to achieve its sustainable development goals and secure a prosperous future for the next generation.

Recommendations

Based on the analysis and discussion presented in this study, the following recommendations are proposed to ensure the effective repositioning of Nigerian libraries for national sustainability. These recommendations align with the paper's core objectives:

1. Strategic Technological Integration

Adoption of the "Hybrid Library" Model: Institutional and public libraries must move beyond traditional physical storage. Prioritising the integration of digital resources with physical collections is essential. This includes investing in cloud-based library management systems and robust institutional repositories (IRs) to ensure that researchers and students have 24/7 access to information, regardless of their physical location.

2. Professional Re-Skilling and Competency Standards

Mandatory Tech-Driven CPD: To bridge the significant digital skills gap identified in this study, the Librarians' Registration Council of Nigeria (LRCN) and the Nigerian Library Association (NLA) should mandate Continuous Professional Development (CPD). Training should focus on high-impact areas such as Artificial Intelligence (AI) literacy, data analytics, and digital curation to ensure that librarians remain relevant in the 2026 global information economy.

3 Legislative Advocacy and Funding Integrity

Strict Policy Enforcement: There is an urgent need for proactive lobbying to safeguard library funding. Advocacy efforts should ensure that the 10% library component of the TETFund intervention and other state-level allocations are used exclusively for technological modernisation and collection development, rather than diverted to administrative overheads or non-library expenses.

4. Structural and Service Innovation

Creation of Innovation Hubs (Makerspaces): To revitalise the public's perception of libraries, physical spaces should be redesigned as collaborative hubs. By incorporating tools such as 3D printers, coding workshops, and high-speed internet, libraries can attract Nigeria's youth and directly support local entrepreneurship and the acquisition of technical skills.

Community-Centric Advocacy: Librarians must proactively "market" their relevance by designing programmes that address immediate societal problems. This includes launching health literacy campaigns or providing agricultural information services for rural farmers, thereby demonstrating the library's tangible value to policymakers and the community.

Abstract

Library orientation programmes are essential initiatives designed to familiarize students with the resources, services, and facilities of school libraries, equipping them with the skills to locate, evaluate, and effectively use information for learning . This study explored the repositioning of library orientation programmes as a strategy for enhancing students' information literacy skills in Federal Government Colleges in Rivers State, Nigeria. The study was guided by **three research objectives** and **corresponding research questions.** The research adopted a descriptive survey design, the **population comprised six school librarians** drawn from the **three Federal Government Colleges in Rivers State,** and **census sampling technique was adopted. The data were analyzed using descriptive statistics,** specifically mean scores. The findings revealed that the **content of library orientation programmes** adequately introduced students to library sections, resources, rules, and material location processes, thereby supporting the development of basic information literacy skills. The study concluded that while library orientation programmes contribute positively to students' information literacy skills, their effectiveness is constrained by inadequate ICT integration. It was recommended that orientation programmes be **systematically strengthened, interactive instructional methods standardized,** and **ICT facilities fully integrated** to enhance effective library service delivery and students' information literacy skills in Federal Government College

Keywords: Library Orientation, Information Literacy, Information Literacy Skills, Federal Government Colleges, Rivers State

Introduction

In the contemporary educational landscape, mastery of information literacy is indispensable for students' academic success. Information literacy encompasses the ability to locate, evaluate, and effectively use information from diverse sources, including print and digital formats, to support learning, problem-solving, and lifelong learning (Onyeneke & Obichere, 2018). In school settings, especially in Federal Government Colleges in Nigeria, the library is a key institutional space where students can develop these competencies. However, mere access to books and electronic resources does not guarantee that students will use them effectively. Information literacy competencies are cultivated through structured interventions, of which library orientation programmes are fundamental.

Library orientation programmes are formal activities designed to introduce new users to the library's resources, services, facilities, and systems. These programmes typically include explanations of library rules and regulations, tours of the physical space, demonstrations of cataloguing systems, and instructions on accessing electronic resources. When thoughtfully delivered, orientation extends beyond mere awareness of resources; it lays the foundation for students' confidence in engaging with information environments (Haruna, Ajogwu, Alaku, & Saidu, 2024). They are frequently delivered as one-off sessions at the start of the academic year, are brief in scope, and rely heavily on didactic approaches that fail to build practical information skills (Adetola, 2024). As a result, many students complete orientation without the practical skills needed to locate, assess, and apply relevant information for academic tasks.

The deficit in effective orientation has tangible consequences, these challenges are structural and resource constraints commonly observed in Nigerian school libraries, including limited ICT infrastructure, inadequate staffing, and irregular implementation of orientation activities. For many students, orientation does not extend to practical instruction on digital catalogues, online databases, or critical evaluation of information sources skills that modern learners must possess in increasingly digital and information-rich environments (Ovokeyen & Emmanuel, 2019). This situation underscores the need for a comprehensive rethinking, or repositioning, of library orientation strategies to emphasize information literacy outcomes.

Repositioning library orientation involves shifting the focus from superficial introductions to purposeful, skills-based instruction that aligns with students' academic needs. It means incorporating interactive pedagogies, integrating ICT tools, and embedding critical thinking within orientation content. Such repositioning not only enhances students' competencies in handling information but also contributes to broader educational goals such as improved academic performance, self-directed learning, and lifelong engagement with information. Without systematic repositioning of orientation programmes, students are likely to remain ill-equipped for the demands of contemporary academic work.

Statement of the Problem

Library orientation programmes are intended to introduce students to library resources, services, facilities, and procedures to effectively meet their information needs. In theory, these programmes function as a foundational strategy to cultivate information literacy skills such as the ability to identify information needs, locate appropriate sources, critically evaluate information, and apply it to academic tasks. Information literacy is widely recognized as a key

determinant of academic achievement, lifelong learning, and effective use of information resources in any educational setting (Onyeneke & Obichere, 2018). In Federal Government Colleges in Rivers State, Nigeria, school libraries are expected to play a central role in fostering these competencies among students, positioning orientation programmes as critical interventions in the academic development process.

Despite the theoretical importance of library orientation programmes and the acknowledged relevance of information literacy, existing research evidence suggests persistent deficiencies in how orientation activities are planned and delivered in Nigerian educational contexts. Studies examining information literacy competencies among secondary school students in Nigeria show that learners often exhibit **low levels of information literacy skills**, with notable weaknesses in evaluating information, formulating search strategies, and distinguishing between credible and non-credible sources (Onyeneke & Obichere, 2018).

Despite these insights, there is limited empirical evidence on how library orientation programmes in **secondary schools** particularly Federal Government Colleges in Rivers State are repositioned to explicitly enhance **students' information literacy skills**. Existing programmes tend to be one-off, largely descriptive, and delivered with minimal interactive engagement or emphasis on practical information-handling competencies. As a result, students often complete these orientation sessions without the ability to independently navigate library systems, evaluate information quality, or apply information effectively in academic tasks. Hence this study, which seeks to find how repositioning library orientation programmes can enhance students' information literacy skills in Federal Government Colleges in Rivers State.

Purpose of the Study

The purpose of the study is to examine how repositioning library orientation programmes can enhance students' information literacy skills in Federal Government Colleges in Rivers State. Specifically, the study sought to:

1. To identify the content of library orientation programmes on students' information literacy skills in Federal Government Colleges in Rivers State.
2. To examine of instructional methods used in library orientation programmes on students' information literacy skills in Federal Government Colleges in Rivers State.
3. To determine Information Communication Technology integration in library orientation programmes on students' information literacy skills in Federal Government Colleges in Rivers State.

Research Questions

1. What is the content of library orientation programmes influence students' information literacy skills in Federal Government Colleges in Rivers State?
2. What are the instructional methods used in library orientation programmes on students' information literacy skills in Federal Government Colleges in Rivers State?
3. What Information Communication Technology are integrated in library orientation programmes impact students' information literacy skills in Federal Government Colleges in Rivers State?

Literature Review

Concept of Library Orientation Programmes

Library orientation programmes are designed to equip students with the skills to navigate library resources effectively. In Federal Government Colleges in Rivers State, Nigeria, orientation plays a critical role in fostering students' information literacy skills, which include the ability to locate, evaluate, and apply information for academic and research purposes (Onyeneke & Obichere, 2018). Despite its recognized importance, research shows that many orientation programmes in Nigerian secondary schools are brief, largely theoretical, and poorly integrated with practical instruction, limiting their impact on students' information competencies (Haruna, Ajogwu, Alaku, & Saidu, 2024).

Library orientation programmes are structured instructional activities designed to introduce users especially new students to library resources, services, facilities, and information retrieval procedures. It can be referred to the structured instructional elements delivered to new library users to familiarise them with the library's physical layout, resources, services, rules, and information retrieval processes. Citing Agboola and Aduku (2018), traditionally, orientation content in Nigerian school libraries has focused on basic awareness, including introductions to different sections of the library, opening hours, borrowing rules, and general conduct expectations While such content is necessary, it is no longer sufficient in an era where information literacy has emerged as a core educational outcome. These programmes function as a form of user education, equipping learners with the knowledge and confidence to navigate library systems efficiently. In academic settings, orientation may take the form of guided tours, demonstrations of cataloguing systems, explanations of borrowing policies, and explanations of electronic database access. The ultimate goal is to ensure students can independently locate, evaluate, and use information for academic tasks.

However, it frequently lacks depth in content and fails to move beyond basic introductions to meaningfully influence students' information behaviors (Haruna, Ajogwu, Alaku, & Saidu, 2024). *Library orientation programmes are therefore not always successful in building practical competencies for information use, especially in environments where resources are under-utilized or where interactive instructional strategies are limited.*

Core Elements of Library Orientation Content

1. **Introduction to library organisation and classification systems**: Students' ability to locate information independently depends heavily on their understanding of how library materials are organised. Afolabi and Aragbaye (2022), however opined that poor knowledge of classification schemes and shelving systems remains a major barrier to effective information retrieval.
2. **Awareness of information resources and formats**: This constitutes a critical aspect of orientation content. Nigerian school libraries typically house a range of resources, including textbooks, reference materials, newspapers, magazines, atlases, and, increasingly, digital resources. However, in a study conducted by Adeeko (2021) shows that students often limit their use to a narrow range of materials due to inadequate awareness
3. I**nstruction on information search strategies**: This has been identified as a key but often neglected component of orientation content. According to Abubakar (2021), it was revealed that many Nigerian secondary school students rely on trial-and-error methods when searching for information, both in print and digital environments.
4. **Guidance on evaluating information sources:** This is increasingly critical in the digital age. The proliferation of online information has intensified concerns about misinformation, poor-quality sources, and unethical information use. Although evaluation skills are rarely emphasised in traditional orientation programmes, Nigerian scholars argue that early exposure to criteria for assessing authority, accuracy, relevance, and currency of information can strengthen students' academic judgment.
5. **Instruction on ethical and responsible use of information**, including citation practices and avoidance of plagiarism, has emerged as an essential component of modern orientation programmes. The widespread challenges with plagiarism and improper attribution, often linked to lack of early instruction (Mulenga & Shilongo, 2024). Orientation programmes that address ethical information use at an early stage help instill academic integrity and responsible scholarship habits.

Information Literacy

Information literacy refers to a set of cognitive and practical skills that enable individuals to recognize when information is needed and to identify, locate, evaluate, and use that information effectively and ethically. It is widely considered a cornerstone of academic success, lifelong learning, and effective participation in an information-rich society. Information literacy skills refer to the ability to recognise information needs and to locate, evaluate, organise, and use information effectively and ethically. In the Nigerian educational context, information literacy has gained increasing attention due to curriculum reforms, examination demands, and the integration of digital technologies into teaching and learning. Nigerian researchers conceptualise information literacy as a multidimensional construct encompassing information identification, access, evaluation, application, and ethical use. These dimensions align closely with international models such as the Association of College and Research Libraries framework, but they are interpreted within the realities of Nigerian school environments, where access to resources and trained librarians varies widely.

A study by Owolabi, Adekunle, and Olaseigbe (2023) found that students with higher levels of information literacy demonstrated better study habits, improved assignment quality, and greater independence in learning tasks. However, these studies also highlight that many students lack foundational information skills due to insufficient instructional interventions at the school level. Information literacy is not limited to higher education; it has relevance at all levels of schooling. Secondary students who develop strong information literacy skills demonstrate improved academic performance, greater autonomy in research tasks, and enhanced critical thinking abilities (Babarinde & Adesina, 2023). Such evidence points to the critical role that library programmes especially orientation play in initiating students into meaningful information practices early in their educational journey.

Relationship between Library Orientation and Information Literacy

Research consistently points to a positive relationship between structured orientation programmes and students' acquisition of information literacy competencies. When orientation programmes are designed to move beyond mere awareness and incorporate active instruction on information search strategies, evaluation of sources, and use of digital tools, students show significantly better skills in locating and using library resources In the Nigerian context, studies among tertiary students reveal similar concerns. For Nigerian postgraduate students, Pelemo, Onanuga, Ilori, and Ugbala (2020) found that the absence of formal orientation and information literacy training led to low proficiency in accessing online catalogues and electronic databases, suggesting that orientation programmes must be deliberately paired with instruction on information literacy skills to be effective. Although these studies are rooted in tertiary contexts, the implications for secondary education are clear: **without intentional orientation designed to develop information literacy, students are likely to struggle with independent information seeking and research tasks**, even where library resources exist. Orientation that is superficial or one-dimensional fails to support the development of competencies necessary for 21st-century learning.

Instructional Methods in Orientation Programmes

The instructional methods used in library orientation significantly affect students' engagement and learning outcomes. Traditional approaches primarily lecture-based sessions or passive tours are insufficient for developing practical skills. Instead, active learning strategies such as demonstrations, hands-on workshops, small group sessions, and integrated

ICT instruction are more effective in encouraging participation and skill acquisition (Haruna et al., 2024). For example, guided demonstrations of search techniques and electronic database navigation give students practical experience rather than abstract knowledge. The professional literature also suggests that instructional methods which involve learners interactively lead to greater retention and use of information skills, supporting the argument for student-centered, practice-oriented orientation design.

ICT Integration in Library Orientation

The integration of information and communication technologies (ICT) into library orientation programmes is a growing area of emphasis, particularly given the shift toward digital information environments. Technologies such as online catalogues (OPAC), e-databases, multimedia presentations, and virtual tours can make orientation more accessible and engaging. ICT tools not only support delivery but also constitute essential elements of information literacy itself, as students must learn to use them to access, evaluate, and apply digital information (Owolabi et al., 2022). However, research indicates that **ICT integration in orientation remains inconsistent in many Nigerian and African educational settings**. Challenges such as limited internet connectivity, inadequate computer facilities, and insufficient librarian training constrain the effective use of ICT in orientation and information literacy instruction. This suggests that repositioning orientation programmes requires addressing both pedagogical and infrastructural barriers to effective ICT use.

Methodology

The research adopted a descriptive survey method. The population of the study consists of Six School librarians from the three federal government colleges in Rivers State. Census sampling was used for this study since the population is not large, Data were collected using structured questionnaires titled “Repositioning Library Orientation Programme for Student Information Literacy Skills Questionnaire” (RLOPSILSQ). It was analyzed using descriptive statistics. Using a rating scale of 4,3,2,1 with a range of 2.50 was used to determine if the mean score indicates agree or disagree. Mean scores above 2.50 indicate "Strongly Agree" while mean scores below 2.50 indicate "Strongly Disagree”.

Results

Research Question 1: What is the content of library orientation programmes influence students’ information literacy skills in Federal Government Colleges in Rivers State?

Table 1: Mean Response on Content of library orientation programmes

S/N	Content of library orientation programmes	Strongly Agree	Agree	Disagree	Strongly Disagree	Mean	Remarks
1.	The library orientation programme introduces students to different sections of the library.	4	2	0	0	3.67	**Agree**
2	The orientation programme explains the types of information resources available in the library.	3	3	0	0	3.50	**Agree**
3	The orientation programme explains the rules and regulations guiding library use.	5	1	0	0	3.83	**Agree**
4	The orientation programme teaches students how to locate library materials.	4	2	0	0	3.67	**Agree**
5	The orientation programme explains how library facilities should be used.	3	2	1	0	3.33	**Agree**

Source: Field Data, 2026

Table 1 presents respondents’ views on the content of library orientation programmes in Federal Government Colleges in Rivers State. Specifically, the item on introducing students to different sections of the library recorded a mean score of **3.67**, the explanation of types of information resources available in the library had a mean score of **3.50**, The highest mean score **3.83** was recorded for the explanation of library rules and regulations, showing that orientation programmes strongly emphasize library use policies. Teaching students how to locate library materials also received a high mean score of **3.67**, guidance on the use of library facilities recorded a mean score of **3.33**, which, though lower than other items, still reflects general agreement.

Research Question 2: What are the instructional methods used in library orientation programmes on students’ information literacy skills in Federal Government Colleges in Rivers State?

Table 2: Mean Response on Instructional methods used in library orientation programmes

S/N	Instructional Methods Used for Library Orientation	Strongly Agree	Agree	Disagree	Strongly Disagree	Mean	Remarks
1	The library orientation programme is delivered through lectures.	2	3	1	0	3.17	**Agree**
2	Librarians demonstrate how to use library resources during orientation.	4	2	0	0	3.67	**Agree**
3	Students are taken on guided tours of the library during orientation.	5	1	0	0	3.83	**Agree**
4	Students are given opportunities to practice using library resources during orientation.	2	3	1	0	3.17	**Agree**
5	Students are allowed to ask questions during the orientation programme.	5	1	0	0	3.83	**Agree**

Source: Field Data, 2026

Table 2 shows respondents' perceptions of the instructional methods used in delivering library orientation programmes. The use of lectures to deliver orientation recorded a mean score of **3.17**, Demonstration of library resource use by librarians recorded a mean score of **3.67**, while guided tours of the library had a mean score of **3.83**, showing strong agreement that these methods are widely used. Opportunities for students to practice using library resources during orientation recorded a mean score of **3.17**, and allowing students to ask questions during orientation also recorded a high mean score of **3.83**, indicating an interactive learning environment.

Research Question 3: What Information Communication Technology are integrated in library orientation programmes impact students' information literacy skills in Federal Government Colleges in Rivers State?

Table 3: Mean response ICT integration in library orientation programmes

S/N	Use of ICT in Library Orientation Programme	Strongly Agree	Agree	Disagree	Strongly Disagree	Mean	Remarks
1	Computers are used during orientation to demonstrate resource access.	1	1	2	2	2.17	**Disagree**
2	Slides are used during orientation.	0	0	3	3	1.50	**Disagree**
3	Students are taught how to use digital online databases.	1	1	3	1	2.33	**Disagree**
4	Internet-based materials are used to support the orientation programme.	1	1	4	0	2.50	**Agree**
5	Audiovisual equipment is used during the library orientation programme.	1	1	2	2	2.17	**Disagree**

Source: Field Data, 2026

Table 3 presents data on the extent of ICT integration in library orientation programmes. The use of computers to demonstrate access to library resources recorded a mean score of **2.17**, showing disagreement among respondents. Similarly, the use of multimedia tools such as slides or videos had a very low mean score of **1.50**, indicating that such tools are rarely used. Instruction on the use of digital online databases also recorded a low mean score of **2.33**. Internet-based materials used to support orientation recorded a mean score of **2.50**, which marginally suggests agreement, but remains low compared to other components. The use of audiovisual equipment during orientation also recorded a low mean score of **2.17**, further confirming inadequate ICT integration.

Discussion of Findings

Content of Library Orientation Programmes and Students' Information Literacy Skills

Findings from Table 1 revealed that the content of library orientation programmes positively influences students' information literacy skills. The majority of respondents agreed that orientation programmes introduce students to different sections of the library, explain available information resources, teach procedures for locating materials, and clarify library rules and regulations. The high mean scores recorded for these items indicate that orientation content is sufficiently structured to support students' understanding of library organization and resource use. This finding aligns with the study by Onyeneke and Obichere (2018), who reported that students' information literacy competencies improve when they are adequately exposed to structured guidance on library resources and information access

procedures. Similarly, Babarinde (2023) found that students who are properly introduced to library resources and services demonstrate better information-seeking behavior and improved academic engagement. The result further supports the assertion by Pelemo, Onanuga, Ilori, and Ugbala (2020) that well-designed orientation content enhances users' ability to locate and use information resources effectively.

Findings from Table 2 showed that instructional methods used in library orientation programmes have a positive influence on students' information literacy skills. Respondents agreed that librarians employ lectures, demonstrations, guided tours, and interactive sessions during orientation. Higher mean scores were recorded for demonstrations, guided tours, and opportunities for interaction, indicating that practical and learner-centered methods are commonly used. This result supports the findings of Haruna, Ajogwu, Alaku, and Saidu (2024), who observed that students develop better information retrieval skills when orientation programmes incorporate demonstrations and guided practice rather than relying solely on lectures. Likewise, Okafor (2024) reported that interactive instructional strategies during orientation significantly enhance students' understanding and use of library resources.

The study's finding suggests that instructional methods that encourage participation and hands-on practice are effective in developing students' information literacy skills. However, the moderate mean scores recorded for practical engagement indicate that such methods may not be consistently applied across all orientation sessions. Strengthening interactive instructional approaches could further improve students' competence in locating and evaluating information.

ICT Integration in Library Orientation Programmes

Findings from Table 3 revealed that ICT integration in library orientation programmes is generally low. Respondents disagreed that computers, multimedia tools, online databases, and audiovisual equipment are adequately used during orientation. The low mean scores indicate that orientation programmes rely predominantly on traditional instructional methods, with minimal exposure to digital information tools. This finding is consistent with the observations of Pelemo et al. (2020), who found that limited exposure to electronic resources during orientation contributes to low digital information literacy among students. Similarly, Babarinde (2023) reported that inadequate ICT facilities and limited digital instruction hinder students' ability to develop comprehensive information literacy skills. The result also aligns with Haruna et al. (2024), who identified poor ICT integration as a major challenge affecting the effectiveness of orientation programmes in Nigerian educational institutions.

Conclusion

This study examined the repositioning of library orientation programmes for enhancing students' information literacy skills in Federal Government Colleges in Rivers State, Nigeria. The findings revealed that library orientation programmes play a significant role in supporting students' ability to locate, evaluate, and use information for academic purposes. Specifically, the study established that the content of library orientation programmes is generally adequate and positively contributes to students' understanding of library resources, services, and usage procedures. The study revealed that ICT integration in library orientation programmes is inadequate. The limited use of computers, multimedia tools, online databases, and internet-based resources indicates a reliance on traditional instructional methods. The findings underscore the need to reposition library orientation programmes by strengthening content delivery, standardizing interactive instructional methods, and integrating ICT tools.

Recommendation

1. Library orientation content should be systematically strengthened and regularly reinforced to ensure students gain comprehensive knowledge of library resources, services, and information access procedures.
2. Librarians should emphasize demonstrations, guided tours, and hands-on practice to enhance students' engagement and practical understanding of information retrieval and library use.
3. Federal Government Colleges should provide adequate ICT facilities and incorporate training on digital catalogues, online databases, and internet-based resources to improve students' digital information literacy skills.

Re-skilling Information Professionals for Sustainable and Innovative Library Services in Emerging Technologies in Nigeria

Hadiza Abubakar O. & Solomon Yisa
Department of Library and Information Science, Federal University of Technology, Minna
Corresponding author: Email: hadizaolowodara@gmail.com; Phone number: +2348132486531

Abstract

Rapid advances in information and communication technologies are compelling information professionals to adapt quickly in order to remain relevant in the digital era. This study highlights the rapid adoption of emerging technologies in library operations, including artificial intelligence (AI), cloud computing, integrated library management systems (ILMS), virtual reference services, and data analytics. The paper also examines the skills, knowledge, and competencies required to equip library and information science professionals for effective service delivery in emerging technologies. It further addresses challenges such as infrastructural and institutional barriers that hinder capacity building. The study proposes a comprehensive re-skilling framework encompassing continuous professional development, curriculum reform, policy advocacy, and consortium-based resource sharing. It concludes that empowering Nigerian librarians with future-focused competencies is critical for achieving resilient, inclusive, and technologically advanced library services aligned with a sustainable future for librarianship in Nigeria.

Keywords: Librarianship, information professionals, Re-Skilling, sustainable, emerging technologies

Introduction

Libraries worldwide are undergoing profound transformations, fuelled by digital technologies, artificial intelligence (AI), and evolving user expectations. In Nigeria a country with a burgeoning youth population and significant educational ambitions, libraries serve as critical nodes for research, lifelong learning, and national development. Yet, for libraries in Nigeria to fully contribute to the knowledge economy, their workforce must evolve with global information trends.

Libraries are no longer limited to traditional functions of book acquisition, preservation and circulation. They now provide digital repositories, virtual reference services, research support, information literacy training and smart discovery systems (Igbo *et al*., 2024). Nigerian university libraries have also begun integrating emerging technologies such as artificial intelligence, big data analytics and machine learning to improve information retrieval and accessibility (Achugbue, 2024).

Despite these developments, the adoption rate remains slow due to inadequate infrastructure, limited funding and shortages of digitally competent personnel (Odigie, 2024). Library and information science (LIS) professionals must therefore develop competencies in the digital literacy, data management, automation and AI applications to remain relevant in the rapidly changing environment. Continuous professional development is essential in preparing librarians for modern service demands (Akpukpu and Osawele, 2025).

Consequently, re-skilling has become essential for enhancing the capacity of information professionals to adapt to changing technologies and evolving user expectations. It is against this background that this paper examines the emerging technologies shaping library service delivery, the competencies required by information professionals, strategies for continuous professional development and re-skilling and the challenges affecting the successful implementation of re-skilling initiatives in Nigeria libraries.

Statement of the problem

Technological advancement has placed information professionals under increasing pressure to deliver modern, efficient and user-centred services. Technologies such as artificial intelligence, cloud computing, big data analytics, digital repositories and automation tools are increasingly being integrated into library services to improve efficiency, accessibility and user satisfaction. As a result, information professionals are expected to possess the knowledge and skills required to effectively utilise these technologies in meeting the evolving information needs of users.

However, many libraries in Nigeria continue to face challenges in adapting to these technological changes. While emerging technologies are becoming integral to modern library services, a significant number of information professionals (Ubogu, 2022; *Igbo et al*.,2024).

The Situation is further complicated by challenges such as inadequate funding, poor technological infrastructure, limited training opportunities, policy constraints and resistance organisational change. These challenges often hinder the ability of information professionals to acquire new competence and adapt to technological innovations, if these issues are not adequately addressed, libraries may struggle to remain relevant in the digital age and may be unable to provide the quality services expected by contemporary users.

Despite increasing discussions on emerging technologies and digital transformation in libraries, there remains a need to examine the competencies required by information professionals, the strategies that can support effective re-skilling and the challenges affecting the implementation of re-skilling initiatives. Therefore, this paper seeks to explore emerging technologies relevant to library service delivery, identify the competencies required by information professionals, examine strategies for continuous professional development and re-skilling, and highlight the challenges affecting re-skilling efforts in Nigerian libraries.

Objectives of the Study

Specifically, the objectives are to:

i. identify emerging technologies relevant to library service delivery.
ii. examine essential skills and competency required by information professionals in emerging technologies
iii. Suggest effective strategies for continuous professional development and re-skilling
iv. Highlight challenges affecting re-skilling initiatives in Nigerian libraries.

Methodology

This study adopted a descriptive review approach. Relevant literature was sourced from scholarly journals, conference proceedings, books and reports on emerging technologies, reskilling and library service delivery. The collected literature was analysed thematically based on the objectives of the study.

Literature Review

Emerging Technologies Relevant to Library Service Delivery

Objective 1: Identify emerging technologies relevant to library service delivery

Libraries today have the opportunity to utilise a wide range of modern technologies to improve their operations and services delivery. Emerging technologies refer to innovative tools and systems that have gained considerable acceptance and are increasingly being adopted across various sectors, including libraries. These technologies support different aspects of library operations such as user services, information literacy instruction, technical services and library management.

The integration of emerging technologies has created significant opportunities for libraries worldwide to enhance access to information resources and improve the quality of services offered to users. In many developed countries, libraries have successfully adopted technologies such as Chatbots, Natural Language Processing, Semantic engines, Machine Learning and Institutional Repositories.

Nigerian libraries are beginning to adopt and explore emerging technologies such as

Artificial Intelligence (AI) and Machine Learning, Cloud Computing, Integrated Library Management Systems (ILMS), Blockchain, Internet of Things (IoT), Data Analytics, Virtual and Augmented Reality (VR/AR) and Robotics and Automation.

The adoption of emerging technologies can help libraries meet evolving information needs of users, improve operational efficiency and remain relevant in the digital age. This paper examines the concept of emerging technologies and their applications in library and information services through a review of existing literature.

Artificial Intelligence (AI) refers to the ability of computer systems and machines to perform tasks that typically require human intelligence, such as learning, reasoning, problem-solving and decision-making. AI has emerged has one of the most transformative technologies of the twenty-fist century and is increasingly being adopted across various sectors, including education and library services. In libraries, AI technologies are being utilised to improve information retrieval, automate routine tasks, enhance user experience and support decision-making processes.

According to Igbo *et al*. (2024), the adoption of AI in academic libraries has potential to revolutionise service delivery through intelligent systems capable of providing personalised information services and improving access to information resources. AI-Powered tools such as chatbots, recommendation systems and automated cataloguing applications enable libraries to respond more efficiently to users' information needs. These technologies reduce time required for information retrieval and improve user satisfaction.

According to Igbo *et al*. (2023), Nigerian academic libraries that leverage big data analytics can enhance research support services, resource allocation, and digital content recommendations based on user engagement trends. Virtual reality (VR) and augmented reality (AR) are also emerging as innovative tools in libraries, offering immersive learning experiences and interactive engagement with digital collections. For example, VR-based archival tours provide users with an interactive way to explore historical documents and cultural artifacts without physical constraints. Blockchain technology is being explored in some libraries to enhance security, authentication, and data integrity in digital repositories. This technology ensures transparent and tamper-proof record-keeping, particularly in managing digital rights and preserving intellectual property. As these technologies continue to evolve, information professionals must embrace digit a l transformation through strategic training and policy adaptation. (Achugbue, 2024).

The adoption of these technologies can enhance efficiency, user satisfaction and sustainability, but their successful implementation depends largely on competent personnel and institutional readiness (Akpukpu and Osawele, 2025; Odigie, 2024).

These technologies enhance service efficiency, user experience, and sustainability, but require trained professionals to implement and maintain them.

AI-powered chatbots are increasingly used in libraries to provide instant responses to user queries, thereby improving reference services. Automated cataloguing systems leverage AI and machine learning algorithms to classify materials more efficiently, reducing the time and effort required for manual cataloguing. Additionally, predictive analytics tools help libraries assess user behaviour and anticipate information needs, enabling proactive and tailored service delivery. However, challenges such as inadequate funding, poor ICT infrastructure, lack of technical expertise, ethical concerns and resistance to change continue to hinder its widespread adoption in many Nigerian libraries. Despite these challenges, AI remains a critical emerging technology that can significantly contribute to sustainable and innovative library services delivery when supported by appropriate polices, infrastructure and professional training.

Essential Skills and Competency Required by Information Professionals

Objective 2: Competencies Required by Information Professionals in emerging technologies in Nigeria

Reskilling refers to the process of learning new competencies required for changing professional roles, technological environments, or labour market demands. It differs from upskilling, which focuses on improving existing knowledge and capabilities. Re-skilling prepares workers for new tasks and responsibilities created by innovation and automation (Akinola, 2023). In the library context, re-skilling involves preparing professionals to work with new systems, platforms, tools and service models. This includes training in integrated library management systems, metadata creation, digital repositories, AI- assisted reference services, research data management and virtual user support (Igbo *et al*.,2024)

In 2019, PricewaterhouseCoopers; a multi-national company that provides its services to more than 80% of the Global Fortune 500 companies, announced a three-billion-dollar investment on training and development programs for existing employees. Joe Atkinson, the vice-chair, claims that employees not only get to apply their new skills but also learn from one another in the process.

In the modern age of technology and automation, an assurance is that while jobs will be both made redundant as well as created, any individual regardless of age will either be required to reskill or upskill one's expertise. Performance reviews work well to pick areas of work and talent mobility programs allow the employer to receive the possible skills the employee wants to develop and then appropriately place him in an area that will produce the desired results.

To function effectively in technology-driven libraries, information professionals require a broad-mix of technical, managerial, pedagogical and ethical competencies.

1. Technological and Digital Literacy Competencies: Digital competency has become increasingly important for professionals working in today's technology-driven environment. The concept goes beyond the ability to use computers and digital devices. It includes the knowledge, skills, attitudes and ethical considerations required to use digital technologies effectively in professional practice. Falloon (2020) noted that digital competencies involve information management, communication, collaboration, problem-solving and the responsible use of digital technologies. Falloon (2020) further argued that digital competencies should not be viewed only as technical ability but as a combination of technical, cognitive and social skills that enable individuals to function effectively in digital environments. This suggests that librarians need continuous training and professional development to remain relevant in an era characterised by rapid technological change. Developing digital competencies will enable information professionals to effectively utilise emerging technologies and enhance the quality of library services.

Information professionals must develop proficiency in contemporary technologies including Artificial Intelligence (AI), Machine Learning, cloud computing, and Integrated Library Management Systems (ILMS). The implication of this study for Nigerian libraries is that librarians can no longer rely solely on traditional professional skills. There is a need for continuous acquisition of digital and technological competencies to effectively manage modern library services and emerging technologies.

2. Data Management and Analytical Competencies

The growing use of digital technologies in libraries has increased the importance of data management and analytical competencies among information professionals. Modern libraries generate and manage large volumes of data relating to users, collections, services, and research activities. Consequently, librarians require the knowledge and skills needed to collect, organize, analyse, interpret, and utilize data for effective decision-making and service improvement.

Ahmad *et al* (2019) examined the competencies and skills required by academic librarians for the implementation of big data analytics in libraries. Their study revealed that librarians need competencies in data management, statistical analysis, information technology, problem-solving, and critical thinking to effectively utilize big data technologies. The authors further noted that these competencies enable librarians to extract meaningful insights from data, improve service delivery, support institutional decision-making, and enhance user satisfaction.

In contemporary library environments, data management competencies extend beyond the traditional organization of information resources. It includes research data management, bibliometric analysis, data curation, and the use of analytical tools to assess user behaviour and information needs. As academic libraries continue to support research and knowledge creation, librarians must develop analytical capabilities that will enable them to provide evidence-based services and contribute to institutional research goals. Therefore, strengthening data management and analytical competencies is essential for information professionals seeking to remain relevant in an increasingly data-driven information environment.

3. Digital Preservation and Curation Competencies

The increasing digitization of information resources has made digital preservation and curation an important area of competencies for information professionals. Libraries are now responsible for managing a wide range of digital materials, including electronic publications, institutional repositories, research data, and digitized archival collections. To ensure the long-term accessibility and usability of these resources, librarians require specialized knowledge and skills in digital preservation and curation.

Feng and Richards (2018) examined the professional competencies required for effective digital curation and observed that digital curation involves more than the storage of digital resources. According to the authors, professionals engaged in digital curation require competencies in metadata creation, digital preservation planning, repository management, information organization, and technology management. They further emphasized the importance of communication, collaboration, and continuous professional development in responding to the changing nature of digital information environments.

In the library context, digital preservation and curation competencies enable information professionals to maintain the authenticity, accessibility, and long-term value of digital resources. These competencies are particularly important in academic libraries where institutional repositories, electronic theses and dissertations, and research datasets require proper management and preservation. As digital collections continue to grow, librarians must continuously update their knowledge and skills to effectively manage and preserve information resources for present and future users.

4. Cybersecurity and Information Ethics Competencies

The increasing use of digital technologies in libraries has heightened concerns about the security of information resources and the protection of users' data. As libraries continue to adopt digital platforms, cloud-based services, and online information systems, information professionals must possess the competencies required to identify, prevent, and respond to cybersecurity threats. Cybersecurity competencies involve understanding information security principles, data protection measures, risk management practices, and strategies for safeguarding digital resources.

Pasipamire (2025) emphasized the importance of building a strong culture of cybersecurity awareness within libraries. Through a review of best practices and existing frameworks, the study found that effective cybersecurity management requires not only technological solutions but also continuous education and awareness among library staff. The author noted that information professionals play a critical role in promoting secure information practices, protecting users' privacy, and ensuring the confidentiality and integrity of digital resources.

In addition to technical knowledge, librarians are expected to demonstrate ethical responsibility in the management and use of information. Information ethics competencies include respecting intellectual property rights, protecting confidential user information, ensuring equitable access to information, and promoting the responsible use of digital technologies. As libraries increasingly operate in digital environments, the ability of information professionals to combine cybersecurity awareness with ethical decision-making has become essential for maintaining users' trust and ensuring the safe delivery of library services.

The findings of Pasipamire (2025) suggest that cybersecurity should be viewed as a shared responsibility within libraries rather than solely an information technology function. Consequently, continuous training and professional development are necessary to equip librarians with the knowledge and skills required to address emerging security challenges in contemporary library environments.

Objective 3: Suggest effective strategies for continuous professional development and re-skilling

Reskilling Nigerian librarians requires a multi-pronged, systematic approach that combines education, professional development, institutional support, and collaboration with stakeholders. Effective strategies must target both pre-service (LIS students) and in-service (practicing librarians) populations.

Curriculum Reform in Library and Information Science Education

The rapid advancement of emerging technologies has created the need for continuous review and restructuring of Library and Information Science (LIS) curricula. As libraries increasingly adopt technologies such as artificial intelligence, data analytics, cloud computing, and digital repositories, there is growing concern about whether LIS education is adequately preparing graduates for the changing information environment.

Oladokun and Olatokun (2026) investigated the integration of emerging technologies into LIS education in Nigeria and found significant gaps between existing curricula and the competencies required in contemporary library practice. The study revealed that the inclusion of emerging technologies in many Nigerian LIS programmes remains limited and largely introductory, with advanced areas such as artificial intelligence, data science, and cloud computing receiving inadequate attention. The authors attributed this situation to factors such as inadequate infrastructure, limited staff capacity, weak collaboration between academia and industry, and policy-related challenges.

The study further emphasized the need for curriculum reform to ensure that graduates acquire the knowledge and practical skills required in technology-driven library environments. Recommended measures include the introduction of emerging technology courses, increased practical training, staff retraining, stronger industry partnerships, and investment in digital infrastructure. According to the authors, these reforms are necessary to bridge the gap between library education and professional practice and to ensure that future information professionals remain relevant in the digital age.

The findings suggest that curriculum reform should be viewed as an important strategy for re-skilling information professionals in Nigeria. Updating LIS curricula to reflect current technological realities will better prepare librarians to deliver innovative and sustainable library services in an increasingly digital information environment.

Continuous Professional Development

Continuous Professional Development (CPD) is widely recognized as an effective strategy for improving professional competencies and adapting to changes in the workplace. In the library profession, CPD enables information professionals to update their knowledge, acquire new technological skills, and remain responsive to emerging trends in information service delivery. As libraries increasingly adopt digital technologies, continuous learning has become essential for maintaining professional relevance and service quality. Ambon *et al* (2024) examined the impact of continuous professional development on professional performance through a systematic review. The study found that participation in professional development activities contributes significantly to improved knowledge, skills acquisition, confidence, and overall effectiveness in professional practice. The authors observed that regular training opportunities help professionals adapt to changing work environments and enhance their ability to implement new ideas and technologies.

The findings of the study have important implications for information professionals in Nigeria. As emerging technologies continue to reshape library operations and services, librarians must engage in continuous learning through workshops, conferences, seminars, online courses, and professional certification programmes. Such opportunities provide avenues for acquiring competencies in areas such as artificial intelligence, data management, digital preservation, and cybersecurity.

Therefore, continuous professional development should be regarded as a critical component of re-skilling initiatives aimed at preparing information professionals for sustainable and innovative library service delivery. Investment in CPD will not only improve individual competencies but also strengthen the overall capacity of libraries to meet the evolving information needs of their users.

Institutional Partnerships and Collaboration

Collaboration has become increasingly important in addressing the challenges facing libraries and information professionals. As technological developments continue to transform library services, libraries can no longer operate in isolation. Partnerships with academic departments, information technology units, research centres, professional associations, and external organizations provide opportunities for knowledge sharing, capacity building, and innovation. Pellen and Miller (2012) emphasized the importance of creative collaborations within institutions as a means of strengthening library services and enhancing organizational effectiveness. The authors argued that collaborative relationships enable libraries to leverage available expertise, share resources, and develop innovative solutions to emerging challenges. Through such partnerships, libraries are better positioned to respond to changing user needs and institutional priorities.

In the context of re-skilling information professionals, institutional collaboration can provide access to specialized training, technical support, and practical learning opportunities. Partnerships between libraries and information technology units, for example, can facilitate training in emerging technologies such as artificial intelligence, data analytics, and digital repository management. Similarly, collaboration with professional associations and academic institutions can support continuous professional development initiatives and promote the exchange of knowledge and best practices.

The study suggests that strengthening collaborative networks is an important strategy for enhancing the competencies of information professionals and supporting sustainable library service delivery. By working closely with relevant stakeholders, libraries can create an environment that encourages continuous learning, innovation, and professional growth.

Challenges to an effective library delivery to Reskilling information professionals in Nigeria

Objective 4: Highlight Challenges affecting re-skilling initiatives among information professionals and Librarians in Nigeria

Policy and Infrastructural Challenges

The successful adoption of emerging technologies and implementation of re-skilling programmes depend largely on the availability of supportive policies and adequate infrastructure. Without clear institutional policies, reliable technological facilities, and an enabling environment, libraries may struggle to provide equitable access to information resources and innovative services.

Fakoyede *et al*. (2026) examined the challenges affecting equitable access to library resources in tertiary institutions. Their study identified policy constraints, infrastructural deficiencies, and socio-cultural barriers as major factors limiting effective access to library services. The authors observed that inadequate technological infrastructure, weak policy implementation, and unequal access to digital resources continue to hinder the ability of libraries to meet the diverse information needs of users. The study further emphasized the need for strategic policies, improved infrastructure, and inclusive practices to promote effective service delivery. The findings are relevant to Nigerian libraries where efforts to re-skill information professionals are often constrained by similar challenges. In many institutions, inadequate ICT facilities, unstable internet connectivity, insufficient funding, and weak policy frameworks limit opportunities for training and technology adoption. Consequently, librarians may find it difficult to acquire and apply the competencies required for emerging technologies. Addressing these challenges is therefore essential for enhancing professional development, improving access to information resources, and ensuring sustainable library service delivery.

Inadequate Funding

Funding remains one of the major challenges confronting libraries in developing countries. The availability of adequate financial resources determines the ability of libraries to acquire modern technologies, develop infrastructure, organize staff training programmes, and provide quality services to users. Where funding is insufficient, libraries often struggle to meet both their operational and developmental needs.

Kakiri *et al*. (2024) examined the impact of poor funding on the performance of academic libraries using the Federal University Otuoke Library as a case study. The study revealed that inadequate funding negatively affects collection development, acquisition of information resources, technological advancement, staff development, and overall service delivery. The authors noted that limited financial resources restrict the ability of libraries to invest in modern facilities and professional capacity-building programmes needed to meet contemporary information demands.

The findings have significant implications for the re-skilling of information professionals in Nigeria. Continuous professional development, technology training, conference attendance, and certification programmes require substantial financial support. When libraries operate under severe budget constraints, opportunities for staff development become limited, making it difficult for librarians to acquire competencies in emerging technologies such as artificial intelligence, data analytics, cloud computing, and digital preservation. Consequently, inadequate funding not only affects library operations but also slows the development of the skilled workforce required for sustainable and innovative library services.

Resistance to Change and Technology Adoption

The successful adoption of emerging technologies in libraries depends not only on the availability of technological resources but also on the willingness of staff to embrace change. Resistance to change remains a significant challenge in many libraries, particularly when new technologies require employees to acquire new skills, modify established work practices, or adapt to unfamiliar systems. Such resistance can slow the implementation of technological innovations and limit the effectiveness of re-skilling initiatives.

Rahman *et al.* (2025) investigated the organizational factors influencing resistance to technology adoption in university libraries in Bangladesh. The study found that organizational culture, leadership support, staff attitudes, communication gaps, and inadequate training opportunities were among the major factors contributing to resistance to technological change. The authors observed that library staff were more likely to accept and utilize new technologies when they received adequate support, training, and encouragement from management. The findings have important implications for libraries seeking to implement emerging technologies and develop the competencies of information professionals. Where staff members are reluctant to embrace technological innovations, opportunities for professional development and service improvement may be hindered. Therefore, library management should create a supportive environment that

encourages continuous learning, participation in training programmes, and positive attitudes toward technological change.

The study further suggests that addressing resistance to change requires more than providing technological infrastructure. Effective leadership, staff involvement in decision-making, clear communication, and continuous professional development are equally important in promoting technology adoption and enhancing the readiness of information professionals for the digital age.

Discussion of Findings

The review revealed that emerging technologies such as artificial intelligence, cloud computing, big data analytics, institutional repositories, blockchain technology, virtual reality, and integrated library management systems are increasingly influencing library operations and service delivery. This finding supports the observations of Igbo *et al*. (2024) and Achugbue (2024), who reported that emerging technologies are transforming information retrieval, reference services, and resource management in academic libraries. The finding suggests that libraries are gradually moving away from traditional service models towards technology-driven service delivery. Consequently, information professionals must develop the competencies required to effectively utilize these technologies in meeting users' evolving information needs.

The study further found that information professionals require a wide range of competencies, including digital literacy, data management and analytical skills, digital preservation and curation skills, cybersecurity awareness, information ethics, digital pedagogy, and user experience design. This finding is consistent with the views of Falloon (2020), who emphasized that digital competencies involve technical, cognitive, and social skills necessary for effective participation in digital environments. Similarly, Ahmad *et al*. (2019) observed that data management and analytical competencies are essential for librarians working in data-driven environments. The implication is that traditional library skills alone are no longer sufficient for effective service delivery in contemporary libraries.

The review also identified curriculum reform, continuous professional development, institutional partnerships, mentorship programmes, and practical technology training as effective strategies for re-skilling information professionals. This finding agrees with Oladokun and Olatokun (2026), who advocated for the integration of emerging technologies into Library and Information Science education to prepare graduates for technology-driven library environments. The finding is further supported by Ambon *et al.* (2024), who found that continuous professional development enhances professional competencies and workplace effectiveness. This indicates that re-skilling should be viewed as a continuous process rather than a one-time activity.

Furthermore, the study revealed that inadequate funding, poor infrastructure, policy limitations, and resistance to change remain major challenges affecting re-skilling initiatives in libraries. This finding corroborates the work of Kakiri *et al.* (2024), who reported that poor funding negatively affects staff development, technology acquisition, and library performance. Similarly, Ketheeswaren (2025) identified infrastructural deficiencies as barriers to effective library service delivery, while Rahman *et al.* (2025) found that organizational resistance can hinder technology adoption in libraries. These findings suggest that successful re-skilling programmes require not only training opportunities but also supportive policies, adequate funding, modern infrastructure, and positive organizational cultures.

Overall, the findings demonstrate that while emerging technologies present significant opportunities for innovation and improved service delivery, their successful adoption depends largely on the competencies of information professionals and the availability of institutional support. Therefore, Nigerian libraries must prioritize capacity building, curriculum reform, and strategic investment in technological infrastructure to achieve sustainable and innovative library services.

Conclusion

The emergence of new technologies has significantly transformed the way libraries acquire, organize, preserve, and disseminate information. Technologies such as artificial intelligence, cloud computing, big data analytics, institutional repositories, and integrated library management systems have created new opportunities for improving library service delivery and enhancing user experience. To effectively utilize these technologies, information professionals must possess relevant competencies in digital literacy, data management, digital preservation, cybersecurity, information ethics, and user-centred service design.

The study has shown that continuous professional development, curriculum reform, institutional collaboration, mentorship programmes, and practical technology training are important strategies for equipping librarians with the skills required in the digital age. However, challenges such as inadequate funding, poor infrastructure, policy limitations, and resistance to change continue to hinder re-skilling efforts in many libraries.

Therefore, re-skilling information professionals should be regarded as a strategic priority for libraries seeking to remain relevant, innovative, and sustainable in a rapidly evolving information environment. By investing in human capacity development and creating supportive conditions for continuous learning, Nigerian libraries will be better positioned to provide quality services and meet the changing information needs of their users.

To ensure the successful reskilling of Nigerian information professionals, the following policy measures are recommended:

Policy Recommendation

1. Integrate Emerging Technologies into LIS Curricula

Federal and state education authorities should mandate the inclusion of AI, data science, cloud computing, digital curation, and cybersecurity in LIS programs.

2. Fund Continuous Professional Development Programs

Governments and institutions should allocate budgets for structured CPD, workshops, and certifications that equip librarians with modern competencies (Nigerian Library Association, 2021).

3. Strengthen Institutional and Industry Partnerships

Libraries should collaborate with ICT firms, international agencies, and research institutions to provide practical training, internships, and access to cutting-edge technology.

4. Establish Innovation and Technology Labs

Dedicated innovation spaces within libraries encourage experimentation, hands-on learning, and adoption of emerging technologies.

Abstract

This study examined restructuring of academic libraries and librarians to support effective teaching, learning, and research in tertiary institutions in Nigeria. The study was anchored on the Sociotechnical Systems Theory (SST) and adopted a descriptive survey design. The population comprised 124 professional librarians in federal university libraries in South-South Nigeria, and the census sampling technique was employed. An online questionnaire was used for data collection, and 93 completed responses were obtained and analyzed using descriptive and inferential statistics. The findings revealed that the extent of academic library restructuring in tertiary institutions in Nigeria was low. However, academic librarians played significant roles in supporting teaching, learning, and research activities. The study further identified technological advancement, digital access, automation systems, ICT infrastructure, reliable internet connectivity, continuous professional development, and the provision of electronic databases and digital information resources as critical requirements for effective restructuring. Major challenges affecting the restructuring of academic libraries include inadequate funding, poor ICT infrastructure, unreliable power supply, and poor internet connectivity. Strategies for enhancing the capacity of academic libraries and librarians include increased funding, stronger collaboration with academic staff, continuous professional development, and the adoption of emerging technologies. The study also revealed a strong positive relationship between the extent of academic library restructuring and the roles academic librarians played in supporting teaching, learning, and research activities. Furthermore, the extent of academic library restructuring significantly predicted the roles performed by academic librarians in tertiary institutions. The study concluded that effective restructuring of academic libraries is essential for improving service delivery and strengthening their contribution to teaching, learning, and research. It therefore recommended increased funding, improved ICT infrastructure, continuous professional development, greater adoption of modern technologies, and stronger policy support to enhance the effectiveness of academic libraries and librarians in Nigeria.

Keywords: Academic libraries, Librarians, Teaching, learning and research support, Tertiary institutions

Introduction

Academic libraries have long been regarded as the intellectual backbone of tertiary institutions, playing a central role in supporting teaching, learning, research, and overall knowledge development. This role has become even more significant in recent years due to rapid changes in the global information landscape. Advances in digital technologies, the growth of online learning environments, and the increasing demand for research output have reshaped how knowledge is created, accessed, and shared (Ogunbodede & Ejitagha, 2026; Altawil, 2025; Perculeza, 2023). As a result, academic libraries and librarians are now expected to move beyond their traditional functions and adapt to these evolving realities. **This shift underscores a clear departure from earlier models of library service, highlighting the need to examine how these institutions have evolved over time.**

Historically, academic libraries globally focused largely on the acquisition, organization, and preservation of print resources. Librarians were primarily seen as custodians of information, responsible for managing collections and assisting users in locating materials (Rit, 2025; Sakhani et al., 2021). While these functions remain important, they are no longer sufficient in a world driven by digital access, data-intensive research, and collaborative learning. This model dominated until the late 20th century, when digital innovations like scanned articles and early electronic libraries emerged in the 1980s–1990s (Jenkins, 2024; George, 2023). Today, libraries manage hybrid or digital-only collections, including e-books, databases, and institutional repositories. They also provide advanced services such as data analysis support, digital literacy programs, information literacy instruction, and collaborative research spaces (George & Wagwu, 2025; Ogunbodede & Okwu, 2023). While print-based functions remain relevant, they are no longer adequate on their own in an era defined by data-intensive research and open access demands. **This shift in expectations has created a**

clear need for academic libraries and librarians in Nigeria to rethink their roles and capabilities to remain effective and relevant.

The concept of retooling, in this context, refers to the deliberate effort to upgrade the skills, competencies, tools, and services of both libraries and librarians to meet contemporary demands. Retooling is not merely about adopting new technologies; it also involves a shift in mindset, professional roles, and service delivery models (Rameshwari, 2025). Librarians are increasingly expected to function as information specialists, research partners, digital curators, and educators who can support users in navigating complex information ecosystems (Michalak et al., 2026). In developed countries, academic libraries have made significant progress. They provide integrated digital systems, access to diverse electronic resources, and support research through data management, open access advocacy, and scholarly communication (Okonoko et al., 2022). Librarians are actively embedded in teaching and research, co-designing curricula and offering ongoing research consultations. They also manage institutional repositories, deliver information literacy instruction, and support data curation for faculty projects (Hoving, 2025; Lee & Stvilia, 2017). Continuous training ensures competencies in emerging tech, positioning librarians as strategic partners.

In developing countries like Nigeria, academic libraries lag significantly behind, hampered by chronic underfunding, poor infrastructure, insufficient staff training, and limited digital access (Sahabi & Otobo, 2021; Adeyemi, 2015). Librarians struggle to provide basic services amid unreliable internet, erratic power supply, and skill gaps, with minimal involvement in research or advanced data support (George et al., 2025). These constraints hinder their ability to fully support teaching, learning, and research activities. The increasing reliance of students and researchers on electronic resources, open access materials, and digital research tools highlights a growing gap between user expectations and library capabilities, underscoring the need for strategic transformation (Oyigan et al., 2026; Oshebor & Okekeuche, 2024). Retooling academic libraries in Nigeria also aligns with broader national goals of improving the quality of higher education and promoting research and development. Universities and other tertiary institutions are expected to produce graduates who are not only knowledgeable but also information literate, innovative, and capable of contributing to societal development. Retooling boosts library patronage, research output, and graduate employability by integrating AI driven services and open resources, positioning libraries as innovation hubs that support national development goals (Idiegbeyan-Ose & Idahosa, 2025).

Academic libraries, when properly equipped and staffed, can play a vital role in achieving these objectives by providing access to relevant resources, supporting research processes, and fostering critical thinking skills. Furthermore, the role of librarians is evolving, and modern librarians are required to possess a diverse skill set, including digital literacy, data management, information technology proficiency, and instructional abilities (Atchrimi & Ogunbodede, 2024; Adepoju, 2020). They must be able to guide users in evaluating information sources, avoiding plagiarism, and using digital tools effectively. This study is premised on the understanding that retooling academic libraries and librarians is not optional but necessary for the survival and relevance of tertiary institutions in Nigeria. The future of tertiary education in Nigeria depends, to a large extent, on how effectively academic libraries can adapt to change and respond to the needs of a knowledge driven society.

Statement of the Problem

The role academic libraries in supporting teaching, learning, and research in tertiary institutions cannot be overemphasize, many academic libraries in Nigeria are struggling to meet the evolving demands of a rapidly changing digital information environment. The shift from traditional print-based services to digital, data-driven, and user-centered library services has created new expectations for both libraries and librarians. However, studies show that academic libraries in Nigeria are still constrained by inadequate funding, poor technological infrastructure, unreliable internet connectivity, and insufficient professional training (Amos & Tekawa, 2025: Posigha & Idiedo, 2020). These challenges have limited the capacity of librarians to adopt emerging technologies, provide advanced research support, and effectively engage in digital service delivery. As a result, there exists a noticeable gap between the information needs and expectations of students and researchers and the actual services provided by academic libraries. This gap not only affects the quality of research and learning but also undermines the relevance of libraries in the contemporary knowledge economy. Although the concept of retooling offers a pathway for addressing these challenges through the upgrading of skills, tools, and service models, its implementation in many Nigerian academic libraries remains inadequate and inconsistent. Therefore, the problem of this study lies in the inability of academic libraries and librarians in Nigeria to effectively adapt to modern information demands, thereby necessitating a critical examination of the extent of retooling required to enhance service delivery and ensure their continued relevance in tertiary education.

Research Questions

The following research questions guided the study:

1. To what extent have academic libraries in tertiary institutions in Nigeria been restructured to support effective teaching, learning, and research services?
2. What roles do academic librarians play in supporting teaching, learning, and research activities in tertiary institutions in Nigeria?

3. What technological, administrative, and professional changes are required for the effective restructuring of academic libraries and librarians in Nigeria?
4. What challenges hinder the restructuring of academic libraries and librarians for improved teaching, learning, and research support services in tertiary institutions in Nigeria?
5. What strategies can be adopted to enhance the capacity of academic libraries and librarians in providing effective teaching, learning, and research support services in Nigeria?

Hypotheses

The following null hypotheses were formulated and tested at 0.05 level of significance:

- There is no significant relationship between the extent to which academic libraries in tertiary institutions in Nigeria have been restructured and the roles academic librarians play in supporting teaching, learning, and research activities.
- The extent to which academic libraries in tertiary institutions in Nigeria have been restructured does not significantly predict the roles academic librarians play in supporting teaching, learning, and research activities.

Literature review

Literature were reviewed based on the research questions

Extent to which academic libraries have been restructured to support teaching, learning, and research

Academic libraries have increasingly been restructured to support teaching, learning, and research through the adoption of digital technologies, AI, open access initiatives, and virtual learning services, particularly following the COVID 19 pandemic which accelerated online learning and digital information delivery. In developed countries, AI has been integrated into library services through chatbots, intelligent enquiry systems, and automated user support services, particularly in countries such as China and the United Kingdom (Li, 2024). Research data management services have also expanded, although implementation in some institutions still lags behind policy expectations. During the pandemic, libraries improved access to electronic resources, virtual reference services, and remote learning support, reflecting broader trends in digital restructuring of academic library services (Ambrose et al., 2021). Academic libraries have evolved through digital learning spaces, collaborative environments, and user centered services, while librarians increasingly serve as research partners and technology facilitators, supported by adequate funding, infrastructure, and professional development.

In contrast, academic libraries in Nigeria and other developing countries have shown growing awareness and gradual adoption of these innovations, although the extent of restructuring remains limited by inadequate funding, poor infrastructure, unstable electricity supply, limited digital skills, and weak technological support systems (Adeyeye & Oladokun, 2023; Ajani et al., 2022). During the COVID 19 pandemic, many Nigerian academic libraries expanded electronic resources, remote database access, and online information literacy programmes. Some also introduced digital learning spaces, collaborative study areas, and user centered service models to better support teaching, learning, and research in tertiary institutions (Ogunbodede & Wiche, 2022). In addition, librarians' roles have gradually expanded beyond traditional library functions to include information brokerage, digital literacy training, research support, and technology facilitation, although these responsibilities are still developing compared to practices in developed countries where librarians function more extensively as research partners and digital scholarship specialists (Abubakar, 2022; Itsekor, 2011). However, poor internet connectivity and inadequate technological facilities reduced the effectiveness of these restructuring efforts. Similarly, the development of e libraries, mobile technologies, and open access initiatives in Nigerian academic libraries has remained relatively slow because of financial constraints and low awareness levels (Posigha & Idiedo, 2020). Nevertheless, the effectiveness of these restructured services continues to be constrained by unreliable internet services, erratic power supply, inadequate institutional support, and gaps in digital competencies among library personnel (George et al., 2025).

Roles of academic librarians in supporting teaching, learning, and research activities

Academic librarians support teaching, learning, and research through information services, user education, research support, and digital literacy training, and are more actively integrated into academic activities in developed countries such as the United Kingdom, United States, and Australia. For example, the integration of digital and information literacy instruction into teaching activities at the Open University has been associated with improved student learning outcomes (Killick, 2023). Academic librarians also support inclusive education and student well-being through initiatives such as curriculum decolonization, academic mentoring, and learning support services (Cox & Brewster, 2020; Needham & Appleton, 2025). In the area of research support, academic librarians assist researchers through research data management, bibliometric analysis, scholarly communication support, reference management training, and institutional repository services, thereby improving the visibility and quality of research outputs. However, inadequate staff capacity and technological limitations still affect the delivery of some of these services (Kennan et al., 2014; Parker, 2024). In African countries such as Ghana, studies have shown that academic librarians contribute significantly to quality education and lifelong learning through effective user services and information support systems, resulting in high levels of user satisfaction (Banleman et al., 2024; Banleman et al., 2023). During the COVID 19

pandemic, academic librarians also played important roles in ensuring continuity of learning by providing remote access to electronic resources, online reference services, and virtual user education programmes (Tsekea & Chigwada, 2020).

In Nigeria and Kenya, academic librarians contribute to research development, postgraduate training, information literacy education, and access to academic resources, although the level of effectiveness varies across institutions (Fingillah & Zuru, 2025; Sawe et al., 2024). Librarians in Nigerian academic institutions increasingly support teaching and learning through user orientation programmes, selective dissemination of information, digital literacy instruction, and assistance with online databases and electronic information resources. Nevertheless, the effectiveness of academic librarians in supporting teaching, learning, and research activities continues to be constrained by inadequate infrastructure, poor internet connectivity, weak digital platforms, insufficient funding, staff skill gaps, and underutilization of library services, particularly in developing countries (Dei, 2024; Adekoya et al., 2023). Therefore, academic librarians are more effective in supporting teaching, learning, and research when they are fully integrated into institutional academic systems and supported with adequate infrastructure, funding, and continuous professional training.

Technological, administrative, and professional changes required for effective restructuring of academic libraries and librarians

Technological restructuring involves the integration and effective utilization of digital technologies to support teaching, learning, and research activities. In developed countries, academic libraries have achieved significant progress in the deployment of technologies such as electronic resources, online public access catalogues (OPACs), institutional repositories, library web platforms, mobile library services, and online information literacy instruction (Tenya et al., 2023). Many of these systems were integrated into institutional learning management platforms before the COVID 19 pandemic. The pandemic further accelerated the expansion of remote access services, virtual reference support, and digital literacy training, thereby strengthening the role of librarians in online education and research support (Onunka & Onunka, 2024). Academic libraries are also evolving into technology driven innovation centres through the adoption of emerging technologies such as artificial intelligence, virtual reality, augmented reality, and makerspaces.

In developing countries such as Nigeria, South Africa, and Kenya, academic libraries are increasingly adopting digital technologies including e-catalogues, electronic databases, institutional repositories, library websites, wireless internet services, and mobile based platforms (Shimray et al., 2025; Shehu et al., 2025). These technologies have improved access to information resources and supported remote learning and research activities. However, the implementation and utilization of advanced technologies such as artificial intelligence applications, research data management systems, robotics, and makerspaces remain limited (Owate, 2024; Khumalo, 2022). Their effective use is constrained by inadequate funding, poor internet connectivity, unstable power supply, low user awareness, and weak integration with institutional teaching and learning systems (Omarsaib, 2024; Shehu et al., 2025). Academic libraries in Nigeria have experienced varying levels of administrative and professional restructuring to support teaching, learning, and research. Empirical studies have shown that some libraries have adopted digital policies, strategic planning initiatives, staff training programmes, and technology based services to improve service delivery (Amos & Martins, 2025; Sadiku & Kasim, 2024; Umeozor & Emasealu, 2022). Evidence also indicates that librarians are increasingly involved in digital content management, online instruction, virtual reference services, and research support activities (Ogunbodede & Adebayo, 2024). However, inadequate funding, limited technological infrastructure, and insufficient professional development opportunities continue to constrain effective restructuring.

Challenges hindering the restructuring of academic libraries and librarians for improved teaching, learning, and research support services in tertiary institutions in Nigeria

The restructuring of academic libraries and librarians in Nigeria for improved teaching, learning, and research support services is hindered by several interconnected challenges. One of the major barriers is inadequate and irregular funding, which restricts the acquisition of current information resources, ICT infrastructure, and staff development programmes (Eze & Chukwuemeka, 2022). Poor allocation of funds to the education sector and diversion of library funds further weaken library operations and technological advancement. Another challenge is the persistence of outdated organizational structures that emphasize traditional library operations instead of flexible, user centered, and technology driven services (Schwartz, 2024). Resistance to organizational change among library staff also slows restructuring efforts. Insufficient ICT infrastructure and inadequate digital competencies among librarians remain significant obstacles. Many academic libraries face poor internet connectivity, inadequate digital facilities, and limited access to emerging technologies (Odurukwe, 2010). Inadequate training and retraining programmes further contribute to skill gaps in digital librarianship and research support services (Dube, 2021; Bello, 2025). Weak Library and Information Science curricula also fail to adequately prepare librarians for modern professional demands (Korpelainen, 2024). Leadership and management challenges, including lack of transformational leadership and management interference, further hinder innovation and technological adoption (Olanrewaju, 2019; Eze & Chukwuemeka, 2022). Compared with developed countries that enjoy stable funding, advanced ICT infrastructure, and continuous staff development, Nigeria

continues to face socio economic and institutional challenges that limit effective library transformation (Schwartz, 2024; Emerson, 2021).

Strategies for enhance the capacity of academic libraries and librarians in providing effective teaching, learning, and research support services in Nigeria

Several strategies can enhance the capacity of academic libraries and librarians in providing effective teaching, learning, and research support services in Nigeria. Research emphasizes the need for Nigerian academic libraries to upgrade technologies, workforce skills, and management practices in order to remain relevant in a digital and AI driven environment. A major strategy is strengthening digital infrastructure through increased investment in ICT facilities such as computers, library software, electronic resources, reliable internet connectivity, and stable power supply to support automation and virtual library services (Mesagan & Hossana, 2025; Ikenwe & Udem, 2022). The development of responsive library websites, hybrid service models, and AI enabled systems is also necessary for improving access to teaching, learning, and research resources (Ifijeh & Yusuf, 2020; Nwachokor & Chegwe, 2025). Continuous professional training and retraining programmes are equally essential for improving librarians' competencies in modern service delivery. Areas such as e library services, digitization, Online Public Access Catalogue (OPAC) usage, and social media applications should be prioritized to enhance user satisfaction and information access (Omosekejimi et al., 2019). Additional capacity building strategies including workshops, seminars, staff rotation, conferences, and formal educational support can further sustain professional competence and adaptability among librarians (Igbokwe, 2023; Garbobi et al., 2025). Furthermore, librarians must develop skills in artificial intelligence, data analytics, and other emerging technologies to effectively support digital scholarship and research services (Oladokun et al., 2025; Oghuvwu et al., 2025). Effective restructuring and retooling also require supportive institutional policies, adequate funding, and strategic partnerships, while intervention agencies such as TETFUND remain crucial for infrastructure development and staff capacity building (Nwachokor & Chegwe, 2025; Mesagan & Hossana, 2025).

Theoretical Framework

The study is anchored on the Sociotechnical Systems Theory (SST) developed by Eric Trist and Fred Emery in the 1950s. The theory explains that organizations operate through the interaction of two interdependent systems namely the social system and the technical system. The social system includes staff competencies, leadership, organizational structure, communication patterns, and institutional policies, while the technical system comprises ICT infrastructure, digital technologies, library software, databases, and information systems. The theory emphasizes that organizational effectiveness can only be achieved when both systems are properly integrated and aligned. The theory aligns with research question one, which seeks to determine the extent to which academic libraries in Nigeria have been restructured to support effective teaching, learning, and research services. SST explains that restructuring involves both technological transformation and organizational adjustment. Therefore, the level of restructuring can be assessed through the availability of modern technologies, digital services, and supportive organizational systems that enhance library operations. Research question two focuses on the roles of academic librarians in supporting teaching, learning, and research activities. This aligns with the social component of SST, which recognizes the importance of human skills, professional competencies, communication, and collaboration in achieving organizational goals. Librarians serve as key actors who facilitate access to information resources and digital services.

Research question three examines the technological, administrative, and professional changes required for effective restructuring. SST directly supports this question because it stresses the need for balanced development between technological infrastructure and human capacity. Effective restructuring requires improved ICT facilities, updated policies, staff training, and innovative management practices. Research question four investigates the challenges hindering restructuring efforts. SST explains that problems arise when there is poor alignment between social and technical systems. Challenges such as inadequate funding, poor infrastructure, resistance to change, weak policies, and insufficient digital competencies create imbalance and reduce organizational effectiveness. Research question five focuses on strategies for enhancing the capacity of academic libraries and librarians. SST suggests that effective improvement can only occur through integrated strategies that combine investment in technology, continuous professional development, supportive leadership, adequate funding, and effective policy implementation. Such alignment between social and technical systems will strengthen the ability of academic libraries to provide effective teaching, learning, and research support services in Nigerian tertiary institutions.

Methodology

The descriptive survey was applied in the study. The study population included 124 professional librarians in federal university libraries in South-South Nigeria and the census sampling method was utilized. The instrument for data collection was the online questionnaire. The questionnaire was distributed via the professional social networks, such as LinkedIn and WhatsApp platforms, of the Nigerian Library Association, which are restricted to librarians. The questionnaire was also sent privately to the respondents to encourage timely responses. The respondents were given about one month to respond to the questionnaire (February 1st to March 2nd, 2026). It was stated on the questionnaire that the respondents should not fill it out more than once. Out of the librarians who received the questionnaire, 93

completed it, and with that, the analysis was made. The research procedures were conducted ethically during the distribution of the questionnaire. Initially, the researcher introduced themselves and the purpose of the study to the participants, obtaining their consent. All participants who completed the questionnaire process did so voluntarily.

The questionnaire was validated by three experts in LIS education to enhance its content and improve its clarity. To ensure that the instrument was reliable, a Cronbach's alpha value of 0.85 was obtained. Descriptive and inferential statistics were used to analyze the data via SPSS version 29. A nominal scale and 4-point Likert-type scale were used to measure and analyze responses to the questionnaire. The research questions 1-5 adopted a criterion score of 2.5. The criterion score was calculated by dividing the total by 4, where the sum was (4 + 3 + 2 + 1) divided by 4, or the criterion score = (4 + 3 + 2 + 1)/4 = 2.5. For research questions 1-4, the mean response less that 2.5 was considered low, the mean response between 2.5 to 3.0 was considered moderate, while the mean response of 3.1 and above was considered high. The mean scores less that 2.5 were taken as disagreement, and the mean scores between 2.5 and above were taken as agreement for research question 5.

Section A: Demographic Information
Analysis and Presentation of Data
Table 1: Gender of the respondents

Gender	Frequency	Percentage %
Male	42	45
Female	51	55
Total	**93**	**100**

The finding shows that the majority of the respondents are female. The higher number of female respondents may be attributed to the fact that the library profession in Nigeria has a larger population of female librarians compared to males. This suggests that women are more actively represented in academic library services and related professional activities.

Research Question 1: To what extent have academic libraries in tertiary institutions in Nigeria been restructured to support effective teaching, learning, and research services?
Table 2: Extent of Academic Library Restructuring in Tertiary Institutions in Nigeria

S/N	Extent of academic library restructuring	SA	A	D	SD	Mean	S.D.
1	Academic libraries have restructured their services to better support teaching, learning, and research activities.	40	27	13	13	3.0	1.06
2	Library facilities and infrastructure have been upgraded to meet the changing needs of users.	-	80	13	-	2.9	0.35
3	Academic libraries have expanded access to digital information resources and electronic databases.	-	66	13	13	2.6	0.72
4	Library collections have been updated to support current teaching, learning, and research needs.	-	40	40	13	2.3	0.70
5	Academic libraries have adopted modern technologies to improve service delivery.	-	53	27	13	2.3	0.74
6	Library staff have acquired relevant skills and competencies to support emerging teaching, learning, and research practices.	-	27	53	13	2.2	0.64
7	Academic libraries have introduced innovative services to meet the evolving information needs of users.	-	-	66	27	1.7	0.45
	Grand Mean					**2.4**	**0.67**

The results presented in Table 2 show that only three of the seven items recorded mean scores above the criterion mean of 2.50. The grand mean of 2.40 (SD = 0.67), which is below the benchmark of 2.50, indicates that the extent of academic library restructuring in tertiary institutions in Nigeria to support effective teaching, learning, and research services is low. The highest mean score was recorded for the item stating that academic libraries have restructured their services to better support teaching, learning, and research activities ($\bar{x}$ = 3.0, SD = 1.06). This was followed by the upgrading of library facilities and infrastructure to meet users' changing needs ($\bar{x}$ = 2.9, SD = 0.35) and the expansion of access to digital information resources and electronic databases ($\bar{x}$ = 2.6, SD = 0.72). However, respondents rated the updating of library collections to support current teaching, learning, and research needs ($\bar{x}$ = 2.3, SD = 0.70), the adoption of modern technologies for service delivery ($\bar{x}$ = 2.3, SD = 0.74), and the acquisition of relevant skills and competencies by library staff ($\bar{x}$ = 2.2, SD = 0.64) below the criterion mean. The lowest mean score was recorded for the introduction of innovative services to meet evolving information needs ($\bar{x}$ = 1.7, SD = 0.45). These findings suggest that although some restructuring efforts have been undertaken, academic libraries in Nigeria have not been extensively restructured to effectively support teaching, learning, and research services.

Research Question 2: What roles do academic librarians play in supporting teaching, learning, and research activities in tertiary institutions in Nigeria?

Table 3: Roles of Academic Librarians in Supporting Teaching, Learning, and Research Activities

S/N	Roles of Academic Librarians	SA	A	D	SD	Mean	S. D.
1	Academic librarians provide information literacy instruction to support teaching and learning.	27	53	13	-	3.2	0. 63
2	Academic librarians assist users in accessing and utilizing electronic information resources and databases.	27	53	13	-	3.2	0. 63
3	Academic librarians support e-learning and online teaching activities in their institutions.	27	53	13	-	3.2	0. 63
4	Academic librarians provide research support services to students and academic staff.	27	53	13	-	3.2	0. 63
5	Academic librarians guide users on scholarly communication and research publication processes.	27	40	27	-	3.0	0. 77
6	Academic librarians support research data management and organization.	13	53	27	-	2.9	0. 64
7	Academic librarians provide current awareness and selective dissemination of information services to support teaching, learning, and research.	-	66	27	-	2.7	0. 45
	Grand Mean					**3.1**	**0. 63**

The results presented in Table 3 indicate that all the items recorded mean scores above the criterion mean of 2.50. The grand mean of 3.10 (SD = 0.63) suggests that academic librarians play a significant role in supporting teaching, learning, and research activities in tertiary institutions in Nigeria. The highest mean scores were recorded for providing information literacy instruction, assisting users in accessing and utilizing electronic information resources and databases, supporting e-learning and online teaching activities, and guiding users on scholarly communication and research publication processes ($\bar{x}$ = 3.2, SD = 0.63, respectively). These findings indicate that librarians are actively engaged in instructional, digital, and research support services. Academic librarians' provision of research support services also recorded a high mean score ($\bar{x}$ = 3.0, SD = 0.77), demonstrating their contribution to enhancing research productivity. Support for research data management ($\bar{x}$ = 2.9, SD = 0.64) and the provision of current awareness and selective dissemination of information services ($\bar{x}$ = 2.7, SD = 0.45) received comparatively lower ratings, although both remained above the criterion mean. Overall, the findings reveal that academic librarians make substantial contributions to teaching, learning, and research activities in tertiary institutions in Nigeria, particularly through information literacy instruction, digital resource support, and research assistance.

Research Question 3: What technological, administrative, and professional changes are required for the effective restructuring of academic libraries and librarians in Nigeria?

Table 4: Technological, Administrative and Professional Changes Required for Effective Restructuring

S/N	Technological, administrative and professional changes	SA	A	D	SD	Mean	S.D.
1	Academic libraries require regular upgrading of digital technologies to enhance service delivery.	53	40	-	-	3.6	0.49
2	Academic libraries need improved remote access to online library services for users.	40	53	-	-	3.4	0.50
3	Functional and integrated library automation systems are required for effective library operations.	40	53	-	-	3.4	0.50
4	Reliable and high speed internet connectivity is required for effective library service delivery.	53	27	13	-	3.4	0.72
5	Librarians require continuous training to effectively utilize digital library systems and emerging technologies.	27	66	-	-	3.3	0.47
6	Academic libraries require adequate computers and other ICT facilities to support users' needs.	40	40	13	-	3.3	0.69
7	Academic libraries need increased provision of electronic databases and digital information resources.	27	53	13	-	3.1	0.60
	Grand Mean					**3.3**	**0.57**

The results presented in Table 4 reveal that all the identified technological, administrative, and professional changes required for the effective restructuring of academic libraries and librarians recorded mean scores above the criterion

mean of 2.50. The grand mean of 3.3 (SD = 0.57) indicates a high level of agreement among respondents that these changes are essential for effective restructuring of academic libraries in Nigeria. The highest mean score was recorded for the regular upgrading of digital technologies ($\bar{x}$ = 3.6, SD = 0.49), showing strong agreement that continuous technological advancement is necessary for improved library service delivery. Improved remote access to online library services ($\bar{x}$ = 3.4, SD = 0.50), functional and integrated library automation systems ($\bar{x}$ = 3.4, SD = 0.50), and reliable high speed internet connectivity ($\bar{x}$ = 3.4, SD = 0.72) were also highly rated, reflecting the importance of digital infrastructure in modern academic libraries. Continuous training for librarians in the use of digital library systems and emerging technologies recorded a mean score of 3.3 (SD = 0.47), while the provision of adequate computers and ICT facilities also recorded a mean score of 3.3 (SD = 0.69). Increased provision of electronic databases and digital information resources had a mean score of 3.1 (SD = 0.60). Overall, the findings indicate that technological advancement, digital access, automation systems, ICT infrastructure, internet connectivity, and continuous professional development are critical requirements for the effective restructuring of academic libraries and librarians in Nigeria.

Research Question 4: What challenges hinder the restructuring of academic libraries and librarians for improved teaching, learning, and research support services in tertiary institutions in Nigeria?

Table 5: Challenges Hindering the Restructuring of Academic Libraries

S/N	Challenges Hindering the Restructuring	SA	A	D	SD	Mean	S.D.
1	Inadequate funding hinders effective restructuring of academic libraries.	53	40	-	-	3.6	0.49
2	Poor ICT infrastructure limits digital transformation in academic libraries.	40	53	-	-	3.4	0.50
3	Irregular power supply affects the effective use of digital library services.	53	27	13	-	3.4	0.72
4	Poor internet connectivity hinders access to electronic information resources and online services.	53	27	13	-	3.4	0.72
5	Inadequate staff training limits librarians' ability to adapt to emerging technologies.	27	66	-	-	3.3	0.47
6	Lack of adequate computers and ICT facilities affects library service delivery.	40	40	13	-	3.3	0.69
7	Resistance to change among library staff hinders restructuring efforts.	27	53	13	-	3.1	0.60
	Grand Mean					**3.6**	**0.49**

The results presented in Table 5 reveal that all the identified challenges hindering the restructuring of academic libraries and librarians recorded mean scores above the criterion mean of 2.50. The grand mean of 3.4 (SD = 0.60) indicates a high level of agreement among respondents that several challenges significantly hinder the effective restructuring of academic libraries in tertiary institutions in Nigeria. The highest mean score was recorded for inadequate funding ($\bar{x}$ = 3.6, SD = 0.49), indicating strong agreement that insufficient financial support remains a major obstacle to effective restructuring. Poor ICT infrastructure ($\bar{x}$ = 3.4, SD = 0.50), irregular power supply ($\bar{x}$ = 3.4, SD = 0.72), and poor internet connectivity ($\bar{x}$ = 3.4, SD = 0.72) were also highly rated, reflecting the major technological and infrastructural barriers affecting academic libraries. Inadequate staff training in emerging technologies recorded a mean score of 3.3 (SD = 0.47), while lack of adequate computers and ICT facilities also recorded a mean score of 3.3 (SD = 0.69). Resistance to change among library staff had a mean score of 3.1 (SD = 0.60), indicating that organizational and human related factors also contribute to the challenges of restructuring. Overall, the findings suggest that financial constraints, inadequate infrastructure, technological limitations, and insufficient professional capacity are major challenges hindering the effective restructuring of academic libraries and librarians in Nigeria.

Research 5: What strategies can be adopted to enhance the capacity of academic libraries and librarians in providing effective teaching, learning, and research support services in Nigeria?

Table 6: Strategies for Enhancing the Capacity of Academic Libraries and Librarians

S/N	Strategies	SA	A	D	SD	Mean	S.D.
1	Increased funding is necessary for effective library services.	53	40	-	-	3.6	0.50
2	Collaboration with academic staff should be strengthened.	53	40	-	-	3.6	0.50
3	Continuous professional training should be prioritized for librarians.	40	53	-	-	3.4	0.50
4	Libraries should adopt emerging digital technologies.	40	53	-	-	3.4	0.50
5	Librarians should receive regular ICT capacity building programmes.	40	53	-	-	3.4	0.50
6	Institutional policies should support library innovation.	40	53	-	-	3.4	0.50
7	Strategic planning is essential for improving library service delivery.	40	53	-	-	3.4	0.50
	Grand Mean					**3.5**	**0.50**

The results presented in Table 6 reveal that all the identified strategies recorded mean scores above the criterion mean of 2.50, indicating respondents' agreement on the strategies required for enhancing the capacity of academic libraries

and librarians in Nigeria. The grand mean of 3.5 (SD = 0.50) shows a high level of consensus among respondents on the importance of these strategies for improving teaching, learning, and research support services. The highest mean scores were recorded for increased funding for effective library services ($\bar{x}$ = 3.6, SD = 0.50) and strengthening collaboration with academic staff ($\bar{x}$ = 3.6, SD = 0.50), highlighting these as the most important strategies. Continuous professional training, adoption of emerging digital technologies, ICT capacity building programmes, institutional policy support, and strategic planning all recorded high and identical mean scores ($\bar{x}$ = 3.4, SD = 0.50). This suggests a widespread agreement among respondents on the importance of these strategies. The findings therefore indicate that retooling efforts should focus on funding, collaboration, capacity building, technological advancement, and policy support to enhance the effectiveness and sustainability of academic libraries in Nigeria.

Hypothesis 1: There is no significant relationship between the extent to which academic libraries in tertiary institutions in Nigeria have been restructured and the roles academic librarians play in supporting teaching, learning, and research activities.

Table 7: Extent of Academic Libraries Restructuring and Academic Librarians' Roles in Supporting Teaching, Learning, and Research Activities

Variable	Mean	Stand. Dev.	N	R	p-value	Remark
Extent of academic libraries restructuring	16.8	4.69	93	0.71	0.000	Significant
Roles academic librarians	21.7	4.41				

$\alpha = 0.05$

Table 5 indicates a strong positive relationship between the extent of academic library restructuring and the roles academic librarians play in supporting teaching, learning, and research activities in tertiary institutions in Nigeria, with a correlation coefficient of 0.712 and a p-value of 0.000. Since the p-value is less than the 0.05 level of significance, the null hypothesis is rejected. This implies that there is a significant positive relationship between the extent of academic library restructuring and the roles academic librarians play in supporting teaching, learning, and research activities in tertiary institutions in Nigeria ($r = 0.712$, $p < 0.05$). The finding further suggests that improvements in the restructuring of academic libraries are associated with enhanced roles of academic librarians in supporting teaching, learning, and research activities.

Hypothesis 2: The extent to which academic libraries in tertiary institutions in Nigeria have been restructured does not significantly predict the roles academic librarians play in supporting teaching, learning, and research activities.

Table 8: The extent to which academic libraries are restructured predicting academic librarians' roles in supporting teaching, learning, and research

Model		Sum of Squares	Df	Mean Square	F	Sig. (2-tailed)
1	Regression	18.420	1	18.420	92.964	
	Residual	18.029	91	0.198	-	0.000
	Total	36.449	92			

$\alpha = 0.05$; R= 0.71; R Square= 0.51

The regression result presented in Table 8 reveals that academic library restructuring significantly predicts the roles academic librarians play in supporting teaching, learning, and research activities in tertiary institutions in Nigeria. The model summary shows a correlation coefficient (R) of 0.712 and an R Square value of 0.507, indicating that academic library restructuring accounted for 50.7% of the variance in the roles performed by academic librarians. The ANOVA result further shows that the regression model is statistically significant ($F = 92.964$, $p < 0.05$). Since the significance value of 0.000 is less than the 0.05 level of significance, the null hypothesis is rejected. This implies that the extent of restructuring in academic libraries significantly influences the effectiveness of academic librarians in supporting teaching, learning, and research activities in tertiary institutions in Nigeria.

Discussion of findings

Research question one revealed that the extent of academic library restructuring in tertiary institutions in Nigeria to support teaching, learning, and research services is low. The findings indicate that challenges such as inadequate funding, insufficient staffing, and weak management support hinder effective library operations. These limitations affect the provision of adequate infrastructure, current information resources, and efficient service delivery, thereby reducing the capacity of academic libraries to effectively support teaching, learning, and research. The findings underscore the need for stronger institutional commitment and government intervention in the areas of funding, infrastructure development, staffing, and policy support. This finding aligns with the Socio Technical Systems Theory (SST), which posits that organizational effectiveness depends on the integration of technological resources and supportive

organizational structures. The low level of restructuring observed suggests weaknesses in both the technological and organizational dimensions of academic libraries. This finding contrasts with the situation in many developed countries, where academic libraries have undergone significant restructuring through the adoption of AI technologies, digital services, innovative learning spaces, and specialized professional roles to enhance teaching, learning, and research (Li, 2024; Ambrose et al., 2021).

Research question two revealed that academic librarians play significant roles in supporting teaching, learning, and research activities in tertiary institutions in Nigeria. The findings showed that librarians provide information literacy instruction, assist users in accessing and utilizing electronic information resources and databases, support e learning and online teaching activities, guide users on scholarly communication and research publication processes, and provide research support services. These findings demonstrate that academic librarians are actively engaged in instructional, digital, and research support functions that contribute to the achievement of institutional goals. However, the effectiveness of these roles is often constrained by inadequate infrastructure, poor internet connectivity, weak digital platforms, insufficient funding, and gaps in professional competencies. This finding aligns with the social dimension of SST, which emphasizes the importance of human expertise, communication, and professional competence in organizational performance. It also supports previous studies that found that academic librarians contribute significantly to quality education and lifelong learning through effective information services and user support systems (Fingillah & Zuru, 2025; Sawe et al., 2024; Banleman et al., 2024).

Research question three revealed that technological advancement, digital access, automation systems, ICT infrastructure, reliable internet connectivity, continuous professional development, and the increased provision of electronic databases and digital information resources are critical requirements for the effective restructuring of academic libraries and librarians in Nigeria. These requirements are essential for enhancing service delivery and ensuring that academic libraries remain responsive to the evolving needs of teaching, learning, and research. This finding supports the SST, which emphasizes the importance of a balanced interaction between technological systems and human capabilities. The theory posits that the availability of technology alone is insufficient unless it is complemented by adequate organizational support, staff competencies, and continuous capacity building. The finding is consistent with those of Amos and Martins (2025), Sadiku and Kasim (2024), and Ogunbodede and Adebayo (2024), who reported that academic libraries in Nigeria have experienced varying levels of administrative and professional restructuring aimed at enhancing teaching, learning, and research support services.

Research question four revealed that several challenges hinder the effective restructuring of academic libraries in tertiary institutions in Nigeria. The findings identified inadequate funding, poor ICT infrastructure, unreliable power supply, poor internet connectivity, inadequate staffing, limited training opportunities, and resistance to change among library personnel as major constraints. These challenges collectively limit the transformation of academic libraries and reduce their capacity to support teaching, learning, and research effectively. This finding aligns with SST, which argues that organizational performance is weakened when there is poor alignment between social and technical systems. Inadequate resources, weak institutional support, and insufficient digital competencies create imbalances that undermine effective restructuring. The finding is consistent with previous studies that identified funding deficiencies, infrastructural limitations, and inadequate staff development as major barriers to academic library transformation in Nigeria (Bello, 2025; Eze & Chukwuemeka, 2022; Dube, 2021).

Research question five revealed several strategies for enhancing the capacity of academic libraries and librarians in Nigeria. The findings showed that increased funding, stronger collaboration with academic staff, continuous professional training, adoption of emerging digital technologies, regular ICT capacity building programmes, supportive institutional policies, and strategic planning are essential for improving library services. These strategies are critical for strengthening the capacity of academic libraries to support teaching, learning, and research effectively. This finding aligns with SST, which maintains that sustainable organizational improvement requires the integration of technological investment, human capacity development, supportive leadership, adequate funding, and effective policies. Such integration promotes synergy between the social and technical components of academic libraries, leading to improved service delivery and long term organizational effectiveness. The finding also supports previous studies that emphasized funding, collaboration, policy support, and continuous training as critical requirements for effective academic library restructuring (Nwachokor & Chegwe, 2025; Mesagan & Hossana, 2025; Ifijeh & Yusuf, 2020).

Hypothesis one indicates a strong positive relationship between the extent of academic library restructuring and the roles academic librarians play in supporting teaching, learning, and research activities in tertiary institutions in Nigeria. This suggests that improvements in library restructuring are associated with enhanced performance of librarians in delivering academic support services. Hypothesis two shows that the extent of academic library restructuring significantly predicts the roles academic librarians play in supporting teaching, learning, and research activities in tertiary institutions in Nigeria. This implies that restructuring efforts in academic libraries have a meaningful influence on how effectively librarians carry out their responsibilities in supporting teaching, learning, and research activities.

Conclusions

This study examined the restructuring of academic libraries and librarians in tertiary institutions in Nigeria for improved teaching, learning, and research support services. The findings revealed that the extent of academic library restructuring is generally low, despite the significant roles played by academic librarians in supporting teaching, learning, and research activities. Academic librarians actively provide information literacy instruction, research support, access to electronic resources, and scholarly communication services. However, their effectiveness is constrained by inadequate funding, poor ICT infrastructure, unreliable internet connectivity, insufficient staffing, limited professional development opportunities, and weak institutional support. The study further revealed that effective restructuring requires technological, administrative, and professional changes, including continuous technological advancement, improved digital access, functional library automation systems, reliable internet connectivity, adequate ICT infrastructure, and sustained capacity building for librarians. Major challenges identified include inadequate funding, poor infrastructure, inadequate staffing, resistance to change, and limited training opportunities. The study also established a significant positive relationship between academic library restructuring and the roles librarians play in supporting teaching, learning, and research. Furthermore, academic library restructuring was found to be a significant predictor of librarians' effectiveness in carrying out these roles. Therefore, strengthening the restructuring of academic libraries is essential for improving service delivery and enhancing their contribution to teaching, learning, and research in tertiary institutions in Nigeria.

Recommendations

Based on the findings of the study, the following recommendations are made:

1. Government and institutional management should increase funding for academic libraries to improve infrastructure, expand access to current information resources, and support effective service delivery.
2. Tertiary institutions should upgrade ICT infrastructure by providing reliable internet connectivity, stable power supply, adequate computers, and fully functional library automation systems to support digital library services.
3. Academic libraries should prioritize continuous professional development through regular training and ICT capacity building programmes to equip librarians with relevant digital, instructional, and research support skills.
4. Library management should strengthen the adoption and effective use of modern technologies such as electronic databases, digital platforms, and emerging tools to enhance teaching, learning, and research support services.
5. Institutional leadership should improve policy support and staffing structures in academic libraries by recruiting qualified personnel, addressing staff shortages, and promoting a supportive environment for innovation and effective library restructuring.

Abstract

The increasing prevalence of digital technologies in higher education has raised significant concerns about declining undergraduate attention spans, particularly within Library and Information Science (LIS) education. This paper examines the concept of attention span in learning environments, emphasizing its critical role in students' ability to process, retain, and engage with academic content. Evidence suggests that students' attention during lectures is often limited to short intervals, typically declining after 10–15 minutes of passive engagement, a challenge further worsened by cognitive limitations and evolving digital learning behaviours. The study explores the growing influence of digital distractions in higher education, including smartphone use, social media engagement, multitasking, and constant notifications, all of which contribute to fragmented attention and reduced academic performance. The paper further analyzes pedagogical approaches commonly used by LIS educators, highlighting the dominance of traditional lecture-based methods in many Nigerian universities and their limitations in sustaining student attention in digitally mediated classrooms. Also, the study discusses practical engagement strategies for improving attention and learning outcomes, including the adoption of blended pedagogical approaches, implementation of digital detox practices during lectures, use of handwritten assignments, continuous assessment techniques, and effective utilization of both print and electronic library resources. The paper concludes that while digital technologies present challenges to sustained attention, they also offer opportunities for enhancing student engagement when used strategically. It emphasizes the need for LIS educators to rethink instructional practices by integrating interactive, student-centred, and contextually relevant teaching strategies that align with students' cognitive capacities and digital realities. Such approaches are essential for improving attention, fostering deeper learning, and preparing students for effective participation in the contemporary information environment.

Keywords: Attention span, Digital distractions, Higher education in Nigeria, Library and Information Science (LIS) education, Pedagogical approaches.

Introduction

The rapid growth of digital technologies has transformed higher education by changing how students access information, learn, and engage in academic activities. While smartphones, social media, and other digital tools provide unprecedented learning opportunities, they have also contributed to declining attention spans and increased distractions among students, creating what scholars describe as an emerging "attention crisis" in contemporary classrooms (Kaushik et al., 2024; Somani et al., 2025). Attention is fundamental to learning because it influences students' ability to process, understand, and retain information. However, sustained attention is increasingly challenged by digital stimuli that compete with academic tasks for students' cognitive resources (Davidson, 2017; Bradbury, 2016).

The digital era has also reshaped students' expectations of higher education, with contemporary learners preferring interactive, flexible, and technology-supported learning environments over traditional lecture-based approaches (Gütl et al., 2015). At the same time, digital distractions such as social media, online entertainment, notifications, and fragmented reading habits have reduced students' ability to engage deeply with academic content (Ali Rabah, 2024; Khan et al., 2025). The problem is further compounded by digital overload, where excessive exposure to online information results in cognitive fatigue, multitasking, and reduced academic engagement (Tafesse et al., 2024).

The rise of short-form digital content has also encouraged shorter attention cycles and frequent shifts in focus, making it more difficult for students to sustain concentration during lectures, reading, and research activities (Mark, 2023; Opara et al., 2025). These challenges are particularly significant in Library and Information Science (LIS) education, where students are expected to engage critically with information resources and digital systems. In Nigeria, increasing access to digital technologies in higher education has intensified both the opportunities and challenges associated with student attention and engagement. Consequently, there is a need for LIS educators to rethink traditional teaching approaches

and adopt engagement strategies that address digital distractions while promoting meaningful learning experiences in contemporary educational environments.

Literature Review

Concept of Attention Span in Learning Environments

Attention span refers to the length of time an individual can sustain concentration on a task without becoming distracted, and it remains a critical factor in determining how effectively students process, understand, and retain information in learning environments. In higher education, particularly during lectures, attention is central to meaningful engagement because it enables students to focus cognitive resources on instructional content while filtering out competing stimuli (Davidson, 2017). Studies show that when students maintain attention, they demonstrate better comprehension, participation, and retention; however, this sustained focus is difficult to maintain over long periods. Empirical evidence suggests that the average student can maintain focused attention during a lecture for approximately 10–15 minutes before a noticeable decline occurs, especially in passive, lecture-based settings (Bradbury, 2016). After this period, attention tends to fluctuate, and students may gradually disengage unless instructional methods are varied or interactive elements are introduced.

This limitation is rooted in the cognitive capacity of the human brain, which can only process a finite amount of information at a given time. When lectures exceed this cognitive threshold, students experience reduced concentration and diminished learning outcomes. In contemporary classrooms, this challenge is intensified by the digital environment, where students are exposed to constant streams of online content, notifications, and social media interactions that compete for their attention (Somani et al., 2025). As a result, many students engage in multitasking switching between listening to lectures and interacting with digital devices which fragments attention and reduces the depth of cognitive processing (Mark, 2023). Additionally, the overwhelming volume of digital information contributes to cognitive overload, making it more difficult for students to sustain focus on a single academic task for extended periods (Tafesse et al., 2024).

The nature of attention has also evolved significantly from traditional to digital-era learning environments. Traditionally, students were accustomed to prolonged engagement with textbooks, extended lectures, and structured academic tasks that required deep concentration and reflection. In contrast, the digital age has introduced patterns of rapid information consumption, where learners frequently shift attention between multiple sources of content. Digital platforms encourage quick scanning and fragmented reading rather than sustained analytical engagement, thereby influencing how students interact with academic materials (Ali Rabah, 2024). Furthermore, continuous exposure to fast-paced digital media and constant connectivity has shortened attention cycles, encouraging frequent interruptions and reducing the ability to focus deeply on a single task (Opara et al., 2025; Somani et al., 2025).

Despite these challenges, the evolving attention patterns of students also reflect changing expectations of learning environments. Contemporary learners increasingly prefer interactive, technology-supported, and engaging instructional approaches over traditional lecture methods (Gütl et al., 2015). Therefore, the issue is not merely that attention spans are declining, but that they are being reshaped by digital experiences. Understanding this shift is essential for educators, as it highlights the need to design teaching strategies that align with students' cognitive limits and digital realities.

Digital Distractions in Higher Education

Digital distractions refer to the range of technology-related stimuli that divert students' attention away from academic tasks in learning environments. In higher education, the increasing integration of digital devices and online platforms has created a complex learning environment where students must constantly navigate between academic engagement and competing digital activities. While digital technologies provide valuable access to information and learning resources, they also introduce interruptions that can fragment attention and reduce the quality of learning (Somani et al., 2025). The issue of digital distraction is therefore central to understanding declining attention spans and student engagement in contemporary classrooms, including Library and Information Science (LIS) education.

Types of Digital Distractions

One of the most prominent forms of digital distraction in higher education is smartphone and social media usage during lectures. Students frequently use smartphones to access platforms such as messaging applications, social networking sites, and entertainment content while lectures are ongoing. This behaviour often leads to divided attention, where students attempt to follow academic instruction while simultaneously engaging in non-academic digital activities. Research indicates that such divided attention significantly reduces comprehension and retention of lecture materials because cognitive resources are split between multiple tasks (Khan et al., 2025). Furthermore, exposure to fast-paced social media content has been associated with shorter attention cycles, making it difficult for students to sustain focus during extended academic sessions (Opara et al., 2025).

Another major form of digital distraction is multitasking behaviour among students. In digitally connected environments, students often engage in multiple activities at the same time, such as listening to lectures while browsing the internet, responding to messages, or switching between academic and non-academic applications. Although multitasking may appear efficient, cognitive research suggests that it actually reduces the depth of information

processing and increases the likelihood of errors (Mark, 2023). Multitasking leads to fragmented attention, as students continuously shift their focus between tasks rather than maintaining sustained concentration on a single academic activity. Tafesse et al. (2024) further explain that digital overload encourages such behaviours, as students attempt to manage large volumes of information from multiple digital sources simultaneously.

A third critical dimension is the influence of constant notifications and digital platforms on concentration. Notifications from smartphones, emails, and social media platforms act as immediate attention triggers, interrupting students' cognitive focus even during structured learning activities. These interruptions, although often brief, can significantly disrupt the continuity of thought and reduce the efficiency of learning. Studies show that even the anticipation of notifications can negatively affect concentration, as students remain mentally alert to potential digital interruptions (Somani et al., 2025). This constant state of partial attention prevents deep engagement with academic content and contributes to reduced learning outcomes.

Beyond these, other forms of digital distractions include online entertainment and streaming services, gaming, and non-academic internet browsing, all of which compete for students' attention during study time and classroom activities. Additionally, fragmented digital reading habits, characterized by skimming and scanning rather than deep reading, have been identified as a growing concern in digital learning environments (Ali Rabah, 2024). Such habits can limit students' ability to engage critically with academic texts, particularly in disciplines like LIS that require careful analysis and interpretation of information.

Pedagogical Approaches Used by Library and Information Science (LIS) Educators

Pedagogical approaches refer to the methods and strategies educators use to facilitate teaching and learning in academic environments. In Library and Information Science (LIS) education, pedagogical practices are particularly important because the discipline combines theoretical knowledge with practical skills related to information organization, retrieval, and management. Effective pedagogy therefore influences how students engage with information resources, develop critical thinking abilities, and acquire professional competencies required in the information profession. In contemporary higher education, the choice of pedagogical approach also affects students' attention span and engagement, especially in digitally mediated learning environments (Somani et al., 2025).

Types of Pedagogical Approaches in LIS Education

Several pedagogical approaches are commonly used in higher education and LIS programmes. One of the most widely used approaches is the traditional lecture-based approach. This method involves the instructor delivering structured content to students while learners primarily listen, take notes, and occasionally ask questions. The lecture method has long been considered effective for transmitting large amounts of information within a limited time frame. However, research indicates that prolonged lectures may reduce student attention and engagement because they provide limited opportunities for active participation (Bradbury, 2016).

Another important pedagogical approach is the interactive or student-centred approach, which emphasizes active participation in the learning process. This method includes activities such as group discussions, collaborative learning, problem-solving exercises, and classroom debates. Interactive pedagogy encourages students to engage critically with course materials and contributes to deeper understanding of information-related concepts. Studies suggest that students in the digital age prefer participatory learning environments that allow them to interact with instructors, peers, and digital learning tools (Gütl et al., 2015).

A third approach is technology-enhanced or digital pedagogy, which integrates digital tools and online platforms into the teaching and learning process. Examples include the use of learning management systems, multimedia presentations, digital libraries, e-books, and online collaborative platforms. Technology-enhanced learning can make academic content more accessible and interactive, especially in disciplines such as LIS where digital information resources play a central role. However, excessive reliance on digital tools may also expose students to distractions and digital overload, which can negatively influence attention and learning outcomes (Tafesse et al., 2024; Khan et al., 2025).

Another approach is experiential or practical-based learning, where students engage in hands-on activities such as library practicum, information retrieval exercises, database searching, and real-life information management projects. This method helps bridge the gap between theory and practice by enabling students to apply classroom knowledge in realistic professional contexts. Experiential learning is particularly relevant to LIS education because the field requires practical competencies in managing information systems and digital resources.

Practical Engagement Strategies for LIS Education

Sustaining students' attention in contemporary higher education requires deliberate instructional strategies that respond to shortened attention cycles, cognitive limits, and the pervasive influence of digital distractions. Given that students' concentration during lectures typically declines after about 10–15 minutes of passive engagement (Bradbury, 2016), and that constant digital stimulation fragments attention (Somani et al., 2025), educators in Library and Information Science

(LIS) must adopt structured, context-appropriate strategies that actively re-engage learners and promote deeper cognitive involvement.

One effective approach is the adoption of a blended pedagogical model, which combines brief lecture segments with interactive and technology-supported learning activities. Rather than relying solely on prolonged lectures, instructors can divide teaching into short, focused segments interspersed with discussions, problem-solving tasks, or quick practical exercises. This approach aligns with students' evolving expectations for interactive learning environments and helps reset attention periodically, thereby improving engagement and retention (Gütl et al., 2015). When carefully implemented, digital tools within this blended model can support—not hinder—attention by making learning more participatory and relevant.

Closely related is the introduction of structured digital detox practices during lecture periods. This involves setting clear guidelines that limit non-academic use of smartphones and other digital devices during class time. Considering that notifications and multitasking significantly disrupt concentration (Mark, 2023), temporarily minimizing digital interruptions allows students to focus more fully on instructional content. Such practices do not reject technology entirely but encourage mindful and purposeful use, helping students develop better attention management habits within academic settings.

Another practical strategy is the use of handwritten assignments and note-taking activities. Writing by hand has been associated with deeper cognitive processing, as it requires students to actively engage with and summarize information rather than passively transcribe or copy content. In an environment dominated by digital typing and quick information access, handwritten tasks can slow down the learning process in a productive way, encouraging reflection, comprehension, and long-term retention of knowledge. This approach is particularly useful in countering the fragmented reading and learning behaviours associated with digital environments (Ali Rabah, 2024).

Frequent and structured assessment is also essential. Implementing continuous assessment (C.A.) tests tied to specific learning objectives or conducted at intervals during lectures can significantly enhance attention and participation. Short quizzes or reflective tasks at the end of each instructional segment encourage students to remain attentive, as they anticipate active evaluation of their understanding. This strategy not only reinforces learning but also helps lecturers gauge students' comprehension in real time, thereby addressing cognitive overload and disengagement early (Tafesse et al., 2024).

In addition, the use of existing information resources in both print and electronic formats within the library can strengthen student engagement. Encouraging students to consult textbooks, reference materials, databases, and other academic resources both physical and digital promotes active learning beyond passive listening. This practice is particularly relevant in LIS education, where familiarity with diverse information sources is a core professional skill. Engaging with library resources also fosters sustained attention, as students must navigate, evaluate, and synthesize information independently, thereby deepening their cognitive involvement in the learning process (Maity & Mete).

Therefore, enhancing attention in the face of digital distractions requires a balanced and intentional approach that combines pedagogical innovation with practical classroom management strategies. By integrating blended teaching methods, regulating digital device usage, promoting reflective learning through handwriting, implementing continuous assessments, and leveraging library resources, LIS educators can create learning environments that sustain attention, improve engagement, and support meaningful academic outcomes in the digital age.

Conclusion

This paper has examined the growing concern of declining undergraduate attention spans within Library and Information Science (LIS) education, particularly in the context of digitally mediated learning environments. It established that attention span is a fundamental determinant of effective learning, yet is increasingly constrained by cognitive limits and the pervasive influence of digital distractions such as smartphones, social media, multitasking, and constant notifications. These factors contribute to fragmented attention, reduced concentration, and diminished academic engagement among students. The paper further revealed that the continued reliance on traditional lecture-based pedagogical approaches in many Nigerian universities may not adequately address the learning needs and expectations of contemporary students. Given that attention during lectures typically declines after short periods of passive engagement, there is a clear need to rethink instructional strategies to better align with students' cognitive capacities and digital realities. In response, the paper highlighted practical engagement strategies that can enhance attention and learning outcomes in LIS education. These include the adoption of blended and interactive teaching approaches, the introduction of structured digital detox practices during lectures, the use of handwritten assignments to promote deeper cognitive processing, continuous assessment to sustain engagement, and the effective use of both print and electronic library resources to support active learning

Abstract

The rapid advancement of digital technologies has transformed the operational landscape of academic libraries and reshaped the professional responsibilities of librarians in higher education institutions. Traditional library services are increasingly inadequate for supporting the evolving demands of teaching, learning, research, and scholarly communication in technology-driven academic environments. This study employed a systematic review approach guided by the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) framework to examine emerging technologies, librarian competencies, and institutional challenges affecting academic libraries in Nigeria. Relevant peer-reviewed literature published between 2010 and 2025 was retrieved from major scholarly databases and analysed using thematic narrative synthesis. The review revealed that technologies such as artificial intelligence, cloud computing, digital repositories, integrated discovery systems, electronic resource management platforms, and big data analytics are significantly transforming academic library services and improving access to scholarly information resources. The findings further indicate that librarians are increasingly required to develop competencies in digital scholarship, instructional technology, research support services, data management, and technology-mediated information delivery. Despite these developments, the review identified persistent barriers to sustainable library transformation, including inadequate funding, infrastructural deficiencies, inconsistent policy implementation, and limited digital competencies among library professionals. The study concluded that sustainable academic development in Nigerian tertiary institutions depends largely on strategic investment in digital infrastructure, continuous professional development, curriculum reform in Library and Information Science education, and stronger institutional support for technological innovation. The paper contributes to existing scholarship by providing a conceptual synthesis linking emerging technologies, librarian competencies, institutional readiness, and sustainable academic library development within the Nigerian context.

Keywords: Academic libraries, digital transformation, emerging technologies, librarians' competencies, sustainable academic development, Nigeria.

Introduction

In an era when knowledge economies drive national progress, the capacity of libraries and librarians at tertiary institutions to adapt to the evolving demands of teaching, learning, research, and development has become a decisive factor in shaping Nigeria's academic and developmental trajectory. The need to build institutional and professional capacity has become increasingly important in academic environments shaped by digital technologies, online information systems, and evolving user expectations. The traditional description of libraries as repositories of printed materials must now evolve; they are expected to function as dynamic knowledge hubs that support teaching, learning, research, and development (Breeding, 2015). The growth of electronic resources, digital content creation, and web-based scholarly communication has fundamentally transformed how information is accessed, processed, and disseminated in higher education institutions. Studies indicated that academic librarians must continuously adapt to emerging technologies to remain relevant (Anderson, 2015). Emerging Technologies such as artificial intelligence (AI), virtual reality (VR), big data analytics, and Internet of Things (IoT), coupled with older technologies like library automation systems, electronic resource management software, instructional design platforms, and integrated search systems, which many libraries and librarians still struggle with, are redefining library services. Consequently, there is an urgent need for structured retooling programmes aimed at equipping libraries and librarians with the competencies and technologies required for contemporary academic service delivery

The process of retooling tertiary institutions' libraries and librarianship entails deliberate interventions to modernise library services and enhance the competencies of library professionals. Re-tooling involves adopting emerging technologies, such as artificial intelligence (AI), virtual reality (VR), big data analytics, and Internet of Things (IoT), and relatively older but still relevant technologies such as library automation systems, electronic resource management platforms, integrated search tools, digital repositories, and instructional design applications (Breeding, 2015). It also encompasses professional development initiatives, including training workshops, seminars, and continuous education programs that equip librarians with the skills necessary to manage digital resources, provide

reference services, support e-learning, and facilitate research activities (Adegbija & Oyediran, 2019; Okoro, 2017). The availability of modern infrastructure, such as high-speed internet, up-to-date computer systems, and electronic library databases, also plays a critical role in this variable (Abubakar, 2021). Collectively, these interventions represent the resources, knowledge, and tools that libraries and librarians need to function effectively in a contemporary academic environment.

The outcomes associated with retooling are specifically the ability of academic libraries and librarians to enhance teaching, learning, research, and development in tertiary institutions. These outcomes include improved access to quality information, efficient library service delivery, increased research productivity, and the promotion of innovation in both academic and professional contexts (Onuoha & Okocha, 2018; Adegbija & Oyediran, 2019). For teaching and learning, re-tooled libraries enable students and lecturers to access electronic course materials, online journals, and interactive learning platforms, fostering a richer and more flexible educational experience (Okoro, 2017). For research and development, librarians equipped with modern skills and technologies can provide more effective literature searches, data management support, and scholarly communication assistance (Breeding, 2015; Abubakar, 2021). Ultimately, these dependent variables reflect the extent to which retooling initiatives can transform libraries from traditional repositories into dynamic knowledge hubs that actively contribute to institutional growth, academic excellence, and national development (Onuoha & Okocha, 2018).

In Nigeria, however, the adoption of these technologies remains uneven due to infrastructural limitations, funding challenges, and skills gaps among library professionals. The Nigerian Library Association (NLA) theme, *"Our Future, Our Hope: The State of Libraries and Librarianship in Nigeria,"* underscores the urgent need to reposition libraries as critical drivers of national development. Within this context, retooling tertiary institution libraries and librarians is imperative for sustaining quality education, enhancing research output, and fostering innovation. This paper, therefore, explores pathways for the adoption of emerging technologies in academic libraries and examines the evolving competencies of librarians, with a focus on strategies that Nigerian tertiary institutions can employ to effectively support teaching, learning, research, and development.

Statement of the Problem

Academic libraries play a crucial role in supporting teaching, learning, research, and innovation. However, in Nigeria, many tertiary institution libraries face significant challenges in adopting and integrating emerging technologies. These challenges include inadequate infrastructure, limited funding, and a lack of professional skills among librarians to effectively leverage digital tools for library services. Consequently, the full potential of technologies such as library automation systems, electronic resource management software, integrated search platforms, and digital content creation tools remains largely untapped. This situation limits access to information, reduces the efficiency and relevance of library services, and hinders academic librarians' ability to support research and innovation effectively. Despite the Nigerian Library Association's emphasis on repositioning libraries as drivers of national development, there is insufficient empirical evidence on strategies for retooling both libraries and library professionals to meet contemporary technological demands. Addressing this problem is critical to ensuring that Nigerian academic libraries remain responsive to evolving educational needs and global standards in scholarly communication.

Objectives of the Study

The objectives of this study were to:

1. Examine emerging technologies shaping academic libraries in Nigeria.
2. Identify new roles and competencies required of librarians in academic libraries in Nigeria.
3. Assess how technological tools enhance teaching, learning, research, and development of academic libraries in Nigeria
4. Highlight challenges facing the retooling of academic libraries in Nigeria.
5. Propose strategies for strengthening libraries and librarians for the sustainable academic development of academic libraries in Nigeria.

Theoretical Framework

This study is anchored on the Diffusion of Innovation Theory (DOI) developed by Rogers (2003) and the Technology Acceptance Model (TAM) proposed by Davis (1989). The Diffusion of Innovation Theory explains how new technologies, ideas, and innovations are adopted within organisations and social systems over time. The theory identifies important factors influencing innovation adoption, including perceived usefulness, compatibility, complexity, organisational readiness, and communication channels. Within the context of academic libraries, the theory provides a useful framework for understanding how emerging technologies such as artificial intelligence, digital repositories, cloud computing, and integrated discovery systems are adopted and utilised in tertiary institutions. The TAM Model complements DOI by explaining librarians' behavioural intentions toward technology usage. TAM posits that perceived usefulness and perceived ease of use significantly influence users' acceptance of technological systems. In academic libraries, librarians' willingness to adopt emerging technologies depends largely on their digital competencies, institutional support, training opportunities, and perceptions regarding the effectiveness of technological tools in

enhancing teaching, learning, and research services. The integration of DOI and TAM provides a robust analytical framework for understanding the relationship between emerging technologies, librarians' competencies, institutional readiness, and sustainable academic development in Nigerian tertiary institutions.

Literature Review

Emerging Technologies and Digital Transformation in Academic Libraries

Many emerging technologies are at the forefront of scholarly debate about their impact across different strata of society. Academic libraries, as centres of innovation, cannot ignore these developments. AI, VR, big data analytics, IoTs, and smart libraries will continue to dominate the discourse as evolving services enhance efficiency, positioning libraries as vital drivers of academic excellence in the digital age.

Diagramatic Representation

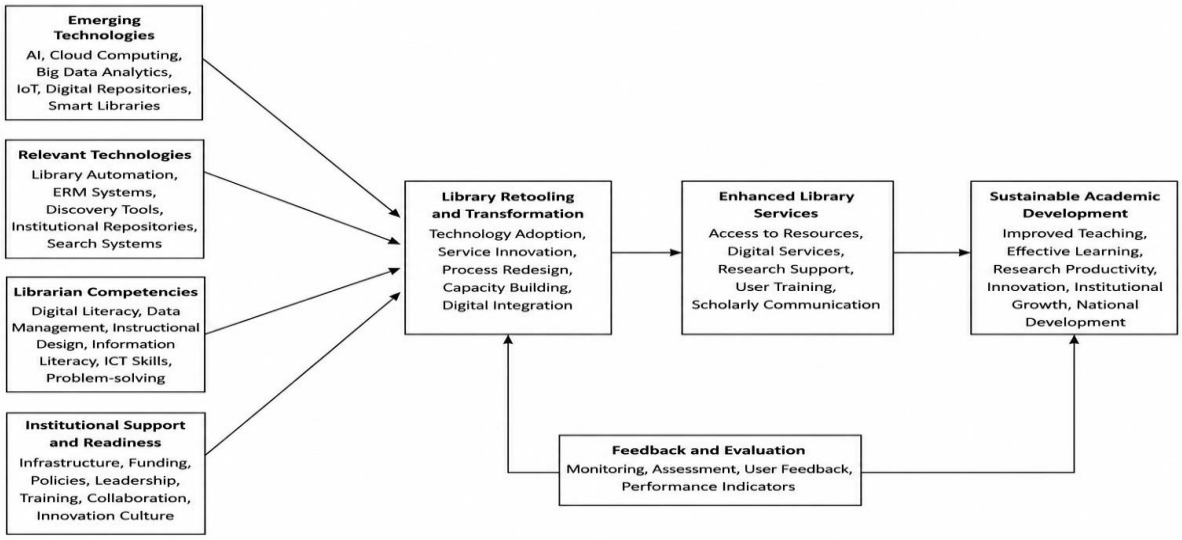

Figure 1: Conceptual Framework for Retooling Academic Libraries and Librarians for Sustainable Academic Development in Nigeria

Emerging technologies are significant drivers of transformation in academic libraries. Technologies such as artificial intelligence (AI), machine learning, cloud computing, radio-frequency identification (RFID), integrated discovery systems, big data analytics, and virtual and augmented reality have reconfigured how libraries acquire, organise, manage, and disseminate information resources within contemporary academic environments (Cox, Pinfield, & Rutter, 2019; Makinde, Olatunji, Igbinlola, & Gyang, 2024; Nwala, Otuza, & Johnson, 2025; Malgwi, Dawha, Inuwa, & Rabasa, 2025). These technologies automate routine processes, enable personalised information retrieval, and facilitate real-time access to distributed digital collections. For instance, AI-driven recommender systems and natural language search engines now enhance user discovery experiences, while cloud platforms allow libraries to scale services, support remote access, and reduce infrastructural costs (Cox et al., 2019; Adeyeye & Oladokun, 2025).

Oladokun and Adeyeye (2025) found that academic libraries employing data management systems, digital repositories, and automated metadata generation tools significantly improved research support and institutional visibility. Similarly, Makinde et al. (2024) reported that integrating information technology and telecommunications infrastructure in university libraries facilitates digital pedagogy, cross-institutional collaboration, and access to open scholarly resources. These findings reinforce the argument that emerging technologies are not merely operational tools but strategic assets that reposition libraries as integral components of the academic knowledge ecosystem.

In developing contexts such as Nigeria, however, technology adoption remains uneven. Emmanuel and Emmanuel (2025) observed that while automation software, electronic resource management systems, and integrated discovery platforms are increasingly deployed in federal university libraries, their utilisation is constrained by infrastructural deficiencies and skills shortages. Agboke and Oladokun (2025) further contend that the transformative potential of AI and related technologies in Nigerian academic libraries is yet to be fully realised due to limited institutional investment and policy direction. Consequently, while global trends highlight the centrality of emerging technologies in academic librarianship, local contexts reveal significant gaps between technological potential and practical implementation.

The reviewed studies consistently demonstrated that emerging technologies have become central to the transformation of academic library operations, particularly in the areas of information access, digital scholarship, and research support. However, the literature also reveals considerable disparities in the extent of technological adoption across institutions. While some universities have integrated artificial intelligence applications, cloud-based services, and advanced discovery systems into library operations, others remain dependent on basic automation tools due to infrastructural and financial limitations (Cox et al., 2019; Emmanuel & Emmanuel, 2025). The studies largely concentrate on operational

efficiency and electronic resource management, with comparatively limited attention given to ethical concerns surrounding AI deployment, algorithmic bias, data governance, and the sustainability of digital transformation initiatives within African academic library environments. The literature, therefore, suggests that technology adoption in Nigerian academic libraries remains uneven and requires stronger institutional frameworks, contextualised implementation strategies, and sustained investment to achieve meaningful transformation.

Evolving Professional Roles and Competencies of Academic Librarians

The increasing integration of emerging technologies into academic library services has expanded the range of competencies expected of librarians in contemporary higher education environments. Recent studies suggest that librarians are increasingly involved in digital resource management, research support services, instructional collaboration, and technology-mediated information services, in addition to their traditional responsibilities related to collection organisation and access provision (Cox et al., 2019; Enakrire, Oladokun, Morodi, & Ajani, 2025). This shift reflects the growing incorporation of libraries into teaching, learning, and research activities, particularly in areas such as scholarly communication, digital pedagogy, and research data support. Some studies conducted within Nigerian tertiary institutions reveal persistent skills gaps that limit librarians' ability to exploit emerging technologies fully. Olayemi, Olayemi, and Michael (2025) reported that while cataloguing librarians demonstrate basic ICT proficiency, advanced competencies such as metadata interoperability, digital repository management, and system customisation remain underdeveloped. Similarly, Abubakar and Yahaya (2024) found that librarians' effectiveness in managing institutional repositories was significantly influenced by their exposure to professional training and continuing education. Their study highlights the need for structured capacity-building programmes to equip librarians with competencies in digital scholarship, open-access publishing, and research data curation. Beyond technical expertise, scholars emphasise the importance of **adaptive, analytical, and collaborative competencies**. Agboke and Oladokun (2025) argue that librarians must cultivate skills in data analytics, user experience design, and technology-mediated instruction to remain relevant in digitally mediated academic environments. Enakrire et al. (2025) further note that emerging environments such as the metaverse and AI-supported information systems require librarians to develop critical digital literacy, ethical reasoning, and continuous learning orientations. Collectively, the literature establishes that retooling librarians is as critical as upgrading infrastructure, since human capacity ultimately determines the success of technological transformation.

These literatures reviewed indicated a broad consensus that the professional identity of librarians is undergoing a significant transformation in response to technological advancements and changing academic expectations. Contemporary librarians are increasingly expected to possess competencies extending beyond traditional cataloguing and reference functions to include digital scholarship support, data curation, instructional technology integration, and research analytics (Enakrire et al., 2025; Olayemi et al., 2025). Nevertheless, contradictions exist regarding the preparedness of librarians to perform these emerging responsibilities effectively. While some studies report increasing ICT proficiency among academic librarians, others reveal persistent deficiencies in advanced digital competencies, particularly in areas such as metadata interoperability, repository management, and AI-supported information services (Abubakar & Yahaya, 2024; Agboke & Oladokun (2025). Most existing studies focus primarily on technical competencies, with less attention devoted to adaptive skills such as critical digital literacy, interdisciplinary collaboration, innovation management, and ethical decision-making in technology-mediated environments. The literature, therefore, suggests that sustainable professional retooling requires a balance between technological expertise, continuous learning, and institutional support systems.

Technological Integration and Academic Support Services in Higher Education

Technological integration in academic libraries has demonstrably enhanced pedagogical delivery, research productivity, and institutional development. Digital platforms, electronic databases, and automated discovery systems facilitate ubiquitous access to scholarly resources, thereby supporting student-centred learning and faculty-led instruction (Makinde et al., 2024; Oladokun & Adeyeye, 2025). Adeyeye and Oladokun (2025) further observed that data mining tools and digital research infrastructures enable researchers to efficiently synthesise large volumes of literature, improve citation management, and increase the global visibility of institutional research outputs.

In Nigeria, empirical evidence suggests that libraries adopting research support technologies contribute significantly to academic productivity. Oladokun and Adeyeye (2025) reported that institutional repositories, digital indexing services, and electronic resource management systems enhanced research dissemination and scholarly communication in universities where they were effectively deployed. However, they also caution that inadequate technical expertise and inconsistent system maintenance often limit the sustainability of such initiatives. These findings are consistent with Abubakar and Yahaya's (2024) assertion that librarians' technological competence is a critical determinant of research support quality. Furthermore, the pedagogical implications of library technologies extend beyond access to resources. Makinde et al. (2024) demonstrated that integrated IT and telecommunication infrastructures facilitate blended learning environments, collaborative knowledge production, and distance education. Through virtual reference services, learning management system integration, and digital content creation, libraries increasingly function as **learning commons** that

mediate academic engagement. Consequently, technological tools not only enhance operational efficiency but also redefine the library's pedagogical and research roles within tertiary education systems.

Across the reviewed literature, there is substantial consensus that technological tools have significantly expanded the capacity of academic libraries to support teaching, learning, research, and institutional development. Digital repositories, electronic databases, virtual reference services, integrated search platforms, and learning management system integrations have improved access to scholarly resources, strengthened research dissemination, and facilitated flexible learning environments (Makinde et al., 2024; Oladokun & Adeyeye, 2025). However, the literature also suggests that the effectiveness of these technologies depends heavily on institutional readiness, technical expertise, and sustained infrastructural support. While some studies emphasise improved research visibility and enhanced academic productivity resulting from digital integration, others caution that inadequate maintenance culture, inconsistent internet connectivity, and insufficient user training continue to undermine long-term effectiveness in many Nigerian institutions (Abubakar & Yahaya, 2024). In addition, limited empirical attention has been given to measuring the direct impact of emerging technologies on learning outcomes, research quality, and innovation capacity within higher education institutions. The literature, therefore, points to the need for more evidence-based assessments of how technological interventions shape academic performance and knowledge production in developing-country contexts.

Institutional and Infrastructural Barriers to Academic Library Retooling in Nigeria

The benefits of emerging technologies to the retooling of Nigerian academic libraries is impeded by persistent structural, financial, and human-capacity constraints. Infrastructure deficits, including unstable electricity supply, inadequate broadband connectivity, and obsolete hardware, remain the most significant barriers to digital transformation (Agboke & Oladokun, 2025). These limitations restrict the deployment of cloud services, AI-driven systems, and advanced discovery platforms, thereby undermining the efficiency and reliability of library services.

Human capital challenges further complicate technological integration. Agboke and Oladokun (2025) found that while librarians recognise the importance of emerging technologies, many lack the specialised training required to implement and manage them effectively. Enakrire et al. (2025) similarly reported that librarians experience technology anxiety and professional uncertainty when confronted with complex digital environments, particularly AI-supported and immersive systems. Such skills gaps often result in underutilization of available technologies and resistance to innovation.

Financial and institutional constraints also play a critical role. Agboke and Oladokun (2025) identified insufficient funding, high costs of software licensing, and limited institutional prioritisation of library technology as major impediments to retooling efforts. In many institutions, library development remains peripheral to strategic planning, leading to fragmented adoption of technologies without long-term sustainability frameworks. Consequently, the challenges confronting Nigerian academic libraries are systemic and require coordinated policy, funding, and capacity-building interventions. The reviewed studies collectively identify infrastructural deficiencies, inadequate funding, limited digital competencies, and institutional resistance to change as the major barriers confronting the retooling of academic libraries in Nigeria (Agboke & Oladokun, 2025; Agboke & Oladokun (2025). Although there is a broad consensus regarding the existence of these constraints, differences emerge concerning their relative impact on technological transformation. Some scholars emphasise financial limitations and poor technological infrastructure as the most critical obstacles, whereas others argue that weak institutional policies, inadequate leadership commitment, and low investment in human capital development constitute deeper systemic challenges (Enakrire et al., 2025). Existing scholarship also tends to focus more heavily on operational challenges while paying less attention to organisational culture, technology anxiety, digital inequality, and policy inconsistencies affecting sustainable innovation in academic libraries. The literature therefore suggests that the challenges associated with library retooling are multidimensional and require coordinated responses involving institutional leadership, government intervention, professional training, and strategic policy reform.

Strategic Approaches for Sustainable Academic Library Development

The literature consistently advocates a multi-dimensional approach to strengthening academic libraries for sustainable development. Central to this is **continuous professional development.** Olayemi et al. (2025) emphasise that structured training in metadata standards, digital resource management, and emerging technologies enhances librarians' operational competence and professional confidence. Similarly, Abubakar and Yahaya (2024) demonstrate that librarians who participate in regular workshops, certifications, and collaborative learning programmes are more effective in managing institutional repositories and digital scholarship initiatives. Equally important is the continual reform of **Library and Information Science (LIS) curricula** to reflect contemporary technological realities. Agboke and Oladokun (2025) argue that integrating courses on data management, AI applications, information systems design, and digital pedagogy into LIS education is essential for preparing future professionals. Enakrire et al. (2025) further recommend embedding ethical technology use, digital rights management, and user-experience research into professional training to address emerging challenges in virtual and AI-driven environments.

At the institutional level, sustainable retooling requires **strategic investment, policy alignment, and cross-sector collaboration**. Agboke and Oladokun (2025) argue that governments and university administrations should prioritise library infrastructure within national digital development agendas. Partnerships with ICT units, research centres, and international organisations can further facilitate resource sharing and innovation. When professional development,

curriculum reform, and institutional commitment converge, academic libraries can be repositioned as transformative agents of teaching, learning, research, and national development.

The literature strongly supports continuous professional development, curriculum reform, strategic investment, and institutional collaboration as essential strategies for strengthening academic libraries and librarians in the digital era (Olayemi et al., 2025; Agboke & Oladokun, 2025). Many studies emphasise that sustainable academic development depends not only on the acquisition of technological infrastructure but also on the ability of librarians to continuously adapt to evolving digital environments. However, the literature reveals limited consensus regarding the most sustainable implementation models for developing-country contexts such as Nigeria. While some scholars advocate technology-driven institutional reforms, others prioritise human capacity development and collaborative partnerships as more realistic pathways for long-term sustainability. Furthermore, relatively few studies have examined the role of national digital policies, inter-university resource-sharing frameworks, competency certification systems, and regional collaboration in strengthening academic libraries across Africa. The literature therefore suggests that sustainable retooling requires an integrated approach that combines infrastructure development, policy support, professional capacity-building, and institutional innovation.

Methodology

This study adopted a systematic review approach to synthesise existing literature on emerging technologies, librarian competencies, and the retooling of academic libraries in Nigeria. The systematic review method was considered appropriate because it enables the identification, evaluation, and synthesis of relevant scholarly evidence relating to digital transformation and sustainable academic library development. The review was guided by the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) framework developed by Page et al. (2021), which provides a transparent and replicable process for identifying, screening, and selecting relevant studies. Relevant literature was retrieved from major scholarly databases, including Google Scholar, Scopus, Web of Science, ResearchGate, ScienceDirect, and Library and Information Science Source. Additional materials were obtained from institutional repositories, conference proceedings, and reputable open-access journals in Library and Information Science. The search process focused on studies published between 2010 and 2025 to capture contemporary developments in emerging technologies and digital transformation within academic libraries. The search strategy employed combinations of keywords and Boolean operators such as: “emerging technologies” AND “academic libraries”; “artificial intelligence” AND “librarians”; “digital transformation” AND “university libraries”; “library automation” AND “Nigeria”; “librarian competencies” AND “academic libraries”; and “technology adoption” AND “library services.” These keywords were refined during the search process to improve relevance and coverage. Studies were included in the review if they: (a) focused on academic or tertiary institution libraries; (b) addressed emerging technologies, digital transformation, librarian competencies, or technology-driven library services; (c) were published in peer-reviewed journals, conference proceedings, or credible scholarly outlets; and (d) were written in English language. Studies focusing exclusively on public libraries, school libraries, or unrelated information systems were excluded. Duplicate studies and articles lacking sufficient methodological or conceptual clarity were also excluded from the review. The review process followed the four major PRISMA stages of identification, screening, eligibility assessment, and inclusion. An initial search produced 124 studies across the selected databases. Following duplicate removal and abstract screening, 76 studies were retained for full-text assessment. After applying the inclusion and exclusion criteria, 42 studies were finally selected for qualitative synthesis. Data extracted from the selected studies included authorship, year of publication, study focus, technological themes, librarian competencies, institutional challenges, and strategic recommendations. The extracted data were analysed using thematic narrative synthesis. This approach enabled the identification of recurring themes, areas of convergence, contradictions within the literature, methodological trends, and underexplored issues relating to academic library transformation in Nigeria. To ensure the credibility of the review, studies were further assessed based on relevance, methodological clarity, analytical depth, and contribution to knowledge on digital transformation in academic libraries. Nevertheless, the study is limited by its reliance on published literature and English-language sources, which may have excluded relevant unpublished studies and non-English scholarly contributions.

PRISMA FLOW Diagram

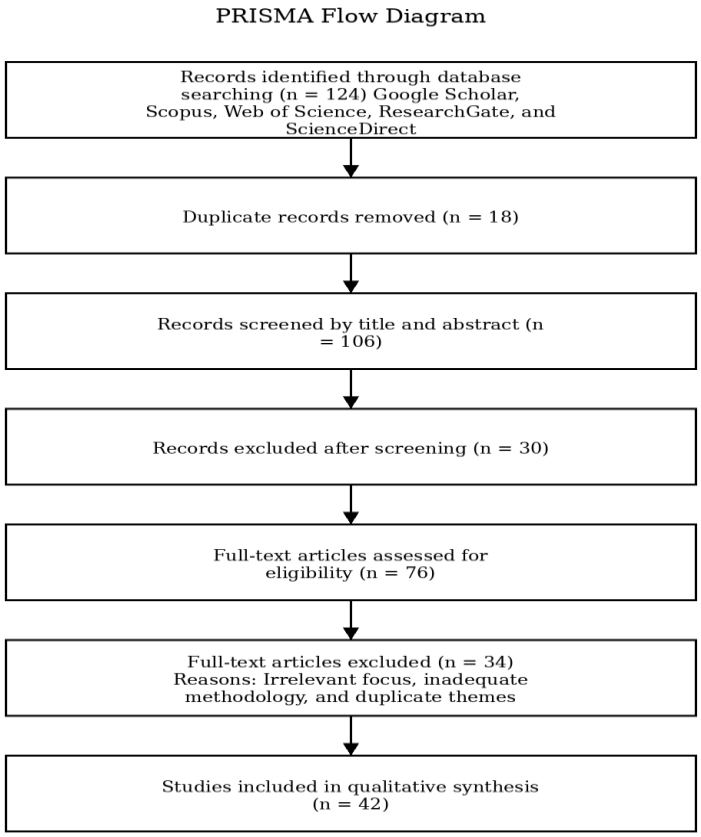

Figure 2: 124 studies were identified through database searching. After duplicate removal and screening, 76 studies were assessed for eligibility, while 42 studies met the inclusion criteria and were included in the final qualitative synthesis

Discussion

The findings of this review demonstrate that emerging technologies have become increasingly central to the transformation of academic library services and operations within higher education institutions. The reviewed literature indicates that technologies such as library automation systems, electronic resource management platforms, integrated discovery tools, institutional repositories, cloud computing, and artificial intelligence applications have significantly reshaped how information resources are acquired, organised, accessed, and disseminated in academic environments (Cox, Pinfield, & Rutter, 2019). This transformation reflects the growing shift from traditional print-based library operations to digitally mediated knowledge ecosystems that support contemporary teaching, learning, research, and scholarly communication. The increasing integration of digital technologies into academic libraries aligns with Rogers' (2003) Diffusion of Innovation Theory, which explains how institutions gradually adopt innovations that are perceived as useful, relevant, and capable of improving organisational performance.

The review further revealed that technological tools significantly improve access to scholarly resources and enhance research support services within tertiary institutions. Electronic databases, integrated search systems, bibliographic management software, and digital repositories enable students, lecturers, and researchers to retrieve and utilise information resources more efficiently. Chickering and Yang (2014) observed that integrated discovery systems improve resource visibility and simplify information retrieval across multiple databases, thereby enhancing user experience and academic productivity. Similarly, Butros and Taylor (2010) noted that bibliographic and citation management applications facilitate research organisation, referencing accuracy, and literature management for researchers and postgraduate students. These developments demonstrate that emerging technologies are no longer supplementary tools within academic libraries but have become essential infrastructures for supporting teaching effectiveness, distance learning, collaborative scholarship, and research dissemination.

The study also revealed that the effectiveness of technological transformation in academic libraries depends largely on librarians' professional competencies and institutional support systems. Findings from the reviewed literature suggest that librarians are increasingly expected to perform functions extending beyond traditional cataloguing and circulation services to include digital scholarship support, instructional technology integration, electronic resource management, and information literacy instruction (Partridge, Lee, & Munro, 2010; Radniecki, 2013). This changing professional landscape reflects the broader evolution of librarianship from custodial information management to technology-mediated knowledge facilitation. Radniecki (2013) specifically argued that librarians working within emerging

technology environments require competencies in digital content management, systems coordination, user support, and technological innovation. In the Nigerian context, however, the review revealed that many librarians still face limitations relating to advanced digital competencies, particularly in areas such as metadata management, institutional repository administration, and emerging AI-driven information systems.

The findings equally suggest that professional retooling is indispensable for sustaining digital transformation within academic libraries. Continuous professional development through workshops, seminars, certification programmes, and specialised training initiatives was consistently identified as essential for strengthening librarians' digital competencies and improving technology utilisation. These findings support Davis' (1989) Technology Acceptance Model, which posits that users are more likely to adopt technological systems when they perceive them as useful and when they possess the competencies required for effective utilisation. In many Nigerian tertiary institutions, inadequate training opportunities and limited exposure to emerging technologies continue to affect librarians' confidence and capacity to manage advanced digital systems effectively. Consequently, technological investment without corresponding human-capacity development may produce limited institutional outcomes.

Another important issue emerging from the review relates to the uneven nature of technology adoption across Nigerian tertiary institutions. While some academic libraries have successfully implemented automation systems, digital repositories, and electronic resource management platforms, others continue to struggle with infrastructural deficiencies, unstable internet connectivity, inadequate electricity supply, and obsolete technological facilities (Breeding 2015). These infrastructural limitations significantly affect the sustainability and effectiveness of digital library initiatives. The findings further revealed that inadequate funding remains one of the most persistent barriers to academic library transformation in Nigeria. Limited financial allocation to libraries restricts the acquisition of technological infrastructure, software licensing, database subscriptions, and staff training opportunities. This finding reinforces the argument that sustainable digital transformation requires not only technological adoption but also long-term institutional commitment and strategic investment.

Beyond infrastructural and financial challenges, the review also identified institutional and organisational factors as major determinants of successful library retooling. In several institutions, weak policy frameworks, inconsistent administrative support, and low institutional prioritisation of libraries continue to undermine technological innovation and service delivery. The literature suggests that libraries are sometimes viewed primarily as auxiliary service units rather than strategic partners in teaching, learning, and research development. Such institutional perceptions may hinder the integration of libraries into broader digital transformation agendas within universities. Sustainable academic library development therefore requires stronger collaboration among library management, university administrations, ICT units, academic departments, and policymakers to ensure coordinated planning, resource allocation, and institutional support for innovation.

The review additionally revealed that emerging technologies introduce complex ethical and governance concerns that academic libraries must increasingly address. Artificial intelligence systems, digital surveillance technologies, and data-driven information services raise important questions relating to data privacy, algorithmic bias, intellectual freedom, and equitable access to information resources. Cox et al. (2019) argued that while AI technologies possess the potential to improve information retrieval and service delivery, they also create ethical concerns regarding transparency, accountability, and user autonomy within digital environments. In developing countries such as Nigeria, unequal access to technological infrastructure may further widen digital inequalities between well-funded institutions and resource-constrained universities. Consequently, discussions surrounding academic library transformation must extend beyond operational efficiency to include ethical governance, digital inclusion, and responsible technology implementation.

The findings of this review further indicate that sustainable retooling requires a multidimensional approach involving curriculum reform, professional capacity-building, infrastructural investment, and institutional policy development. Library and Information Science education programmes must continually evolve to incorporate contemporary areas such as digital librarianship, research data management, instructional technologies, artificial intelligence applications, and information systems design. Equally important is the need for institutional policies that support innovation, technology integration, collaborative partnerships, and continuous professional learning. When these elements are effectively combined, academic libraries can be repositioned as strategic centres for knowledge creation, digital scholarship, research productivity, and national development. The successful retooling of libraries and librarians therefore depends on the extent to which tertiary institutions are willing to integrate technological innovation, human-capacity development, and strategic planning into their broader academic development agendas.

Findings

From the systematic review, the following findings emerged:

1. Emerging technologies such as artificial intelligence, cloud computing, integrated discovery systems, digital repositories, and electronic resource management platforms significantly enhance teaching, learning, research support, and scholarly communication in academic libraries.
2. The professional roles of librarians are expanding beyond traditional cataloguing and reference services to include digital scholarship support, instructional technology integration, research data management, and technology-mediated user education.
3. The adoption of emerging technologies across Nigerian tertiary institution libraries remains uneven due to disparities in funding, infrastructure availability, internet connectivity, and institutional readiness.
4. Major barriers confronting the retooling of academic libraries include inadequate funding, insufficient digital infrastructure, limited technical competencies among librarians, weak policy implementation, and resistance to organisational change.
5. Continuous professional development, curriculum reform in Library and Information Science education, and institutional collaboration were consistently identified as essential strategies for strengthening librarians' competencies and sustaining digital transformation initiatives.

Conclusion

Retooling tertiary institution libraries and librarians is no longer optional in the digital age. Emerging technologies have transformed the academic information landscape, redefining how teaching, learning, and research are conducted. This study contributes to knowledge by providing an integrated conceptual synthesis of how emerging technologies, librarian competencies, institutional readiness, and policy environments collectively shape sustainable academic development within Nigerian tertiary institutions. The study also extends existing scholarship by situating digital transformation within the broader realities of developing-country academic library systems. However, future studies should undertake empirical and comparative investigations on AI integration, digital scholarship practices, and technology adoption across African academic libraries

Recommendations

Based on the findings, this paper recommends that:

1. Tertiary institutions should allocate adequate funding for digital infrastructure, automation systems, and electronic resource management tools in academic libraries.
2. Regular training, workshops, and certification programmes should be provided to librarians on emerging technologies and instructional design to lecturers and librarians of academic libraries.
3. Library schools should update and harmonise their curricula to emphasise digital librarianship, data management and technology integration for future generation librarians and information professionals.
4. University management should develop policies that support innovation, collaboration, and continuous professional development of librarians.
5. Libraries should collaborate with ICT units, academic departments and external organisations to enhance service delivery. Through the following strategies:
    i. Continuous professional development through regular training, workshops, and certification programmes on emerging technologies and digital librarianship.
    ii. Reform of Library and Information Science (LIS) curricula to incorporate artificial intelligence, digital pedagogy, data management, and information systems design.
    iii. Strategic institutional investment and collaborative partnerships involving libraries, ICT units, research centres, and international organisations to strengthen digital infrastructure and sustainable service delivery.

ABSTRACT
This article examined library internet governance in Nigeria, examining the libraries and librarians role of managing digital resources, ensuring equitable access, and balancing technological advancement with socio-cultural contexts. Through a synthesis of existing literature, stakeholder perspectives, and case studies, this study investigates the rationale behind establishing robust internet governance frameworks in Nigerian libraries. The study objectives are to identify the libraries and librarians Awareness of library internet Governance and identify their roles in digital inclusion as library internet governance in Nigeria with Ahmadu Bello University library complex as a case study area. The study adopted a quantitative research methodology with descriptive survey design. The study population comprised 50 librarians in Ahmadu Bello University, Zaria-Kaduna state. The complete enumerative sampling technique was adopted because the entire 50 Librarians were used as a sample size. The instrument of data collection was an online survey questionnaire designed by researcher using Google forms and administered to respondents Via Ahmadu Bello University Library what's-up app group and the Library Internet Governance whatsapp Groups and during the online sessions of library internet governance. The data collected were analyzed using descriptive statistics. The study revealed high awareness of internet governance among librarians in Ahmadu Bello University library complex. The study further, revealed that librarians have a role to play in internet governance discussion with multiple responsibility. The study concluded by recommended that strength capacity building and continuous professional training for libraries and librarians on internet governance by institutions and professional bodies is very important.
Keyword: Library, Librarians, Internet governance, Nigeria

Introduction

The Internet has become an indispensable infrastructure for education, research, communication, and knowledge dissemination in the twenty-first century. Universities across the world increasingly rely on internet-based technologies to support teaching, learning, scholarly communication, collaboration, and access to information resources (Hanke, 2017). In Nigeria, the rapid adoption of Information and Communication Technologies (ICTs), digital learning platforms, electronic databases, institutional repositories, and online research tools has transformed the operations of higher education institutions and their libraries. As universities become more dependent on digital environments, concerns regarding internet access, digital rights, privacy, cybersecurity, information ethics, data governance, and equitable participation in the digital ecosystem have become increasingly important (Han & Guo, 2022:Imam, 2023). These concerns are collectively addressed through the concept of Internet Governance.

Internet governance refers to the development and application of shared principles, norms, rules, decision-making procedures, and programmes that shape the evolution and use of the Internet (Umar, 2025). It involves multiple stakeholders, including governments, private sector organizations, civil society groups, technical communities, educational institutions, and information professionals. The objective of internet governance is to ensure that the Internet remains accessible, secure, reliable, inclusive, and beneficial to all users. In the university environment, effective internet governance is essential for safeguarding academic freedom, promoting responsible use of digital technologies, protecting user privacy, combating misinformation, and ensuring equitable access to information resources (Dunmade, 2023:Tella, 2025).

Academic libraries occupy a strategic position within the digital information ecosystem of universities. Traditionally regarded as repositories of knowledge and centers for information access, libraries have evolved into dynamic hubs for digital learning, information management, and technology-enabled services (Nworie, 2018). Contemporary academic librarians are no longer limited to the acquisition and organization of information resources; they are increasingly involved in digital literacy instruction, information ethics education, data management, open access advocacy, cybersecurity awareness, and the promotion of responsible online behavior. Studies have highlighted that academic librarians are expected to possess technological expertise and digital competencies that enable them to support users in navigating complex digital environments and emerging technologies (Aiyebelehin, 2021).

In the context of internet governance, libraries and librarians contribute significantly to promoting equitable access to information, bridging the digital divide, fostering digital inclusion, and enhancing information and digital literacy among university communities. Nigerian academic libraries play a vital role in ensuring that students, researchers, and faculty members can effectively access, evaluate, and utilize digital information resources. Through user education

programmes, digital literacy training, and information literacy initiatives, librarians help users develop critical skills necessary for participating responsibly and effectively in the digital world.

Despite the growing relevance of internet governance in higher education, the participation of libraries and librarians in internet governance processes remains underexplored in Nigeria. Existing studies (Uwaifo, 2013: Florence, 2015: Makinde, 2025: Opele, 2025) have largely focused on digital literacy, information literacy, ICT adoption, and the evolving roles of librarians in the digital age, with limited attention given to how librarians contribute to internet governance frameworks and discussions within universities. Consequently, there is a need to examine the specific roles played by libraries and librarians in shaping internet governance practices in Nigerian universities, the challenges they encounter, and the opportunities available for strengthening their participation.

Understanding the roles of libraries and librarians in internet governance is important because academic libraries serve as gateways to information access and digital engagement within universities. Their involvement can contribute to the development of policies and practices that promote digital inclusion, responsible internet use, information security, and equitable access to knowledge. Therefore, this study seeks to investigate the roles of libraries and librarians in internet governance in Ahmadu Bello University Library Complex, Zaria – Kaduna state with a view to highlighting their contributions, identifying existing challenges, and proposing strategies for enhancing their participation in the governance of the digital information environment.

Objective of the Study

1. To understand librarians awareness of library internet governance in Nigeria.
2. To identify Librarians roles in digital inclusion as library internet governance in Nigeria.

Literature Review on Librarians' Awareness of Internet Governance in Nigeria

Internet governance refers to the development and application of shared principles, norms, rules, decision-making procedures, and programs that shape the evolution and use of the Internet (Khan et al., 2025). Therefore, it encompasses issues such as digital rights, cybersecurity, privacy, data protection, internet accessibility, and online information management. For library and librarians, particularly in academic institutions, awareness of internet governance is essential because libraries serve as gateways to information access, digital literacy, and responsible internet use.

However, existing literature specifically examining librarians' awareness of internet governance in Nigeria remains limited. However, related studies on librarians' awareness of digital technologies, ICTs, Web 2.0 tools, artificial intelligence, and emerging digital trends provide useful insights into their preparedness to engage with internet governance issues such as: Research by (Adenike & Raliat, 2023) reported that Nigerian university librarians demonstrated high awareness of Web 2.0 technologies such as social networking platforms, blogs, wikis, and media-sharing tools. The study revealed that while awareness levels were generally high, actual utilization varied due to infrastructural and organizational challenges. This suggests that librarians possess foundational knowledge of internet-based technologies that can facilitate participation in internet governance discussions. Similarly, a study conducted among academic librarians in Akwa Ibom State revealed positive perceptions of Web 2.0 technologies but a relatively low level of adoption. Constraints identified included inadequate training, poor infrastructure, and limited institutional support. These factors may also affect librarians' engagement with internet governance initiatives and policy discussions (Adeyeye, 2024). In another related study by (Ajani et al., 2022) examined librarians' awareness and readiness for the integration of artificial intelligence in Nigerian academic libraries. The findings indicated that librarians were generally aware of global developments in AI applications within libraries, although many institutions were not fully prepared for implementation. The study highlighted awareness as an important prerequisite for adopting emerging digital technologies and participating in digital policy environments. (Khan et al., 2025) investigated librarians' awareness and attitudes toward cloud computing technologies in university libraries in South-South Nigeria. Their findings revealed substantial awareness among librarians and positive attitudes toward technology adoption. Since cloud computing raises issues related to data privacy, security, and digital governance, such awareness contributes indirectly to understanding internet governance concepts. Studies on ICT awareness among librarians further demonstrate the growing digital competence of library professionals in Nigeria. Research on ICT facilities in academic libraries showed that librarians recognize the importance of information and communication technologies for effective service delivery. However, challenges such as inadequate infrastructure, funding constraints, and insufficient training continue to limit full utilization.

Therefore, these reviews on the evolving roles of academic librarians in Nigeria indicate that librarians are increasingly expected to engage with issues beyond traditional information management, including digital literacy, open access, scholarly communication, information ethics, and digital policy. These responsibilities align closely with the objectives of internet governance, highlighting the strategic role librarians can play in promoting a safe, inclusive, and accessible internet ecosystem.

Literature Review on the Roles of Libraries and Librarians in Internet Governance

Internet governance in library and librarians key issues include access to information, digital rights, cybersecurity, data protection, privacy, net neutrality, and online safety. Within this framework, libraries and librarians are increasingly

recognized as critical stakeholders because they mediate access to information and support digital inclusion. The follows are key roles of library and librarians in internet governance in Nigeria:

Libraries and Librarians as Information Access Gateways: Literature consistently identifies libraries as institutions that ensure equitable access to information, which is a foundational principle of internet governance. In the digital age, academic and public libraries function as access points to internet-based resources, bridging the digital divide and promoting inclusive participation in the information society. Studies in Nigeria emphasize that libraries contribute to national development by providing information access and reducing inequalities in ICT usage among citizens (Strover et al., 2020). Similarly, librarians are described as facilitators of knowledge access who help users navigate complex digital environments. Their role in organizing, curating, and guiding users in the use of online information systems positions them as essential actors in ensuring that internet access is meaningful and productive.

Libraries and Digital Rights, Ethics, and Cybersecurity: A significant area of literature links librarianship with digital ethics and cybersecurity awareness. (Dunmade & Tella, 2023) argue that libraries and librarians play a critical role in promoting cyberethical behaviour among students by educating users on responsible internet use, protecting intellectual property, and reducing cyber risks. This aligns directly with internet governance concerns such as online safety, privacy protection, and ethical information use. In addition, librarians are increasingly involved in teaching information literacy and digital citizenship, which include understanding rights and responsibilities in online spaces. These competencies are essential for empowering users to participate safely in digital environments governed by evolving internet policies.

Libraries as Advocates for Open Access and Inclusive Internet Policies: The literature also highlights libraries as advocates for open access, freedom of expression, and equitable information policies. According to the IFLA Internet Governance Guide for Libraries, libraries are key stakeholders in internet governance discussions because they depend on the internet to fulfill their mission of providing access to information and preserving intellectual freedom. In the Nigerian context, librarians have been identified as contributors to national information policy formulation, acting as educators, collaborators, and facilitators of access to knowledge systems. This role extends to influencing policy environments that regulate internet access and information dissemination(Adeyeye, 2024).

Librarians' Role in Bridging the Digital Divide: Another dominant theme in literature is the role of libraries in bridging the digital divide. Nigerian studies show that inadequate ICT infrastructure, low digital literacy, and limited training hinder equitable access to internet resources. Libraries help mitigate these challenges by providing internet-enabled services, training users in ICT skills, and supporting digital literacy initiatives. By enabling access to digital tools and training users in effective internet use, librarians indirectly contribute to internet governance goals such as universal access, inclusivity, and equitable participation in the digital economy(Adeyeye, 2024).

Emerging Roles in Policy and Governance Participation: Recent literature indicates that librarians are no longer passive information providers but active participants in digital policy discussions. Their involvement in institutional governance, information policy development, and digital transformation initiatives positions them as stakeholders in shaping internet governance frameworks, particularly in academic environments.

In this study, library internal governance is very important to libraries and librarians due new digital technologies in the library operation. Therefore, there is a pressing need for librarians and libraries to understand library internet governance as data privacy and protection, digital inclusion, free of information and cybersecurity etc in the library operations. Similarly, libraries are recognized as indispensable partners in fostering inclusive and sustainable development by the International Federation of Library Associations and Institutions (IFLA)(Subramanian, 2014). Their pivotal role lies in ensuring meaningful access to information, which is essential for economic, social, and environmentally sustainable development. Without such access, informed decision-making, innovation, and full participation in science and culture are hindered, impacting individuals, communities, and global society. In line with the United Nations 2030 Agenda, libraries are identified as key partners for achieving policy goals which library internet governance is policy concerning the digital environment of today.

Research Methodology

The study used Quantitative research method was adopted with descriptive survey design. This type of research design was deemed fit in a bid to elicit data from librarians to ascertains the awareness and the roles of libraries and librarians in library internet governance in Nigeria using Ahmadu University library complex as a case study area. The population of the study comprised 50 librarians from Ahmadu Bello University library, Kaduna state - Nigeria. The entire 50 librarians were adopted as the sample size of the study using total enumeration sample technique. The instrument used for gathering data was an online survey questionnaire designed by the researchers using Google forms. The survey was than administered to the respondents online via Ahmadu Bello University Library whats – up group app, the Library internet governance What's -up app group and during the panel discussion of Library Internet Governance online sessions.

Findings and Discussion

Table 1: Respondent Rate

s/no	Libraries of respondent	No of Frequency	Percentage

a.	Academic Librarians	40	80%
b.	Non-academic Librarian	10	20%
	Total	50	100%

The above table 1, clearly show that 40 (80%) of the respondents are academic Librarians in Nigeria while 10 (20%) are non- Libraries librarians that participants in the survey. This implies that majority of the respondents are academic librarians at Ahmadu Bello University library, complex Zaria - Kaduna State.

Table 2: Awareness of Library Internet Governance

s/no	Are you aware of Library Internet Governance	No of Frequency	Percentage
a.	Yes	37	74%
b.	No	13	26%
	Total	50	100%

The above table 2, clearly show that 37 (74%) librarians in Ahmadu Bello University Library are aware of library internet governance. This indicates there are knowledge of library internet governance among librarians in Ahmadu Bello University Zaria. In support of this finding (Adenike & Raliat, 2023) reported that Nigerian university librarians demonstrated high awareness of Web 2.0 technologies such as social networking platforms, blogs, wikis, and media-sharing tools. The study revealed that while awareness levels were generally high, actual utilization varied due to infrastructural and organizational challenges. This suggests that librarians possess foundational knowledge of internet-based technologies that can facilitate participation in internet governance discussions.

Table 3: The librarian's role in internet governance discussions

s/no	Did believe Librarians have a role to play in internet governance discussion?	No of Frequency	Percentage
a.	yes	50	100%
b.	no	0	0
	Total	50	100%

The table 3, revealed that 50 (100%) of respondents believe they have role to play in internet governance discussion table. Similarly, (Khan et al., 2025) mentioned that Librarians has role in discussion of internet governance due the ethical characteristics of librarianship must dependably highlighted standards comprising Intellectual freedom, information entrance, and user privacy. Moral codes from entities such by Means of the International Federation of Library Associations & Institutions (IFLA, 2012) & the American Library Association (ALA, 2017) highlight librarians' responsibility to oppose Censorship and advocate for equivalent access.

Table 4: The library and librarians roles in internet governance in Nigeria

s/no	What are the role of library and librarians in internet governance	No of Frequency	Percentage
a.	Libraries and Librarians as Information Access Gateways	5	10%
b.	Libraries and Digital Rights, Ethics, and Cybersecurity	6	12%
c.	Libraries as Advocates for Open Access and Inclusive Internet Policies	2	4%
d.	Librarians' Role in Bridging the Digital Divide	3	6%
e.	Emerging Roles in Policy and Governance Participation	4	8%
f.	All of the above	30	60%
	total	50	100%

The table 4, shows that 30 (50%) of respondents reviewed that all of the above are the key roles of libraries and librarians in internet governance in Nigeria. However, this implies that libraries and librarians are information access gateways, Libraries as Advocates for Open Access and Inclusive Internet Policies, Emerging Roles in Policy and Governance Participation and Libraries as Advocates for Open Access and Inclusive Internet Policies. However, some studies have reported that libraries enabling access to digital tools and training users in effective internet use, librarians indirectly contribute to internet governance goals such as universal access, inclusivity, and equitable participation in the digital economy(Adeyeye, 2024). In another study by (Dunmade & Tella, 2023) argue that libraries and librarians play a critical

role in promoting cyberethical behaviour among students by educating users on responsible internet use, protecting intellectual property, and reducing cyber risks.

Summary of the Findings

The following are the major findings of the study:

1. High awareness of internet governance among librarians in ABU Zaria

The study found that a significant proportion of librarians in Ahmadu Bello University Library (74%) are aware of library internet governance, indicating a strong level of knowledge and understanding of the concept among respondents. This aligns with previous studies which show that Nigerian librarians generally possess high awareness of internet-based technologies such as Web 2.0 tools, although actual application may be limited due to infrastructural and institutional challenges. This shows that librarians have a foundational digital awareness that can support engagement in internet governance issues.

2. Universal recognition of librarians' roles in internet governance

The findings also revealed that all respondents (100%) acknowledged that librarians have a role to play in internet governance discussions, with many identifying multiple responsibilities such as promoting open access, supporting information equity, ensuring ethical internet use, and participating in policy-related issues. It further implies that libraries contribute to internet governance through information access, digital literacy training, and advocacy for inclusive and ethical internet use.

Conclusion

In conclusion, the study establishes that librarians at Ahmadu Bello university Library complex are aware of internet governance and recognize their essential roles in shaping it, particularly through access provision, advocacy, and user education. However, strengthening their participation in policy and governance frameworks is necessary to fully harness their potential in the evolving digital information environment in this 21st century.

Recommendation

1. Strengthen capacity building and continuous professional training for librarians on internet governance: since librarians already show high awareness of internet governance, university library management and professional bodies should organize regular workshops, seminars, and ICT-driven training programmes focused specifically on internet governance issues such as digital rights, cybersecurity, data privacy, and policy engagement. This will help transform existing awareness into practical competence and active participation in internet governance processes.

2. Enhance institutional involvement of librarians in internet governance and policy development: Given that librarians universally recognize their role in internet governance, university authorities and relevant stakeholders should formally involve librarians in institutional ICT committees, digital policy formulation, and national internet governance forums. This will ensure that libraries contribute meaningfully to decisions on access, open knowledge, and ethical internet use while strengthening their advocacy role in promoting inclusive and equitable information access.

Abstract

University libraries are established to provide information services to students, lecturers, and other members of the university community. However, the effectiveness of these libraries largely depends on the performance of library personnel. Studies have shown that job performance in University libraries is relatively low, which may be influenced by factor such as staff quality. This study, therefore, investigated staff quality and job performance of library personnel in selected university libraries in Osun State, Nigeria. Descriptive survey design of the correlational type was adopted. The population comprised 113 personnel from five University libraries in Osun State. A total enumeration sampling technique was used, and a validated questionnaire served as the data collection instrument. Data were analysed using descriptive statistics (mean and standard deviation), Pearson Product Moment Correlation (PPMC), and regression analysis. Job performance ($\bar{x}$ = 3.29), staff quality ($\bar{x}$ = 3.29) of personnel were high above the threshold. Significant relationships were found between staff quality and job performance ($r = 0.78$ $p < 0.05$) Regression analysis further showed that staff quality influenced job performance with an F-value of 204.605 ($p < 0.05$), indicating a strong predictive capacity of the independent variables on the dependent variable. The R value (0.905) indicates a very strong positive relationship between the predictors (staff quality) and the outcome variable (job performance). The R Square value of 0.819 suggests that 81.9% of the variance in job performance can be explained by the combined influence of staff quality. The Adjusted R Square value of 0.815 confirms the model's robustness by adjusting for the number of predictors while other factor not in this study account for other factor that could influence the job performance of library personnel in Osun State. Staff quality is significant predictor of job performance of library personnel in Osun State. It is recommends that university libraries should prioritize continuous professional development through conference, workshops, seminars, and certifications. It Is also recommends promoting collaborative practices and team work among personnel. enhance performance and service delivery within university libraries.

Keywords: Job performance, personnel, Staff quality, university libraries.

Introduction

A university library is a collection of resources, including books, journals, newspapers, magazines, databases and multimedia materials that serve the research, learning and teaching needs of students, faculty and staff at a university Edu Tinker, (2023). University libraries are constituted in the literature by a range of overlapping and shifting conceptual models that are deployed to capture, express and legitimise their repurposing, progressive status and function within the university campus. Over the last two decade university libraries have been increasingly characterised as highly responsive and receptive to the fast-moving currents of technological innovation, emergent teaching and discusses the evolutionary trajectory of the university library set within an historical context, exploring the discursive influences that have both stimulated and propagated what might be described as progressive transformation Partrick O. Donnel & Lorraine Anderson (2022). University library performs different functions in different universities. These functions

include: collection development, organisation of knowledge for easy storage and retrieval, preservation and conservation of knowledge and dissemination of knowledge to foster academic and research activities. They also provide other services such as lending of resource materials, provision of seat and study facilities, user education, reference services, current awareness services, selective dissemination of information, document delivery, and referral services, amongst others.

The activities in the university library are carried out by library personnel who are expected to perform on their job. Library personnel in universities are librarians who hold bachelor postgraduate diploma master and doctorate in library and information science and other related field. They may also hold bachelor degrees of any other discipline, but for librarians to be registered and practice in Nigeria, the Librarian's Registration Council of Nigeria (LRCN) requires that they possess bachelor degree in library science. Librarians in every university library hold leadership position. They are heads of university libraries, called university librarians. University librarians are among the principal officers and management staff in university libraries. Furthermore, librarians also head various units under them. Para-professionals and library assistants are subordinates to librarians (Eyo, 2021).

These professionals are responsible for managing library systems, curating collections, implementing policies, and ensuring the effective organisation and dissemination of information. They may also focus on conducting research, teaching information literacy, and overseeing staff and services. Their expertise enables them to make decisions regarding the acquisition of resources, the management of budgets, and the application of technology in libraries. An example of a library professional's work is the role of a librarian who is responsible for cataloguing materials, developing user services, and conducting outreach to enhance the library's impact within a community or institution Rubin, (2021)

Para-professionals are those library personnel who possess qualifications higher than senior secondary school certificate. They possess certificate, National Diploma and Higher Diploma in Library Science from accredited universities or polytechnics. On the other hand, library assistants are those library personnel who possess only Senior Secondary School Certificate or General Certificate in Education (GCE) ordinary level. Library assistant forms the majority of the workforce of the university library. The library personnel Librarians, Para-professional and Library Assistants and library porter, all have their different job descriptions tailored towards the satisfaction of the library users. Also, para-professionals (also known as library technicians or assistants) typically support library operations and assist professionals in performing their duties, though they do not require a graduate-level degree. Lekwa (2021) explained that para-professionals may possess specialised certifications or associate degrees in library science, which equip them with the skills necessary to assist in routine tasks such as shelving books, cataloguing materials, assisting library users, and maintaining databases. For instance, library personnel might be job with managing the circulation of books or helping patrons with basic queries, thus enabling library professionals to focus on more complex tasks.

Job performance is defined as the record of an individual’s achievements at work; it is also defined as both behaviour and outcomes of personnel. This is due to the fact that performance’s actions are what transforms performance from abstraction to results. It indicates that when managing team or individual performance, both inputs (behaviour) and outputs (result) must be examined Reddy (2021) Job performance, which is a popular concept in managerial psychology, has thus become an important index in predicting probable success or otherwise of any organisation, which also include University libraries. Job performance refers to the ability of personnel to effectively carry out the duties and responsibilities of the librarian role. This can include jobs such as organising and maintaining library collections, assisting patrons with finding and using resources, providing reference and research assistance, and collaborating with other staff members to provide programmes and services to the community. Job performance refers to the level of success employee have in completing the tasks and responsibilities associated with their job. It can be evaluated by a supervisor or manager through various methods such as goal attainment, employee evaluations, and feedback from colleagues and users Adenekan (2024).

Staff quality refers to the skills, knowledge, and qualifications of library staff members. High-quality staff members can help to improve the overall quality of services provided by the library, as well as increase efficiency and productivity. Job training is a factor that can influence personnel’s productivity and efficiency; it can also lead to library personnel commitment. Library personnel can collect feedback from users through surveys to assess their level of satisfaction with library services and facilities Eyo (2021). However, documented evidence on staff quality and job performance of personnel is high and this indicates a need for this study. Hence, the study required identifying the work experience of staff quality and users satisfaction towards job performance of personnel in selected university libraries in Osun-State, Nigeria.

Objective of study

The main objective of the study is to investigate staff quality and job performance of personnel in selected university libraries in Osun-State, Nigeria. The specific objectives are to:

1. ascertain level of job performance of personnel in selected university libraries in Osun- State, Nigeria; and

2. examine the level of staff quality of personnel in selected university libraries in Osun State, Nigeria;

Literature Review

Staff quality refers to the knowledge, skills, competencies, experience, integrity, and professional attributes employees possess, which enable them to perform organizational tasks effectively. Job performance, on the other hand, reflects the extent to which employees achieve organizational goals through efficiency, productivity, and quality service delivery. Recent empirical studies have consistently established a positive relationship between staff quality and job performance.

Okunlola (2023) investigated the influence of training, remuneration, and teamwork on employee job performance among workers of the National Examinations Council (NECO) in Nigeria. Using a descriptive survey design, the study found that employee training significantly enhanced job performance, indicating that organizations with highly skilled and well-developed staff achieve better performance outcomes. The study concluded that investment in staff development is essential for improving employee effectiveness and productivity. Similarly, Ajibola et al. (2023) examined the relationship between human capital development and employee performance in the Osun State Ministry of Human Resources and Capacity Building. The study revealed that training, education, and employee development positively influenced employee performance. Employees who possessed higher levels of knowledge and professional competence demonstrated greater efficiency and effectiveness in carrying out their responsibilities.

In another Nigerian study, Olanipekun et al. (2024) explored the effect of staffing on employee performance in tertiary institutions. Using a cross-sectional survey of academic and non-academic staff, the researchers found that quality recruitment and selection practices significantly improved employee performance. The study emphasized that attracting and retaining competent personnel enhances organizational competitiveness and productivity. Ede (2024) examined the effect of human capital planning on employee performance among small and medium enterprises in Nigeria. The findings indicated that organizations that strategically develop and utilize high-quality personnel experience improved employee productivity and service delivery. The study recommended continuous investment in workforce quality through planning, training, and career development.

Beyond Nigeria, Serenko, Abubakar et al. (2024) analyzed the drivers of organizational performance from a human capital perspective using data from employees in North American credit unions. Their findings showed that training opportunities, constructive feedback, and employee development significantly improved job satisfaction and reduced turnover intentions, leading to enhanced organizational performance. The study reinforced the view that high-quality staff constitute a critical source of competitive advantage. Furthermore, Leontes & Hoole (2024) investigated the impact of human capital management practices on employee performance in the South African hospitality sector. Using Partial Least Squares Structural Equation Modeling (PLS-SEM), the study found that effective human capital practices improved employee engagement, which subsequently enhanced performance. The researchers concluded that organizations should prioritize staff quality through continuous development and supportive management practices. Additionally, Konadu et al. (2024) examined the role of employee integrity in shaping work performance in the public sector. The study established that integrity, a critical dimension of staff quality, significantly contributes to higher levels of employee effectiveness and organizational performance. Employees exhibiting ethical behavior and accountability were found to perform better and contribute more positively to organizational objectives.

Methodology

The study adopted a survey research method which involves questionnaire and sampling in order to reach out to a sizeable number of personnel in selected universities libraries. This design is suitable for this study because descriptive survey research is fact-finding in nature. The target population for this study comprised the personnel in selected universities libraries in Osun-State, Nigeria. However, the five universities personnel in Osun-State, Nigeria were selected (one federal, one state and three private universities) were finally used for the study.

The total population of personnel in selected universities was 113 as presented in Table 1. We choose these university libraries because they are existing over 5 years before the study and they have larger library personnel that can be study.

The study adopted total enumeration method used in selecting the respondents for this study. A total of 113 copies of the questionnaire were personally administered to the personnel in the five selected university libraries. Therefore, the sample size was the total population of the personnel of the selected universities, 113 respondents, which were taken as the sample for the study through a purposive sampling technique.

Table 1 presented figures on population, number of questionnaires distributed and number returned used.

Table 1 Return Rate of the Questionnaire Administered

S/N	Name of University	Population	Proportional Sample	Number Retuned	Number Used
1	Adeleke University	15	15	15	15
2	Fountain University	8	8	7	7
3	Obafemi Awolowo University	58	55	51	51

4	Osun State University	19	18	17	17
5	Redeemer`s University	13	13	13	13
	Total	**113**	**109**	**103**	**103**

One hundred and nine copies of the questionnaire were distributed to the personnel in selected universities libraries in Osun-State, Nigeria. One hundred and three copies were returned while ten copies of this questionnaire were completed and found unusable.

Objective 1: To ascertain the level of job performance of library personnel in selected university libraries in Osun-State, Nigeria. In response to objective 1, a range of responses was elicited which was presented in Table 2.

S/N	**Statement**	**SA**	**A**	**D**	**SD**	**Mean**	**SD**
	Productivity						
1.	I effectively manage my time to complete jobs efficiently	72 (69.9%)	25 (24.3%)	3 (2.9%)	3 (2.9%)	3.61	.69
2	I prioritise my responsibilities to maximise productivity	45(43.75)	51(49.5%)	3(2.9%)	4(3.9%)	3.33	.72
3	I use tools and technology to enhance my work effectively	65 (63.1%)	31 (30.1%)	6 (5.8%)	1 (1%)	3.55	.65
4	I believe my contributions positively impact the library's overall productivity	52(50.6%)	41(39.8%)	4(3.9%)	6(5.8%)	3.34	.81
5	I collaborate with colleagues to improve workflow and productivity	60 (58.3%)	37 (35.9%)	4 (3.9%)	2 (1.8%)	3.50	.70
	Weighted mean					**3.46**	
	Competence						
1	I am knowledgeable about the best practices in my area of work within the library	49 (47.6%)	46 (44.7%)	7 (6.8%)	1 (1%)	3.50	.66
2	I can effectively troubleshoot common issues that arise in my role	53 (51.5%)	41 (39.8%)	7 (6.8%)	2 (1.9%)	3.40	.71
3	I understand and can apply library policies and procedures accurately	53 (51.5%)	45 (43.7%)	5 (4.9%)	-	3.53	.59
4	I am able to stay up-to-date with new developments and technologies relevant to my role	43 (41.7%)	50 (48.5%)	6 (5.8%)	4 (3.9%)	3.28	.75
5	I can communicate clearly and effectively with patrons and colleagues	57 (55.3%)	43 (41.7%)	1 (1%)	2 (1.9%)	3.50	.62
	Weighted mean					**3.44**	
	Resourcefulness						
1	I can quickly locate information using various library resources	61 (61%)	32 (32%)	3 (3%)	4 (4%)	3.50	.75
2	I effectively use technology to enhance library services	47 (45.6%)	46 (44.7%)	6 (5.8%)	4 (3.9%)	3.32	.76
3	I am able to solve problems independently when they arise	56 (54.4%)	38 (36.9%)	7 (6.8%)	2 (1.9%)	3.43	.71
4	I actively seek out new resources and tools to improve my work	53 (51.5%)	37 (35.9%)	9 (8.7%)	4 (3.9%)	3.34	.80
5	I can adapt to changes in library policies and technologies easily	58 (56.3%)	36 (35%)	5 (4.9%)	4 (3.9%)	3.43	.76
	Weighted mean					**3.40**	
	Users satisfaction						
1	Patrons are satisfied with the assistance I provide	47 (45.6%)	43 (41.7%)	7 (6.8%)	6 (5.8%)	3.27	.83
2	I address patron inquiries promptly and effectively	58 (56.3%)	37 (35.9%)	5 (4.9%)	3 (2.9%)	3.45	.73

3	Patrons feel comfortable approaching me with their questions	58 (54.4%)	40 (38.8%)	4 (3.9%)	3 (2.9%)	3.44	.71
4	I create a welcoming atmosphere for patrons	57 (55.3%)	37 (35.9%)	6 (5.8%)	3 (2.9%)	3.43	.73
5	I regularly seek feedback from patrons to improve services	59 (57.3%)	36 (35%)	2 (1.9%)	6 (5.8%)	3.43	.80
	Weighted mean					**3.40**	
	Overall mean					**3.43**	

Note: SA + A = Agree while D + SD = Disagree

Table 2 presents the level of job performance of personnel in selected university libraries in Osun-State, Nigeria based on four key constructs: Productivity, competence, resourcefulness, and user satisfaction. Each construct was assessed through five items using a four-point Likert scale: Strongly Agree (SA), Agree (A), Disagree (D), and Strongly Disagree (SD). The weighted mean score for productivity is 3.46, indicating a high level of perceived productivity among library personnel. The highest-rated statement under this construct is, I effectively manage my time to complete jobs efficiently (Mean = 3.61), while the lowest is, I prioritise my responsibilities to maximise productivity" (Mean = 3.33). This suggests that although staffers are generally productive, time management is slightly better executed than prioritization strategies.

Under the competence dimension, the weighted mean is 3.44, also indicating a high level of perceived competence. Personnel particularly agreed with statements such as, I understand and can apply library policies and procedures accurately (Mean = 3.53) and I can communicate clearly and effectively with patrons and colleagues (Mean = 3.50), reflecting a strong grasp of core operational skills and communication abilities.

The resourcefulness construct yielded a weighted mean of 3.40, which still falls within the high performance category. Staff were most confident in their ability to quickly locate information using various library resources (Mean = 3.50), while the lowest-rated statement was, I effectively use technology to enhance library services (Mean = 3.32). This suggests that while staff is resourceful; there is room to improve the effective use of technology in service delivery. The user satisfaction dimension also has a weighted mean of 3.40, indicating that library personnel generally meet user expectations. Highest scores were seen in statements like, I address patron inquiries promptly and effectively (Mean = 3.45), suggesting a positive user experience. However, Patrons are satisfied with the assistance I provide, had a relatively lower mean of 3.27, suggesting that while users are generally satisfied, more could be done to enhance service delivery and engagement.

The overall mean score of 3.43 implies a high level of job performance among library personnel in selected university libraries in Osun-State. Based on the Likert scale used, where the maximum possible mean score is 4.0, this suggests that respondents exhibit strong levels of productivity, competence, resourcefulness, and user engagement. To determine the level of job performance, a similar method to the one used in the cyber ethics example can be applied:
Objective 2: To examine the level of staff quality of personnel in selected university libraries in Osun-State, Nigeria. In response to objective 2, a range of responses was sought to examine the level of personnel in selected universities. The itemised level were gotten from previous studies and deliberately grouped by the researchers for organisation. This was presented in Table 3 in which SA, A, D, SD imply Strongly Agreed, Agreed, Disagreed Strongly Disagreed respectively.

S/N	Statement	SA	A	D	SD	Mean	SD
	Work experience						
1.	I feel that my skills are effectively utilised in my role	67 (65%)	30 (29.1%)	6 (5.8%)	-	3.59	.60
2	The library provides sufficient resources to perform my job effectively	37 (35.9%)	55 (53.4%)	9 (8.7%)	2 (1.9%)	3.23	.69
3	I receive adequate training to perform my job responsibilities	46 (44.7%)	45 (43.7%)	8 (7.8%)	4 (3.9%)	3.29	.78
4	I have necessary resources to perform my job effectively	38 (36%)	53 (51.5%)	8 (7.8%)	4 (3.9%)	3.21	.75
5	My work is recognized and appreciated by my supervisors	41 (39.8%)	50 (48.5%)	10 (9.7%)	2 (1.9%)	3.26	.71
	Weighted mean					**3.32**	
	Work quality						

1	The quality of services I provide meets the expectations of library users	49 (47.6%)	41 (39.8%)	10 (9.7%)	3 (2.9%)	3.32	.80
2	I consistently deliver accurate information to library patrons	39(38.2%)	51(50%)	8(7.8%)	4(3.9%)	3.21	.76
3	I regularly review and improve my work practices to enhance services quality	44 (42.7%)	52 (50.5%)	5 (4.9%)	2 (1.9%)	3.33	.67
4	The library's resources are well-organised and easy for users to access	52 (50.5%)	40 (38.8%)	9 (8.7%)	2 (1.9%)	3.37	.73
5	I maintain high standards of professionalism in my work	48 (46.6%)	50 (48.5%)	3 (2.9%)	2 (1.9%)	3.39	.65
	Weighted mean					**3.32**	
	Training						
1	The training I received adequately prepared me for my job responsibilities	53 (51.5%)	38 (36.9%)	9 (8.7%)	3 (2.9%)	3.36	.77
2	I have access to ongoing training opportunities relevant to my role	46 (44.7%)	42 (40.8%)	12 (11.7%)	3 (2.9%)	3.27	.78
3	The training programs provided are up-to-date with current library programme	42 (40.8%)	50 (51.5%)	8 (7.8%)	3 (2.9%)	3.27	.73
4	I feel confident applying the skills learned in training to my daily work	37 (35.9%)	53 (51.5%)	10 (9.7%)	3 (2.9%)	3.20	.73
5	The library encourages participation in external training and workshops	36 (35%)	51 (49.5%)	12 (11.7%)	4 (3.9%)	3.15	.78
	Weighted mean					**3.25**	
	Team collaboration						
1	Team members effectively communicate with each other	42 (40.8%)	51 (49.5%)	4 (3.9%)	6 (5.8%)	3.25	.79
2	I feel comfortable sharing my ideas and suggestion with my team	37 (35.9%)	55 (53.4%)	9 (8.7%)	2 (1.9%)	3.23	.69
3	We collaborate well on projects and tasks within the library	49 (47.6%)	41 (39.8%)	9 (8.7%)	4 (3.9%)	3.31	.79
4	The team supports each other in achieving our objectives	40 (38.8%)	49 (47.6%)	11 (10.7%)	3 (2.9%)	3.22	.75
5	Team collaboration enhances the overall effectiveness of our library services	43 (41.7%)	48 (46.6%)	8 (7.8%)	4 (3.9%)	3.26	.77
	Weighted mean					**3.25**	
	Overall mean					**3.29**	

Note: SA + A = Agree while D + SD = Disagree

Table 3 presents the level of staff quality of personnel in selected university libraries in Osun-State, Nigeria based on four key constructs: Work experience, work quality, training, and team collaboration. Each construct was assessed using five items rated on a four-point Likert scale: Strongly Agree (SA), Agree (A), Disagree (D), and Strongly Disagree (SD). The weighted mean score for the Work Experience construct is 3.32, indicating that library personnel generally perceive their skills as being well-utilized and that they have adequate support to perform their roles. The highest-rated statement under this construct is "I feel that my skills are effectively utilised in my role" (Mean = 3.59), suggesting that staff feel confident in the relevance of their abilities. The lowest-rated item is "I have necessary resources to perform my job effectively" (Mean = 3.21), implying that while staff are capable, access to resources could still be improved.

For the Work Quality dimension, the weighted mean is also 3.32, reflecting a high level of service quality and professionalism. Respondents rated, I maintain high standards of professionalism in my work (Mean = 3.39) and the library's resources are well-organised and easy for users to access (Mean = 3.37) most highly. These responses suggest that staff not only value professionalism but also prioritize service accessibility. However, I consistently deliver accurate

information to library patrons scored slightly lower (Mean = 3.21), indicating room for enhancement in information accuracy and delivery.

The training construct had a slightly lower weighted mean of 3.25, but it still reflects a generally positive perception of training quality and relevance. The highest-rated item is "The training I received adequately prepared me for my job responsibilities (Mean = 3.36), showing that initial training is effective. On the other hand, the statement the library encourages participation in external training and workshops received the lowest rating (Mean = 3.15), highlighting a potential gap in ongoing professional development support. The weighted mean for Team Collaboration is 3.25, indicating that staff perceive team dynamics positively but with potential for further improvement. Respondents rated we collaborate well on projects and tasks within the library" (Mean = 3.31) and team collaboration enhances the overall effectiveness of our library services" (Mean = 3.26) as the highest indicators of effective teamwork. However, I feel comfortable sharing my ideas and suggestions with my team, had a slightly lower score (Mean = 3.23), suggesting a need to strengthen open communication and idea sharing within teams. The overall mean score of 3.29 indicates a high level of staff quality among library personnel in selected university libraries in Osun-State. This reflects a generally strong foundation in work experience, service quality, training adequacy, and collaborative work culture.

Discussion of the Findings

This study primarily examined staff quality and job performance of personnel in selected university in Osun State, Nigeria. Specifically, the findings of the study showed that majority of the respondents hold positive staff quality. Findings reveal a high level of job performance among library personnel in selected university libraries in Osun-State, Nigeria, as reflected across four key constructs indicate a generally positive perception of job performance among the respondents. This suggests that library personnel are actively engaged in their roles and demonstrate effectiveness in delivering library services. Productivity emerged as the highest-rated construct, with library staff showing strong agreement on their ability to manage time efficiently and complete tasks effectively. However, the slightly lower score for the item on prioritizing responsibilities points to an area where staff may benefit from further training or support in task management and strategic planning.

In terms of competence, the personnel demonstrated a strong understanding of library operations and policies, with high agreement on statements related to applying policies and communicating effectively with patrons and colleagues. These results align with the findings of Nwokike & Unegbu (2019), who noted that knowledge of job specific tasks and communication are vital indicators of job performance among librarians. The dimension of resourcefulness also recorded a high mean, with staff indicating confidence in their ability to locate information and navigate various library resources. However, a relatively lower mean score was observed for the use of technology to enhance services. This suggests that while library staffs are resourceful, there is a need for capacity building in the area of digital tools and emerging technologies to further enhance service delivery and efficiency.

User satisfaction, though also within the high range, recorded the lowest average among the four constructs. This finding echoes earlier research suggesting that even when service providers perform effectively, user experience may not always reflect the same level of satisfaction (Adeniran, 2011). There is a high-performance range of librarians. This suggests that library personnel in Osun State are generally productive, competent, resourceful, and responsive to users' needs. This supports findings from prior studies such as Oyewusi & Oyeboade (2009), which emphasised the positive performance and role of library staff in academic environments and contradicts claims from less favourable assessments where library personnel were perceived as underperforming due to poor infrastructure or lack of motivation.

Interestingly, the result of present study is revealing a generally high level of staff quality among personnel in selected university libraries in Osun-State, Nigeria. This was measured across four core constructs work experience, work quality, training, and team collaboration. The analysis shows a strong perception among library staff of their competencies, professionalism, and collaborative engagement, all of which contribute to effective service delivery in the academic library setting. Specifically, both Work Experience and Work Quality recorded the highest weighted mean scores. Within the Work Experience construct, respondents strongly affirmed that their skills are effectively utilised and suggesting that staff feel competent and appropriately placed in their roles. However, access to necessary resources was rated lower although personnel are skilled, infrastructural or material constraints may sometimes hinder optimal performance. In terms of Work Quality, staff indicated high standards of professionalism and praised the organization and accessibility of library resources, which together reflect a commitment to service excellence. A relatively lower mean score for accurate information delivery suggests there is room to improve information handling practices, which are crucial for user satisfaction.

The Training dimension had a slightly lower mean score, still indicating a positive perception. While staff felt their initial training prepared them well for their responsibilities, the lower score for encouragement to participate in external workshops and training points to a gap in ongoing professional development opportunities. This could potentially affect long-term skill growth and adaptability among staff. Similarly, Team Collaboration also had a weighted mean, indicating good but improvable team dynamics. While staff agreed they collaborate well on tasks and that teamwork enhances library effectiveness, the slightly lower comfort level in sharing ideas suggests that open communication and inclusiveness in decision-making could be strengthened to further boost team cohesion.

The high level of staff quality reflects an encouraging staff quality profile, marked by solid professional competence, a culture of service, and collaborative spirit. These findings align with existing literature suggesting that staff effectiveness in university libraries significantly enhances service delivery and user satisfaction e.g., Olajide & Adetoro, (2019). However, the observed gaps in continuous training and internal communication mirror challenges highlighted in previous studies e.g., Nwalo, (2017), which emphasize the need for ongoing investment in staff development and organisational culture. The study concludes that the level of staff quality in university libraries across Osun-State is high, with opportunities for further strengthening in resource provision, continuous training, and collaborative openness.

Conclusion

The study highlighted the intricate relationship between staff quality and job performance of personnel in selected university libraries in Osun-State, Nigeria. The study revealed that high levels of staff quality significantly contribute to improved job performance. Specifically, personnel who demonstrate effective time management, proficiency with tools and technology, and collaborative work ethics tend to achieve higher productivity and user satisfaction. The results Similarly, the positive impact of staff quality, including effective training, access to resources, and skill utilisation, underscores the importance of continuous professional development and resource provision in enhancing job performance. However, areas of disagreement, such as resource adequacy and variability in team collaboration and user satisfaction, point to specific gaps that require targeted intervention. Addressing these disparities by improving infrastructure, fostering teamwork, and implementing mechanisms for user feedback can further enhance overall performance and satisfaction.

In conclusion, the study emphasises the importance of fostering an enabling environment where staff quality is prioritised through effective training, resource allocation, and collaborative practices. Such initiative is not only vital for achieving organisational goals but also for ensuring that library personnel are equipped to meet the evolving demands of academic institutions. By addressing the identified gaps and leveraging the strengths of the workforce, university libraries can continue to serve as pivotal hubs for knowledge dissemination and academic excellence.

5.4 Recommendations

Basedon the findings of the study, the following recommendations are proposed:

1. Universities should invest in continuous professional development programs to enhance the skills, knowledge, and technical competencies of library personnel. Workshops, seminars, and certifications should be regularly organized to keep staff updated with industry best practices.Library management should promote teamwork by encouraging collaborative projects and cross-departmental initiatives to improve information sharing and joint problem-solving.

2. Equip library personnel with modern tools and resources, such as digital catalogs and automated systems, to improve efficiency and user satisfaction.

Abstract

The school library plays a foundational role in the preparation of library and information professionals, serving as both a training ground and a practical laboratory for developing core competencies. This study examines the current state of school libraries and their effectiveness in equipping future professionals with the knowledge, skills, and ethical orientation required in contemporary information environments. Drawing on existing literature, policy frameworks, and institutional practices, the paper evaluates key indicators such as infrastructure adequacy, collection development, integration of information and communication technologies (ICT), staffing qualifications, and collaboration with academic departments of library and information science. Findings indicate that while school libraries remain central to experiential learning and professional socialization, many face persistent challenges, including inadequate funding, outdated resources, insufficient technological infrastructure, and limited professional development opportunities. These constraints hinder the capacity of school libraries to fully support practical training in areas such as information literacy instruction, digital resource management, user services, and emerging technologies. The paper concluded that revitalizing school libraries through strategic investment, policy enforcement, curriculum alignment, and strengthened partnerships between educational institutions and professional bodies is critical for producing competent, adaptable, and innovation-driven library and information professionals. The study recommended that Schools should employ professionally trained librarians rather than assigning library duties to unqualified staff, schools should employ professionally trained librarians rather than assigning library duties to unqualified staff.

Keywords: Library, Schools Library, Preparation of Library and Information Professionals

Introduction

School libraries are fundamental components of educational systems, serving as centers for learning, literacy development, and access to information. In many countries, they play a crucial role in supporting students' academic achievement and fostering a culture of reading and inquiry Esan (2022). Beyond their immediate impact on learners, school libraries also serve as important training grounds for future library and information professionals. However, the effectiveness of these libraries in fulfilling this dual role varies widely due to differences in infrastructure, staffing, resources, and recognition within educational policies.

According to Diso and Njoku (2023) library and information professionals are expected to possess a broad set of competencies including information organization, digital literacy, user education, collection development, and management skills. Traditionally, preparation for these roles includes both theoretical coursework and practical experiences. School libraries, when adequately equipped and professionally managed, offer real-world environments in which trainees can observe and practice essential skills, such as cataloguing, reader advisory, information retrieval, and community engagement. These experiential learning opportunities can strengthen the quality of professional preparation by bridging theory and practice.

Despite this potential, research indicates that the state of school libraries in many regions is challenged by under-funding, inadequate resources, lack of qualified staff, and low priority within school systems. In some cases, school libraries are poorly stocked, lack up-to-date information resources, or function without trained librarians' altogether. This situation not only limits students' access to quality information, but also reduces the opportunities for library and information science (LIS) students to engage meaningfully with real professional settings. As a result, aspiring professionals may graduate with limited practical experience, affecting their readiness to enter the workforce and contribute effectively to information services in schools and other sectors.

Statement of the problem

School libraries are expected to function as vital centers for learning, information access, and literacy development within the educational system. They also serve as practical training environments for students studying Library and Information Science (LIS), where theoretical knowledge is expected to be reinforced through hands-on experience. However, evidence suggests that many school libraries are not functioning at optimal standards due to inadequate funding, insufficient infrastructure, outdated collections, limited technological resources, and the absence of qualified professional librarians.

The poor state of many school libraries raises serious concerns about their ability to effectively contribute to the preparation of competent library and information professionals. Practical training is a critical component of LIS education, as it equips students with essential skills in cataloguing, classification, information retrieval, collection development, digital resource management, and user services. When school libraries lack proper organization, modern information resources, and professional supervision, students may not acquire the necessary practical exposure required for professional competence. Therefore, the problem this study seeks to address is the extent to which the existing state of school libraries supports or hinders the effective preparation of library and information professionals. It is based on this backdrop that the study seeks examine state of school library in preparation of library and information professionals.

Aim and Objectives of the Study

This study aims to examine the state of school library in preparation of library and information professionals. Specifically, the study seeks to:

- assess the current condition of school libraries in terms of infrastructure, facilities, and learning environment in preparation of library and information professionals
- examine the availability and adequacy of information resources in school libraries in preparation of library and information professionals.
- determine the level of technological integration in school libraries in preparation of library and information professionals.

Conceptual Clarification

School Libraries

A school library is an information center established within a primary or secondary school to support teaching, learning, and research activities. It provides access to a variety of information resources in print and non-print formats, including textbooks, reference materials, storybooks, journals, digital resources, and multimedia materials.

School libraries play a crucial role in promoting information literacy and academic development. They serve as access points for a variety of resources, both print and digital, and act as instructional partners that support curriculum delivery, reading engagement, and research competence. According to the International Federation of Library Associations and Institutions (IFLA, 2015), the primary function of a school library is to provide information and ideas fundamental to students' successful participation in an information-rich society.

In practice, effective school libraries collaborate with teachers, facilitate reading and digital literacy, offer safe learning environments, and support diverse learning needs (Bamigbola
& Onifade, 2024).

Aliyu (2018) states that school library is a place where relevant learning, teaching, viewing, reference books and new books are housed. In each school, reasonable and suitable reading materials are organized by a trained staff. These materials are meant for teachers and pupils at relevant level to enrich the subject taught and the teaching methods. Supporting this, Fayose (2023) Observes, that today, school libraries are referred to as instructional resource centre, media resource centre, information resource centre, learning resources centre. Adebamowo (2019) states that “school libraries have moved far beyond room with books to become an active, technology-rich learning environment with an array of information resources”.

School libraries are seen as part of the school where information resources are gathered for the benefit of teachers and students. Eze and Ugwu (2021) refer to school library as a place where books and other collections are processed, catalogued and arranged for the use of teachers and students. School library is a place where teachers and students interact with the right stock in quality, quantity and relevance, professionally organized. Gojeh (2024) opines that school libraries are equipped with professional staff to provide access to resources. A functional school library is an ideal library that provides services that attract students and teachers, their primary role is to acquire, process, organize, preserve, and disseminate information to users. Byass (2017) views that school libraries are part of the school curriculum and laboratories where many experiments are conducted. This enables learners to master content and extend their investigation into their own learning. Kolade (2019) states that “the school library is the heart of the school with a wide variety of educational media”. In this context, school libraries are regarded as the nerve-centre for information resources that serve students and teachers, indeed they remain focal to the development of individual student in his information literacy skills. They are educational agent that provide access to information resources for all students and teachers. Petters and Ottong (2019) assert that school libraries are depositories of print and non-print materials and source for qualitative education

According to the International Federation of Library Associations and Institutions (IFLA), a school library is essential for developing information literacy, lifelong learning skills, and independent inquiry among students. Similarly, the American Association of School Librarians (AASL) emphasizes that school libraries empower learners to think critically, create knowledge, and share information ethically.

School libraries typically perform the following functions:

- Supporting the school curriculum
- Promoting reading culture and literacy
- Providing access to information resources
- Teaching information literacy skills
- Supporting research and project work
- Serving as a learning hub within the school

School libraries are not only centers for student learning but also practical environments where Library and Information Science (LIS) students can gain professional experience.

State of School Libraries

Yusuf (2023) opined that the state of school libraries refers to the overall condition, quality, functionality, and level of development of school libraries. It encompasses physical infrastructure, adequacy and relevance of collections, availability of technological facilities, funding levels, staffing, management practices, and policy support. A well-developed school library typically has sufficient space, current and diverse resources, functional ICT facilities, internet connectivity, automation systems, and qualified professional staff. However, in many contexts, school libraries face serious challenges such as inadequate funding, outdated materials, lack of technological integration, and absence of trained librarians Ajegbomogun, and Salaam (2021). These deficiencies affect not only student learning outcomes but also the quality of professional exposure available to LIS students undergoing training. When the state of school libraries is poor, opportunities for meaningful practical engagement are significantly limited.

The "state" of school libraries refers to their overall condition, quality, and level of development. This includes:

- Physical infrastructure (space, seating, lighting, ventilation)
- Availability and relevance of collections
- Technological facilities (computers, internet access, automation systems)
- Funding and administrative support
- Staffing (presence of qualified librarians)
- Organization and management practices

The condition of school libraries varies significantly across regions. In many developing countries, school libraries face challenges such as:

- Inadequate funding
- Outdated or insufficient collections
- Lack of automation
- Absence of professional librarians
- Poor maintenance of facilities

When the state of school libraries is weak, their ability to function effectively as training grounds for future professionals becomes limited. Conversely, well-equipped and properly managed school libraries provide rich opportunities for experiential learning.

Library and Information Professionals

Marchionini (2022) stressed that library and information professionals are individuals formally trained in LIS programmes to organize, manage, preserve, and disseminate information resources in various information environments. They are expected to possess competencies in cataloguing and classification, collection development, reference and information services, digital resource management, information literacy instruction, and library administration. The Chartered Institute of Library and Information Professionals highlights that modern professionals must be adaptable, technologically competent, and responsive to evolving information needs. In school settings, these professionals play a critical role in supporting curriculum delivery, promoting reading culture, and guiding students in effective and ethical information use. Their preparation therefore, requires a balance between theoretical knowledge and practical skills
Library and Information Professionals are individuals trained in Library and Information Science (LIS) to manage, organize, preserve, and disseminate information resources. They work in various settings, including school libraries, academic libraries, public libraries, special libraries, archives, and information centers.

Professional competencies generally include:

7. Cataloguing and classification

8. Collection development
9. Information retrieval
10. Digital literacy and ICT skills
11. User education and reference services
12. Library management and administration
13. Ethical information practices

The Chartered Institute of Library and Information Professionals (CILIP) highlights that modern library professionals must adapt to digital transformation, information overload, and evolving user needs.

Library professionals are responsible for supporting curriculum delivery, promoting literacy, and guiding students in responsible information use. Therefore, their training must combine both theoretical knowledge and practical experience.

Preparation of Library and Information Professionals

Lynch (2018) asserted that preparation refers to the structured process through which LIS students acquire the knowledge, practical skills, ethical standards, and professional attitudes required for effective practice. This preparation typically involves classroom instruction, supervised internships, fieldwork, workshops, and research projects. Practical training is particularly important because it bridges the gap between theory and real-world application. School libraries often serve as sites for teaching practice and industrial attachment, where students can apply cataloguing rules, manage collections, interact with users, implement information literacy programmes, and utilize library technologies. However, if these libraries lack adequate facilities or professional supervision, students may graduate without sufficient hands-on competence.

Preparation refers to the process of equipping LIS students with the knowledge, skills, attitudes, and competencies required for professional practice. This preparation typically occurs through:

- Classroom instruction
- Practical training and internships
- Fieldwork placements
- Workshops and seminars
- Research and project work

Practical exposure is a critical component of professional preparation. It allows students to apply theoretical concepts in real-life environments. School libraries serve as important sites for such practical experiences, especially for students specializing in school librarianship.

Effective preparation requires:

- Exposure to functional library systems
- Use of automated cataloguing tools
- Interaction with real users (students and teachers)
- Experience in collection development
- Participation in information literacy instruction

If school libraries lack adequate resources or professional management, LIS students may not gain meaningful practical experience. This gap may result in graduates who are theoretically sound but practically underprepared.

Roles of Library and Information Professionals in State School Libraries

School libraries are essential components of the educational system. They serve as centers for learning, research, information access, and intellectual development. In state schools, where resources may sometimes be limited, library and information professionals play a critical role in ensuring that students and teachers have access to quality information resources and services. These professionals are trained individuals who organize, manage, preserve, and disseminate information to support teaching, learning, and research activities.

The role of library and information professionals in state school libraries extends beyond the traditional responsibility of managing books. They act as educators, information managers, technology facilitators, literacy promoters, and advocates for lifelong learning. Their contributions significantly influence students' academic achievement and personal development.

Collection Development and Management

One of the primary responsibilities of library professionals is developing and managing the library's collection. They:

- Select relevant books, journals, magazines, newspapers, and digital resources.
- Ensure that materials align with the school curriculum.
- Remove outdated and damaged materials.
- Maintain a balanced collection that meets the diverse needs of students and teachers.
- Acquire resources that support both academic and recreational reading.

Effective collection development ensures that students have access to current and reliable information.

Organization of Information Resources
Library professionals organize information resources to make them easily accessible. They:
- Classify materials using standard classification systems.
- Catalogue books and other resources.
- Create indexes and bibliographies.
- Arrange materials systematically on shelves.

Proper organization saves users' time and enables efficient retrieval of information.
Promotion of Reading Culture
A major role of school librarians is encouraging reading habits among students. They:
- Organize reading clubs and literary activities.
- Conduct book talks and book reviews.
- Celebrate reading campaigns and literacy events.
- Recommend books according to students' interests and reading levels.

Promoting a reading culture helps improve language skills, academic performance, and critical thinking abilities.
Information Literacy Instruction
In the information age, students need skills to locate, evaluate, and use information effectively. Library professionals:
- Teach students how to search for information.
- Guide them in evaluating the credibility of information sources.
- Train students on proper citation and referencing.
- Educate students about ethical use of information.

Information literacy skills enable learners to become independent and responsible information users.
Support for Teaching and Learning
Library professionals collaborate with teachers to enhance classroom instruction. They:
- Provide supplementary learning materials.
- Assist teachers in curriculum planning.
- Develop instructional resources.
- Support project-based learning activities.
- Help students conduct research assignments.

This collaboration improves the quality of education and learning outcomes.
Integration of Information and Communication Technology (ICT)
Modern school libraries increasingly rely on technology. Library professionals:
- Manage electronic databases and digital libraries.
- Assist students in using computers and internet resources.
- Introduce online learning tools.
- Facilitate access to educational websites and e-books.
- Support digital literacy programs.

By integrating ICT, they prepare students for participation in the digital world.
Reference and Information Services
Library professionals provide guidance and assistance to library users. They:
- Answer users' information queries.
- Help students locate relevant resources.
- Provide research assistance.
- Recommend appropriate information sources.

These services ensure that users obtain accurate and timely information.
User Education and Library Orientation
Many students may not know how to use library resources effectively. Library professionals therefore:
- Conduct orientation programs for new students.
- Explain library rules and regulations.
- Teach users how to locate and borrow materials.
- Demonstrate the use of electronic resources.

User education increases library utilization and promotes independent learning.
Preservation and Conservation of Resources
School library resources require proper maintenance. Library professionals:
- Repair damaged books.
- Protect resources from environmental damage.
- Implement preservation policies.
- Ensure proper storage of materials.

Preservation activities help extend the lifespan of library collections.
Creating a Conducive Learning Environment
Library professionals maintain an atmosphere that supports learning by:

- Ensuring cleanliness and orderliness.
- Providing comfortable reading spaces.
- Maintaining discipline within the library.
- Creating welcoming and inclusive environments.

A conducive environment encourages students to study and conduct research.

Promotion of Lifelong Learning

Libraries are centers for continuous education. Library professionals:

- Encourage self-directed learning.
- Expose students to diverse sources of knowledge.
- Foster curiosity and intellectual growth.
- Support learning beyond the classroom.

These efforts help students develop lifelong learning habits.

Supporting Inclusive Education

Library professionals ensure that library services are accessible to all learners, including students with special needs. They:

- Provide accessible information resources.
- Offer specialized services where necessary.
- Promote equal access to information.
- Support diverse learning styles.

Inclusive library services contribute to educational equity.

Record Keeping and Administrative Functions

Library professionals perform administrative duties such as:

37. Maintaining circulation records.
38. Preparing library reports.
39. Managing budgets and expenditures.
40. Conducting inventory of library materials.
41. Developing library policies and procedures.

These functions ensure effective library management and accountability.

Advocacy and Resource Mobilization

Library professionals advocate for the development of school libraries by:

- Seeking funding from government and stakeholders.
- Promoting the importance of library services.
- Establishing partnerships with educational organizations.
- Encouraging community support for libraries.

Advocacy helps improve library facilities and services.

Encouraging Research and Innovation

Library professionals support students' research activities by:

- Providing access to research materials.
- Guiding students in information searching.
- Supporting inquiry-based learning.
- Encouraging critical and creative thinking.

This role helps develop future researchers and innovators.

Challenges Faced by Library and Information Professionals in State School Libraries

Despite their importance, library professionals often face several challenges, including:

- Inadequate funding.
- Insufficient library resources.
- Lack of modern ICT facilities.
- Shortage of qualified personnel.
- Poor infrastructure.
- Limited professional development opportunities.
- Low recognition of the library's role in education.

Addressing these challenges is necessary for effective library service delivery.

The current condition of school libraries in terms of infrastructure, facilities, and learning environment in preparation of library and information professionals

Akwanga (2017) opined that the current condition of school libraries in terms of infrastructure, facilities, and learning environment plays a crucial role in the preparation of library and information professionals. School libraries are expected to function not only as resource centers that support teaching and learning but also as practical training grounds for students of Library and Information Science (LIS). However, the effectiveness of school libraries in fulfilling this dual responsibility largely depends on the adequacy and quality of their physical structures, available facilities, and overall learning atmosphere.

In terms of infrastructure, many school libraries face significant challenges. Ideally, a school library should be housed in a purpose-built structure that provides adequate space for reading areas, book stacks, reference sections, staff offices, and digital resource centers. The building should have proper lighting, ventilation, comfortable seating arrangements, and accessibility features. However, in many schools, especially in developing regions, libraries are often located in small, repurposed classrooms with limited seating capacity and poor environmental conditions. Overcrowding, insufficient shelving, and lack of maintenance are common problems. Such infrastructural limitations not only restrict students' access to resources but also limit the practical exposure of LIS students who require organized and well-structured library settings to practice classification, shelving, and space management techniques (Varshney, 2017).

Facilities within school libraries are another important determinant of their current condition. A functional school library should be equipped with up-to-date print materials, reference collections, periodicals, and digital resources. In addition, modern libraries are expected to have computers, internet connectivity, printers, scanners, and library management software to support automation and digital information services (Varshney, 2017). However, the reality in many school libraries is characterized by outdated textbooks, insufficient copies of essential materials, and limited or nonexistent digital infrastructure. The absence of automation systems prevents LIS trainees from gaining hands-on experience with cataloguing software, online public access catalogues (OPAC), and electronic database management. Without exposure to these facilities, the preparation of future library professionals becomes largely theoretical and disconnected from contemporary professional standards.

The learning environment of a school library also significantly affects professional preparation. A conducive learning environment promotes independent study, collaboration, research, and information literacy development. It should be quiet, organized, and user-friendly, with clear signage, accessible catalogues, and supportive staff. According to the International Federation of Library Associations and Institutions, a well-managed school library fosters critical thinking, creativity, and lifelong learning. Similarly, the American Association of School Librarians emphasizes that the school library should serve as a dynamic learning hub within the school community. Unfortunately, in many cases, school libraries lack professional librarians and are managed by untrained personnel, which affects service delivery and reduces mentorship opportunities and supervised practical training for LIS students.

For library and information professionals in training, practical exposure to a well-functioning library environment is essential. Infrastructure allows them to understand space planning and collection arrangement; facilities enable them to practice technical processes such as cataloguing, classification, and digital resource management; and a supportive learning environment provides opportunities for user interaction, reference services, and information literacy instruction. When these elements are weak or absent, LIS students may complete their programmes without acquiring sufficient real-world competencies.

Availability and adequacy of information resources in school libraries in preparation of library and information professionals.

According to Benson et al. (2017) the availability and adequacy of information resources in school libraries are central to their effectiveness both as learning support centers and as training environments for future library and information professionals. Information resources refer to the wide range of materials that provide knowledge and support teaching, learning, and research. These include print resources such as textbooks, reference books, dictionaries, encyclopedias, atlases, newspapers, magazines, and fiction materials, as well as non-print and digital resources like e-books, online databases, audiovisual materials, multimedia content, and internet-based information services. The quality, relevance, currency, and diversity of these resources determine the strength of a school library and its capacity to contribute meaningfully to professional preparation.

In many well-developed school systems, libraries are equipped with diverse and up-to-date collections that reflect the school curriculum and the reading interests of students. The International Federation of Library Associations and Institutions emphasizes that school library collections should be balanced, inclusive, and aligned with educational goals. Adequate resources allow students to develop reading culture, critical thinking skills, and information literacy competencies. At the same time, they create an enabling environment where Library and Information Science (LIS) students can practice collection development, cataloguing, classification, indexing, and reader advisory services using relevant and current materials (Chimah & Nwokocha, 2022). However, in many contexts, particularly in developing regions, the availability and adequacy of information resources in school libraries remain a major challenge. Many school libraries operate with outdated textbooks, limited reference materials, and insufficient copies of core academic resources. In some cases, collections are poorly organized or not aligned with the current curriculum. The absence of electronic databases, limited internet connectivity, and lack of digital resources further weaken the library's capacity to meet modern information needs. These limitations reduce opportunities for LIS trainees to gain hands-on experience in managing contemporary information systems and digital collections.

Dike (2024) opined that adequacy of information resources goes beyond quantity; it also involves relevance, currency, diversity, and accessibility. A library may possess a large number of books, but if the materials are obsolete or unrelated to the curriculum, they cannot effectively support learning or professional training. For LIS students, exposure to current and well-organized collections is essential for understanding modern cataloguing standards, subject analysis, metadata creation, and digital resource management. Without adequate resources, practical exercises in classification systems, such as Dewey decimal classification, become limited and unrealistic. Furthermore, the integration of digital resources

is increasingly important in the preparation of library and information professionals. Modern librarians are expected to manage electronic information systems, institutional repositories, online catalogues, and digital literacy programmes. The Chartered Institute of Library and Information Professionals highlights the need for information professionals to be technologically competent and adaptable to digital transformation. If school libraries lack access to computers, internet facilities, and electronic databases, LIS students may graduate without essential digital skills required in contemporary information environments.

Another important aspect is the role of adequate resources in supporting information literacy instruction. School libraries with sufficient materials enable trainees to conduct user education programmes, guide students in research activities, and teach effective information retrieval skills. Where resources are scarce, opportunities for such professional practice are limited. As a result, the gap between theoretical knowledge acquired in LIS classrooms and practical experience in real library settings widens.

The level of technological integration in school libraries in preparation of library and information professionals.

Ternenge and Agipu (2019) asserted that the level of technological integration in school libraries is a critical factor in determining their effectiveness in the preparation of library and information professionals. In the contemporary information society, libraries are no longer limited to print collections and manual processes; they have evolved into hybrid or fully digital information centers that rely heavily on information and communication technologies (ICT). Technological integration in school libraries refers to the extent to which digital tools, automated systems, internet connectivity, and electronic resources are incorporated into library operations and services. This integration significantly influences the quality of practical training available to students of Library and Information Science (LIS).

Modern school libraries are expected to utilize technology in various aspects of their operations, including cataloguing, circulation, information retrieval, user education, and digital resource management. Automation systems such as integrated library management software enable librarians to organize collections efficiently, generate reports, and provide Online Public Access Catalogues (OPAC) for users. Access to computers, internet services, scanners, printers, and multimedia equipment enhances the delivery of library services and supports research and learning activities. According to the International Federation of Library Associations and Institutions, effective school libraries should integrate digital technologies to promote information literacy and prepare learners for participation in a knowledge-driven society. When such technologies are available and functional, they create opportunities for LIS students to gain hands-on experience in automated cataloguing, database searching, metadata creation, and digital archiving (Todd, 2022).

The level of technological integration in many school libraries remains low, particularly in developing regions. Challenges such as inadequate funding, poor internet connectivity, lack of ICT infrastructure, and insufficient technical expertise limit the adoption of modern technologies. In some schools, library operations are still performed manually, with card catalogues replacing digital systems and limited access to electronic resources. This situation restricts LIS trainees from acquiring essential digital competencies required in contemporary professional practice. Without exposure to automated systems, electronic databases, and digital information services, graduates may find it difficult to adapt to technologically advanced library environments.

Mills et al (2017) stressed that technological integration also plays a vital role in enhancing information literacy instruction. School libraries equipped with internet-enabled computers and access to online databases allow trainees to guide students in effective search strategies, evaluation of online sources, and ethical use of information. The American Association of School Librarians emphasizes that school librarians must be leaders in teaching digital citizenship and information literacy skills. For LIS students, participating in such instructional activities strengthens their confidence and competence in delivering user education programmes. In contrast, where technology is absent or underutilized, opportunities for practicing digital instruction are limited. Modern library and information professionals are expected to be adaptable and technologically proficient. The Chartered Institute of Library and Information Professionals highlights digital skills and technological innovation as essential competencies for today's information workforce. Therefore, the preparation of LIS students must include practical exposure to emerging technologies such as library automation software, electronic cataloguing standards, digital repositories, and online collaboration tools. School libraries that embrace technological integration provide a realistic environment for students to develop these competencies, while those that lag behind hinder professional growth. Technological integration enhances collaboration and networking opportunities. School libraries connected to wider information networks can participate in resource sharing, inter-library cooperation, and online professional communities. LIS trainees exposed to such environments gain insight into modern trends such as digital preservation, open access resources, and cloud-based library services. These experiences are invaluable in preparing them for dynamic professional roles.

Way Forward

The way forward in improving the state of school libraries for the effective preparation of library and information professionals lies in deliberate policy implementation, sustained funding, and technological advancement. School libraries must be repositioned as dynamic learning resource centers equipped with modern information and communication technologies, current print and digital collections, and professionally trained librarians who can mentor future practitioners. In countries such as Nigeria, stronger government commitment, monitoring mechanisms, and

enforcement of national library standards are essential to ensure quality and uniform development. Collaboration between Library and Information Science (LIS) departments and school libraries should also be strengthened through structured internships and practical training programs that bridge the gap between theory and practice. Additionally, continuous professional development, public private partnerships, and ongoing research should be encouraged to promote innovation and sustainability. Through coordinated efforts among stakeholders, school libraries can be transformed into effective training grounds that produce competent, adaptable, and forward-looking library and information professionals capable of meeting the demands of the evolving information society.

Conclusion

The state of the school library plays a foundational role in the preparation of competent library and information professionals. A well-equipped, properly funded, and professionally managed school library serves as the first training ground where theoretical knowledge is translated into practical experience. It exposes future professionals to core library operations such as cataloguing, classification, information organization, user services, digital resource management, and information literacy instruction. For library and information professionals to be effectively prepared, school libraries must evolve beyond traditional book repositories into dynamic learning resource centers that integrate digital technologies, research support services, and information literacy programs. Strengthening partnerships between library schools and primary/secondary institutions, investing in ICT infrastructure, and ensuring the employment of qualified librarians are critical steps toward improving training quality. These deficiencies weaken the practical training environment and hinder the development of essential professional competencies required in modern information environments.

In conclusion, the effectiveness of library and information professionals is closely tied to the condition of the school libraries that shape their early training experiences. Sustainable investment, policy support, and curriculum alignment are necessary to transform school libraries into vibrant hubs that nurture skilled, innovative, and adaptable information professionals capable of meeting contemporary information needs.

Recommendations

1. Governments and educational authorities should allocate adequate funding specifically for the development of school libraries.
2. Schools should employ professionally trained librarians rather than assigning library duties to unqualified staff.
3. School libraries should be equipped with computers, reliable internet access, library management software, and access to electronic databases.
4. Library and Information Science (LIS) departments should establish partnerships with primary and secondary school libraries to provide structured internship and practicum opportunities.

ABSTRACT

This study investigated strategic retooling initiatives and its perceived impact on service efficacy in public university libraries in Akwa Ibom State, Nigeria. Specifically, the study examined the predominant forms of strategic retooling initiatives undertaken by public university libraries, users' perception of strategic retooling initiatives on service efficacy, and the impact of strategic retooling initiatives on service efficacy in public university libraries in Akwa Ibom State. A quantitative research method and descriptive survey design were adopted for the study. The population comprised 13,483 registered library users from the University of Uyo and Akwa Ibom State University libraries. A sample size of 388 respondents was selected using the Taro Yamane formula. Data was collected using a researcher-developed instrument titled Strategic Retooling and Perceived Service Efficacy Questionnaire (SRPSEQ). Mean and standard deviation were used to answer Research Questions One and Two, while simple linear regression analysis was used to answer Research Question Three and test the hypothesis at the 0.05 level of significance. The findings revealed that the predominant strategic retooling initiatives undertaken by public university libraries include library automation, digital library development, subscription to electronic databases, staff training and development, information literacy programmes, and improvements in ICT infrastructure. The study further revealed that strategic retooling initiatives positively influenced service efficacy through improved access to information resources, enhanced service delivery, operational efficiency, and increased user satisfaction. The result also showed a significant relationship between strategic retooling initiatives and service efficacy in public university libraries in Akwa Ibom State. The study concluded that strategic retooling initiatives are critical to the modernization and effectiveness of university library services. It was therefore recommended that adequate funding should be provided for technological infrastructure, continuous staff development programmes should be strengthened, and university libraries should expand digital and user-centred services to improve service efficacy.

Keywords: Strategic Retooling Initiative, Library User Perception, Impact of Strategic Retooling, Perceived Service Efficacy

INTRODUCTION

University libraries occupy a central position in higher education institutions because they provide the information resources and services required to support teaching, learning, research, and community engagement. As knowledge centres of universities, they acquire, organize, preserve, and disseminate information resources in both print and electronic formats to meet the academic and research needs of students, lecturers, and researchers. The effectiveness of university libraries is therefore closely associated with the quality of academic programmes, research productivity, and overall institutional performance. According to Okhovati et al. (2026), university libraries contribute significantly to academic excellence by providing access to relevant information resources and research support services. Similarly, Koloniari et al. (2018) and Ugwu and Ekere (2018) described university libraries as the intellectual heart of universities because they provide the knowledge infrastructure required for teaching, learning, innovation, and research. However, the rapid advancement of information and communication technologies (ICTs), changing user expectations, and the increasing demand for digital information services have transformed the operating environment of university libraries. Consequently, libraries are increasingly compelled to adopt innovative strategies that enable them to remain relevant, responsive, and effective in the delivery of information services.

One of the major approaches adopted by university libraries to address these challenges is strategic retooling. Strategic retooling refers to the deliberate efforts undertaken by libraries to upgrade their technologies, infrastructure, staff competencies, resources, and service delivery systems in response to changes within the information environment. It encompasses a variety of initiatives aimed at improving operational efficiency, enhancing access to information resources, and strengthening the capacity of libraries to meet the evolving needs of users. According to Odularu (2025), libraries must continuously upgrade their technological capabilities and staff competencies in order to remain effective in a rapidly changing information environment. Similarly, Oyedokun (2025) noted that strategic retooling enables libraries to respond proactively to emerging information needs while improving service quality and operational effectiveness. Such initiatives may include library automation, digitization of collections, development of institutional repositories, subscriptions to electronic databases, improvement of ICT infrastructure, and continuous staff training and professional development. Moonasar (2024) observed that continuous retooling is essential for academic libraries because it enhances their ability to adapt to technological changes and meet contemporary information demands.

A major focus of strategic retooling in university libraries is the adoption of initiatives that modernize library operations and improve service delivery. According to Okonoko et al. (2022), university libraries increasingly implement strategic retooling initiatives such as automation of library operations, provision of electronic information resources, establishment of institutional repositories, development of digital libraries, and staff capacity-building programmes. Similarly, Bello and Adepegba (2023) reported that improvements in ICT infrastructure, internet connectivity, and digital information systems have become critical strategies for enhancing library effectiveness and resource accessibility. Identifying the predominant strategic retooling initiatives adopted by university libraries is important because it provides insight into the specific modernization strategies being implemented to improve library performance. Tsenga (2023) argued that understanding the dominant forms of strategic retooling helps stakeholders evaluate the direction of library transformation efforts, identify best practices, and formulate evidence-based policies for improving service delivery. Therefore, investigating the predominant strategic retooling initiatives adopted by university libraries is essential for understanding how libraries are responding to technological developments and changing user expectations.

Beyond identifying the initiatives adopted, it is equally important to examine the perceptions of library users regarding strategic retooling initiatives. Library users constitute the primary beneficiaries of library services, and their perceptions provide a valuable basis for evaluating the effectiveness of modernization efforts. Users often assess retooling initiatives based on their experiences with access to electronic resources, availability of digital services, speed of information retrieval, quality of research support services, and overall satisfaction with library operations. According to Adeyemi et al. (2025), user perceptions serve as important indicators of the success of library innovations because they reflect the extent to which services meet the expectations and information needs of users. Positive perceptions may indicate that strategic retooling initiatives are enhancing service delivery, while negative perceptions may reveal implementation challenges or service gaps. Understanding users' perceptions is therefore necessary because it enables library administrators to evaluate the effectiveness of modernization efforts and identify areas requiring improvement. Furthermore, user feedback provides empirical evidence regarding the extent to which strategic retooling initiatives contribute to improved library experiences and user satisfaction.

Aside the perceptions of library users is the impact of strategic retooling initiatives on service efficacy. Service efficacy refers to the extent to which library services effectively satisfy users' information needs and support academic activities such as teaching, learning, and research. It encompasses dimensions such as accessibility, reliability, responsiveness, service quality, and user satisfaction. According to Ajith et al. (2025), service efficacy reflects the ability of library services to provide timely, relevant, and accessible information that supports academic productivity. Similarly, Kautonen and Nieminen (2018) noted that service efficacy can be assessed through indicators such as service quality, user satisfaction, responsiveness, and value delivery. Strategic retooling initiatives are expected to improve service efficacy by enhancing access to information resources, reducing service delays, strengthening staff competence, and improving the overall quality of library services. For example, automation systems can improve the efficiency of circulation, cataloguing, and information retrieval processes, while electronic databases and digital repositories expand access to scholarly resources beyond the physical boundaries of the library. According to Ikwuanusi et al. (2024), automated library systems enhance operational efficiency and accuracy in service delivery. Likewise, Verma and Dwivedi (2023) observed that digital repositories and electronic databases significantly improve access to scholarly information and research productivity. Furthermore, Okwu and Oladokun (2024) emphasized that staff training programmes improve librarians' digital competencies and their ability to provide effective user support in technology-driven environments.

The relationship between strategic retooling initiatives and service efficacy has become increasingly important because university libraries continue to invest substantial resources in modernization programmes with the expectation of improving service performance. Evaluating the impact of strategic retooling initiatives on service efficacy therefore provides evidence regarding whether such investments are translating into measurable improvements in service quality, information accessibility, and user satisfaction. It also enables library managers and university administrators to make informed decisions regarding resource allocation, policy formulation, and future retooling interventions.

Despite the growing emphasis on strategic retooling, many public university libraries in Nigeria continue to face challenges such as inadequate funding, poor technological infrastructure, unstable internet connectivity, and insufficient opportunities for staff development. These challenges may limit the successful implementation of retooling initiatives and reduce their effectiveness in improving service delivery. Consequently, there is a need to investigate the predominant strategic retooling initiatives adopted by university libraries, examine library users' perceptions of these initiatives, and assess their impact on service efficacy. Such an investigation will provide empirical evidence on the effectiveness of modernization efforts and contribute to the development of strategies for enhancing library service delivery and improving the overall performance of university libraries.

Statement of the Problem

University libraries play a crucial role in supporting teaching, learning, and research activities in higher education institutions by providing access to relevant information resources and services. In recent years, the rapid advancement of information and communication technologies (ICTs), the growth of digital information resources, and the changing information needs of users have significantly transformed the nature of library services. As a result, university libraries are expected to continuously update their operations, services, and professional competencies to remain relevant and effective in supporting academic activities. One of the approaches adopted by libraries to achieve this is strategic retooling which involves the upgrading of staff skills, modernization of technological infrastructure, and the adoption of innovative service delivery models.

Despite the increasing recognition of the importance of strategic retooling in enhancing library services, many public university libraries in Nigeria still struggle with issues such as inadequate technological infrastructure, insufficient professional development opportunities for library staff, and limited adoption of innovative service delivery strategies. These challenges may affect the efficiency of library services and limit the ability of libraries to effectively meet the information needs of students, researchers, and academic staff. Scholars have noted that the effectiveness of academic libraries depends largely on their ability to adapt to technological changes and improve service delivery through continuous staff development and innovation.

Furthermore, while several university libraries have attempted to implement different forms of strategic retooling initiatives such as library automation, digital resource provision, and staff capacity building, there is limited empirical evidence on the extent to which these initiatives influence the efficacy of library services. In addition, the perception of library users regarding the impact of these retooling initiatives on service delivery has not been sufficiently explored, particularly in the context of public university libraries in Akwa Ibom State, Nigeria. Understanding users' perceptions is important because the ultimate measure of effective library service lies in the level of satisfaction and usefulness experienced by the users of the library.

Therefore, the problem of this study lies in the limited understanding of how strategic retooling initiatives influence service efficacy in public university libraries and how these initiatives are perceived by library users. Without such knowledge, it may be difficult for library administrators and university management to design effective strategies that will improve library services and meet the evolving information needs of users. This study therefore seeks to investigate strategic retooling and its perceived impact on service efficacy in public university libraries in Akwa Ibom State, Nigeria

Research Objectives

The main objective of this study was to examine strategic retooling and its perceived impact on service efficacy in public university libraries in Akwa Ibom State, Nigeria. The specific objectives were to:

i. Identify the predominant forms of strategic retooling initiatives undertaken by public university libraries in Akwa Ibom State.
ii. Determine the perceptions of library users regarding strategic retooling initiatives in public university libraries in Akwa Ibom State.
iii. Examine the impact of strategic retooling initiatives on service efficacy in public university libraries in Akwa Ibom State.

Research Questions

The study was guided by the following research questions:

i. What are the predominant forms of strategic retooling initiatives undertaken by public university libraries in Akwa Ibom State?
ii. What is the perceptions of library users regarding strategic retooling initiatives in public university libraries in Akwa Ibom State?
iii. What is the impact of strategic retooling initiatives on service efficacy in public university libraries in Akwa Ibom State?

Research Hypotheses

The study was guided by the following hypothesis:

i. There is no significant impact of strategic retooling initiatives on service efficacy in public university libraries in Akwa Ibom State

REVIEW OF RELATED LITERATURE

Strategic Retooling and Service Efficacy in University Libraries

Strategic retooling has become an indispensable strategy for university libraries seeking to remain relevant in an increasingly digital and knowledge-driven environment. According to Moonasar and Ngoepe (2023), the rapid transformation of information technologies and user expectations has compelled academic libraries to continuously redesign their services and operational systems. In the same vein, Oyedokun (2025) describes strategic retooling as the deliberate alignment of library services, staff competencies, and technological infrastructure with institutional objectives and emerging user needs. Earlier, Omosekejimi et al. (2019) defined strategic retooling as the systematic upgrading of librarians' professional skills alongside the adoption of modern information technologies, while Aslam et al. (2025) viewed it as an organizational renewal process that emphasizes innovation, capacity building, and technological integration. These perspectives collectively suggest that strategic retooling is a continuous process through which university libraries strengthen their ability to support teaching, learning, and research in a rapidly changing information landscape.

Closely associated with strategic retooling is the concept of service efficacy. Trivedi et al. (2021) explain that service efficacy refers to the extent to which library services effectively meet users' information needs through quality, accessibility, timeliness, and user satisfaction. Similarly, Khaemba and Mareri (2025) describe service efficacy as the ability of library services to deliver value by providing relevant information resources and support services that enhance academic productivity. According to Kinya and Muthee (2022), service efficacy encompasses not only the actual performance of library systems but also users' perceptions of their usefulness and effectiveness. Consequently, the ability of university libraries to achieve high service efficacy depends largely on the extent to which strategic retooling initiatives improve service quality and responsiveness. As noted by Kuyela (2025), investments in technology, infrastructure, and staff development often translate into better service outcomes and improved user satisfaction.

Predominant Forms of Strategic Retooling Initiatives

Several strategic retooling initiatives have been adopted by public university libraries in Nigeria to improve service delivery and adapt to emerging information needs. One of the most widely implemented initiatives is library automation. According to Devi (2022), automation involves the use of integrated library management systems to computerize routine library operations such as cataloguing, circulation, acquisitions, and serials management. Bagewadi et al. (2025) observed that automation has significantly enhanced operational efficiency by facilitating faster processing and retrieval of information resources. Supporting this position, Ikwuanusi et al. (2024) and Okojie and Olujobi (2025) reported that automated systems improve information access and reduce delays associated with manual library operations.

Another major strategic retooling initiative is the establishment of digital libraries and institutional repositories. Abubakar et al. (2021) noted that many university libraries have developed digital platforms for preserving and disseminating theses, dissertations, research articles, and other scholarly outputs. According to Olubiyo and Olubiyo (2023), institutional repositories increase the visibility and accessibility of research produced within universities while supporting global knowledge sharing. Similarly, Odaro-Ekhaguebor et al. (2023) emphasized that digital repositories have strengthened scholarly communication and improved access to institutional research outputs.

The subscription to electronic databases and online information resources also represents a significant aspect of strategic retooling. Ternenge and Kashimana (2019) observed that access to electronic journals and databases has expanded the range of scholarly materials available to students and researchers. Likewise, Okunola (2021) reported that databases such as JSTOR, EBSCOhost, ScienceDirect, and Research4Life have substantially improved access to current academic literature, thereby enhancing teaching, learning, and research activities within universities.

Staff training and professional development constitute another important component of strategic retooling. According to Abdullahi et al. (2024), the adoption of digital technologies in libraries requires librarians to acquire competencies in electronic resource management, information literacy instruction, and digital service delivery. In support of this view, Corrall and Jolly (2019) argued that continuous professional development is essential for enabling librarians to adapt to technological changes and provide innovative services that address contemporary user needs.

Furthermore, university libraries have increasingly invested in information literacy and user education programmes. Senthur and Ganesan (2022) explained that these programmes equip users with the skills needed to locate, evaluate, and effectively utilize information resources. Similarly, Twum et al. (2021) found that information literacy initiatives improve users' ability to maximize available resources and enhance their overall academic performance. Complementing these efforts are improvements in ICT infrastructure, including internet connectivity, computer facilities, and remote access systems. According to Onunka et al. (2023), modern ICT infrastructure enables users to access information resources conveniently regardless of location, while Emmanchika et al. (2026) emphasized that robust technological infrastructure is fundamental to the successful delivery of digital library services.

Users' Perception on Impact of Strategic Retooling Initiatives

The perceptions of library users regarding strategic retooling initiatives largely depend on the extent to which such initiatives improve access to information resources and enhance service quality. Mutula (2020) observed that users generally perceive digital library services positively when technological systems function efficiently and provide seamless access to information. Similarly, Esse and Haliso (2024) found that the availability of electronic resources and online services contributes significantly to positive user experiences. According to Oden et al. (2025), users often

associate strategic retooling initiatives with faster information retrieval, improved accessibility, and greater convenience in accessing library resources.

Digital literacy has also been identified as an important factor influencing user perceptions. Hamad et al. (2024) reported that users with higher levels of digital competence tend to derive greater benefits from digital library services and consequently perceive them more positively. Likewise, Akinyemi and Mary (2025) noted that inadequate digital skills may hinder effective utilization of electronic resources and reduce users' appreciation of retooled library services.

The effectiveness of automated systems further shapes users' perceptions. According to Lemounes (2024), well-designed and user-friendly systems improve users' experiences and satisfaction levels. In contrast, Igbudu and Ver (2020) found that poorly maintained systems often result in frustration and negative perceptions of service quality. Beyond technology, users continue to value human support services. Gómez-Cruz (2019) emphasized that responsive reference services and professional assistance remain critical determinants of user satisfaction, while Singha and Das (2021) highlighted the importance of librarian-user interactions in enhancing perceptions of service effectiveness. Nevertheless, infrastructural challenges such as inadequate funding, poor internet connectivity, and unstable electricity supply continue to limit the effectiveness of strategic retooling initiatives and negatively influence user perceptions, as reported by Ogunbote and Abimbola (2025).

Impact of Strategic Retooling Initiatives on Service Efficacy

Strategic retooling initiatives have significantly enhanced service efficacy in university libraries by improving the accessibility, quality, and efficiency of information services. According to Oyedokun (2025), technological innovations have transformed library operations and expanded opportunities for delivering user-centred services. Similarly, Meesad and Mingkhwan (2024) observed that digital transformation initiatives have improved the speed and effectiveness of information delivery in academic libraries.

The adoption of automation systems has improved cataloguing, circulation, and information retrieval services. Amannah and Ojekudo (2021) reported that automated operations reduce processing time and improve service quality, while Bagewadi et al. (2025) emphasized that automation enhances operational efficiency and information accessibility. In the same manner, digital repositories and electronic databases have expanded access to scholarly resources and improved research productivity among library users. According to Baryshev et al. (2020), these developments have increased user satisfaction and strengthened support for teaching, learning, and research activities.

Staff training and capacity-building initiatives have also contributed significantly to service efficacy. Omosekejimi et al. (2019) observed that professionally competent librarians are better positioned to support users in technology-driven environments, while Akintola (2021) argued that continuous training enhances librarians' ability to provide innovative and effective services. Furthermore, Tizhe (2025) noted that strategic retooling facilitates collaboration, resource sharing, and user engagement through digital platforms and virtual services.

Despite these benefits, the impact of strategic retooling is often constrained by inadequate funding, infrastructural deficiencies, and limited technological expertise. Haruna (2025) identified funding limitations as a major barrier to the successful implementation of digital initiatives in academic libraries. Likewise, Ogunbote and Abimbola (2025) observed that poor infrastructure continues to impede effective service delivery in many university libraries. Consequently, Esse and Haliso (2024), Bello and Adepegba (2023), and Masenya (2021) advocated increased investment in ICT infrastructure, staff development, and policy support as essential measures for maximizing the contribution of strategic retooling initiatives to service efficacy.

Research Methodology

A quantitative research method and descriptive survey design were adopted for the study. The population of the study comprised 13,483 registered library users in public university libraries in Akwa Ibom State, specifically the University of Uyo and Akwa Ibom State University. From this population, a sample size of 388 respondents was selected using the Taro Yamane formula. Data for the study were collected using a researcher-developed instrument titled Strategic Retooling and Perceived Service Efficacy Questionnaire (SRPSEQ). The instrument consisted of three sections: Sections A, B, and C. Section A elicited respondents' demographic information, Section B contained 21 items designed to obtain information on strategic retooling initiatives, while Section C comprised 14 items focused on perceived service efficacy.

The questionnaire items in Sections B and C were structured on a four-point rating scale of Always (4 points), Often (3 points), Sometimes (2 points), and Never (1 point). Mean and standard deviation scores were used to answer Research Questions One and Two, while the R-value of simple linear regression was used to answer Research Question Three. The F-ratio of simple linear regression was used to test the hypothesis at the 0.05 level of significance. For Research Questions One and Two, a criterion mean of 2.50 was adopted. Any item with a mean score of 2.50 and above was accepted (Agreed), while items with mean scores below 2.50 were rejected (Disagreed). The standard deviation was used to determine the degree of dispersion or closeness of respondents' opinions. For Research Question Three, the R-value was interpreted using a correlation strength classification in which 0.10–0.39 indicates a low relationship, 0.40–0.59 indicates a moderate relationship, 0.60–0.79 indicates a high relationship, while 0.80–0.99 indicates a very high

relationship. In testing the hypothesis, the null hypothesis was rejected whenever the p-value was less than the 0.05 level of significance, whereas the null hypothesis was accepted whenever the p-value was greater than 0.05.

DATA ANALYSIS AND PRESENTATION OF RESULTS

Research Question One

What are the predominant forms of strategic retooling initiatives undertaken by public university libraries in AkwaIbom State?

Table 1: Mean and standard deviation of the predominant forms of strategic retooling initiatives undertaken by public university libraries in Akwa Ibom State **(N=383)**

S/N	Forms of Strategic Retooling Initiatives	Mean	SD	Decision
1.	The use of automated library systems helps me find books and materials more quickly	3.72	0.55	**Agreed**
2.	Access to the university's digital library and intuitional repository has improved my academic work.	3.32	0.72	**Agreed**
3.	Electronic databases provided by the library are useful for my assignments and research	3.62	0.72	**Agreed**
4.	Library training or information literacy programmes have improved my ability to search and use information effectively.	3.32	0.84	**Agreed**
5.	Library staff provide adequate assistance when I need help with accessing information resources.	3.58	0.50	**Agreed**
6.	The availability of internet access, computers and Wi-Fi in the library makes it easier for me to use library services	3.24	0.68	**Agreed**
7.	The recent improvements in library services have made it easier for me to study and complete academic tasks.	3.37	0.73	**Agreed**
	Cluster Mean	**3.45**	**0.68**	Agreed

The result in Table 1 showed the predominant forms of strategic retooling initiatives undertaken by public university libraries in Akwa Ibom State. The findings revealed that the mean scores of items 1, 2, 3, 4, 5, 6, and 7 were above the criterion mean of 2.50, indicating that the respondents agreed with all the statements. The standard deviation values, which ranged from 0.50 to 0.84, indicate that the respondents' opinions were relatively consistent with little variation. Furthermore, the cluster mean of 3.45, which is above the criterion mean of 2.50, implies that the predominant forms of strategic retooling initiatives undertaken by public university libraries in Akwa Ibom State include the use of automated library systems, digital libraries and institutional repositories, electronic databases, information literacy programmes, staff support services, and ICT facilities aimed at improving library services and supporting academic activities.

Research Question Two

What are the perceptions of library users regarding strategic retooling initiatives in public university libraries in AkwaIbom State?

Table 2: Mean and standard deviation of the perceptions of library users regarding strategic retooling initiatives in public university libraries in AkwaIbom State **(N=383)**

S/N	Forms of Strategic Retooling Initiatives	Mean	SD	Decision
1.	The use of digital library systems makes it easier for me to access information resources efficiently	3.62	0.57	**Agreed**
2.	My level of digital skills affects how well I can use the library's electronic resources.	3.47	0.59	**Agreed**
3.	Automated library systems are reliable and make information retrieval faster for me.	3.27	0.71	**Agreed**
4.	Difficulty in using digital tools reduce my satisfaction with library services.	3.24	0.61	**Agreed**
5.	Library staff provide helpful guidance when I need assistance with finding information	3.27	0.77	**Agreed**
6.	Both physical and online reference services provided by the library meet my academic needs	3.18	0.80	**Agreed**
7.	Poor internet connection, power supply or lack of computers affects my perception of the library's effectiveness.	3.34	0.57	**Agreed**
	Cluster Mean	**3.34**	**0.66**	Agreed

The result in Table 2 showed the perceptions of library users regarding strategic retooling initiatives in public university libraries in Akwa Ibom State. The findings revealed that the mean scores of items 1, 2, 3, 4, 5, 6, and 7 were above the criterion mean of 2.50, indicating that the respondents agreed with all the statements. This implies that the library users had positive perceptions of the strategic retooling initiatives such as digital library systems, automated services, staff assistance, online reference services, and ICT facilities introduced to improve library services and academic activities. The findings also indicate that challenges such as poor internet connection, unstable power supply, and inadequate computer facilities affect users' perception of library effectiveness.

The standard deviation values, which ranged from 0.57 to 0.80, indicate that the respondents' opinions were relatively consistent. Furthermore, the cluster mean of 3.34, which is above the criterion mean of 2.50, implies that the perception of library users regarding strategic retooling initiatives in public university libraries in Akwa Ibom State is positive.

Research Question Three

What is the impact of strategic retooling initiatives on service efficacy in public university libraries in Akwa Ibom State?

Table 3: Result of Simple Linear Regression of the impact of strategic retooling initiatives on service efficacy in public university libraries in Akwa Ibom State (N=383)

Variables	R	R^2	Adjusted R^2
Strategic retooling initiatives	0.722	0.521	0.520
Service efficacy			

The result in Table 3 show a correlation coefficient (R-value) of 0.722, indicating a high positive relationship between strategic retooling initiatives and service efficacy in public university libraries in Akwa Ibom State. The coefficient of determination (R^2 – value) of 0.521 also shown in Table 3 indicates that 52.1 percent of the variance in service efficacy in public university libraries in Akwa Ibom State is explained or predicted by strategic retooling initiatives. This means that there is impact of strategic retooling initiatives on service efficacy in public university libraries in Akwa Ibom State.

Hypothesis One

There is no significant impact of strategic retooling initiatives on service efficacy in public university libraries in AkwaIbom State

Table 4 : Result of Simple Linear Regression of the impact of strategic retooling initiatives on service efficacy in public university libraries in AkwaIbom State (N=383)

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	1516.14	1	1516.14	77.99	.00[b]
	Residual	7407.16	381	19.44		
	Total	8923.30	382			

The result in Table 4 shows the F-ratio of 77.99 with the corresponding probability level of significance of .00 alpha at 1 and 381 degrees of freedom. This level of significance is less than .05 in which the decision is based. With this result, the null hypothesis was rejected. The result implies that there is significant impact of strategic retooling initiatives on service efficacy in public university libraries in Akwa Ibom State.

.

Discussion of Findings

The findings of the study are here under discussed in line with the constructs used in the study.

Predominant Forms of Strategic Retooling Initiatives Undertaken by Public University Libraries

The findings of the study revealed that public university libraries in Akwa Ibom State have adopted several strategic retooling initiatives aimed at improving library operations and enhancing service delivery. The result showed that library automation, subscription to electronic databases, staff training and development, provision of internet facilities, digital library services, and information literacy programmes were among the predominant retooling initiatives undertaken by the libraries. This finding confirms the position of Onunka et al. (2023), who asserted that academic libraries must continuously upgrade their technological systems, information resources, and staff competencies to remain relevant in the digital information environment. The finding also supports that of Ajiboye et al. (2025), which observed that the establishment of digital repositories and electronic information systems has become a major retooling strategy in Nigerian university libraries.

Furthermore, the finding suggests that public university libraries are increasingly embracing digital transformation as a response to the changing information needs of users. The adoption of integrated library systems and electronic information resources indicates a shift from traditional library practices to more technology-driven service models. This finding is in agreement with Odularu (2025), who emphasized that strategic retooling in libraries involves the integration of technology, innovation, and staff development to improve operational effectiveness and service quality. Therefore,

the study demonstrates that strategic retooling initiatives have become central to the modernization and sustainability of university library services.

Impact of Strategic Retooling Initiatives on Service Efficacy in Public University Libraries

The findings of the study indicated that strategic retooling initiatives positively influenced service efficacy in public university libraries in Akwa Ibom State. Respondents agreed that automation, electronic databases, digital services, and staff development programmes improved access to information resources, increased the speed of service delivery, enhanced user satisfaction, and promoted efficient library operations. The finding aligns with the views of Devi and Bhatt (2024), who explained that service efficacy in libraries is measured through accessibility, responsiveness, service quality, and user satisfaction. The finding also corroborates the work of Paul et al. (2024), which revealed that libraries that invest in technological innovations and digital information resources provide more effective and user-oriented services.

The positive impact recorded in the study may be attributed to the ability of retooling initiatives to improve information accessibility and simplify library operations. Automation systems and online resources enable users to retrieve information more quickly and conveniently, thereby improving their perception of library services. Staff training programmes also contribute to improved service delivery because librarians become more competent in handling digital tools and supporting users effectively. However, despite these positive outcomes, the study also suggests that infrastructural challenges such as poor internet connectivity and inadequate funding may still limit the full realization of service efficacy in some public university libraries.

Relationship Between Strategic Retooling Initiatives and Service Efficacy in Public University Libraries

The findings of the study revealed that there is a significant relationship between strategic retooling initiatives and service efficacy in public university libraries in Akwa Ibom State. The result of the simple linear regression analysis showed that improvements in strategic retooling initiatives were associated with corresponding improvements in service efficacy. This finding implies that the modernization of library technologies, staff competencies, and information systems contributes significantly to the quality and effectiveness of library services. The finding supports the assertion of Kautonen and Nieminen (2018). that libraries that invest in technological innovation and human capacity development are better positioned to provide efficient and user-centred services. Similarly, Hamdani (2026) maintained that service efficacy is strongly influenced by the performance and effectiveness of library systems and services.

The finding further indicates that strategic retooling serves as a critical driver for improving service performance in university libraries. Libraries that adopt comprehensive retooling strategies such as automation, digital resource development, staff training, and improved ICT infrastructure are more likely to satisfy the information needs of users effectively. This finding also agrees with the study of Adeyemi et al. (2025), which found that technological innovation and strategic development initiatives significantly improve service delivery in academic libraries. Therefore, the study establishes that strategic retooling initiatives and service efficacy are closely interconnected, and continuous investment in retooling efforts is essential for sustaining efficient and responsive library services in Nigerian public universities.

Conclusion

The study concluded that strategic retooling initiatives play a significant role in enhancing service efficacy in public university libraries in Akwa Ibom State. The findings revealed that predominant retooling initiatives such as library automation, digital library development, subscription to electronic databases, staff training programmes, information literacy initiatives, and improved ICT infrastructure have contributed positively to the modernization of library services and improved access to information resources. These initiatives have enhanced operational efficiency, increased user satisfaction, and strengthened the ability of university libraries to support teaching, learning, and research activities effectively.

The study further established that there is a significant relationship between strategic retooling initiatives and service efficacy in public university libraries. Libraries that invested more in technological innovation, staff capacity building, and digital transformation were found to provide more efficient, accessible, and user-centred services. However, challenges such as inadequate funding, infrastructural deficits, and limited technological advancement may hinder the full realization of the benefits of strategic retooling. Therefore, continuous investment in modern technologies, staff development, and infrastructural improvement remains essential for sustaining effective library service delivery in Nigerian public universities.

Recommendations

Consequent upon the findings from this study, the following recommendations were proferred:

1. Public university management and government agencies should provide adequate and sustained funding for library automation, digital resource acquisition, internet facilities, and other technological infrastructures necessary for effective library service delivery.

2. University libraries should organize regular staff training, workshops, and professional development programmes to equip librarians with advanced digital competencies and emerging technological skills required for modern library operations.
3. Public university libraries should strengthen their strategic retooling efforts by expanding access to electronic resources, improving ICT infrastructure, and implementing user-centred digital services that enhance information accessibility and overall service efficacy.

Abstract

As libraries increasingly rely on digital collections, ensuring their long-term preservation and accessibility is crucial. This study investigates current trends and best practices in digital preservation, focusing on sustainable digital repositories that enable libraries to manage digital collections effectively. By examining challenges and opportunities in implementing sustainable digital preservation strategies, this research aims to inform the development of effective digital preservation frameworks that support long-term accessibility of digital information. The study sought to achieve the following research objectives: to investigate current trends and best practices in digital preservation in libraries; to examine challenges and opportunities in implementing sustainable digital preservation strategies; and to identify opportunities for libraries to leverage sustainable digital repositories in supporting long-term accessibility of digital information. A quantitative research method was used to study current trends and best practices of sustainable digital repositories in libraries. The targeted population was 183 registered and certified librarians in Nigeria, and one hundred and forty-two (142) responded to the questionnaire. The results showed that 90% of respondents perceived sustainable digital repositories as important in ensuring long-term accessibility of digital information, while 88.03% of the respondents thought that the lack of funding challenges effective digital preservation. The study concluded that by investing in digital preservation infrastructure, developing digital preservation policies, and providing training and support for library professionals, libraries can ensure the long-term preservation and accessibility of digital information. It was recommended that libraries should develop guiding policies, allocate resources, and train staff for sustainable digital preservation of their resources.

Keywords: Digital Preservation, Sustainable Digital Repositories, Library Collections, Digital Curation, Long-term Accessibility.

Introduction

Libraries have been vital institutions in acquiring, organizing, preserving, and disseminating knowledge since long ago. The role of academic libraries has, however, been greatly enhanced with the rapid development of digital technologies and the proliferation of digital information that is created in various forms including electronic journals, institutional repositories, e-books, and research data sets in the contemporary information age (Zareef & Jabeen, 2025). The shift has brought digital preservation practices and sustainable digital repositories to the forefront in today's library environment, especially in the context of long-term access to scholarly information. Digital preservation deals with the collection of processes, policies and technologies for the ongoing maintenance and continued access to digital content into the future, regardless of changes in technology, obsolescence or degradation of the data. In the academic library, digital preservation is realized in the form of institutional repositories and digital archiving systems, as structured platforms for the storage, management and dissemination of digital scholarly products. These systems are the primary independent variables of this study and therefore, reflect the strategies and practices of librarians in order to ensure the sustainability of digital information resources. A number of contextual factors affect the effectiveness of these digital preservation approaches: current trends in digital preservation, best practices used by librarians, challenges and opportunities in the institutional environment. The use of new technologies like cloud computing, artificial intelligence and digital curation systems in libraries to improve preservation practices and to ensure repository sustainability is growing increasingly common in both the global context and beyond (Zareef & Jabeen, 2025; Ailakhu, 2024). These trends are indicators of changing professional practice that impact on the management and maintaining of digital repositories over time.

The building of sustainable digital repositories is underway in Africa but it is not uniform. Research shows that, despite the growth of institutional repositories, there are still challenges to effective implementation including poor infrastructure, lack of technical skills and poor policy frameworks (Luthuli, 2023). Likewise, Shonhe (2025) underscores the increasing role of artificial intelligence in archives and records management, particularly in the context of digital preservation, where AI can help enhance efficiency; however, there is a need for adequate capacity development and governance arrangements. The reality is that empirical evidence shows that there are ongoing problems in sustainable implementation of digital preservation systems in academic libraries in Nigeria. According to Yusuf and Salisu (2022) and Olatokun and Ayanbode (2019), several factors such as lack of adequate funding, ICT infrastructure, and trained personnel have significant impact on the preservation practices. Ezeani and Igwesi (2021) also point out that although the awareness of digital preservation has increased, there remains a lack of uniformity and standardization of digital preservation strategies in many libraries. These challenges are important moderating factors that affect the successful

implementation of a digital repository system. In this context, the role of librarianship in tertiary institutions in Katsina State is crucial in managing digital repositories and for the sustainability of digital information resources. Their actions affect the preservation of digital materials and the accessibility of digital materials over time. Thus, the dependent variable of this study is long-term accessibility of digital information resources, representing the degree of trustworthiness regarding whether or not the digital information resources are available for users to access consistently in academic libraries. Thus, the general objectives of this study is to examine the trends and best practice in the use of sustainable digital repositories in libraries with of registered librarians in tertiary institutions in Katsina State, Nigeria.

Statement of the Problem

Libraries, particularly in tertiary institutions, should have very efficient and sustainable digital repository systems that will facilitate continuous preservation, access and integrity of digital information resources in an ideal academic environment. Hence, sustainable practices of digital preservation would be seamlessly embedded in the working of the library, means that knowledge resources would be accessible and usable even if the technology changes or the system becomes obsolete (Zareef & Jabeen, 2025; Ailakhu, 2024).

But, in practice, in most academic libraries in Nigeria and Katsina State in particular this is not a reality. Previous research reveals that despite the importance of digital preservation in libraries, many of them continue to grapple with problems such as inadequate infrastructure, weak policy frameworks, lack of technical expertise, and insufficient funding (Yusuf & Salisu, 2022; Olatokun & Ayanbode, 2019; Ezeani & Igwesi, 2021). While some institutions have already established institutional repositories, there are concerns about their sustainability and effectiveness as they have been poorly maintained, not widely adopted to the new technologies and have not developed a consistent preservation strategy. The difference between what is ideal and what really is, calls for the existence of the problem, since information resources, if left unmanaged, risk being lost, inaccessible, or obsolete. Hence, this research work aims to study sustainable digital repositories in libraries through the identification of trends, practices, problems and opportunities and possible measures to strengthen the sustainable digital repositories to improve the accessibility of digital information resources in the long term among tertiary institutions librarians in Katsina state, Nigeria.

Research Objectives

The objectives can be outlined as follows:

1. To identify the current trends and best practices in digital preservation in libraries
2. To find out challenges and opportunities for the implementation of sustainable approaches to digital preservation in libraries.
3. To ascertain opportunities to use sustainable digital repositories to enhance the Accessibility of information in the digital environment in libraries on a long-term basis.

Literature Review

Since the increasing change from print-based to digital information resources in academic libraries, digital preservation has become a central concern in the academic libraries. The shift has transformed libraries into proactive agents for the preservation and management of digital knowledge, necessitating the use of sophisticated technological systems to ensure its long-term preservation and accessibility. Recent literature shows that digital preservation is now more focused on artificial intelligence (AI) and cloud computing technologies, as well as on advanced digital curation systems. According to Ailakhu (2024) and Shonhe (2025), digital preservation is becoming more and more reliant on intelligent automation, and emerging technologies that provide support for the intelligent automation and predictive preservation and improved metadata management. This indicates a transition from conventional methods of manual preservation to more data-driven, automated solutions that enhance efficiency and accessibility. Digital preservation, on the other hand, is also increasingly fueled by artificial intelligence and new technologies that further automate, improve metadata management and information retrieval processes (Ailakhu, 2024; Shonhe, 2025). These technologies are also reshaping preservation practice in recent studies (Ailakhu, 2024; Shonhe, 2025) which focus on the advantages for classification, decision-making and access to digital resources over the long term. Yet, a scrutiny of literature shows that there is a definite bias towards theory over implementation in practice. Most of the studies concentrate on the capacities of the emerging technologies without proper evidence of their actual use in academic library environment; especially in developing countries like Nigeria. In such settings, technical skills, financial resources and infrastructure remain as restraints to the successful deployment of sophisticated digital preservation tools and systems, resulting in a disconnect between technology and practice.

The preservation strategies that are required to be sustainable, must be incorporated into an institutional repository, Luthuli (2023) and Zareef and Jabeen (2025). It has been mentioned in the literature that the management of institutional repositories, policy development and professionalism of librarians are very important factors in the success of digital

preservation initiatives and are important to sustainable digital preservation initiatives. Institutional repositories (IRs) are important infrastructures for the storage, structuring and dissemination of scholarly works in the digital environment. To ensure sustainability in preservation strategies, these strategies have to be embedded in an institutional repository as stated by Luthuli (2023) and Zareef and Jabeen (2025). The studies include some examples of best practice, such as the standardized metadata schemas, interoperability frameworks, and continuous migration models and structured digital curation workflows. Where these practices have been adopted worldwide, they are typically undertaken in good institutional conditions; with good infrastructure and funding. One caveat of this literature is that it mostly does not account for resource poor environments.

In developing countries, many academic libraries have been unable to put these best practices into practice due to a variety of reasons including technological infrastructure, lack of trained staff and financial resources. It is important to note that, while the frameworks may be good in their abstract form, they must be contextualised and tailored to the local context in order that they do not need to be imported without alteration (Omosor & Otaru, 2026 and Luthuli, 2023). In the case of these practices, if accepted globally, they are mostly carried out in good institutional settings with excellent infrastructure and funding. A major difficulty with this literature is that it excludes resource-poor settings. In developing countries, many academic libraries have been unable to put these best practices into practice due to a variety of reasons including technological infrastructure, lack of trained staff and financial resources. This suggests that frameworks good in their abstraction must be customized to the local context so that they are not just imported without modification.

Yusuf and Salisu (2022) and Olatokun and Ayanbode (2019) stated that the issue of digital preservation in academic libraries in Nigeria is beset by very many operational constraints that restricts effective implementation of digital preservation strategies. Similarly, Ezeani and Igwesi (2021) noted that although there is growing awareness of digital preservation, it is not always being put into practice because of institutional and technical constraints. Supported opportunities, on the other hand, are also found in the literature. Moruf and Etoroabasi (2023) pointed out that the adoption of ICT, development of institutional repositories and the rising consciousness about digital sustainability offer avenues to make preservation practices better. Most of the studies, however, are more focused on the identification of challenges rather than the development of workable and easily replicable solutions in specific institutional settings like in Katsina State tertiary institutions.

The long-term availability of digital information resources highlights the need for sustainable digital repositories for continued access to scholarly content, as demonstrated in the literature. Omosor and Otaru (2026) and Luthuli (2023) posited that Digital Repositories can have a profound impact on access, visibility and preservation of academic output, thus improving institutional memory and scholarly communication. Notwithstanding these theoretical contributions, however, empirical evidence of how librarians in particular regional contexts actively use these repositories to increase the long-term access to them is still scarce. Other studies like Ezeani and Igwesi (2021) and Olatokun and Ayanbode (2019) also indicate that the low use and effectiveness of institutional repositories are often attributed to poor implementation practices. This results in the mismatch between what is expected and what is achieved in the real world of academic libraries. A review of the literature suggests a significant international focus on technologically based digital preservation systems, best practices and sustainability models based in repositories. An analysis of the critical reveals, however, a continuing gap between the advanced theoretical models and practice in developing regions. The majority of studies are descriptive and technology oriented, and have too little empirical support in actual institutional settings. This highlights empirical research on the adoption, adaptation and implementation of sustainable digital preservation strategies by the librarians of Katsina State tertiary institutions for the purpose of making digital information resources accessible in the long term.

Methodology

The study adopted a descriptive survey research design using a quantitative research method to investigate the present status and best practices of sustainable digital repositories in libraries. The population of the study was 142 librarians from the tertiary institutions in Katsina state. All the population was included in the study by adopting an all-encompassing technique of sampling, which is total enumeration sampling technique. A structured questionnaire was used for collecting the data, and the content validity of the questionnaire was tested by experts of Library and Information Science. High reliability of this instrument has been obtained, which is 0.98. A total of 142 questionnaires were issued to the respondents, and 105 questionnaires were returned, which were properly filled out and analysed. Descriptive statistics were used to analyze the data using mean and standard deviation to understand the perceptions of librarians about sustainable digital repositories, digital preservation practices and challenges in the long-term preservation of digital information in libraries.

Result and Discussion

Table 1. To identify the current trends and best practices in digital preservation in libraries (N=105):

Statements	**Mean**	**STD**
Libraries adopt current digital preservation trends	2.96	1.31
Libraries apply international best practices in digital preservation	2.48	1.15
Cloud-based systems are used for digital preservation in libraries	2.78	1.40

Libraries use automated tools for digital archiving	2.60	1.39
Libraries follow standard metadata practices for preservation	2.26	1.32

(Source: Field Data, 2026, SD= Strongly disagree -1; **D**= Disagree -2; **UD**= Undecided -3; **A**= Agree -4; **SA**= Strongly agree –5)

Table 1 shows the respondents' opinions on what they see as the current trends and best practices in digital preservation within libraries. The results show that libraries tend to follow the current digital preservation trends with a mean score of 2.96 (SD = 1.31) being the highest one. The mean scores for use of cloud-based systems for digital preservation (2.78, SD = 1.40) were also relatively high, indicating moderate adoption in libraries. Likewise, the automated tools for digital archiving received a mean score of 2.60 (SD = 1.39) which reflects some libraries adopting technological solutions for preservation activities. The use of international best practices for digital preservation (Mean = 2.48, SD = 1.15) and standard practices for digital preservation metadata (Mean = 2.26, SD = 1.32) were rated lower, suggesting that these are important preservation practices that are not widely applied. The results indicated that libraries are actively working to follow emerging best practices and technologies for digital preservation but that efforts must be increased to more consistently meet international best practices and metadata standards for sustainable digital preservation.

Table 2. To find out challenges and opportunities for implementation of sustainable approaches to digital preservation in libraries.

Statements	**Mean**	**STD**
Challenges		
Libraries face inadequate funding for digital preservation	3.36	1.45
Lack of technical skills limits digital preservation	3.29	1.24
Poor infrastructure affects preservation activities	3.00	1.45
Obsolete technologies hinder digital preservation	2.98	1.32
Limited institutional support challenges implementation	3.10	1.27
Opportunities		
Digital preservation improves access to library resources	3.30	1.32
Collaboration enhances sustainable preservation practices	3.20	1.36
Emerging technologies support preservation development	3.69	1.39
Institutional policies encourage digital preservation growth	3.30	1.30
Capacity-building programs improve preservation practices	3.01	1.32

(Source: Field Data, 2026, SD= Strongly disagree -1; **D**= Disagree -2; **UD**= Undecided -3; **A**= Agree -4; **SA**= Strongly agree –5)

The results show that the most significant challenges encountered with the implementation of SDP in libraries are inadequate funding (Mean = 3.36, SD = 1.45), lack of technical skills (Mean = 3.29, SD = 1.24), limited institutional support (Mean = 3.10, SD = 1.27), poor infrastructure (Mean = 3.00, SD = 1.45), and obsolete technologies (Mean = 2.98, SD = 1.32). On the other hand, the emerging technologies were seen as the best opportunity (Mean = 3.69, SD = 1.39), followed by improved access to library resources and supportive institutional policies (Mean = 3.30, SD = 1.32; 3.30, SD = 1.30), collaboration (Mean = 3.20, SD = 1.36) and capacity-building programmes (Mean = 3.01, SD = 1.32). The data indicated that libraries are facing a lot of difficulties in regard to resources and capacity, but there is a lot of potential to improve the sustainable digital preservation practices.

Table 3. To ascertain opportunities to use sustainable digital repositories to enhance the Accessibility of information in digital environment in libraries on long term basis (N=105):

Statements	**Mean**	**STD**
Sustainable repositories ensure long-term information access	3.55	1.27
Digital repositories support preservation of scholarly outputs	3.27	1.38
Repositories improve accessibility of digital resources	3.44	1.32
Libraries use repositories for long-term content storage	3.69	1.39
Digital repositories enhance information retrieval efficiency	3.30	1.30

(Source: Field Data, 2026, SD= Strongly disagree -1; **D**= Disagree -2; **UD**= Undecided -3; **A**= Agree -4; **SA**= Strongly agree –5)

The results indicate that the biggest problems with sustainable digital preservation in libraries are inadequate funding (Mean = 3.36, SD = 1.45) and lacking in technical skills (Mean = 3.29, SD = 1.24). The results also show that there is a high level of awareness in the library community of the importance of sustainable digital repositories for long-term information access. Ensuring long-term access to information (Mean = 3.55, SD = 1.27) and improving the accessibility of digital resources (Mean = 3.44, SD = 1.32) were the second and third highest rated opportunities respectively, followed by use of repositories for long-term storage of content (Mean = 3.69, SD = 1.39).

Discussion of Findings

1. The results showed that the libraries incorporate the following trends in digital preservation moderately (Mean = 2.96, SD = 1.31) and use cloud based systems in digital preservation moderately (Mean = 2.78, SD = 1.40). The use of automated digital archiving tools was also moderately reported (Mean = 2.60, SD = 1.39), and

standard metadata practices was also low (Mean = 2.26, SD = 1.32), as was the application of international best practices (Mean = 2.48, SD = 1.15). The moderate presence of the current digital preservation trends, cloud-based systems and automated archiving tools while the low application of metadata standards and international best practices confirms the result obtained by Olatokun and Ayanbode (2019), and Ezeani and Igwesi (2021) which found that although academic libraries are now using digital preservation technologies, implementation of the recognized standards is reported to be low.

2. The results indicate that the challenges that hinder sustainable digital preservation in libraries are mainly lack of funding (Mean = 3.36, SD = 1.45) and technical skills (Mean = 3.29, SD = 1.24). Emerging technologies (Mean = 3.69, SD = 1.39) was also cited as the biggest opportunity for improving information preservation practices. Likewise, the inadequate funding of and technical skills to implement sustainable digital preservation initiatives in libraries was identified as a major challenge, which is in line with the findings of Moruf and Etoroabasi (2023) and Luthuli (2023). In addition, the recognition of emerging technologies as a key opportunity for sustainable digital preservation aligns with the conclusions drawn by Yusuf and Salisu (2022), Ailakhu (2024), and Shonhe (2025) who highlighted the potential of emerging technologies, such as AI and digital curation tools, to enhance the efficiency, sustainability, and accessibility of preserved digital resources.
3. The results show that the long-term storage of content (Mean = 3.69, SD = 1.39) and long-term access to information (Mean = 3.55, SD = 1.27) are most highly rated by the respondents, indicating that sustainable digital repositories can greatly improve the long-term access to information. The discovery that sustainable digital repositories further information accessibility and storage is also in line with the studies conducted by Luthuli 2023, Zareef and Jabeen 2025 and Omosor and Otaru 2026 which emphasized the significance of institutional repositories in ensuring long-term access to digital information, enhancing information retrieval, and preserving scholarly outputs. Thus, the current research builds on the existing work by proving that sustainable digital repositories are needed to support and maintain the accessibility of digital products in the face of continuing problems associated with funding, technical resources and policy implementation.

Conclusions

The study concludes that sustainable digital repositories are important for sustaining the preservation, storage and access to digital information in libraries. Mostly, digital preservation trends and tools such as cloud-based systems and automated archiving tools are adopted by libraries to a moderate level, while the adoption of standard metadata and international best practices are still not enough. The study also finds that insufficient funds, insufficient technical skills, limited institutional support are ongoing challenges for digital preservation, and emerging technologies offer great potential to improve preservation efforts. In order to ensure sustainable digital preservation and ongoing access to scholarly and digital resources in Libraries, more investments in preservation infrastructure, capacity building for staff, implementation of policies and use of new technologies are a must.

Recommendations

1. **Current Trends and Best Practices:** Libraries should increase support for international digital preservation standards and metadata practices by creating guidelines at the institutional level and by making them a routine part of all digital preservation repository systems.
2. **Challenges and Opportunities:** Library management and relevant stakeholders should make sufficient provision of funding and also continuous capacity building programmes for the librarians' technical skills shall be provided to make the library to work effectively on digital preservation and should make use of new technologies to enhance the preservation processes.
3. **Long-Term Accessibility of Information:** Libraries should develop and sustain digital repositories that have stable and dependable storage systems and an effective backup plan for the preservation and access of scholarly and digital information resources.

Abstract

This study examined strengthening career development in librarianship through collaboration between academic librarians and Library and Information Science (LIS) departments in North-Western Nigeria. The study adopted quantitative methodology and a descriptive survey research design. The population comprised 335 academic librarians and LIS lecturers from selected federal universities, with a sample size of 182 respondents determined using Taro Yamane formula. Data were collected using a structured questionnaire and analyzed using frequency counts, percentages, and mean scores, with a criterion mean of 2.50 for decision-making.The findings revealed a high level of collaboration between academic librarians and LIS departments. Strategies such as joint research, workshops, mentorship programmes, and practical training were identified as key approaches for enhancing career development. However, challenges such as inadequate funding, lack of institutional support, workload, poor communication, and absence of clear policies were found to hinder effective collaboration. The study concludes that collaboration plays a significant role in strengthening career development in librarianship, but its effectiveness is limited by existing challenges. The study recommends improved institutional support, increased collaborative activities, and the establishment of clear policies to enhance sustainable collaboration and professional development.

Keywords: Academic librarians, LIS departments, collaboration, career development, federal universities, North-Western Nigeria.

Introduction

The rapid advancement in information and communication technologies (ICTs) has significantly transformed the roles of librarians in the 21st century. Academic librarians are now expected to provide services beyond traditional library operations, including digital literacy instruction, research support, electronic resource management, and scholarly communication (Rabasa & Abrizah, 2022). These emerging responsibilities require continuous professional development in order for librarians to remain relevant and effective in supporting teaching, learning, and research activities within universities (De Groote, 2023).

Library and Information Science (LIS) departments play an important role in preparing future librarians by providing theoretical knowledge and professional competencies required for effective practice. Academic libraries, on the other hand, provide practical environments where such knowledge is applied. Collaboration between academic librarians and LIS departments is therefore essential for improving curriculum relevance, research productivity, mentorship opportunities, and professional competence (Roy & Habib, 2024). Effective collaboration promotes knowledge sharing, innovation, and continuous skills development required in modern librarianship (Chen, Taylor, & Rorissa, 2024).

In North-Western Nigeria, federal universities serve as major centres for LIS education and professional practice. Strengthening collaboration between academic librarians and LIS departments will enhance career development opportunities, improve research productivity, and ensure sustainability of librarianship in the digital information environment.

Statement of the Problem

Career development is essential for improving the competence, productivity, and relevance of academic librarians in a rapidly changing information environment. Librarians are expected to continuously update their skills in areas such as digital librarianship, information literacy instruction, and research support services (Rabasa & Abrizah, 2022). However, collaboration between academic librarians and LIS departments in many federal universities in North-Western Nigeria appears to be limited and inadequately structured.

Limited collaboration may reduce opportunities for joint research, mentorship, curriculum development, and professional training. This gap between theory and practice may affect the quality of LIS education and limit career development opportunities for librarians (Roy & Habib, 2024). In addition, lack of collaboration may reduce research productivity and hinder innovation in library services (De Groote, 2023).

Although previous studies have examined professional development and competencies of librarians, limited attention has been given to collaboration between academic librarians and LIS departments as a strategy for strengthening career development, particularly in North-Western Nigeria. This suggests the need for empirical investigation into how collaboration can enhance professional competence and ensure the future sustainability of librarianship in the region (Chen et al., 2024).

Therefore, this study seeks to examine how collaboration between academic librarians and LIS departments can strengthen career development in federal universities in North-Western Nigeria.

Objective of the study

1. **To examine the existing level of collaboration** between academic librarians and Library and Information Science (LIS) departments in federal universities in North-Western Nigeria for the purpose of enhancing career development in librarianship.
2. **To identify the strategies and activities** through which academic librarians and LIS departments collaborate to promote professional skills, mentorship, and career advancement opportunities for LIS students and early-career librarians.
3. **To determine the challenges affecting effective collaboration** between academic librarians and LIS departments in strengthening career development in librarianship in North-Western Nigeria.

Literature Review

In North-Western Nigeria, the development of librarianship depends largely on the quality of interaction between academic librarians and Library and Information Science (LIS) departments in universities and related institutions. The region, which includes states such as Kaduna, Kano, Kebbi, Sokoto, Katsina, Jigawa, and Zamfara, hosts several institutions offering LIS programmes and academic library services. Collaboration between LIS educators and practicing librarians in this region is essential for bridging the gap between theory and practice, improving professional competence, and enhancing career development among LIS students and early-career librarians (Ocholla, 2008).

Scholars have noted that in Nigeria, particularly in the northern region, professional development in librarianship requires stronger institutional partnerships, mentorship opportunities, and practical training frameworks to meet the demands of the evolving information environment (Aina, 2014). Therefore, this section reviews literature in line with the study objectives within the context of North-Western Nigeria.

Collaboration between Academic Librarians and LIS Departments in North-Western Nigeria

Collaboration between academic librarians and LIS departments in North-Western Nigeria is gradually gaining attention, although it remains underdeveloped. Academic librarians in federal universities in the region contribute to teaching information literacy, user education, and research support services, which complement the efforts of LIS departments (Iwhiwhu, 2015). However, such collaboration is often informal and lacks structured frameworks.

Studies conducted in Nigerian universities show that cooperation between LIS lecturers and practicing librarians improves curriculum relevance and ensures that students are exposed to practical aspects of librarianship (Aina, 2014). In institutions within North-Western Nigeria, this collaboration is particularly important due to the need to equip students with digital and information management skills required in modern libraries.

Research also indicates that collaboration in the region enhances research productivity among academic librarians and LIS educators. Librarians who engage in joint research activities with LIS departments tend to develop stronger

academic profiles and contribute more effectively to scholarly communication (Hicks, 2014). Despite these benefits, the level of collaboration in many institutions in North-Western Nigeria remains limited and inconsistent.

Strategies for Strengthening Collaboration in Career Development in North-Western Nigeria

Several strategies have been identified for strengthening collaboration between academic librarians and LIS departments in North-Western Nigeria. These include joint research projects, co-teaching arrangements, mentorship programmes, student industrial training (SIWES), workshops, and professional conferences (Aina, 2014). These strategies provide opportunities for LIS students to gain practical experience and enhance their employability.

Mentorship is particularly important in the North-Western Nigerian context, where experienced academic librarians guide LIS students and young professionals in career planning and skill development. Iwhiwhu (2015) noted that mentoring and internship opportunities help students to acquire hands-on experience in cataloguing, classification, digital librarianship, and information service delivery.

Workshops and training programmes organized by academic libraries and LIS departments in the region also contribute to developing digital literacy and information management skills among librarians. Collaborative research activities further enhance professional competence and academic visibility, thereby supporting career advancement in librarianship (Hicks, 2014).

Challenges Affecting Academic Collaboration in North-Western Nigeria

Despite the importance of collaboration, several challenges hinder effective partnership between academic librarians and LIS departments in North-Western Nigeria. One major challenge is inadequate institutional support, as many universities lack formal policies that encourage collaboration between LIS departments and academic libraries (Ocholla, 2008).

Funding constraints also limit the ability of institutions to organize joint programmes, workshops, and research activities. In addition, heavy workload and limited time reduce the participation of academic librarians in collaborative teaching and research (Aina, 2014). These challenges are more pronounced in some institutions within the region due to resource limitations.

Another significant barrier is poor communication and lack of awareness of the benefits of collaboration among LIS professionals. Some librarians and academics operate independently without engaging in joint professional activities that could enhance career development (Iwhiwhu, 2015). Furthermore, inadequate technological infrastructure in some institutions affects the implementation of collaborative digital initiatives.

Methodology

This study adopts a quantitative methodology and a descriptive survey research design. The population comprises 335 academic librarians and LIS lecturers in selected federal universities in North-Western Nigeria, including UDUS, BUK, ABU, Federal University Dutsin-Ma, and Federal University Dutse, consisting of 247 academic librarians and 88 LIS lecturers. Purposive sampling is used to select universities offering LIS programmes, stratified sampling was used to group respondents, and simple random sampling was used to select proportionately. Using Taro Yamane formula, a sample size of 182 respondents was obtained and distributed into 134 academic librarians and 48 LIS lecturers. Data was collected using a structured questionnaire on a four-point Likert scale. The questionnaire was validated by experts and tested for reliability using Cronbach Alpha. The data were analyzed using frequency counts, percentages, and mean scores of 2.50.

Results.

The data collected through the questionnaire is analyzed and interpreted as presented

Table 1: Distribution of Respondents

S/N	Institutions	Academic Librarians	LIS Lecturers	Total
1.	UDUS	9	5	14
2.	BUK	22	12	34
3.	ABU	57	10	67

4.	Federal University Dutsin-Ma	42	14	56
5.	Federal University Dutse	4	7	11
	Total	134	48	182

Table 1 shows that the 182 participants were proportionately selected across the universities based on their population sizes. Academic librarians (134) are more than LIS lecturers (48), reflecting their higher number in the population. Larger institutions like ABU and Dutsin-Ma have more respondents, while smaller ones like UDUS and Federal University Dutse have fewer. This ensures fair representation and improves the reliability of the study.

Table 2: Level of Collaboration

S/N	Options	SA	A	D	SA	Mean	Decision
1	There is effective collaboration between academic librarians and LIS departments	80	70	20	12	3.20	Agreed
2	Academic librarians participate in teaching LIS courses	60	65	35	22	2.90	Agreed
3	LIS lecturers collaborate with librarians in research activities	70	60	30	22	2.98	. Agreed
4	There is regular interaction between LIS departments and academic libraries	55	65	40	22	2.85	Agreed
5	Collaboration enhances professional development in librarianship	90	60	20	12	3.25	Agreed

The results in Table 2 show that all the items have mean scores above the criterion mean of 2.50. This indicates that respondents agreed that there is effective collaboration between academic librarians and LIS departments. Specifically, collaboration exists in teaching, research activities, and regular interaction between both groups. The grand mean of **3.04** further confirms that the level of collaboration is high. This implies that collaboration plays a significant role in enhancing career development in librarianship in North-Western Nigeria.

Table 3: Strategies for Collaboration

S/N	Options	SA	A	D	SD	Mean	Decision
1	Joint research projects are encouraged between librarians and LIS lecturers	75	65	25	17	3.09	Agreed
2	Workshops and seminars are jointly organized	70	60	30	22	2. 98	Agreed
3	Mentorship programmes exist between librarians and LIS students	60	65	35	22	2. 90	Agreed
4	Students are exposed to practical training through collaboration	85	60	22	15	3. 18	Agreed
5	Conferences and professional meetings promote collaboration	65	70	30	17	3. 01	Agreed

The findings in Table 3 reveal that all the identified strategies have mean scores above 2.50, indicating agreement among respondents. Strategies such as joint research projects, workshops, mentorship programmes, practical training, and conferences are actively used to promote collaboration. The grand mean of **3.03** suggests that these strategies are widely practiced and contribute positively to career development in librarianship. This shows that structured collaborative activities are essential for improving professional skills and competencies.

Table 4: Challenges Affecting Collaboration

S/N	Options	SA	A	D	SD	Mean	Decision
1	Lack of institutional support affects collaboration	90	65	17	10	3. 28	Agreed

2	Inadequate funding hinders collaborative activities	95	60	15	12	3. 30	Agreed
3	Workload and time constraints limit participation	80	65	22	16	3. 15	Agreed
4	Poor communication affects collaboration	70	65	30	17	2. 98	Agreed
5	Lack of clear policies hinders effective collaboration	85	60	25	12	3.20	Agreed

Table 4 shows that all the listed challenges have mean scores above the criterion mean of 2.50, indicating that respondents agree that these factors hinder effective collaboration. Challenges such as lack of institutional support, inadequate funding, workload, poor communication, and absence of clear policies were identified as major barriers. The grand mean of **3.20** indicates a high level of agreement on these challenges. This suggests that despite the existence of collaboration, several obstacles limit its effectiveness in strengthening career development in librarianship.'

Discussion

The findings of the study revealed that collaboration between academic librarians and LIS departments in federal universities in North-Western Nigeria is relatively high and contributes positively to career development in librarianship. Respondents agreed that collaboration exists in areas such as teaching, research activities, mentorship programmes, workshops, seminars, and practical training, which enhance professional competence, research productivity, and practical skills acquisition. The findings support earlier studies which emphasized that effective collaboration between LIS educators and practicing librarians helps bridge the gap between theory and practice in librarianship. However, the study also identified major challenges affecting effective collaboration, including inadequate funding, lack of institutional support, workload, poor communication, and absence of clear policies. These challenges limit the full realization of collaborative benefits in strengthening professional development.

Recommendations

1. **It is recommended that** university management should provide adequate institutional support and funding to strengthen collaboration between academic librarians and LIS departments.
2. **It is recommended that** academic librarians and LIS lecturers should intensify joint activities such as research, workshops, and mentorship programmes to enhance career development in librarianship.
3. **It is recommended that** clear policies and effective communication channels should be established to promote sustainable collaboration and reduce barriers affecting professional cooperation.

Conclusion

Based on the findings, the study concludes that collaboration between academic librarians and LIS departments plays a significant role in strengthening career development in librarianship in North-Western Nigeria. Although effective strategies for collaboration exist, the presence of several challenges limits their full potential. Therefore, improving institutional support and addressing these challenges will enhance collaboration and promote professional growth in the field.

Abstract

The paper investigates the influence of professional associations on the development of librarians and information services professionals. The study looked at the role played by professional associations in promoting research and innovation, the benefits of librarians' membership in professional associations, how professional associations influence library policies and legislation, the challenge faced by professional associations in shaping librarians and information services professionals and the strategies professional associations use to advocate for libraries' rights and interest. Five (5) objectives with corresponding research questions would guide the study while two null hypotheses would be formulated. Descriptive survey design was adopted for the study. The targeted total population was three hundred and ninety eight (398) members of various professional associations in Nasarawa State. The instrument for data collection include questionnaire, interviews and focal group discussion. Data was analyzed using frequency and simple percentage, Mean (X) and standard deviation (SD). Recommendation include; professional association should totally by all sectors and organization since it plays a significant roles in all facet of the economy. It support nation building which is one of its goal. Benefits for the effective future of library and information science profession. professional associations should be made compulsory to all organization both trade union and non-trade union, It should come out with more educative programs for it members that will help to add additional knowledge to them, the role professional associations play in the society cannot be overemphasized, in that manner government should enabling environment to support them rather than antagonizing them.

Keywords: Professional Association, Librarians, Information Services Professionals.

Introduction

Professional Associations in Librarianship and information service unit information professionals to set ethical standards, drive industry advocacy, and provide continuing education. These bodies ensure global collaboration, career development and access to knowledge, global and regional associations are like; International Federation of Library Associations and Institutions (IFLA). This is the global voice of library and information profession, representing libraries worldwide to advocate for equitable information access. African Library and Information Associations (AfLIA) is the premier organizations, representing libraries and information professionals across Africa, fostering continental collaboration and innovation. The national and regional associations also known as Local Focus such as the Nigerian Library Association (NLA), overarching professional body in Nigeria that unites information professionals and advocate library legislation and capacity building. American Library Association (ALA), is the largest and oldest national library association globally offering accreditation, professional development and widespread advocacy. Chartered Institute of Library and Information Professionals (CILIPS), is the leading body in the United Kingdom representing library, information and knowledge management professionals.

Professional Associations are main way individuals acquired understanding of their organization, network and maintain high top level current information that affect the company/organization. The members in the associations also shows the employer and your peers the seriousness about the commitment of the career. Joining the association is often one of the best decision/ investment to take member to the peak of his career.

Professional associations are found in great abundance and varied strictly from local to international. Practitioners of most professions and people of many special interests band together into associations. In psychological terms, such groups are a means by which individual try to distinguish themselves from the masses by aligning with a group that behaves differently and then adhering to the standards of that group. It has been suggested by sociologists and anthropologists that such groups must tolerate some deviation from their standards or risk losing members through an overly strictly insistence on adherence to rules (Herskoyits, 1945). One reason that individuals in our occupation form and join professional association is "to establish identity as a member of the library profession or, given the wide latitude
most library associations offer, to indicate ... interest in librarianship and its improvement" (Sullivan, 1976).

Each professional association recognize the importance of codifying and making known to the profession and to the general public the ethical principles that guide the work of librarians, other professionals providing information services, library trustees and library staffs. The Code of Conduct indicates the standards of behavior expected of a member of the Association. It sets out, in general terms, the standards and duties which is reasonable, to expect a professional to observe. This can be used as a point of reference when dealing with disciplinary procedures against members. This is intended to protect the profession, individual practitioners, and their clients. This Code of library Professional Conduct was approved by Library Association Council in the Annual General Meeting in 1983, in accordance with The Library Association's Bye-laws. Examples of some of these set guidance and rules are;
• Members of the Association must conduct themselves in such a way that their conduct would not be reasonably regarded by their professional colleagues within the field of librarianship (including the provision of information services) as serious professional misconduct or as professional misconduct. It is by this overall test that the conduct, will be judged.

• Members must not engage in conduct which may seriously prejudice the standing and reputation of the library profession or of their Library Association.

• Members must not divulge or permit to be divulged any materials, information or administrative record (in manual or electronic form) which has been entrusted to them in confidence, to any third party nor use such information without the prior consent of the client for any purpose other than that for which it was first obtained. This duty to the client continues after the relationship of librarian and client ceases.

• Members should not knowingly promote material the prime purpose of which is to encourage discrimination on the grounds of race, color, creed, gender or sexual orientation and etc.

Professional development for library and information professionals is the continuous, lifelong process of acquiring and refining skills, knowledge and competencies. It ensures practitioners agile in a rapidly evolving digital landscape, adapt to new technologies and meet the changing needs of library patrons. To achieve professional growth, library and information professionals engage in various structured and independent pathways such as formal education and certification, workshops and conferences, networking and mentorship, e-learning and independent study among others.

The capacity building and continuous learning are strategies, long-term initiatives designed to ensure the skills, knowledge, and competencies of individuals and organizations. They bride skills gaps, foster adaptability and empowered workforce to meet evolving challenges. These development frameworks generally operate across three interconnected tiers, combing formal structure programs with self-directed growth.

Statement of the Problem

Professional association generally play a key role in building and promoting of high ranking librarians and information services professionals in library profession, particularly in the present day era. This development also underscores the importance attached to Professional association in all libraries and other related profession. For instance, for any library to function accurately it must fits into the 21st century operation, and must adhere to the guiding laws of its professional association

Thus, it implies that each professional association recognize the importance of codifying and making known to the profession and to the general public the ethical principles that guide the work of librarians, other professionals provides information services, library trustees and library staffs. This Code of Conduct which shows the standards of behavior expected of every member of the Association. It is stated in general terms, one obligation, standards and duties which is reasonable, to expect a professional to observe. This can be used as a point of reference when dealing with disciplinary procedures against members. Thus, intended to protect the profession, individual practitioners, and their clients who are members of the umbrella body of the association.

It is therefore necessary for each of the professional body to embrace the important of the role it's plays in shaping information service professionals along-side its activities. The role of professional association cannot be overemphasized when carrying out research in an academic library.

It is in recognition of this, that the Federal Ministry of Education (FME) initiated the idea of Professional Associations such as Nigerian Library Associations (NLA), Nigerian Society of Engineers among others to be lunch by their parent bodies to help in educating and creating enlightenment program for it professional members and the global society.

Therefore, with the type of ideologies and service oriented services gained by this Professional Associations, members would be guided properly when it comes to work ethics, discharge of duty and service delivery to its patrons such as Current Awareness Service, charging and discharging service, monitoring of users' activities, users' search, recalling among others that are available in the library, it will re-shaping and improve the librarians' work with ease access to information.

However, unavailability of these Professional Associations in our organizations, parastatals, establishments, work places, the ethical principles that guide the work of librarians and the code of conduct which shows the standards and behavior expected of every member of the Association, members obligation, standards and duties which is duly expected a professional to observe will be avoided and as such resulting indiscipline in all work places and organization.

In spite of the enormous effort made by the National Library of Nigeria, Nigerian Library Association, NUC and TETFund in educating librarians on the benefits of Professional Associations as it contribute to improving library services and research work, it has been observed that most librarians in academic and public libraries are yet to come to the knowledge and benefit of these Professional Association for effective service delivery.

These scenarios if not urgently addressed may have far reaching negative effect on the librarians, libraries, researchers, students and other library users. The library users may not efficiently derive quality services from the librarians to aid their research work. It is based on this assumption that the adoption of Professional Associations is being clamored for to see how libraries and information services delivery could be improved upon.

Research Questions

The following research questions guided this study:

1. What are objectives of Professional Library Association?
2. What are the activities and services of Professional Library Associations?
3. What are the functions of Professional Library Associations?
4. What are the role of Professional Associations in facilitating access to information services?
5. What are the benefits of Professional Library Association in Nigeria?

Hypotheses

Two null hypotheses were formulated to guide the study and was tested at 0.05 level of significance.

Ho_1: The role of Professional Associations has no significant effect on librarians and information service professionals

Ho_2: The benefits of Professional Associations has no significant effect on librarians and information service professionals

Theoretical Framework

Theoretically, this study will be anchored on three theories: Technology acceptance model (TAM) Fred Davis (1989);

Significance of the Study

A clear understanding that the of the role of professional associations in shaping librarians and information services professional through the findings of the study will be of tremendous benefit to Nigerian Library Association (NLA), Nigerian Association of Library Information Educators (NALISE), administrators/managers of professional librarians, librarians, academic libraries, students, researchers, library staff and library users.

To the Nigerian Library Association (NLA), Nigerian Association of Library Information Educators (NALISE), administrators/managers of academic libraries and librarians, the findings will be useful in the sense that, they can apply

the recommendations on the ways of re-shaping librarians through this professional association in improving the performance of their operations and services to users. It will also enable the librarians to be up-to-date with current practices in recent professional/ academic librarianship, thus, fully equipping them to render effective and efficient service to their patron.

The findings are expected to be beneficial to librarians in encouraging the management in the provision of necessary and adequate instructions/ guidelines that would guide the librarians on the new development in the area of library and information science.

Similarly, this work will help the professional associations in formulating policies, which will be used to improve policy efficiency which can lead to maximum satisfaction of their users. This is because, the application of the findings of this research in the library will not only accommodate an increased workload but also achieve greater efficiency, increase the range of services offered and more especially, introduce new services and functions into the professional librarians. The academic library administrators through the result of this study will understand the need, usefulness and the tasks of professional associations in library operations.

It will also enable academic library managers to be equipped with the activities, knowledge and competence of professional associations can aid in library management, thus, enhancing their managerial ability in managing information and human resources. Equally, the findings will help them in formulating policies on library service utilization and services in academic libraries. The findings will also enable them appreciate the role of information service professional in enhancing academic library operations and services. The library administrators of the academic libraries through the result of the study will understand the need, and usefulness of information service in carrying out library operations.

The result of this research will help students, researchers and library users to obtain a precise picture of the impact of library service delivery. It would also help the users to know the benefits of AI technology in information searching and retrieval. They will also know the relevance of library AI in enhancing the services provided in the library.

Provision to the findings of this study by beneficiaries, will be made possible through the use of library exploration as copies of the findings will be made available at Departmental, Colleges and University libraries. The findings will as well be published in both local and international journals for public consumption. The findings will equally be accessed through internet sources by reference to the researcher's blog.

Finally, the findings of the study will be useful to researchers in the field of librarianship, ICT and information science by allowing them identify the gap (s) that need filling. It will also afford researchers the opportunity to see the link or relationship of this study with other studies that have been conducted in the areas that needs further investigation. This work is to the researcher's contributing to the existing knowledge AI services in libraries and will serve as a useful resources material for researchers.

Literature Review

Generally, the objectives of professional association exist to advance a specific field, protect the public interest, and support practitioners they achieve this by establishing ethical standards facilitating continuous education, advocating for the profession through lobbying and networking. The core objectives of professional association include; setting standard and ethics, professional development and education, advocacy and representation, networking and community among others. Professional library association, like Nigerian Library Association and African Library and Information Association and Institutions, exist to advance the library profession. Their core services and activities revolve around capacity building advocacy, and establishing ethical guidelines for information. The key activities and services are; professional development, publication and research, advocacy and awareness, standardization and ethics, networking and collaboration and accreditation and certification. Professional associations speak on behalf of libraries. They promote the values of the libraries, fight for better funding and defend intellectual freedom and ensure government and institutions understand the importance of library services. Their function include; advocacy, professional development, influencing institutional policies, collaboration and networking among others. Also, there are some important reasons that brought about the establishment of professional association in the library profession. These professional associations brings about opportunity to network with colleagues as a very important or somewhat important reason to join professional associations. Thus, being a professional membership was important for retention, tenure, and promotion as well. Kamm, (2022) highlighted that professional memberships is used to influence librarians 'professional goals and to keep up with developments in the field through professional journals, while some used the association membership to take decision on members, and speaking or publish (write) to the government on the issues bordering the associations.
These professional associations are seen as relevant sources of information and knowledge sharing and in one way or the other to make contacts with others. Information professionals recognize that they need relevant information to be

effective in their positions and that practical up-to-date information is readily and openly shared at association conferences and in association publications, listservs and websites. Furthermore, association committees, interest groups, discussion groups and round tables further provide informal settings for information. Professional Associations offers professional services and publications to members and non-members, including online news stories from National Libraries and analysis of crucial issues from the Head Office. These organization has since been be established for a decade ago with its mission to provide leadership for the development, promotion, and improvement of library and information services and the profession of librarianship in order to enhance learning and ensure access to information for all. Professional organization membership is open to "any person, library, or other organization interested in library service and librarianship upon payment of its dues provided in the bylaws.
There are different types of library associations in the field of librarianship with the most prominent ones are those where membership is granted on the basis of being in that country, or region, as in these examples: Nigerian Library Association (NLA), National Library of Nigeria (NLN), American Library Association (ALA), Nigerian School Library Association (NSLA), NALISE etc
However, there are international library associations that are truly global, like the International Federation of Library Associations (IFLA), the Chartered Institute of Library and Information Professionals (CILIP) and large associations that are adding international components, like the International Association of Agricultural Information Specialists (IAALD) among others.
the objectives of these professional associations are uniting all persons working in or interested in library work, by convening conferences and meetings for the discussions of matters affecting libraries- their regulations, management or otherwise. Also to encourage the promotion, establishment and improvement of libraries and library services in the country, promoting and encouraging bibliographical study and research, improving the standard of librarianship and the status of the library profession in the country. Others, are watching any legislation affecting libraries find to assist the promotion of such further legislation as may be considered necessary for the regulation and management or extension of library services, collect, collate, and publish (as journals, transactions, bulletins), information of benefit to members of the
Association, or for the promotion of the objectives of the Association and to do all such lawful things as are incidental or conducive to the fulfillment of the above objectives.
In achieving these objectives, the Association performs the following activities such as Workshops, Short courses, Film programmes, Short talks, International conferences participation, Publication of Newsletter, Online discussions and collaboration information dissemination are adopted.

The main characteristics of these professional association includes; volunteer membership; access to a large number of people in the profession; members who collectively have a tremendous wealth of experiences in a common field; access to pooled funds to attack problems that are industry-wide; general standards for the performance of its members and the expectation of continuing professional development; literature for dissemination research developments and reports, ability to attract a significant mass of the profession to meetings, numbers to speak on behalf of the profession on issues affecting the profession; and perception by outside group as an ability about matters relating to that profession. It activities are in line with the International Federation of Library Associations and Institutions (IFLA), which is a worldwide, independent, nongovernmental organization. The purposes of the Federation as stated in its Statutes are "to promote high standards of delivery of library and information services; to encourage widespread understanding of the value and importance of high quality library and information services in the private, public and voluntary sectors; and to
represent the interests of its Members throughout the world." These activities are to be incorporated into the professional programmes throughout IFLA's organizational structure, recognizing especially that the needs, concerns and views of every region of the world are to be taken into account, particularly those in the developing world. Regional concerns, communication and information exchange among IFLA's members and the use of electronic technology to facilitate the implementation of its priorities underpin all of these professional priorities. The function of professional associations are; establishing and monitoring industry standards and professional codes of practice, advising educational institutions on curriculum development, promoting and providing professional and career development activities, providing a forum for member networking, promoting the profession in the community, providing career information to prospective students, assisting graduates with career planning and job seeking, maintaining a professional library for members, and producing regular publications on professional and industry issues e.g. newsletters or magazine/journals. increase your knowledge of the profession and industry you are interested in, which will help you to decide whether you wish to pursue a career in this field. According to Enser, 2021, professional association encourages lifelong learning through training courses on a regular scheduled basis for their members.

Scope of the Study

The study is on Artificial Intelligence and the Future of Library and Information Service Delivery in Academic Libraries in Nasarawa State, Nigeria. Basically, the study is poised to identify the benefits, effects and application of artificial intelligence in library and information science delivery in academic library among others.

The study is focused on six academic libraries in Nasarawa State, Nigeria which includes Federal University of Lafia, Nasarawa State University, Kefffi, Federal Polytechnic, Nasarawa, College of Education Akwanga, Isa Mustapha Agwai Polytechnic, Lafia and College of Agriculture Science and Technology, Lafia. The population scope of the study includes the librarians in the identified institutions under study.

Methodology

The research design adopted for the study was descriptive survey research to investigate the influence of professional associations on the development of librarians shaping librarians and information services professionals. The population of the studies comprised of three hundred and ninety eight (398) members of various professional associations in Nasarawa State. Descriptive survey design was adopted for the study. Sample size drawn from the three hundred and ninety eight (398) members of various library professional associations in Nasarawa State. The instrument used for data collection was a closed ended questionnaire title "the influence of professional associations on the development of librarians shaping librarians and information services professionals (IPADLSLISP), interviews and focal group discussion.

The instrument was validated by three expect, two from the department of Library and Information Science, FULafia and one from the department of Statistics and Computing, Faculty of Science in Federal University of Lafia. The data for the study was collected by the researcher and a researcher assisted through direct contact. To ensure high percentage return, the questionnaire was administered and collected immediately after completion by the library staff with the help of two research assistant each in the three universities. The data collected was analyzed using descriptive and non-parameter inferential statistical tools. Descriptive statistical such as mean (X) and standard deviation (SD) was used to answer the research questions. Descriptive statistics give pictorial evidence of a situation or a population as a tool for describing statistical data used in collecting information using table and simple percentage.

Results and Discussion

This section was devoted to presenting the results from the research questions and subsequently the test of hypotheses.

Research Question 1: What are objectives of Professional Library Association?

Table 1: Objectives of Professional Library Association

S/N	Items	VHE	HE	LE	VLE	$\overline{X}$	Decision
1	Set and maintain standards: Make proposals and laws that guide the profession	79 (30.0%)	127 (48.3%)	20 (14.1%)	37 (14.1%)	**4.0**	**Agreed**
2	Code of ethics: Define professional conduct and discipline members who violate it	77 (29.3%)	7 (2.7%)	14 (5.3%)	165 (62.7%)	**1.2**	**Disagreed**
3	Competency standards: Established bench mark for skills, education and practice quality.	62 (23.6%)	12 (4.6%)	32 (12.2%)	147 (55.9%)	**1.8**	**Disagreed**
4	Certification / Licensing: Run credentialing program that signal expertise to the public	132 (50.2%)	72 (27.4%)	40 (15.2%)	19 (7.2%)	**3.1**	**Agreed**
5	Mentorship: Connect junior and senior professional for guideline	19 (7.2%)	189 (71.9%)	49 (18.6%)	6 (2.3%)	**3.0**	**Agreed**
6	Research and Publications: Fund studies and published journals, newsletters or white papers	26 (9.9%)	154 (58.6%)	51 (19.4%)	22 (8.4%)	**3.2**	**Agreed**

7	Protect interests: Defend members against unfair regulations or profession threat	14 (5.3%)	111 (42.2%)	78 (29.7%)	60 (22.8%)	**1.6**	**Disagreed**
8	Best practices: Collect and distribute what works across the industry	14 (5.3%)	67 (25.5%)	32 (12.2%)	127 (48.3%)	**3.0**	**Agreed**
9	Public awareness: Promote the value of the profession to society, clients and employers.	22 (8.4%)	61 (23.2%)	115 (43.7%)	65 (24.7%)	**2.0**	**Disagreed**
10	Protect interest: Defend members against unfair regulations	32 (12.2%)	114 (43.3%)	91 (34.6%)	26 (9.9%)	**2.6**	**Agreed**

Key: VHE=Very High Extent, HE=High Extent, LE=Low Extent, and VLE=Very Low Extent

Table 5 shows members' responses regarding the objectives of Professional Library Association. From the table, majority of the members at great extent agreed that Set and maintain standards: Make proposals and laws that guide the profession with mean score $\overline{X}$ = 4.0, Research and Publications: Fund studies and published journals, newsletters or white papers ($\overline{X}$ = 3.2), Certification / Licensing: Run credentialing program that signal expertise to the public ($\overline{X}$ = 3.1), Best practices: Collect and distribute what works across the industry ($\overline{X}$ =3.0), Mentorship: Connect junior and senior professional for guideline ($\overline{X}$ = 3.0), and Protect interest: Defend members against unfair regulations ($\overline{X}$ =2.6). In another opinion, some response from the members suggested Public awareness: Promote the value of the profession to society, clients and employers**.** ($\overline{X}$ =2.0), Competency standards: Established bench mark for skills, education and practice quality. ($\overline{X}$ =1.8), Protect interests: Defend members against unfair regulations or profession threat ($\overline{X}$ =1.6) Code of ethics: Define professional conduct and discipline members who violate it ($\overline{X}$ =1.2) in an insignificant manner.

Research Question 2: What are the activities and services of Professional Library Associations?

Table 2: Activities and services of Professional Library Associations?

Activities and services of Professional Library Associations	**SA**	**A**	**D**	**SD**	$\overline{X}$	**Decision**
Education and training services:	19 (7.2%)	205 (77.9%)	18 (6.8%)	21 (8%)	2.8	**Agreed**
CPD programs: Workshops, seminars, webinars, and short courses for continuing professional development.	25 (9.5%)	146 (55.5%)	92 (35.0%)	-	2.7	**Agreed**
Certification examination: Design and run tests for credentials like CL, NLA, COREN, PMP, CIPM	97 (36.9%)	80 (30.4%)	71 (27.0%)	15 (5.7%)	2.0	**Agreed**
Conferences: Annual national conventions and local chapter events with keynotes, papers presentations and master classes.	77 (29.3%)	65 (24.7%)	44 (16.7%)	77 (29.3%)	2.5	**Agreed**
E-Learning: Online portals with recorded lectures, quizzes, and digital certificates	10 (3.8%)	253 (96.2%)	-	-	3.0	**Agreed**
Publications: Peer-reviewed journals, magazines, newsletters, research report.	32 (12.2%)	60 (22.8%)	131 (49.8%)	40 (15.2%)	2.3	**Disagreed**
Awards and recognition: Professional of the year, fellowships, grants for outstanding works.	4 (1.5%)	251 (95.4%)	3 (1.1%)	5 (1.9%)	3.0	**Agreed**
Chapter meetings: Monthly gathering in states like Nasarawa for local members.	52 (9.8%)	201 (76.4%)	10 (3.8%)	-	3.2	**Agreed**
Social events: Dinner, sports, tournaments, annual dinners, family fun days.	40 (15.2%)	214 (81.4%)	9 (3.4%)	-	3.1	**Agreed**
Online community: WhatsApp groups, forums, members directories for quick connections.	25 (9.5%)	146 (55.5%)	92 (35.0%)	-	2.7	**Agreed**

Key: VHE= Very High Extent; HE= High Extent; LE = Very Low Extent, and VLE= Very Low Extent

Table 2: Activities and services such as chapter meetings: Monthly gathering in states like Nasarawa for local members scored high with $\overline{X}$ = 3.2. This is followed by Social events: Dinner, sports, tournaments, annual dinners, family fun days. $\overline{X}$ = 3.1, and the next highest been E-Learning: Online portals with recorded lectures, quizzes, and digital certificates $\overline{X}$ = 3.0 and awards and recognition: Professional of the year, fellowships, grants for outstanding works $\overline{X}$ = 3.0 respectively. Education and training services $\overline{X}$ = 2.8. While CPD programs: Workshops, seminars, webinars, and short courses for continuing professional development and Online community: WhatsApp groups, forums, members' directories for quick connections recorded lower score of $\overline{X}$ = 2.7. Finally, Conferences: Annual national conventions and local chapter events with keynotes, papers presentations and master classes $\overline{X}$ = 2.5 and Publications: Peer-reviewed journals, magazines, newsletters, research report $\overline{X}$ = 2.3.respectively.

Research Question 3: What are the functions of Professional Library Associations?
Table 3: Functions of Professional Library Associations

Items regarding Functions of Professional Library Associations	VH	H	L	VL	$\overline{X}$	Decision
Policy input: Draft position papers and lobby on the bills that affects the field.	11 (4.2%)	252 (95.8%)	-	-	3.0	Agreed
Enforce ethics: Create a code of conduct and sanction members who breach it	100 (38%)	163 (62%)	-	-	3.4	Agreed
Set entry requirement: Decide who qualify to join the profession.	89 (33.8%)	92 (35%)	53 (20.2%)	-	3.2	Agreed
License/ Certify: Issue practicing lincenses or credentials that the public can trust	115 (43.7%)	148 (56.3%)	-	-	3.4	Agreed
Continuous learning: Ensure members stay up to date through CDP, seminars and journals	121 (46.0%)	152 (57.8%)	19 (7.2%)	-	3.3	Agreed
Skill standardization: Define what a competent professional should know and do	116 (44.1%)	147 (55.9%)	-	-	3.4	Agreed
Research: Advanced the body of knowledge and published new findings	24 (9.1%)	153 (58.2%)		-	3.1	Agreed
Train he next generation: Mentor students and run internship scheme	239 (90.9%)	102 (38.9%)	8 (3.0%)	-	3.5	Agreed
Protect members: Defend against unfair laws , exploitation or unsafe work conditions	11 (4.2%)	252 (95.8%)	-	-	3.0	Agreed
Professional insurance: Provides indemnity cover and legal support when things goes wrong	252 (95.8%)	11 (4.2%)	-	-	3.0	Agreed

Key: VH = Very High; H = High; L = Low, and VL = Very Low

Table 3 shows that the function of professional library associations in the first and second column as"Very High" and "High" by the members. This is a proof that the respondents observed a high level of the function of professional library associations is enormous in all sphere of its operations. For the function of professional library associations such as; Train he next generation: Mentor students and run internship scheme is $\overline{X}$ = 3.5; Enforce ethics: Create a code of conduct and sanction members who breach it is $\overline{X}$ = 3.4; License/ Certify: Issue practicing lincenses or credentials that the public can trust is $\overline{X}$ = 3.4; Skill standardization: Define what a competent professional should know and do is $\overline{X}$ = 3.4; Continuous learning: Ensure members stay up to date through CDP, seminars and journals is $\overline{X}$ = 3.3; Set entry requirement: Decide who qualify to join the profession as indicated by the $\overline{X}$ = 3.2; Research: Advanced the body of knowledge and published new findings as indicated by the $\overline{X}$ = 3.1; Policy input: Draft position papers and lobby on the bills that affects the field $\overline{X}$ = 3.0; Protect members: Defend against unfair laws , exploitation or unsafe work conditions and Professional insurance $\overline{X}$ = 3.0; Provides indemnity cover and legal support when things goes wrong $\overline{X}$ = 3.0 respectively.

Research Question 4: What are the role of Professional Associations in facilitating access to information services?
Table 4: Role of Professional Associations in facilitating access to information services

S/N	Items	SA	A	D	SD		$\overline{X}$	Decision
1	Enforce discipline: Investigate complaints and suspend/ expel members who breaks the ethics.	-	142 (54%)	121 (46%)	-		2.5	Agreed

2	Keep skills sharp: Run mandatory CPD s that members don't practice with outdate knowledge	115 (43.7%)	148 (56.3%)	-	-		3.4	Agreed
3	Lobby government: Push for laws that will help the profession and fight harmful ones.	89 (33.8%)	174 (66.2%)	-	-		3.3	Agreed
4	Negotiate conditions: Bargain on pay, pension and working conditions, with employers.	12 (4.6%)	49 (54%)	142 (54%)	51 (19.4%)		2.0	Disagreed
5	Build identity: Gives members a sense of belonging and pride in the profession.	124 (47.1%)	132 (50.2%)	7 (2.7%)	-		3.4	Agreed
6	Connect people: Creates spaces were pros meet mentors, partners, clients and employers.	44 (16.7%)	219 (82.3%)	-	-		3.2	Agreed
7	Host gatherings: Conferences, local chapters, online forums where deals start.	72 (27.4%)	191 (72.6%)	-	-		3.3	Agreed
8	Advance the field: Fund studies and sharing funding through journals.	217 (82.5%)	37 (14.1%)	9 (3.4%)	-		3.7	Agreed
9	Protect the public: Gives clients a verified registered and compliant process.	-	137 (52.1%)	37 (14.1%)	89 (33.8%)		2.2	Disagreed
10	Defend the scope: Stop quacks and other professionals from encroaching on your work.	77 (29.3%)	120 (45.6%)	66 (25.1%)	-		3.0	Agreed
11	Market the profession: PR campaign so the society value and pay for the expertise	188 (71.5%)	-	-	38 (14.4%)		3.0	Agreed
12	Early warning: Alert members to new risk, technology or regulations.	-	52 (19.8%)	159 (60.5%)	52 (19.8%)		2.0	Disagreed

Key: SA=Strongly Agreed, A= Agreed, D=Disagree and SD=Strongly Disagree

Table 5 above shows the role of Professional Associations in facilitating access to information services as listed strongly agreed and agreed such as; Advance the field: Fund studies and sharing funding through journals ($\overline{X}$ =3.7), Keep skills sharp: Run mandatory CPD s that members don't practice with outdate knowledge and Build identity: Gives members a sense of belonging and pride in the profession ($\overline{X}$ =3.4), Lobby government: Push for laws that will help the profession and fight harmful ones and Host gatherings: Conferences, local chapters, online forums where deals start. ($\overline{X}$ =3.3), Connect people: Creates spaces were pros meet mentors, partners, clients and employers ($\overline{X}$ =3.2), Defend the scope: Stop quacks and other professionals from encroaching on your work and Market the profession: PR campaign so the society value and pay for the expertise ($\overline{X}$ =3.0), Enforce discipline: Investigate complaints and suspend/ expel members who breaks the ethics ($\overline{X}$ =2.5). Protect the public: Gives clients a verified registered and compliant process. ($\overline{X}$ =2.2), Negotiate conditions: Bargain on pay, pension and working conditions, with employers ($\overline{X}$ =2.0) and Early warning: Alert members to new risk, technology or regulations. ($\overline{X}$ =2.0).

Research Question 5: What are the benefits of Professional Library Association in Nigeria?

Table 5: Benefits of Professional Library Association in Nigeria

Benefits of Professional Library Association	**SA**	**A**	**D**	**SD**	$\overline{X}$	**Decision**
Salary boost: Survey data shows certified members often earn 10-29% more in fields like IT, accounting, librarianship etc.	19 (7.2%)	205 (77.9%)	18 (6.8%)	21 (8%)	2.8	**Agreed**
Exclusive job access: Members only job boards, recruiters access, headhunting through the network	25 (9.5%)	146 (55.5%)	92 (35.0%)	-	2.7	**Agreed**

Credentials that matters: Post nominal likes CLN, MNIM, FNSE, ACA signal credibility to employers/ clients.	97 (36.9%)	80 (30.4%)	71 (27.0%)	15 (5.7%)	2.0	**Agreed**
Right room: Meets mentors, partners, clients, and employers at chapter meetings and conferences.	77 (29.3%)	65 (24.7%)	44 (16.7%)	77 (29.3%)	2.5	**Agreed**
Group discount: Cheaper professional indemnity insurance, health plans, hotels, soft-wares.	10 (3.8%)	253 (96.2%)	-	-	3.0	**Agreed**
Legal backup: Advised lines and defense funds if a client sues or you face ethics complaints	32 (12.2%)	60 (22.8%)	131 (49.8%)	40 (15.2%)	2.3	**Disagreed**
Welfare support: Benevolent funds for illness, bereavement, or emergencies	4 (1.5%)	251 (95.4%)	3 (1.1%)	5 (1.9%)	3.0	**Agreed**
Higher standard: Collectively raised quality so client trust the whole profession more	52 (9.8%)	201 (76.4%)	10 (3.8%)	-	3.2	**Agreed**
Knowledge pool: Research and best practices get shared instead of hoarded	40 (15.2%)	214 (81.4%)	9 (3.4%)	-	3.1	**Agreed**
Innovation: Association fund research that leads to better service for everyone	25 (9.5%)	146 (55.5%)	92 (35.0%)	-	2.7	**Agreed**

Key: VHE= Very High Extent; HE= High Extent; LE = Very Low Extent, and VLE= Very Low Extent

Table 5: The benefits of Professional Library Association such as Higher standard: Collectively raised quality so client trust the whole profession more members scored high with $\overline{\boldsymbol{X}}$ = 3.2. This is followed by Knowledge pool: Research and best practices get shared instead of hoarded $\overline{\boldsymbol{X}}$ = 3.1, with Group discount: Cheaper professional indemnity insurance, health plans, hotels, soft-wares. $\overline{\boldsymbol{X}}$ = 3.0 and Welfare support: Benevolent funds for illness, bereavement, or emergencies ($\overline{\boldsymbol{X}}$ = 3.0 respectively. Salary boost: Survey data shows certified members often earn 10-29% more in fields like IT, accounting, librarianship etc. ($\overline{\boldsymbol{X}}$ = 2.8). Innovation: Association fund research that leads to better service for everyone ($\overline{\boldsymbol{X}}$ = 2.7). Finally, Right room: Meets mentors, partners, clients, and employers at chapter meetings and conferences. ($\overline{\boldsymbol{X}}$ = 2.5) and Legal backup: Advised lines and defense funds if a client sues or you face ethics complaints ($\overline{\boldsymbol{X}}$ = 2.3) respectively.

Discussion of Findings

The benefits of Professional Library Association is "Very High" and "High" from the responses of the members, as supported by the associated means, as shown in Table 5 above, is appreciably high.

This finding is supported by Ifidon, (2007), research outcome that pointed out that the objectives/ activities of Professional Library Association heighted above, set and maintain standards: Make proposals and laws that guide the profession with mean score $\overline{\boldsymbol{X}}$ = 4.0, Research and Publications: Fund studies and published journals, newsletters or white papers ($\overline{X}$ = 3.2), Certification / Licensing: Run credentialing program that signal expertise to the public ($\overline{\boldsymbol{X}}$ = 3.1), Best practices: Collect and distribute what works across the industry ($\overline{X}$ =3.0), Mentorship: Connect junior and senior professional for guideline ($\overline{X}$ = 3.0) were very high. While Protect interest: Defend members against unfair regulations ($\overline{X}$ =2.6), Public awareness: Promote the value of the profession to society, clients and employers**.** ($\overline{\boldsymbol{X}}$ =2.0), Competency standards: Established bench mark for skills, education and practice quality. ($\overline{\boldsymbol{X}}$ =1.8), Protect interests: Defend members against unfair regulations or profession threat ($\overline{X}$ =1.6) Code of ethics: Define professional conduct and discipline members who violate it ($\overline{\boldsymbol{X}}$ =1.2) in an insignificant manner were considered as low perceived significance.

Further findings from the study revealed that, the function, role and benefit of Professional Library Associations such as, chapter meetings: Monthly gathering in states like Nasarawa for local members scored high with $\overline{\boldsymbol{X}}$ = 3.2. This is followed by Social events: Dinner, sports, tournaments, annual dinners, family fun days. $\overline{\boldsymbol{X}}$ = 3.1, and the next highest been E-Learning: Online portals with recorded lectures, quizzes, and digital certificates $\overline{\boldsymbol{X}}$ = 3.0 and awards and recognition: Professional of the year, fellowships, grants for outstanding works $\overline{\boldsymbol{X}}$ = 3.0 are the main activities and services of Professional Library Associations. This could, therefore, be substantiated by the findings of Enyi (2016), who asserted that the activities and services of Professional Library Associations will be an important in piloting its affairs accurately.

As supporting evidence, (Shohana, 2016) pointed out "activities effectiveness will be used as a strategy in place to outlined it stated goals.

Conclusion

This study has critically explored the influence of professional associations on the development of librarians shaping librarians and information services professionals. The study also revealed the objectives, activities, functions, roles and benefits of t professional association. It is on this background that the following recommendations were put forward:

Recommendations

From the findings and conclusion of the study, the following recommendation are put forward.

1. Professional association should totally be embrace by all sectors and organization since it plays a significant roles in all facet of the economy. It support nation building which is one of its goal, benefits for the effective future of library and information science profession.
2. Professional associations should be made compulsory to all organization both trade union and non-trade union.
3. It should come out with more educative programs for it members that will help to add additional knowledge to them.
4. The role professional association's play in the society cannot be overemphasized, in that manner government should enabling environment to support them rather than antagonizing them.

Abstract

Nigeria is a country located on the western coast of Africa. It has varied topography with climate changes that ranges from arid to humid equatorial. Nigeria covers an area of about 924,000 km2, it is bordered to the north by Niger, to the east by Chad and Cameroon, to the south by the Gulf of Guinea, and to the west by the Benin Republic. Nigeria's population is estimated to be around 229.5 million. Libraries have long been recognized as agencies that provide unlimited access to reliable and unprejudiced information. Environmental literacy is simply a multifaceted term that surpasses mere knowledge and understanding. It encompasses experience, understanding, and most significantly action. This paper based on relevant literature, examines the role of libraries in promoting environmental literacy in Nigeria. It proffers key strategies for libraries in promoting sustainable environmental literacy and security for sustainable development in Nigeria through the provision relevant print and non-print information resources and the use of advanced technology. The paper explores the challenges/constraints that can affect libraries in their efforts to promote environmental literacy in Nigeria. It further suggests approaches for overcoming the identified challenges. This paper concludes by stressing that libraries been institutions that provides free and reasonable access to information globally, Nigeria inclusive must ensure the provision and dissemination of adequate and relevant information to promote environmental literacy and security, inform and educate the citizenry to ensure improvement and sustainability of climate literacy in the country and to also ensure proper security for development.

Keywords: Libraries, Environmental literacy, Promotion, Security, Development, Sustainability, Nigeria.

Introduction

Globally, libraries are devoted to making available free and unbiassed access to information for all and sundry in both print and electronic formats particularly in this rapidly changing digital period. They play a major role in creating and promoting environmental literacy by providing appropriate and attractive reading materials/services to their users. According to Meerab (2023), the global environmental crisis has become one of the major pressing issues of our time because it has led to declining quality of the environment, accelerated the pace of environmental degradation, scarcity of natural resources, loss of biodiversity, and threatening the long-term survival of human civilization which has been on the increase. Similarly, according to Abiolu and Okere (2012), the United Nations Environment Programme (UNEP) has noted that the contemporary international concerns began with the United Nations Conference on the human Environment in Stockholm in 1972. This according to them, continued with efforts in the 1980s with the World Commission on Environment (Brundtland Commission), through to the 1990s with the Earth Summit Conference (Rio Conference); this later culminated in the publication of Agenda 21 in 1992.

According to Maryland Association for Environment and Outdoor Education (2025), environmental literacy is a multidimensional concept that exceeds mere knowledge and comprehension. It involves experiences, understanding, and most importantly action. While environmentally literate person refers to somebody who makes up-to-date decisions about the environment. By being informed, people can make more environmentally informed/compliant decisions, advocate for workable policies, and adapt to understanding the evidence of environmental change.

The term environmental literacy was first used many decades ago in an issue of the '*Massachusetts Audubon'* by Roth (1968) who inquired "How shall we know the environmentally literate citizen?" Since then, the meaning of the concept has evolved and has been extensively reviewed (Mcbridge, Brewer, Berkowitz & Borrie, 2013). Furthermore, the concept of environmental literacy is continuously been advocated and promoted through intensive academic discussions from a diverse perspective in different disciplines.

Nigeria is a country located on the western coast of Africa. It has varied topography, with climate changes that ranges from arid to humid equatorial. Nigeria covers an area of about 924,000km2, it is bordered to the north by Niger, to the east by Chad and Cameroon, to the south by the Gulf of Guinea, and to the west by Benin Republic. Nigeria's population is estimated to be around 229.5 million people. Its most diverse feature is it people. Nigeria has a tropical climate with variant rainy and dry seasons, depending on location. It is hot and wet most of the year in the southeast but dry in the southwest and farther inland. Nigeria has one of the largest economies in Africa which is based primarily on the petroleum industry (Britannica, 2026). The oil sector has significantly impacted on the development contour of the nation since the 1970s.

This paper discusses the role of libraries, particularly public libraries in creating and promoting environmental literacy in Nigeria that support education for all and sundry. It examines the key strategies for libraries in promoting environmental literacy in Nigeria and even beyond bearing in mind the current global best practices.

Environmental Literacy

The concept of "environmental literacy" has gained momentum globally as part of the response to the burning desire to create dynamic and inspiring literate environments that will guarantee literacy acquisition in all its ramifications and lifelong usage of information resources as they are available in libraries and information centers. According to Mcbridge, Brewer, Berkowitz and Borrie (2013), environmental literacy comprises an awareness of and concern about the environment and its associated problems, as well as the knowledge, skills and motivations to work toward solutions of current problems and the prevention of new ones. Similarly, according to Environmental Education Association of Indiana (2025), environmental literacy is an individual's understanding of how their actions and decisions affect the environment. Additionally, environmental literacy is the primary overarching goal of environmental education. It is an experiential lifelong learning process that increases awareness about the environment and results in a citizenry empowered to meet their future responsibilities regarding the environment.

Liu and Tobias (2024), stressed that environmental literacy encompasses dimensions such as environmental awareness, environmental values, and environmental responsibility which ensure interactive relationships between humans and the environment. Whereas, Orr (1990) cited by Ors (2022), amplified that an environmentally literate individual knows the effect of science, technology, and culture agricultural activities on the functioning of natural systems and takes sound environmental decisions that will allow for the sustainability of the environment.

Furthermore, Roth (1992), evaluated the growth of environmental literacy, defining it as the ability to perceive and interpret the relative health of environmental systems and take appropriate actions to maintain, restore, or improve the health systems. Its pervasiveness has been increasing in the field of environmental education. Environmental literacy is knowledge of environmental concepts and issues; the attitudinal dispositions, motivation, cognitive abilities and skills, and the confidence and proper behaviors to apply such knowledge in order to make actual decisions in a range of environmental settings (Wheaton, Kannan & Ardoin, 2018). Roth (1992), further proposed four dimensions of environmental literacy that include among others: knowledge, skills, affect, and behavior. Similarly, Erdogan, Kostova and Marcinkowski (2009), broaden the components of environmental literacy to include six elements; namely, ecological knowledge, socio-political knowledge, knowledge of environmental issues, affect, cognitive skills and environmentally responsible behaviors.

As libraries globally promotes environmental literacy, they not only contribute to environmental awareness and consciousness but also serve as models for sustainable development of environmental literacy in their respective communities. Thus, libraries can help in playing vital roles in the promotion of environmental literacy activities.

Key Strategies for Promoting Environmental Literacy and Security by Libraries in Nigeria

One of the most critical traditional roles of libraries and information professionals is imparting information literacy skills to their clients especially in this digitally changing environment. Information literacy simply denotes the set of skills needed to locate, evaluate, retrieve, analyze and use information in a cost-effective manner and effectively. According to American Library Association (ALA) (2025), information literacy is a set of abilities requiring individuals to "recognize when information is needed to have the ability to locate, evaluate, and use effectively the needed information." To be information literate, then, one needs skills not only in research but in critical thinking.

Similarly, according to Verma and Shukla (2021), information literacy enables individuals to learn techniques and skills for utilizing the wide range of information tools as well identify research methodologies for up-to-date decisions. Environmental literacy is one of the essential literacies that is required by people to manage their environment properly for obvious reasons. Abiolu and Okere (2011), identified some of the areas where environmental information can fit into as follows:

- Stressing environmental challenges and issues concern;
- Raising awareness on the environment;

- Informing the generality of the public and other critical stakeholders;
- Identifying 'hot-spots' and places requiring special and urgent attention;
- Meeting constitutional requirements for environmental reporting;
- Helping to set sustainability targets and goals among others.

Since libraries are gateways for knowledge, they perform a vital role in promoting environmental literacy and security through provision of access to information services and resources in a cost-effective manner that encourage individuals and communities to recognize and respond to environmental challenges, mostly in the case of public libraries. Moreover, they enable the dissemination of timely information and knowledge on environmental/climate change, sustainability strategies, and resilience methods, allowing communities to make meaningful decisions and apply proactive actions on climate/environmental related issues. In fact, Devine and Appleton (2023) noted that that the crucial role of libraries as 'green educators' and 'green teachers' has since been recognized by the American Library Association (ALA) with the roll-out in 2020 of the 'Resilient Communities: Libraries respond to Climate Change' project which provided small grants for selected libraries in the U.S.

According to El-Kalash and Abubakar (2021), since libraries are gateways for knowledge, they are principally well suited as demonstration vehicles as well as for teaching environmental responsibility to communities. In other words, according to the authors, libraries are focused on sustainable management, services, programs, events, literature, and projects, demonstrating the social role and responsibility of libraries as leaders in environmental sustainability.

Onnoghen, Unachukwu, Orji, Ewa and Anabaraonye (2024), have noted that the library is a vibrant link between the user and the information they require, while the key players in achieving this aim are information professionals. The authors specifically, noted that the library can play vital role in achieving climate/environmental literacy in the following major areas:

1. Creating awareness and advocacy campaigns: One of the ways of promoting climate/environmental literacy is through organizing seminars, workshops and training sessions on climate/environmental change for different categories of users. Similarly, the library can collaborate with the media, the NGOs, community leaders, local authorities and policy makers to organize seminars and awareness campaigns on environmental and climate education. Also, Coyle (2005), has noted that environmental literacy has three (3) stages i.e. environmental responsiveness, personal behavior knowledge and true environmental literacy. The author, thus, noted that libraries through the provision of newspaper articles can provide a more detailed understanding and awareness about the environment.
2. Providing access to information: Libraries, particularly public libraries attempt to keep their resources and services open to all members of their community. Such resources ensure the promotion and sustainability of environmental literacy and security initiatives.
3. Library environmental education: Library environmental education can also play a significant role in ensuring proper environmental literacy. This may be done through collaboration with the Federal Ministry of Education in ensuring that both formal and informal educational systems in Nigeria provide the public with up-to-date reading materials on environmental issues. Similarly, Cunningham and Cunningham (2010), added that some other techniques of carrying out environmental education include among others; organizations engaging in teaching in schools, individuals carrying out internships in agencies or environmental organizations and citizen science projects involving ordinary people and established scientists. Likewise, Rowe (2002) cited in Abiolu and Okere (2011) pointed out that integration of a sustainability paradigm into the mission statement of higher institutions would boost environmental education.
4. Library exhibition: In this situation, libraries, public libraries in particular, can host exhibitions and displays that showcase plastic recycling ideas and innovations in plastic pollution. They can organize programmes such as seminars, workshops, and exhibitions to educate people on proper environmental related issues. Additionally, they can impart the use of visual aids and other devices for their special users for proper environmental education and sustainability.
5. Research and information dissemination: Environmental literacy assists us to make up-to-date decisions in all our affairs. Hence, libraries can serve as fountain of information on climate/environmental change education. In this regard, libraries can gather information and data on plastic waste management, recycling initiatives, and best practices globally and make such information available to users through their resources. Furthermore, libraries can be involved in research on environmental literacy and security from a wider perspective. They can as well provide items and information resources for researchers to study the impact of environmental literacy and security, develop new techniques and technologies for managing environmental recycling approaches and other similar activities. Similarly, in line with these,
6. Community engagement and collaboration: According to Aytac (2022), adapting to environmental consequences of climate change will require collaborative action involving all stakeholders, especially libraries. In this regard, libraries can conveniently collaborate with waste management organizations to create a forum for sharing information on effective environment/waste management practices that promote environmental

sustainability. Similarly, libraries can involve the local community and schools in environmental education and plastic waste reduction and management activities. Besides, they can organize community awareness campaigns, school programmes, and reading clubs that involve environmental themes, including their challenges and how to minimize them. According to Abiolu and Okere (2012), sharing of resources and ideas by libraries through partnership and collaborations is a role that is taking on newer dimensions. Consequently, libraries may collaborate with interest groups and key actors in environmental information. Such groups according to them, include government, non-government and community-based organizations, volunteer groups, mass media and other change agents.

7. Institutional support: Here libraries can make available institutional support to government agencies, civil society groups, and academic institutions that are working towards developing policies and plans that will help manage plastic waste effectively. Still, libraries can encourage community building by organizing programmes that bring together community members to learn about recycling ideas, techniques, and best practices. They can also engage in advising, counseling, and training programs for community members to help them adopt sustainable plastic waste management practices (Onnoghen, Unachukwu, Orji, Ewa & Anabaraonye, 2024).
8. Access to digital resources: According to Oshinaike and Saidu (2024), many libraries are increasing digital access to resources that include among others; online databases, environmental/climate-related research, and learning resources. This usually allows persons in remote or underserved communities to have access to information on sustainable practices, security and environmental/climate resilience strategies, thereby reducing the knowledge gap and empowering them to take action accordingly.

Constraints to the Promotion of Environmental Literacy and Security by Libraries in Nigeria

Many prospects abound for embracing environmental literacy by libraries in Nigeria. This may not be unconnected to the fact that environmental literacy reflects a social consciousness and awareness about the environment, preserving and protecting it for the sake of civilization. Despite the above, certain hurdles are militating against the promotion of environmental literacy and security by libraries in Nigeria. These challenges are exacerbated by inadequate funding, lack of specialized expertise and limited resources among others. Scholars like El-Kalash and Abubakar (2021); Aregbesola, Owolabi and Adebisi (2024); Kolawole and Oladokun (2025) have spotlighted several barriers affecting libraries in Nigeria in their quest to promote environmental literacy and security. Some of the challenges are as follows:

- Lack of funding: Most libraries struggle with limited funding which affects their ability and capacity to implement sustainable practices. In most cases, budgetary allocations to libraries are normally insufficient to cover operational needs and the cost associated with environmental initiatives;
- Limited staffing: Many libraries, particularly public libraries operate with limited staff, making it extremely difficult to provide adequate support to their communities. The problem of limited staffing also affects the quality of services provided by libraries, which negatively affects environmental literacy programmes and activities;
- Inadequate awareness by the majority of the public: The general public and many stakeholders are not aware about the importance of environmental literacy. Consequently, this lack of awareness affects the potential of libraries to serve as models of environmental literacy initiatives in their communities;
- Inadequate infrastructure: Most Nigerian libraries lack the necessary tools to implement environmental literacy and green practices. The lack of infrastructure is further aggravated by the poor and epileptic power supply, poor waste management systems, making it difficult for libraries to promote environmental literacy as part of their activities and programmes;
- Lack of policies on environmental and green initiatives: Lack of supportive policies and regulatory frameworks affects the promotion of environmental literacy and green activities in Nigerian libraries. Without proper policies, guidelines or regulations, libraries may not properly promote environmental literacy and security in the country;
- Inadequacy of relevant resources: Libraries, especially, public libraries may face a lack of relevant resources that include materials and information related to environmental literacy. Such challenge can arise due to several factors such as inadequate funding, inadequate access to information and lack of trained staff;
- Failure to recycle certain items in the library i.e. ink cartridges and papers that often constitute nuisance to the ecosystem;
- Lack of adequate trainings/workshop programmes that are tilted towards highlighting the imperatives for environmental literacy, security and greening activities in libraries;
- Limited researches on the prospects for going green;
- Finally, the lack of good projects that can promote sustainability in the environment.

Overcoming the Barriers to the Successful Promotion of Environmental Literacy by Libraries in Nigeria

Given the prevailing challenges confronting the promotion of environmental literacy by libraries in Nigeria, the paper recommends the following towards improving the promotion of environmental literacy by libraries in Nigeria:

- Raising awareness: There is a greater need for a wider understanding of environmental literacy among information professionals, the general public, and the policy makers. This would help to promote environmental literacy initiatives.
- Funding and infrastructure: There is a need for improvement in funding and infrastructural facilities in our libraries. This implies that governments and other sponsoring agencies of libraries and information centers should change their attitudes towards libraries in the country. Moreover, the libraries themselves should develop new proactive strategies of generating more funds to balance their financial allocation to acquire critical infrastructure for meaningful achievement in the promotion of environmental literacy. Equally important is the fact that more relevant information resources especially those related to environmental literacy should be provided in our libraries.
- Recruitment of more professional staff: There is also the need for the recruitment of more information professionals in our libraries who would be actively involved in the promotion of environmental literacy in the libraries.
- Capacity building: Improving the technical skills of information professionals is necessary for the successful promotion of environmental literacy programmes. Acquisition of ICT skills has therefore become inevitable. Additionally, it entails developing training programmes to teach information professionals on how to unite workable practices into their daily activities aimed at promoting environmental literacy and all its related activities.
- Involvement of LIS schools: LIS schools should inject skills that are related to environmental literacy in their curricula so as to enable information professionals to become active players in environmental issues.
- Reinforcing institutional support and capacity: To guarantee the sustainability of environmental literacy programmes, there is the need for building institutional support and capacity. Hence, libraries, particularly public libraries should work collaboratively with governmental agencies, NGOs, environmental interest groups/organizations, and the academia so as to encourage environmental literacy initiatives.
- Revival of public libraries in the country: Reviving public libraries who are closer to the grassroots is another key strategy for overcoming the challenges. Improvement in funding, infrastructure and information resources in public libraries and all the other types of libraries is desirable. Similarly, community information services can contribute tremendously in promoting environmental literacy especially in the rural areas.
- Establishment of policies: To ensure the sustainability of environmental literacy programmes, there should be supportive policies in that regard.
- Improving community involvement in library activities: Libraries should proactively engage with the communities to nurture environmental literacy to ensure its sustainability. Libraries should offer programmes that may provide opportunities for active citizen engagement and participation focusing on environmental literacy.

Conclusion

This paper examines the role, potential as well as the challenges for the involvement of libraries in promoting environmental literacy and security in Nigeria. It also shows that investing in information and libraries is crucial to educational restructuring, literacy enhancement and societal transformation. Additionally, library programmes may provide opportunity for vibrant citizen engagement around environmental literacy and security. Hence, the role of the library in the advancement and sustenance of environmental literacy and security is regarded as critical. This paper concludes by stressing that libraries been institutions that provides free and reasonable access to information globally, Nigeria inclusive must ensure the provision and dissemination of adequate and relevant information to promote environmental literacy, inform and educate the citizenry to ensure improvement and sustainability of climate literacy in the country and to also ensure proper security for development.

Abstract

This study examined the role of the Nigerian Library Association in shaping librarians and information services professionals in Delta State, Nigeria. The study was necessitated by concerns over irregular participation in Association activities, inconsistent payment of membership dues, limited institutional support, and insufficient empirical evidence on the extent to which the Association contributes to professional competence, job performance, service delivery, and ethical practice among librarians. Seven objectives and corresponding research questions guided the study. The study adopted a descriptive survey research design of the correlational type. The population comprised 272 respondents, made up of 195 librarians in institutional libraries and 77 lecturers in library schools across tertiary institutions in Delta State. Since the population was relatively small, the total enumeration sampling technique was employed. Data were collected using a structured questionnaire titled *Questionnaire on the Role of the Nigerian Library Association in Shaping Librarians and Information Services Professionals in Delta State*. The instrument yielded a Cronbach's Alpha reliability coefficient of 0.99, indicating high internal consistency. Data were analysed using frequencies, percentages, mean scores, and standard deviation, with a criterion mean of 3.00. The findings revealed that most respondents were registered and active members of the Nigerian Library Association and participated moderately in its activities. The Association was found to positively influence professional skills and competence, improve job performance and service delivery, and promote professional ethics and standards to a high extent. However, participation was hindered by high membership dues, lack of time, heavy workload, inadequate institutional support, and transportation challenges. Suggested strategies included reducing membership dues, increasing local and online training programmes, improving communication, and enhancing institutional sponsorship of professional activities. The study concluded that the Nigerian Library Association remains a vital platform for professional development and service improvement. It is recommended that greater support and accessibility are needed to maximise its effectiveness.

Keywords: Nigerian Library Association, librarians, professional development, service delivery, professional ethics

Introduction

Professional associations play a vital role in the growth and regulation of professions worldwide. In the field of Library and Information Science (LIS), such associations are responsible for promoting professional standards, ethical conduct, continuing education, and the overall development of their members (Aina, 2014; Varlejs, 2016). These associations provide platforms for training, networking, advocacy, and promoting best practices that strengthen professional identity and service delivery. In Nigeria, the Nigerian Library Association (NLA) is the recognised national professional body for librarians and information services professionals. The Association organises annual national conferences, state chapter meetings, workshops, seminars, and continuing professional development (CPD) programmes aimed at improving professional competence, service delivery, and professional identity (Olorunsaye & Ayanyemi, 2016). Through these activities, the NLA seeks to enhance the capacity of librarians to meet contemporary information needs and uphold professional ethics.

In Delta State, the Nigerian Library Association operates through its state chapter, which brings together librarians and information professionals working in academic libraries, public libraries, school libraries, and special libraries. Through its activities, the Delta State Chapter of the NLA is expected to support professional development, promote ethical standards, encourage networking, and improve the quality of library and information services (Nigerian Library Association [NLA], 2025). In a rapidly changing information environment characterised by digital technologies, automation, and evolving user needs, librarians are required to continuously update their skills and knowledge. Scholars have emphasised that continuous professional development is essential for librarians to remain relevant and effective in-service delivery (Tshabalala & Dube, 2024). Professional bodies such as the NLA are therefore expected to play a key role in helping professionals in Delta State adapt to these changes through training, mentoring, and professional support.

Despite the important role of the Nigerian Library Association, the extent to which the Association actually influences the professional growth, competence, and job performance of librarians and information services professionals in Delta State remains unclear. Previous studies in Nigeria have focused mainly on national or regional assessments of professional development, with little empirical evidence specifically from Delta State (Olorunsaye &

Ayanyemi, 2016; Goshie *et al*., 2022). This study, therefore, seeks to empirically examine the role of the Nigerian Library Association in shaping librarians and information services professionals in Delta State.

Statement of the Problem

The Nigerian Library Association (NLA) was established to promote the interests of librarians, uphold professional ethics, and support the continuous development of library and information services professionals in Nigeria. Through conferences, workshops, seminars, and national and state chapter activities, the Association is expected to enhance professional competence and improve service delivery. However, observations suggest that many librarians and information services professionals in Delta State either do not actively participate in NLA activities at both national and state chapter levels, or are irregular in paying membership dues and attending conferences, workshops, and chapter meetings. Some professionals appear unaware of the benefits of NLA membership, while others are constrained by high membership dues, lack of time, limited institutional support, and poor access to professional development opportunities.

Furthermore, there is limited empirical evidence to show whether membership and participation in NLA activities actually lead to improved professional skills, better job performance, and enhanced service quality among librarians in Delta State. Without such evidence, it becomes difficult for stakeholders to justify investments in association activities or to design policies that encourage active professional participation. This gap in knowledge creates a problem that this study seeks to address by examining the role of the Nigerian Library Association in shaping librarians and information services professionals in Delta State.

Objectives of the Study

The main objective of the study is to examine the role of the Nigerian Library Association in shaping librarians and information services professionals in Delta State. The specific objectives of the study are to:

1. identify librarians' membership status in the Nigerian Library Association in Delta State;
2. examine the extent of librarians' participation in NLA activities in Delta State;
3. determine how NLA activities influence professional skills and competence;
4. assess the impact of the NLA on job performance and service quality;
5. examine the role of the NLA in promoting professional ethics and standards;
6. identify challenges that hinder participation in NLA activities in Delta State; and
7. suggest strategies for improving the effectiveness of the NLA in Delta State.

Research Questions

The following research questions were raised to guide the study.

1. Are librarians and information services professionals in Delta State members of the Nigerian Library Association?
2. To what extent do librarians in Delta State participate in NLA activities?
3. How does the NLA influence the skills and competence of the professionals?
4. What impact does the NLA have on job performance and service delivery?
5. How does the NLA promote professional ethics and standards?
6. What challenges hinder professionals' participation in NLA activities in Delta State?
7. What are the suggested strategies for improving the effectiveness of the NLA in Delta State?

Literature Review

A professional association is an organised body that represents individuals engaged in a particular profession and seeks to promote their collective interests, regulate professional conduct, and support continuous professional development. According to Banire (2025), professional associations exist primarily to enhance professional competence, uphold ethical standards, and provide a collective voice for advocacy and policy influence. Similarly, Carter and Mahallati (2017) described professional associations as formal organisations established to regulate entry into the profession, promote best practices, and protect professional integrity. Banire (2025) further noted that professional associations ensure accountability and maintain public trust through self-regulation and professional governance. Professional associations perform several interrelated functions that contribute to both individual and institutional development. These functions include setting professional standards, formulating and enforcing codes of ethics, organising training programmes, facilitating research dissemination, and representing the profession before policy makers and other stakeholders (Perlis & Shannon, 2012; Andrew & Friedman, 2023; Harvey *et al.*, 2014).

In librarianship, professional associations provide platforms for collaboration, training, networking, mentoring, and professional regulation. Opele (2023) observed that library associations create opportunities for librarians to acquire new skills and keep abreast of emerging trends in information management. Through conferences, workshops, seminars, and publications, associations promote lifelong learning and continuous professional development (Yadav, 2024; Abdul & Iddrisu, 2025). Membership in professional associations has also been found to strengthen professional identity, ethical awareness, and career development through networking, mentorship, and leadership training (Lysfjord & Skarstein, 2024; Ki & Wang, 2016). In addition, professional associations perform important advocacy and policy-influencing roles by engaging government and funding agencies and promoting the interests of the profession. Yahaya *et al.* (2019) and Obi and Mmejim (2019) reported that such associations influence legislation, funding priorities, and

national information policies. Ossai-Ugbah (2013) affirmed that advocacy, standard setting, accreditation, and professional regulation remain central to its mission. Through these combined functions, professional associations contribute significantly to professional identity formation, ethical practice, and the improvement of library and information services.

The Nigerian Library Association (NLA) is the recognised national professional body for librarians and information services professionals in Nigeria. It was established in 1962 with the primary objective of promoting library development, improving professional standards, and supporting the training and welfare of librarians (Aina, 2014; Nigerian Library Association [NLA], 2025). Since its establishment, the Association has served as the principal regulatory and advocacy body for the librarianship profession, providing leadership in professional development, ethical regulation, and policy engagement. The NLA operates through a national executive council and state chapters across the federation, including the Delta State Chapter, which enables the coordination of professional activities at both national and grassroots levels (NLA, 2025; Okiy, 2024). Through its state chapters, the Association fosters collaboration, peer learning, and professional networking among librarians working in different types of libraries.

The major activities of the NLA include organising annual national conferences, workshops, seminars, and continuing professional development (CPD) programmes aimed at enhancing professional competence and service delivery (Aslam, 2019). Daland (2015) reported that these programmes significantly improve librarians' technical competence, confidence, and effectiveness in service provision. In addition, the NLA promotes ethical conduct and professional standards through the formulation and enforcement of codes of ethics and professional guidelines (Atoyebi, 2025; Usman, 2024). According to Omotoso & Igiamoh (2016), these regulatory functions enhance professional discipline, accountability, and public trust in librarianship. The Association also performs important advocacy and policy-influencing roles by engaging government and other stakeholders in promoting library development and improved access to information (Ossai-Ugbah, 2013; Library, Information and Society, 2024). Through its combined roles in professional regulation, continuing education, ethical supervision, advocacy, and networking, the Nigerian Library Association remains a central institution in shaping the professional identity, competence, and service orientation of librarians and information services professionals in Nigeria.

Librarians and information services professionals are individuals trained to organise, manage, retrieve, preserve, and disseminate information resources in support of learning, research, decision-making, and lifelong education. According to Enakrire and Onyancha (2020), librarians apply specialised knowledge and skills in information organisation and dissemination to meet the information needs of diverse user communities, while Hamza *et al.* (2025) described information professionals as individuals responsible for the selection, organisation, retrieval, and delivery of information resources in various information environments. Librarians work in diverse settings such as academic, public, school, and special libraries, archives, and information centres, where they perform roles including collection development, cataloguing and classification, reference and information services, information literacy instruction, digital content management, and research support (Allen, & Taylor, 2017; Lo *et al.,* 2014; Briana, 2023). Through these functions, librarians contribute significantly to access to information, knowledge creation, and national development (Friday & Ekeruche, 2023).

In the contemporary information environment characterised by rapid technological advancement and digitisation, the competencies required of librarians have expanded considerably. Modern librarians are now expected to possess skills in digital librarianship, database management, metadata creation, institutional repository development, information literacy instruction, and the use of emerging information and communication technologies (Bolasco, 2023; Hamza *et al.,* 2025). Adekanye and Aina (2016) noted that these evolving responsibilities require continuous updating of technical, managerial, and pedagogical skills. Continuous professional development (CPD) is therefore essential for maintaining professional relevance, competence, and effectiveness in librarianship. CPD enables librarians to adapt to technological changes, improve service quality, and enhance research support services (Arua, 2022; Moonasar, 2024). Through continuous learning, mentoring, and professional association activities, librarians strengthen their professional identity, career development, and capacity to meet the evolving information needs of users in the digital age.

Professional development refers to a continuous process of learning activities aimed at enhancing professional knowledge, skills, attitudes, and competencies required for effective job performance. According to Nakaziba and Ngulube (2023), continuing professional development (CPD) enables librarians to adapt to technological changes, improve service quality, and enhance career prospects, while Mislan *et al.* (2020) defined CPD as a lifelong process through which information professionals maintain and update their competencies in response to changing professional demands. Professional development activities include formal education, in-service training, workshops, conferences, seminars, webinars, mentoring, and professional certification programmes (Shiri *et al.,* 2023). These activities improve technical competence, managerial capacity, research skills, communication ability, and ethical awareness among professionals. In librarianship, continuous professional development is particularly important due to rapid technological change, digitisation, and evolving user information needs. Ijeh *et al.* (2025) reported that librarians who participate regularly in professional development programmes demonstrate higher competence in digital librarianship, information literacy instruction, and research support services. Similarly, Moonasar (2024) observed that CPD significantly improves librarians' service delivery, professional confidence, and capacity for innovation. Professional associations play a central role in the coordination and delivery of CPD programmes by providing platforms for training, mentoring,

networking, and leadership development. Johnson (2019) further noted that active engagement in CPD enhances job performance, professional recognition, and commitment to professional ethics. Through continuous learning and skills development, CPD remains a fundamental mechanism for sustaining professional relevance and improving the quality of library and information services in the contemporary information environment.

Professional ethics refer to the moral principles and standards that guide professional behaviour, decision-making, and responsibility in professional practice. According to Sophie (2025), professional ethics provide a framework for acceptable conduct, accountability, and integrity among practitioners, while Chen (2024) defined professional ethics as guidelines that regulate behaviour and protect users' rights through fairness, transparency, and professional competence. In librarianship, professional ethics emphasize core values such as equitable access to information, intellectual freedom, respect for privacy and confidentiality, accuracy in information provision, neutrality, and commitment to quality service (Mahadevagouda & Pavithrabai, 2023). These principles guide librarians in their interactions with users, management of information resources, protection of personal data, and defence of users' right to access information without discrimination or censorship (Ashikuzzaman, 2025).

Professional associations play a central role in promoting ethical conduct through the formulation and enforcement of codes of ethics and professional guidelines. Okorie (2016) noted that professional associations defined ethical norms, regulate professional behaviour, and uphold the integrity of the profession, while Pamungkas and Munawir (2025) observed that adherence to ethical standards enhances public trust, professional credibility, and service quality. In Nigeria, the Nigerian Library Association (NLA) promotes ethical practice through codes of conduct and professional guidelines that address confidentiality, intellectual property rights, responsible information dissemination, and professional accountability (NLA, 2025; Afolayan, 2022). Yaya and Adeeko (2015) further reported that librarians who adhere to ethical standards demonstrate higher levels of professionalism, user satisfaction, and commitment to service excellence. By promoting ethical awareness and accountability, professional ethics remain fundamental to sustaining trust, credibility, and effectiveness in library and information services.

Career growth refers to professional advancement through promotions, leadership opportunities, specialization, skill development, and increased professional recognition. According to Faulkner and Reiter (2025), career growth in librarianship involves continuous skill acquisition, upward mobility, leadership development, and enhanced professional visibility, while Yaya and Adeeko (2015) noted that career progression is strongly influenced by continuous learning, professional networking, mentorship, and active participation in professional associations. Service quality refers to the extent to which library and information services meet users' needs in terms of effectiveness, efficiency, accuracy, timeliness, and user-centeredness. Ghaedi *et al.* (2020) defined service quality as the gap between users' expectations and their perceptions of service performance. In librarianship, service quality includes responsiveness to users, accessibility of information resources, reliability of services, and courteous interaction (Griadhi, 2018).

Participation in professional associations has been identified as a major factor influencing both career growth and service quality. Isabirye *et al.* (2024) reported that active involvement in professional associations enhances networking opportunities, mentorship, leadership skills, and professional visibility, thereby facilitating promotions and career advancement. Similarly, Miller (2025) observed that association membership provides access to training programmes, conferences, and leadership roles that significantly enhance career development. Professional associations also contribute to improved service quality by exposing members to best practices, innovative service models, and emerging technologies through conferences, workshops, and professional publications (Sawyer & Castellanos, 2022; Agarwal & Islam, 2016). Anene and Idiedo (2021) further reported that librarians who participate actively in professional development activities demonstrated higher service efficiency, innovation, and user satisfaction. By promoting continuous learning, networking, and professional recognition, professional associations remain key agents in advancing career growth and improving the quality of library and information services.

Methods

This study adopted a descriptive survey research design of the correlational type. The population of the study is 272 librarians, which comprises 195 librarians working in the institution's library and 77 lecturers working in the library schools drawn from all the tertiary institutions in Delta State, Nigeria. The entire population was used as the sample size since the population figure is relatively small. Therefore, the total enumeration sampling technique was employed. Data were collected using a structured questionnaire titled Questionnaire on the Role of the Nigerian Library Association (NLA) in Shaping Librarians and Information Services Professionals in Delta State. The questionnaire consisted of eight sections (A–H) and comprised only closed-ended items to facilitate ease of response and data coding. Section A elicited demographic information such as gender, age, qualification, institution and years of experience. Section B-H contained constructs on related to the objectives of the study.

The reliability of the instrument was determined using Cronbach's Alpha, which yielded a reliability coefficient of 0.99, indicating a high level of internal consistency. Data were analysed using both descriptive and inferential statistical techniques. Descriptive statistics, including frequencies, were used to analyse the response rate and demographic characteristics of the respondents. Mean scores ($\bar{x}$) and standard deviation were used to answer research questions with a criterion mean set at 3.00.

Results

Table 2: Questionnaire Response Rate

No. of Questionnaire Administered	No. of Questionnaire Retrieved	Percentage of Questionnaire Retrieved
272	179	66%

Table 2 shows that a total of 272 questionnaires were administered to the respondents, out of which 179 questionnaires were successfully retrieved, representing a 66% response rate. This indicates that slightly over two-thirds of the distributed questionnaires were returned and found usable for the study, while 34% were not retrieved, due to non-response, incomplete filling, or loss of questionnaires during the administration process. A 66% response rate can be considered reasonably good for survey research, as it provides an adequate number of responses for meaningful data analysis and enhances the credibility of the findings.

Table 3: Gender of the Respondents

Gender	Frequency	Percentage
Male	60	33.5
Female	119	66.5
Total	179	100.0

The data show that 60 respondents (33.5%) were male, while 119 respondents (66.5%) were female, making up the total of 179 respondents (100.0%). This indicates that female respondents constituted the majority of the study participants.

Table 4: Age of the Respondents

Age	Frequency	Percentage
20-29 years	21	11.7
30-39 years	51	28.5
40-49 years	39	21.8
50 years and above	68	38.0
Total	179	100.0

The data revealed that 21 respondents (11.7%) were within the age range of 20–29 years, 51 respondents (28.5%) were aged 30–39 years, 39 respondents (21.8%) fell within 40–49 years, while the largest proportion, 68 respondents (38.0%), were 50 years and above. The findings indicated that respondents aged 50 years and above constituted the highest proportion of the sample.

Table 5: Highest Qualification

Qualification	Frequency	Percentage
BLS/BLIS/B.Sc.	41	22.9
M.Sc./MLIS	86	48.0
Ph.D.	52	29.1
Total	179	100.0

The data showed that 41 respondents (22.9%) possessed BLS/BLIS/B.Sc. qualifications, 86 respondents (48.0%) had M.Sc./MLIS qualifications, while 52 respondents (29.1%) possessed Ph.D. qualifications. The findings indicated that respondents with M.Sc./MLIS qualifications constituted the largest proportion of the study participants.

Table 6: Institution of the Respondents

Institutions	Frequency	Percentage
Universities	111	62.0
Polytechnics	32	17.9
Colleges of Education and Institutions	36	20.1
Total	179	100.0

The data revealed that 111 respondents (62.0%) were drawn from universities, 32 respondents (17.9%) were from polytechnics, while 36 respondents (20.1%) were from colleges of education and related institutions. The findings indicated that respondents from universities constituted the largest proportion of the study participants.

Table 7: Years of Experience

Qualification	Frequency	Percentage
1-5 years	20	11.2
6-10 years	35	19.6
11-15 years	56	31.3
16 years and above	68	37.9
Total	179	100.0

The data showed that 20 respondents (11.2%) had 1–5 years of experience, 35 respondents (19.6%) had 6–10 years of experience, 56 respondents (31.3%) had 11–15 years of experience, while the largest proportion, 68 respondents (37.9%), had 16 years and above of work experience. The findings indicated that respondents with 16 years and above of experience constituted the highest proportion of the study participants.

Research Question 1: Are librarians and information services professionals in Delta State members of the Nigerian Library Association?

Table 8: Membership of NLA

S/N	Items	Yes	%	No	%
1	I am a registered member of the Nigerian Library Association	137	76.5	42	23.5
2	I am an active financial member of the NLA	160	89.4	19	10.6
3	I belong to the Delta State Chapter of the NLA	140	78.2	39	21.8

The data showed that 137 respondents (76.5%) indicated that they are registered members of the NLA. Also, 160 respondents (89.4%) stated that they are active financial members of the NLA. Furthermore, 140 respondents (78.2%) affirmed that they belong to the Delta State Chapter of the NLA. The findings indicated that the majority of the respondents are affiliated with the NLA in one form or another, with a particularly high proportion being active financial members, which recorded the highest percentage among the three membership indicators. Similarly, a substantial proportion of respondents are registered members and belong to the Delta State Chapter of the association. This suggests that most of the respondents maintain professional ties with the recognised library association in Nigeria, reflecting a strong level of professional engagement, commitment to librarianship, and participation in professional networks that may contribute to their knowledge, competencies, and exposure to developments in the library profession.

Research Question 2: To what extent do librarians in Delta State participate in NLA activities?

Table 9: Participation in NLA Activities

S/N	Items	SA	A	U	D	SD	$\bar{x}$	Std. Dev.
1	I regularly attend NLA conferences and workshops	58	53	0	47	21	3.45	1.46
2	I participate in NLA seminars and training programmes	42	19	0	60	58	2.59	1.59
3	I attend meetings organised by the Delta State Chapter of NLA	70	35	10	44	20	3.51	1.49
4	I actively contribute to NLA professional activities	54	54	15	35	21	3.47	1.40
5	My institution supports my participation in NLA activities	20	20	10	72	57	2.30	1.32
	Aggregate Mean						3.06	1.45
	Criterion Mean						3.00	

The results showed that respondents agreed that they regularly attend NLA conferences and workshops with a mean score of 3.45 and a standard deviation of 1.46, attend meetings organised by the Delta State Chapter of NLA with a mean score of 3.51 and a standard deviation of 1.49, and actively contribute to NLA professional activities with a mean score of 3.47 and a standard deviation of 1.40, as these mean values are above the criterion mean of 3.00.

The aggregate mean score of 3.06, which is slightly above the criterion mean of 3.00, indicated that librarians in Delta State participate in NLA activities to a moderate extent. This suggests that while librarians are fairly active in attending conferences, meetings, and contributing to professional activities, their participation is somewhat constrained by limited institutional support and relatively low involvement in seminars and training programmes.

Research Question 3: How does the NLA influence the skills and competence of the professionals?

Table 10: Influence of **NLA on Skills and Competence of Professionals**

S/N	Items	SA	A	U	D	SD	$\bar{x}$	Std. Dev.
1	NLA programmes have improved my professional skills	35	40	10	30	64	2.73	1.60
2	NLA activities have enhanced my digital librarianship skills	20	35	15	45	64	2.45	1.43
3	NLA training programmes have improved my research support skills	72	48	5	32	22	3.65	1.46

4	Participation in NLA activities has increased my professional competence	84	50	0	20	25	3.83	1.47
5	NLA has helped me to keep abreast of new trends in librarianship	50	44	10	35	40	3.16	1.56
	Aggregate Mean						3.16	1.50
	Criterion Mean						3.00	

The results showed that respondents agreed that NLA training programmes have improved their research support skills with a mean score of 3.65 and a standard deviation of 1.46, participation in NLA activities has increased their professional competence with a mean score of 3.83 and a standard deviation of 1.47, and that NLA has helped them keep abreast of new trends in librarianship with a mean score of 3.16 and a standard deviation of 1.56, as these mean values are above the criterion mean of 3.00.

The aggregate mean score of 3.16, which is above the criterion mean of 3.00, indicated that the Nigerian Library Association positively influences the skills and competence of library professionals to a considerable extent. This suggests that the association plays an important role in enhancing professional competence, strengthening research support skills, and exposing professionals to current developments in librarianship. However, the relatively lower ratings on professional skill improvement and digital librarianship skills imply that the NLA may need to strengthen its focus on practical professional development programmes, particularly in digital and technology-driven aspects of library practice, to better meet the evolving competence needs of library professionals.

Research Question 4: What impact does the NLA have on job performance and service delivery?

Table 11: Impact of NLA on Job Performance and Service Delivery

S/N	Items	SA	A	U	D	SD	$\bar{x}$	Std. Dev.
1	NLA activities have improved my behind-the-scenes job performance	74	45	10	15	35	3.60	1.56
2	Participation in NLA programmes has improved my service delivery	70	50	5	20	34	3.57	1.55
3	NLA training has increased my confidence in handling users' needs	82	48	10	21	18	3.87	1.37
4	My productivity has improved as a result of NLA participation	78	64	15	10	12	4.05	1.15
5	NLA activities have enhanced user satisfaction in my library	80	72	10	20	3	4.18	0.97
	Aggregate Mean						3.85	1.32
	Criterion Mean						3.00	

The results showed that respondents agreed that NLA activities have improved their behind-the-scenes job performance with a mean score of 3.60 and a standard deviation of 1.56, participation in NLA programmes has improved their service delivery with a mean score of 3.57 and a standard deviation of 1.55, NLA training has increased their confidence in handling users' needs with a mean score of 3.87 and a standard deviation of 1.37, their productivity has improved as a result of NLA participation with a mean score of 4.05 and a standard deviation of 1.15, and NLA activities have enhanced user satisfaction in their libraries with a mean score of 4.18 and a standard deviation of 0.97, as all the mean scores are above the criterion mean of 3.00.

The aggregate mean score of 3.85, which is significantly above the criterion mean of 3.00, indicates that the Nigerian Library Association has a high positive impact on librarians' job performance and service delivery. This suggests that participation in NLA activities contributes substantially to improved work efficiency, greater professional confidence, enhanced productivity, and better user satisfaction in library services.

Research Question 5: How does the NLA promote professional ethics and standards?

Table 12: Promotion of Professional Ethics and Standards by NLA

S/N	Items	SA	A	U	D	SD	$\bar{x}$	Std. Dev.
1	The NLA promotes adherence to professional ethical standards	60	40	20	45	14	3.49	1.38
2	NLA guidelines help me to handle users ethically and professionally	89	58	10	22	2	4.21	1.01
3	NLA promotes confidentiality and the protection of users' information	90	74	0	5	10	4.28	1.02

4	Ethical standards promoted by NLA improve service quality in my library	98	70	5	0	6	4.42	0.84
	Aggregate Mean						4.10	1.06
	Criterion Mean						3.00	

The results showed that respondents agreed that the NLA promotes adherence to professional ethical standards with a mean score of 3.49 and a standard deviation of 1.38, NLA guidelines help them handle users ethically and professionally with a mean score of 4.21 and a standard deviation of 1.01, NLA promotes confidentiality and the protection of users' information with a mean score of 4.28 and a standard deviation of 1.02, and that ethical standards promoted by NLA improve service quality in their libraries with a mean score of 4.42 and a standard deviation of 0.84, as all the mean scores are above the criterion mean of 3.00.

The aggregate mean score of 4.10, which is well above the criterion mean of 3.00, indicates that the Nigerian Library Association promotes professional ethics and standards to a high extent. This suggests that the association plays a significant role in reinforcing ethical behaviour, encouraging professional responsibility, and guiding librarians toward best practices in service delivery.

Research Question 6: What challenges hinder professionals' participation in NLA activities in Delta State?

Table 13: Challenges Hindering Professionals' Participation in NLA Activities

S/N	Items	SA	A	U	D	SD	$\bar{x}$	Std. Dev.
1	High membership dues discourage my participation in NLA activities	90	80	0	3	6	4.37	0.86
2	Lack of time prevents me from participating actively in NLA programmes	84	94	0	0	1	4.45	0.56
3	Heavy workload limits my participation in NLA activities	74	80	3	10	12	4.08	1.12
4	Lack of institutional support affects my participation in NLA activities	100	74	0	0	5	4.47	0.77
5	Distance and transportation challenges limit my participation	92	64	5	5	13	4.21	1.13
	Aggregate Mean						4.32	0.89
	Criterion Mean						3.00	

The results show that respondents agreed that high membership dues discourage participation in NLA activities with a mean score of 4.37 and a standard deviation of 0.86, lack of time prevents active participation in NLA programmes with a mean score of 4.45 and a standard deviation of 0.56, heavy workload limits participation in NLA activities with a mean score of 4.08 and a standard deviation of 1.12, lack of institutional support affects participation in NLA activities with a mean score of 4.47 and a standard deviation of 0.77, and distance and transportation challenges limit participation with a mean score of 4.21 and a standard deviation of 1.13, as all the mean scores are above the criterion mean of 3.00.

The aggregate mean score of 4.32, which is substantially above the criterion mean of 3.00, indicates that professionals in Delta State face significant challenges that hinder their participation in NLA activities. This suggests that factors such as inadequate institutional backing, time constraints, heavy workloads, financial commitments, and transportation difficulties considerably reduce active engagement in the association's programmes and activities.

Research Question 7: What are the suggested strategies for improving the effectiveness of the NLA in Delta State?

Table 14: Suggested Strategies for Improving the Effectiveness of NLA Activities

S/N	Items	SA	A	U	D	SD	$\bar{x}$	Std. Dev.
1	Reduction of membership dues will increase participation in NLA activities	90	74	0	10	5	4.28	1.02
2	More local training programmes should be organised by the NLA	84	80	5	0	10	4.27	0.97
3	Online training platforms should be increased by the NLA	100	64	5	0	10	4.36	0.98
4	Institutions should sponsor librarians to attend NLA programmes	100	74	0	2	3	4.49	0.72
5	Improved communication between NLA and members will enhance effectiveness	95	65	5	9	5	4.32	0.96
	Aggregate Mean						**4.34**	**0.93**

Criterion Mean	3.00

The results showed that respondents agreed that reduction of membership dues will increase participation in NLA activities with a mean score of 4.28 and a standard deviation of 1.02, more local training programmes should be organised by the NLA with a mean score of 4.27 and a standard deviation of 0.97, online training platforms should be increased by the NLA with a mean score of 4.36 and a standard deviation of 0.98, institutions should sponsor librarians to attend NLA programmes with a mean score of 4.49 and a standard deviation of 0.72, and improved communication between NLA and members will enhance effectiveness with a mean score of 4.32 and a standard deviation of 0.96, as all the mean scores are above the criterion mean of 3.00.

The aggregate mean score of 4.34, which is well above the criterion mean of 3.00, indicates that respondents strongly support the suggested strategies for improving the effectiveness of NLA activities in Delta State. This suggests that reducing financial barriers, expanding training opportunities—especially through online platforms—encouraging institutional sponsorship, and strengthening communication with members are practical and highly valued approaches for enhancing participation and overall effectiveness of the Nigerian Library Association.

Discussion

The finding revealed that a substantial majority of the respondents were registered members of the Nigerian Library Association, were active financial members, and belonged to the Delta State Chapter of the association. This finding agrees with Banire (2025), who noted that professional associations exist to promote collective professional interests, competence development, and professional identity. It also aligns with Lysfjord and Skarstein (2024) and Ki and Wang (2016), who reported that membership in professional associations strengthens professional identity, ethical awareness, and career development through networking and professional engagement. In my opinion, this finding is in clear agreement with the literature because active membership reflects librarians' recognition of the value of professional association affiliation in career growth and professional relevance.

The finding showed that librarians in Delta State participate in Nigerian Library Association activities to a moderate extent, particularly in conferences, workshops, meetings, and professional contributions, although participation in seminars and institutional support were relatively low. This finding supports Opele (2023), Yadav (2024), and Abdul and Iddrisu (2025), who observed that professional associations provide platforms for training, collaboration, and continuous learning through conferences, workshops, and seminars. However, the limited institutional support aspect reflects a slight divergence from Johnson (2019), who emphasized organisational encouragement as critical for sustained professional engagement. In my view, the finding substantially aligns with previous studies, though institutional backing remains an area requiring improvement.

The finding indicated that the Nigerian Library Association positively influences librarians' skills and competence, especially in research support, professional competence, and awareness of emerging trends, though digital librarianship skills received comparatively lower ratings. This finding agrees with Daland (2015), who reported that association programmes significantly improve librarians' technical competence, confidence, and effectiveness, and with Nakaziba and Ngulube (2023), who affirmed that continuous professional development enhances professional knowledge and competence. However, the lower rating on digital skills slightly contrasts with Ijeh *et al*. (2025), who found stronger gains in digital librarianship competence through professional development. In my opinion, the finding generally aligns with literature, but suggests that more targeted digital competency programmes are needed.

The finding revealed that participation in Nigerian Library Association activities has a high positive impact on job performance and service delivery, particularly in productivity, confidence in handling users' needs, and user satisfaction. This finding is consistent with Moonasar (2024), who reported that continuous professional development improves service delivery, professional confidence, and innovation, and with Anene and Idiedo (2021), who found that active professional development participation enhances service efficiency and user satisfaction. It also aligns with Sawyer and Castellanos (2022), who linked professional association participation with improved service quality. In my opinion, this finding strongly agrees with existing studies because improved competence naturally translates into better service delivery outcomes.

The finding showed that the Nigerian Library Association promotes professional ethics and standards to a high extent by encouraging ethical conduct, confidentiality, professionalism, and improved service quality. This finding agrees with Okorie (2016), who noted that professional associations define ethical norms and regulate professional behaviour, and with Pamungkas and Munawir (2025), who observed that adherence to ethical standards enhances public trust and service quality. It also supports Yaya and Adeeko (2015), who linked ethical compliance with professionalism and service excellence. In my opinion, the finding is strongly aligned with the literature because ethics remains central to trust, accountability, and quality library service.

The finding revealed that high membership dues, lack of time, heavy workload, lack of institutional support, and transportation challenges significantly hinder professionals' participation in Nigerian Library Association activities. This partially agrees with Johnson (2019), who recognised organisational support and engagement conditions as vital for professional participation, and with Mislan *et al.* (2020), who stressed that sustained professional development depends on enabling structures and opportunities. However, the severity of these barriers suggests that practical constraints may be stronger in the Delta State context than implied in some prior studies. In my opinion, while the

finding aligns with literature on participation barriers, it also highlights local contextual challenges that require deliberate intervention.

The finding showed that respondents strongly supported reducing membership dues, increasing local and online training programmes, institutional sponsorship, and improved communication between the Nigerian Library Association and members as strategies for improving effectiveness. This finding agrees with Shiri *et al.* (2023), who emphasised the value of diverse professional development platforms including webinars and training programmes, and with Miller (2025), who noted that institutional support and access to association programmes significantly enhance professional engagement and career development. It also aligns with Banire (2025), who stressed that professional associations must remain responsive to members' needs to sustain relevance. In my opinion, this finding is in full agreement with prior studies because improving accessibility, affordability, and communication will likely strengthen participation and overall association effectiveness.

Conclusion

Based on the findings of the study, it was concluded that the Nigerian Library Association plays a significant role in the professional development of librarians in Delta State. The Association has positively influenced librarians' professional competence, research support skills, job performance, service delivery, and adherence to professional ethics and standards. It has also provided an important platform for professional networking, collaboration, and continuous learning. However, despite the high level of membership and the recognised benefits of participation, librarians' involvement in some NLA programmes is hindered by challenges such as inadequate institutional support, high membership dues, heavy workload, time constraints, and transportation difficulties. The study therefore concludes that while the NLA remains a vital professional body for librarianship development in Delta State, deliberate efforts are needed to address participation barriers and strengthen the effectiveness of its programmes and services.

Recommendations

Based on the findings of the study, the following recommendations are made:

1. Universities, polytechnics, colleges of education, and other information institutions in Delta State should provide financial and administrative support to enable librarians to attend Nigerian Library Association conferences, workshops, seminars, and continuing professional development programmes without undue personal financial burden.
2. Since the study revealed relatively low influence of the Association on digital librarianship skills, the Nigerian Library Association should organise more specialised training in areas such as digital librarianship, database management, institutional repository development, artificial intelligence applications in libraries, and emerging information technologies.
3. Considering that high membership dues were identified as a major challenge, the Association should consider introducing flexible payment structures, instalment plans, or subsidised membership categories to encourage wider participation among professionals.
4. To address distance, transportation, and time constraints, the Nigerian Library Association should expand state-level and zonal training programmes while also increasing virtual conferences, webinars, and online workshops to make professional development more accessible.
5. Employers of librarians should reduce workload pressures where possible, grant study leave or official release time for professional activities, and recognise participation in professional association programmes as part of staff development and performance enhancement.
6. The Association should strengthen its communication channels through regular updates, newsletters, active social media engagement, and timely dissemination of information on programmes, opportunities, and professional initiatives to improve awareness and participation.
7. Since attendance at seminars and structured training programmes was relatively low, deliberate efforts should be made by both the Nigerian Library Association and employing institutions to motivate librarians through incentives, recognition, and career advancement considerations tied to active professional development participation.

Abstract

This paper examined the current state of academic libraries in Nigeria, identifying the prevalent problems and proposing potential solutions and ways forward. The paper focused on the challenges encountered by academic libraries in Nigeria, such as inadequate funding, outdated technology, and limited resources to mention just a few. The paper identified key areas that need to be addressed in order to improve the functionality and effectiveness of academic libraries. Through a comprehensive analysis of existing literature, the paper provided insight into the current state of academic libraries in Nigeria and suggest ways to improve their functionality and efficiency. This paper concluded that addressing these key issues will contribute to the development of academic libraries in Nigeria and enhance the overall quality of education in the country.

Keywords: Academic libraries, Challenges, Way forward

Introduction

Academic libraries are the intellectual hubs of tertiary institutions, encompassing universities, polytechnics, and colleges of education. Their primary mandate is to support the teaching, learning, and research activities of their parent institutions by providing access to a wide array of information resources. The academic library is an important academic unit in higher education because it provides information in various formats to support the teaching, learning and research objectives of the parent institution. Omeluzor et al. (2017) posited that the academic library is an established and organised arm of an institution with a clear mandate of providing relevant and up to date library collections that meet the information need of users. The aim of an academic library is to acquire information resources in different formats, in various fields of human knowledge and to process, organise, disseminate and provide access to them.

In the Nigerian context, the development of academic libraries has been intrinsically linked to the growth of higher education, which has expanded significantly since the establishment of the University College, Ibadan, in 1948. These libraries are not merely repositories of books; they are strategic national assets that drive development by fostering a knowledge-based society. They are instrumental in cultivating a skilled workforce, stimulating national innovation, and contributing to global initiatives such as the "Education for All" agenda and the United Nations Sustainable Development Goals (SDGs), particularly SDG 4 (Quality Education) (Nworie et al., 2023).

However, the 21st century has brought about a paradigm shift in the way information is created, stored, and accessed. The transition from traditional print-based services to digital and hybrid models has presented both opportunities and formidable challenges for Nigerian academic libraries. While these institutions are essential for fostering information literacy and academic excellence, they are currently grappling with systemic issues that threaten their functionality and relevance. The problem statement for this study is rooted in the observation that despite their critical role in national development and the significant investments made, Nigerian academic libraries consistently underperform due to persistent challenges in funding, technology adoption, and infrastructure, leading to a widening gap between their potential and actual impact on education and research.

This paper provides a comprehensive analysis of these challenges, integrating insights from recent research and international comparisons, to delineate a sustainable path forward. Specifically, this paper aims to:

1. Provide a comprehensive overview of the current state of academic libraries in Nigeria, including relevant statistics on higher education.
2. Identify and critically analyze the key challenges impeding their effective functioning, such as funding, technological gaps, and infrastructure deficits.
3. Examine the impact of regulatory frameworks and interventions, including NUC standards and TETFund, on library development.
4. Compare the state of Nigerian academic libraries with those in other African and developed nations, highlighting areas for learning and improvement.

5. Propose actionable strategies and recommendations for their sustainable improvement, focusing on digital transformation and knowledge society development.

As of 2024, Nigeria's higher education landscape comprises over 270 universities (Federal, State, and Private), catering to a student population exceeding 2 million (Mbagwu & Udo-Anyanwu, 2021). Despite this vast educational infrastructure, only few Nigerian universities feature in global rankings like the Times Higher Education (THE) World University Rankings, a situation often attributed to deficiencies in library and research infrastructure. This disparity underscores the urgent need for a strategic overhaul of the Nigerian library system to align with global standards.

Historical Evolution of Academic Libraries in Nigeria

The trajectory of academic libraries in Nigeria can be categorized into several distinct eras, each characterized by different priorities and challenges. According to Nworie et al. (2023), these stages include the pre-colonial, colonial, independence, post-independence, and the current 21st-century digital era. During the colonial period, libraries were primarily established to serve the administrative needs of the colonial government and a small elite. The post-independence era saw a rapid expansion of tertiary institutions, leading to the establishment of more robust library systems designed to support national development.

In the contemporary era, the focus has shifted toward the integration of Information and Communication Technologies (ICTs). The emergence of the digital age has necessitated a move toward electronic resources, virtual libraries, and global information networks. However, this evolution has not been uniform across all institutions. While some first-generation universities have made significant strides in automation, many newer and state-owned institutions remain stuck in traditional modes of operation due to resource constraints.

- **National Universities Commission (NUC) Library Standards**

The National Universities Commission (NUC) plays a crucial regulatory role in ensuring quality assurance and maintaining academic standards in Nigerian higher education. The NUC sets Minimum Academic Standards (MAS) for university libraries, which encompass comprehensive guidelines for collection development, staffing, physical infrastructure, and service provision. A critical, albeit often unenforced, standard is the directive for universities to allocate at least 10% of their recurrent budget to the library (Mbagwu & Udo-Anyanwu, 2021). This mandate, established to ensure libraries are adequately funded to support academic programs and research, has been a cornerstone of library advocacy, though its consistent implementation remains a challenge.

- **Tertiary Education Trust Fund (TETFund) Interventions**

The Tertiary Education Trust Fund (TETFund) has emerged as a significant financial lifeline for academic libraries in Nigeria, particularly since its establishment. TETFund interventions provide substantial funding for various aspects of library development, including the construction and renovation of library buildings, acquisition of books and journals, subscription to electronic databases, and staff training and development (Adetarami & Okeke, 2024). These interventions have demonstrably improved library resources and infrastructure in many institutions, facilitating access to a wider array of scholarly materials and enhancing the physical learning environment. However, challenges persist in maximizing their impact, ensuring equitable distribution, and fostering long-term sustainability beyond direct grants.

- **Establishment of Virtual Libraries**

Recognizing the imperative of digital access, Nigeria embarked on initiatives to establish virtual libraries. The National Virtual Library Project, launched around 2002, aimed to provide centralized access to electronic resources for all tertiary institutions, thereby bridging the digital divide and enhancing scholarly communication (Ogunode & Agbor, 2024). While the project faced implementation challenges, it represented a significant milestone in the country's commitment to digital librarianship and resource sharing.

- **Growth of Consortia Initiatives**

The growth of library consortia, such as the Nigerian University Libraries Consortium (NULIB), represents another major milestone in the historical evolution of academic libraries. These consortia facilitate collective bargaining for database subscriptions, inter library loan services, and collaborative collection development, enabling member libraries to access a broader range of resources at reduced costs (Adeyemi et al., 2025). Such initiatives are crucial for maximizing limited resources and fostering a culture of cooperation among institutions.

The Current Landscape: Funding and Economic Constraints

The most pervasive challenge facing academic libraries in Nigeria is inadequate funding. Academic libraries are traditionally funded through budgetary allocations from their parent institutions, which in turn rely on government

subventions. In recent years, consistent dwindling budgetary allocations have severely hampered the ability of libraries to maintain their collections and services (LJLIS, 2025).

- Inflation and Exchange Rate Fluctuations: The volatile Nigerian economy, characterized by high inflation and significant fluctuations in the Naira's exchange rate against major international currencies, has drastically increased the cost of foreign book purchases and database subscriptions (e.g., ScienceDirect, JSTOR). This economic instability leads to what has been termed "information starvation," as libraries struggle to acquire essential current resources (Adetayo, 2024).
- Sustainability of Database Subscriptions: The high cost of international electronic databases and journals, coupled with unstable funding, makes the sustainability of these crucial subscriptions a constant battle. Many libraries are forced to cancel subscriptions, limiting access to cutting-edge research for their users.
- Competition for Institutional Budgets: Libraries often face intense competition for institutional budgets, frequently losing out to other departments despite the NUC's 10% budgetary allocation directive. This internal competition further exacerbates financial woes, making it difficult to invest in new technologies or expand services.

Impact of Poor Funding: Inadequate funding has severe repercussions across several critical areas:

- Accreditation: Libraries unable to meet NUC standards for resources, staffing, and infrastructure risk negatively impacting their parent institutions' accreditation status, potentially leading to sanctions or loss of program approval (Mbagwu & Udo-Anyanwu, 2021).
- Research Output: Limited access to current scholarly journals and databases directly hinders the quality and quantity of research conducted by faculty and students, thereby affecting the institution's overall research output and global competitiveness (Kakiri et al., 2024).
- User Satisfaction: The inability to provide up-to-date resources, modern facilities, and efficient services leads to low user satisfaction, discouraging students and researchers from utilizing library facilities and services.

The impact of poor funding is multifaceted. Firstly, it limits the acquisition of current and relevant information resources. Kakiri et al. (2024) observed that many Nigerian academic libraries are unable to purchase modern reference materials, leading to an over-reliance on outdated textbooks. Secondly, the high cost of information resources, exacerbated by fluctuating exchange rates, makes it difficult for libraries to subscribe to international electronic databases and journals. Mamman and Nwokedi (2019) highlighted that poor availability of information resources is a direct consequence of this financial starvation, which ultimately affects the productivity of researchers and the quality of student learning.

Furthermore, the proliferation of tertiary institutions in Nigeria without a corresponding increase in funding has stretched existing resources thin. As noted by Onuoha and Chukwueke (2020), many libraries are now forced to explore additional income-generating patterns, such as consultancy and fee-based services, to bridge the funding gap.

Technological Challenges and the Digital Divide

The integration of ICT is no longer a luxury but a necessity for modern academic libraries. However, the adoption of technology in Nigerian libraries is fraught with obstacles. Tella et al. (2025) argued that while libraries in Nigeria have been adopting ICT for decades, they have yet to fully embrace Fourth Industrial Revolution (4IR) technologies, such as Artificial Intelligence (AI), Internet of Things (IoT), and robotics.

Several factors contribute to this technological lag:

1. Infrastructure Deficits: Persistent power outages and inadequate internet bandwidth remain significant barriers to the effective use of digital resources (Suleiman et al., 2025).
2. High Costs: The initial investment required for hardware, software, and periodic technological upgrades is often beyond the reach of many libraries (Sage, 2025).
3. Skills Gap: There is a notable disparity between the technological requirements of modern librarianship and the actual skills possessed by many librarians. Oladokun (2024) emphasized the need for continuous professional development to bridge this gap and prepare staff for smart library environments.

The result is a “digital divide” where Nigerian students and researchers have limited access to the same global information resources as their counterparts in developed.

- AI-driven Library Services: While globally, AI is being explored for personalized user services, chatbots for reference, automated cataloging, and enhanced discovery tools, its adoption in Nigerian academic libraries is

still in its infancy (Oladokun, 2025). Challenges include the high cost of AI solutions, lack of technical expertise, and inadequate data infrastructure.

- Cyber-security: With increased reliance on digital resources and institutional repositories, cyber-security threats pose a significant risk to library data, intellectual property, and user privacy. Many Nigerian libraries lack robust cyber-security infrastructure, policies, and trained personnel to effectively mitigate these risks.
- Digital Literacy: A significant digital divide exists, impacting both users and librarians. User readiness for digital resources is often low due to limited access to personal devices and Internet connectivity. Concurrently, librarians' digital competencies often lag behind the requirements of modern librarianship, necessitating continuous professional development in areas such as data management, digital preservation, and emerging technologies (Orubebe, 2024).
- Research Data Management (RDM): The increasing volume of research data necessitates robust RDM practices. While institutional repositories are essential for showcasing an institution's research output, many Nigerian universities struggle to implement comprehensive RDM services due to a lack of technical support, institutional policy gaps, and insufficient librarian training in data curation and management (Oladokun, 2024).

Infrastructure and Resource Management

Beyond funding and technology, the physical and digital infrastructure of many Nigerian academic libraries is in a state of decline. Many library buildings are outdated, with poor ventilation and inadequate seating capacity for the growing student population. The lack of modern library furniture and conducive learning environments further discourages students from utilizing library facilities.

In terms of digital resources, the management of institutional repositories is another area of concern. While repositories are essential for showcasing an institution's research output, many Nigerian universities struggle to maintain them due to lack of technical support and institutional policy gaps. Comparatively, studies in East Africa (Tanzania, Kenya, and Uganda) show similar struggles with institutional repositories, highlighting a regional trend of infrastructure and policy deficiencies (IASSIST, 2024).

Moreover, the global shift toward sustainability has yet to gain significant traction in Nigerian libraries. While green library initiatives are becoming a standard in developed nations, AJHSSR (2024) noted that Nigerian academic libraries face challenges in implementing such initiatives due to limited awareness and the overarching problem of funding.

- Physical Infrastructure: Many library buildings are outdated, characterized by poor ventilation, inadequate seating capacity, and a lack of modern furniture, which discourages students from utilizing facilities. The focus needs to expand beyond just the physical structures to include the effective and efficient management of all information resources, both print and digital.
- Information Resource Management: This encompasses the systematic acquisition, organization, preservation, and dissemination of all types of information resources. Challenges include outdated cataloging systems, inadequate digital preservation strategies, and difficulties in integrating diverse electronic resources into a cohesive and user-friendly access system.
- Open Science Initiatives: The global shift towards Open Science and Open Access (OA) aims to make research freely available and transparent. While there is growing interest in OA in Nigeria as a means to bypass subscription costs, the country lacks a unified national Open Science policy, and implementation faces challenges related to infrastructure, funding, and awareness among researchers and librarians (Oladokun, 2024).

Comparative Analysis: Nigeria in the African and Global Context

To fully understand the state of Nigerian academic libraries, it is useful to compare them with their peers in other developing and developed nations. In Sub-Saharan Africa, countries like Kenya and Ghana face similar chronic financial constraints and infrastructure deficits (AJLAIS, 2024). However, South Africa generally exhibits a higher level of 4IR readiness and better-funded library systems, providing a potential model for Nigerian institutions.

Globally, the 2024-2025 trends in academic libraries, as reported by the Association of College and Research Libraries (ACRL), focus heavily on AI integration, Research Data Management (RDM), and the ethical use of technology (ACRL, 2025). In contrast, many Nigerian libraries are still struggling with basic ICT integration and stable power supply. This disparity underscores the urgent need for a strategic overhaul of the Nigerian library system to align with global standards.

Potential Solutions and the Way Forward

Addressing the challenges of academic libraries in Nigeria requires a multi-pronged approach involving government intervention, institutional leadership, and the proactive engagement of librarians.

- **Diversification of Funding Sources**

Relying solely on government subventions is no longer sustainable. Academic libraries must explore alternative funding models, such as:

1. Public-Private Partnerships (PPP): Collaborating with private organizations for infrastructure development and technology acquisition.
2. Alumni and Philanthropic Support: Engaging alumni networks and philanthropic foundations to fund specific projects or endowments.
3. Income Generation: Developing fee-based specialized services, such as data analysis, document delivery, and information consultancy (Onuoha & Chukwueke, 2020).

- **Strategic Technological Investment**

Instead of piecemeal technology adoption, libraries should develop comprehensive digital strategies. This includes lobbying for dedicated bandwidth from parent institutions and investing in renewable energy sources, such as solar power, to mitigate the impact of power outages. Furthermore, the adoption of Open Access (OA) and Open Educational Resources (OER) can significantly reduce the cost of providing access to high-quality academic content.

- **Capacity Building and Professional Development**

The library of the future requires a new breed of information professionals. Tertiary institutions and professional bodies like the Librarians' Registration Council of Nigeria (LRCN) must prioritize training in digital literacy, data management, and AI applications. Continuous professional development (CPD) should be mandatory to ensure that librarians remain relevant in the digital age (Oladokun, 2024).

- **Strengthening Library Consortia**

Resource sharing through consortia, such as the Nigerian University Libraries Consortium (NULIB), is essential for maximizing limited resources. By pooling funds for joint database subscriptions and inter-library loan systems, Nigerian academic libraries can provide their users with access to a broader range of resources at a lower cost.

Conclusion

The academic library is undeniably the heartbeat of the Nigerian educational system, serving as a critical nexus for knowledge creation, dissemination, and preservation. However, the current state of these institutions is characterized by a persistent struggle for survival amidst chronic underfunding, significant technological lags, and deteriorating infrastructure. Addressing these profound issues is not merely a matter of institutional pride but a national imperative for fostering a competitive knowledge economy and ensuring the relevance of Nigerian higher education on the global stage. By proactively diversifying funding sources, strategically investing in cutting-edge technology, fostering a culture of continuous professional development, and implementing robust policy reforms, Nigerian academic libraries can overcome their current challenges. They can emerge as dynamic, resilient centers of learning and research, fully aligned with the demands of the digital age and the global knowledge society. The way forward demands collective will, innovative thinking, and an unwavering commitment to the ideals of information accessibility, academic excellence, and national development. A strong, forward-looking academic library system is a critical prerequisite for enhancing the overall quality of education and research in Nigeria, driving innovation, and preparing future generations for the complexities and opportunities of the 21st-century knowledge society. Embracing digital transformation, fostering open science, and prioritizing user-centered services will be key to unlocking their full potential and ensuring their enduring strategic importance.

Abstract

This study examined the state of Nigerian Libraries and prospects in the era of the fifth Industrial revolution (5IR). The study adopted a descriptive design. Three research objectives guided the study. The objectives are to examine the strengths of Nigerian Libraries in the face of the 5IR, examine the weaknesses of Nigerian Libraries in the face of the 5IR and to examine the prospects of strengthening Nigerian Libraries in the future to meet the demands of the 5IR. 15 librarians participated in the study. The participants were drawn from academic, school, special, public and national Libraries from different parts of the country. Snowball method of sampling was used to identify the participants. One-on-one interview and Focus group discussion were used for data gathering. The Focus group and interview guides were prepared by the researchers. Thematic analysis was used to analyses the data gathered. Findings show that the strength of the libraries lye more in the loyalty of the communities they serve, new responsibilities being entrusted to the libraries by their parent institutions, availability of computer laboratories and free internet connection in the libraries. Among the challenges of the libraries are lack of internet-compliant facilities, budget cuts and lack of policy to guide library programs. The study concludes that the future of libraries and the Librarianship profession in Nigeria is bright as there are indications that the practitioners and the discipline will be strengthened to meet the demands of the fifth Industrial Revolution.

Keywords: Nigerian Libraries, 5th Industrial Revolution, Librarianship, Strengths, Weaknesses and Prospects.

Introduction

Libraries in Nigeria as in other places play indispensable roles by preserving the cultural heritage of the nation, keep the society informed by creating access to reliable and authentic information and helps to equalize educational opportunities for all learners by offering their services to all users irrespective of demographic variables. There are various types of Libraries in Nigeria. These include academic, special, public and school libraries. All these libraries have their unique users and expected services and resources. Librarians are the human resources that mediate between the learning resources in the libraries and the users. Akor (2023) observed that it is the duty of the librarians to ensure that users have access to the information they need without limiting factors such as language, ethnicity and disability to mention a few.

In Nigeria, the professional education of Librarians is handled in Polytechnics and Universities. While the Polytechnics offer Ordinary National Diploma (OND) and Higher National Diploma (HND) certificates, the Universities offer degree and post graduate studies. Nigerian Library Association, the umbrella association of libraries in Nigeria help with continuous development programs through workshops and seminars (Goshie, Jimada and Habiba, 2022). The Librarians Registration Council of Nigeria (LRCN) also supports with workshops. The parent institutions of the libraries support with staff development programs.

Despite the staff development opportunities available to librarians in Nigeria, libraries and librarians are faced with a many challenges which, if not well managed, will jeopardize the chances of the libraries to function optimally in the future. Among these challenges are funding, skilled staff, staff attitude to work, obsolete learning materials, lack of technological facilities and alternative information sources, to mention but a few. In the midst of this state of affairs in Nigerian libraries, the Library and Information job environment is changing drastically with the emergence of the fifth Industrial Revolution (5IR). George and George (2020) defined the 5IR as an era in which man and machine work hand-in-hand, combining the unique cognitive abilities of workers and the accurate technical expertise of robots to bring in an innovative culture into the workforce. The era has introduced into organizations machines that reason like humans.

These machines are gradually replacing repetitive tasks and simplifying jobs that were once thought of as hard or laborious to perform.

Accompanying the 5IR are a set of new courses/disciplines introduced into institutions of higher learning and changes in the curriculum of higher education institutions to reflect the changes in society. All these stress libraries to modernize in relation to situations at hand. Unfortunately, libraries are part of other larger organizations. Decisions taken for libraries are most often taken outside libraries with the librarians as advisors. The libraries blossom or wilt based on the decision of the parent organisations. In the face of the current situation of libraries, it is important to examine the state of librarianship in the future from the perspectives of practicing librarians.

This study would be significant to policy makers in federal state and local government levels of Nigeria especially those interested in library matters. It will help to advice students and aspiring student of librarianship on the future prospects of their chosen career.

Statement of Problem.

The library world is changing drastically with the emergence of 5IR. Many routine work are now being performed by machines while laborious ones are being simplified. In overseas countries, these changes have been reflected on their staff, resources and services through reskilling of staff and employment of competent staff, procurement of modern equipment and introduction of new services. Unfortunately, the situation is not the same in Nigeria. In Nigeria, libraries continue to operate with staff that are not skilled in modern technologies, obsolete equipment, and old services that have outlived their relevance (Ekwueme, Oluwaseun, Ajie, Ofodu & Ambrose, 2024). This state of affairs may affect library use, the glamour of the library in many institutions and calls for inquiry in the future of the librarianship profession in Nigeria. It is based on this that this study set out to study the state of Nigerian Libraries and Librarianship in the future.

Objectives.

The following are the objectives of this study.

1. Examine the strength of Nigerian Libraries in the face of the 5IR.
2. Examine the weaknesses of Nigerian Libraries in the face of the 5IR.
3. Examine the prospects for strengthening Nigerian Libraries in the future to meet the demands of the 5IR.

Literature Review

Strength of Nigerian Libraries in the face of the 5IR

A good AI gives you a hundred plausible answers in one second; a good librarian advises you on what quality information to feed the AI in the first place and how to frame the right question to obtain valuable ideas and connections (Mental Garden, 2025). The study of Mental- Garden on Future of Libraries in the Digital Age, stress further that librarians will continue to serve as the guide in the search for information. On the other hand, Emmanuel (2020) added that librarians' distinctive skills, such as critical thinking, empathy, personalized or referral service cannot be replicated by Artificial Intelligence, rather, AI can become a complementary mechanism to librarians' artistry or creativity than replace it. Librarians' expertise will coexist with the AI opportunities. Thomas and Gilbert, (2024) demand the development of federated search (all in one search engine) for library users will cut down the need to seek for login details and searching through different databases to get needed information. These library app is expected to improve on the library-patron relationship and boost the use of library visits, both physical and virtual.

Emmanuel (2020) observed that librarians encourage implementing AI powered automation systems in libraries for proper use of library resources among the users. As a librarian, it is necessary to stay informed about the evolving role of artificial intelligence in libraries. Librarians in the era will maintain provision clear guidelines on AI adoption to the ethical implications and the importance of enhancing media literacy skills among library staff.

Weaknesses of Nigerian Libraries in the face of the 5IR

The notion of smart academic library is an idea largely welcomed theoretically and less in practice. This is evident in their capacity to adapt, their collection development approach, their capacity to adequately provide the needed technology for the patrons, the sagacity of academic librarians' technical know-how and show-how, the environment, management and logistics preparedness, their level of information literacy and the information user-behavior of especially the University management, library management and academic librarians (Thomas & Gilbert, 2024). while, Oluwatosin, Sylvester, Lukman, and Onivehu (2026) carried out a study via a survey of LIS professionals in academic libraries throughout North Central Nigeria and uncovers significant deficiencies in skills related to AI, cloud computing, and data literacy. The study emphasize need for ongoing professional development and curriculum revisions to include advanced information and communication technology (ICT) skills, to ensure librarians' pertinent in the digital era. And demand reskilling initiatives to equip LIS professionals for teamwork in data-centric settings within contemporary libraries. The survey of Adeyinka, et al., (2022) identified challenges that libraries in Nigeria may face, including funding and financial constraints, inadequate expertise, limited power supply or power outages, poor attitudes toward integration of new technologies, corruption, and a limited budget to procure the 4IR technologies. In addition, Thomas and Gilbert, (2024) also confirms that most public university libraries need re-skilling and up-skilling, new innovations

and approaches to deploy smart services. The study suggested quality alternative power supply to ameliorate these challenges.

Similarly, Umar (2018) support the views of Thomas and Gilbert by confirming that public libraries in Nigeria are almost not functioning because of lack of funds. And the Apex that is the National Library is still operating on rented accommodation while academic libraries depend heavily on tertiary education trust fund. Cyriacus (2024) summarized the challenges as funding resources by implementing advanced technologies like AI, IoT, robotics requires significant investment in infrastructure, software and staff training. Sivalingam and Mansori (2021) argued that without addressing infrastructural deficits and change management, libraries in Nigeria will lag in global transformation. Jamal et al., (2024) stated that library professionals must adapt to job redesign, upskilling that can significantly improve organisational agility. He further adds that librarians must possess high-level digital literacy, such as AI governance abilities, interdisciplinary collaboration capacity, adaptability to enhance readiness for 5th IR technology evolving in the world. United Nations(2020) argued that Poor information and communications technology in developing countries hinder governments in their efforts to implement 4IR changes. At same time broadband diffusion and infiltration, necessary for high-speed Internet access, lag in developing countries compared to the developed ones. Other challenges were also identified by Samuel,(2019) as unreliable power supply, inadequate technology infrastructure, absence of technical skills, poor attitudes toward advanced automation, perceived absence of senior management support, use of inappropriate library software, technophobia, shelving challenges, financial mismanagement and difficulties searching due to absence of a digitized system.

Prospects for Strengthening Nigerian Libraries in the Future to meet the demands of the 5IR.

Bhakar, (2023) who examine leveraging ICT and AI for enhanced library science stress that libraries are ready to accept symbiotic technology with tradition, coordinating their essentiality, connection and pertinence in community's knowledge hub. Added that libraries presume an affective role in the digital platform, complying with the digital transformation while bearing steadfast to the vision of library. On the other hand, Ingang, Eteobong and Okon (2025) attested that the 5th IR technology offers library profession unparalleled prospects for enhancing user experience and promoting inclusive access to knowledge. Also, promoting holistic access to knowledge by improving their tech savvy and efficiency in meeting the growing demand of a complex and competitive information society. However, Ingang et al., presents significant challenge to library professional; proactive strategies such as continuous upskilling, collaborative partnership, policy development and user education are needed to ensure libraries remain relevant, sustainable and impactful to their users in the digital era. Adeyinka (2020) maintained that the future of libraries is bright in the Fourth Industrial Revolution if they are ready and willing to invest in 4IR technologies. The study of Adeyinka, et al., (2022) posited that most respondents agreed that libraries in the country are ready for the Fourth Industrial Revolution, that it will have an impact on libraries. However, the future jobs of librarians in Nigeria are in danger of being replaced by technologies. The study suggested the need for libraries to increase their readiness for the 4IR era include a need to create awareness; to organize training, workshops, seminars and webinars; to promote collaboration among libraries; and to improve budget allocation for procurement of 4IR technologies, such as robotic technology, artificial intelligence, Internet of Things, big data, virtual and augmented reality, and block-chain. Thomas and Gilbert, (2024) added that smart academic library requires a lot of financial resources because the technologies involved are not cheap. So, fervent financial input is constantly needed to keep it running efficiently in an updated status.

Tunde (2025) in his study, reimaging libraries notes that for library professionals to maintain pertinent and effective in the 5th IR, they must adopt technology alignment, networking, continuous learning for the future service delivery. Simisaye, Salisu, and Awodoyin, (2018) urged librarians and libraries to involved in collaboration and networking among themselves to achieve their objective of provision of effective services to users. As the study stress further that this requires sacrifice, funds, knowledge of ICT, acquisition of requisite skills in retrieval and dissemination of information, teaching information literacy skills to users, adopting friendly attitude towards provisions of effective services to survive the 5th IR. Libraries must plan and control the ethical implications of making use of AI tools and techniques that could be biased against certain user groups (Diakopoulos, 2016). One of the notable ethical considerations for AI implication is that the technological knowhow is fair and equitable. Using artificial intelligence may cause data privacy to put in danger. AI technologies can have unexpected outcomes that may cause inconvenience to the individuals or groups. Hence, it is very much required to think about human rights while using AI algorithms. Libraries and information centres must setup a plan to align with the ethical values.

Research method.

This is a descriptive study that adopted a qualitative method. 15 selected librarians from different types of libraries, academic, special, public, research, and school libraries, were engaged through interviews and focus group discussions to elicit data for the study. The participants were recruited through the snowball sample method. First, the researchers

identified one librarian from each type of library, who then helped to identify others in his/her area. Table 1, presents the libraries that participated in the study and the number of participants from each Library type.

S/n	Type of Library	Parent Institution	Number of participants	Total number of participants from each type of Library
	Academic library	University of Nigeria, Nsuka. Ahmadu Bello University, Zaria Reademmers University, Ede, Osun State, Nigeria	2 1 1	3
	School Library	Professor Patric Okpoko Library, University of Nigeria, Secondary School, Nsukka. Children's Centre Library, University of Nigeria, Nsukka. International Nursery and Primary School Library, Trans-Ekulu, Enugu.	1 1	3
	Special Library	Climate Change Library, Institute of Climate Change and Adaptation Initiative (ACCAI), University of Nigeria, Nsukka. Knowledge Centre, International Institutie of Industrial Research (IITA), Ibadan.	2 1	3
	National Library	National Library of Nigeria, 227, Herbert Macaulay Way, Yaba, Lagos State. National Library of Nigeria, Festival Road, P.M.B. 1, Area 2 (Near Shopping Centre) Garki, Abuja. National Library of Nigeria, NTA road, beside E.S.B.S. junction, Enugu	1 1	3
	State Library	Kwara State Library No 16, Sulu Gambari way, opposite N.I.P.O.S.T. Office, Ilorin Kwara State. Kaduna State Library No 3 Bida road, opposite N.B.T.E., Kaduna Enugu State Library. Market Road, Opposite Mgbemena Park, Enugu.	1 1 1	3
	Total			15

The interview and focus group discussion were guided by an interview guide developed by the researchers. The interview guides contain both the main question as it was in the objectives of the study and probe questions. The probe questions were meant to guide the respondents into deeper understanding of the topic under discussion before responding. Both the interview and focus group discussion were carried out online at a platform (Whatsapp call) and time chosen by the participants. There were two sessions of the Focus group interview with eight persons in one and six persons in the other. In all, 14 respondents participated in the focus group discussion while one person participated in the one-on-one interview. The participants were given code names to boost their courage to speak boldly. Those who participated in the focus group interview were given the codes A-N, while the one-on-one interview participant was given code Z. The focus group discussion and interview were recorded using a phone recorder.
The data gathered from both the interview and the focus group were transcribed verbatim. The responses were sorted and coded into themes based on the objectives of the study.

Data analysis and presentation.

The strength of Nigerian Libraries in the face of the 5IR.

Responses show that the major strength of the librarianship profession in the future lay on the community they serve. These communities depending on the type of library include professional groups, researchers, students, school children and community people. Most of these groups are regular library space users. Participant C who is a librarian in an

academic library, commented, “Our users are our strength. They will always come because they need the quiet library space for studying”. In collaboration of what Participant C, said, Participants F, a school librarian added, “The children cannot afford to lose the fun they experience in the library. They will surely come. We have locally made games which they enjoy”.

Another point considered part of the library’s major strength is the ease with which user’s access library resources and personnel without much bureaucracy. Participant J, a special librarian, commented that, as much as Nigerians are still conducting research, they will always come to the library for help. The library is the only office where people gain attention instantly without filling visitors form. There is no bureaucracy in the library because the library emphasizes service without much waste of time.

Availability of computer laboratories, online resources, and information literacy training in libraries were all considered by the participants as strengths of the libraries. During the interview, participant Z said, “the availability of internet connectivity, computer laboratories, and empathic staff will always count positively for the library. The cost of internet connectivity is soaring, making it difficult for people to access online resources with private internet connections. So many people depended on the library for free internet connection”. Users such as these continued participant Z will also be on the side of the library if it comes to decisions regarding the survival of the library or the librarianship profession”.

The establishment of many private universities in Nigeria means that librarians are in demand in Nigeria to manage the university libraries. This creates a boom in Library and Information Science departments. Commenting on this, participant H, an academic librarian said, librarianship in the future will be a sort-aft profession in Nigeria because young people are more interested in courses that will place food on their tables without much stress. Many of them see the establishment of new universities in Nigeria as job creation for librarians, as such would like to study librarianship.

New responsibilities being placed on libraries by their parent institutions means that the interest of the librarianship profession will be protected in the future. It is in libraries that many academic institutions institutional repositories are domiciled. Libraries also help departments to overcome the hurdles of the accreditation exercise and resource verification. These new responsibilities said participant D, means that libraries and librarians are important to academic institutions.

Availability of some ICT equipment’s required for services in the 5IR era in some libraries means that these libraries have not much problem in rendering required services. Some libraries have internet connections, computer work station, computer laboratories, social media platforms and skilled staff. Such libraries noted participants E, have no problem in rendering modern library services and maintaining the royalty of their customers which is key sustaining the librarianship profession’. Many libraries chirped in participant K, an academic librarian, deploy Artificial Intelligence in serve delivery through the use of reading software, plagiarism checkers, online charging and discharging of learning materials”.

Another factor mentioned as part of the strength of the libraries is the availability of young and enthusiastic librarians who are eager to learn and innovate. These librarians observed participant K, an academic librarian, are drivers of the open access, open science and free knowledge movements”. These librarians noted participant B, are creating name for the library profession in Nigeria.

Weaknesses of Nigerian Librarians and Libraries in the face of the 5IR.

Responses show that among the major problems of libraries and librarianship in Nigeria in the era of the 5IR is the lack of materials. The facilities in many of the libraries are not functional, some of the functional ones are obsolete and not compatible with emerging technologies. Participant G, a public librarian commented, “many of the computers in our libraries are not internet compliant, and they are good for typing and printing only”. Participant I, another public librarian added, many of the libraries operate under leaking roofs which endangers the facilities they house, apart from this, the library building has very few power outlets making use of electronic devices difficult”.

Budget cuts was mentioned among the weaknesses of the libraries. Budget cuts was the reason many libraries cannot afford emerging technologies, replace obsolete ones, mend leaking roofs or procure relevant and current materials. It is also the reason many staff cannot be supported on professional development. In our library, said participant G, access to working materials such as stationeries have become almost impossible”.

Lack of policy guiding library services was mentioned also as part of the weaknesses libraries are facing. Many libraries are operating without a policy. This leads to inconsistencies in service delivery and project development as leadership changes hands. When organizations operate without policies, the future cannot be predicted.

Fluctuating internet connectivity and erratic electric power supply is another weakness mentioned by the participants. Without a strong internet connection and electric power supply, it would be difficult to use digital or online resources in the library. Participant I, commented, there are days in which there will be no electric power supply in the library at all. The solar panels supplied by government are not strong enough to support the building”.

Prospects for strengthening the libraries in the future.

Responses from the participants show a strong belief that the libraries will be improved by the parent bodies in the future. Among the reasons given for these are:

The need for universities to succeed in accreditation and resource verification exercises which will force university administrators to strengthen their libraries. Without input from the libraries, noted participant F, it will be difficult for academic departments to excel in accreditation and resource verification exercises.

The need for visibility needed for university rankings may force university administrators to invest in the University libraries. So also is the issue of the management of institutional repositories. Ranking is the tape with which the reputation of universities is measured and it cannot be achieved without strengthen the capacity of the libraries.

Increasing number of private and Federal Universities in the countries will lead to the employ of librarians to man the University libraries. It also means that departments of Library and information science in the universities will continue to flourish. The implication is that librarianship will thrive in the future said participant B.

Self-realization of the precarious state of libraries in the present dispensation and self-help initiative of many libraries may lead to the libraries being strengthened in the future. Many public libraries in the bid to survive work closely with community leaders and influential members of their community to sustain their libraries. Through this, the libraries are woven more closely into the heart of the community. Communities such as these always protect the interest of the library through financial and material support; and advocacy. Commenting on library community relationship, participant G, said, if not for community support, public libraries such as mine would have closed.

Seeking self-help is not left for public libraries alone. Academic libraries have also learnt to look out for help. Many academic libraries are currently running collaborations to sustain their users.

Discussion of Findings

The findings on the strength of Nigerian Libraries in the face of the 5IR admits that our users are our strength. They will always come because they need the quiet library space for studying and children cannot afford to lose the fun they experience in the library. They will surely come because of locally made games which they enjoy. The study uncovers the easy with which user's access library resources and personal without much bureaucracy. Some of the participant notes that as much as Nigerians are still conducting research, they will always come to the library for help. The library is the only office people gain attention instantly without filling visitors form. There is no bureaucracy in the library because the library emphasis service without much waste of time. This study is similar to that of Emmanuel Uwazie Anyanwu (2020) that asserts, the future of libraries in developing countries is bright if concerted effort is made to provide innovative services that will attract users to the library. The libraries should not wait for users to come to the library but introduce innovative relevant services which will be rendered to users in their homes and offices. Mental-Garden, (2025) shares similar view with this study, that a good AI gives you a hundred plausible answers in one second; a good librarian advises you on what quality information to feed the AI in the first place and how to frame the right question to obtain valuable ideas and connections. In the Digital Age, Mental-Garden stresses that librarians will continue to serve as the guide in the search for information. The discussants, further states that the new responsibilities of institutional repositories creators placed on libraries by academic institutions, indicates the interest of the librarianship profession will be protected in the future. More so, that libraries are key players in the success of accreditation exercise and resource verification.

The study reveals availability of some ICT equipment's required for services in the 5IR era in some libraries, means that these libraries have no much problem in rendering required services. Some libraries have internet connections, computer work station, computer laboratories, social media platforms and skilled staff. Such libraries noted by participants have no problem in rendering modern library services and maintaining the royalty of their customers which is key sustaining the librarianship profession. While, many libraries chirped in participant K, an academic librarian, deploy Artificial Intelligence in service delivery through the use of reading software, plagiarism checkers, online charging and discharging of learning materials.These support the findings in Adeyinka, et al., (2022) that most respondents viewed libraries in Nigeria as ready for the revolution and identified technologies some libraries have implemented. These technologies included automation of services; adoption of cloud computing services; subscription to online databases, e-resources, e-books, and e-journals; and the creation of an online public access catalog (OPAC). However, some respondents indicates that libraries in Nigeria are not ready, they explained that few libraries are automated except for academic libraries, which have tried to integrate new technologies such as cloud computing, social media, e-resources, and online databases to facilitate their service. Also, one respondent argued, no libraries in Nigeria have introduced 4IR technologies such as artificial intelligence, robotics, Internet of Things, block-chain, and the like to their services and operations; therefore, libraries are not ready.

Responses show that among the major problems of libraries and librarianship in Nigeria in the era of the 5IR is the lack of materials. The facilities in many of the libraries are not functional, some of the functional ones are obsolete and not compatible with emerging technologies. A participant of libraries commented that many of the computers in their libraries are not internet compliant, and they are good for typing and printing only. While other participant added that many public libraries operate under leaking roofs which endangers the facilities they house, apart from this, the library building has very few power outlets making use of electronic devices difficult. Budget cuts was mentioned among the

weaknesses of the libraries. This constitute a major reason many libraries cannot afford emerging technologies, replace obsolete ones, mend leaking roofs or procure relevant and current materials. This study is inline with the studies of Cyriacus, 2024; Adeyinka et al., 2022; and Samuel, 2019; who identified unreliable power supply, inadequate technology infrastructure, absence of technical skills, poor attitudes toward advanced automation, perceived absence of senior management support, use of inappropriate library software, techno-phobia, shelving challenges, funding and financial constraints, financial mismanagement, and difficulties searching due to absence of a digitized system. Their study added that libraries to increase their readiness for the revolution through awareness creation, organize training, workshops, seminars, and webinars; to promote collaboration among libraries; and to improve budget allocation for procurement of 4IR technologies, such as robotic technology, artificial intelligence, Internet of Things, big data, virtual and augmented reality, and block-chain.

Another, discovery of the study, is lack of policy guiding library services.This was pointed as a major weaknesses libraries are facing. The participants state that many libraries are operating without a policy and this leads to inconsistencies in service delivery and project development as leadership changes hands. When organizations operate without policies, the future cannot be predicted.

he study reveals self-realization of the precarious state of libraries in the present dispensation and self-help initiative of many libraries may lead to the libraries being strengthened in the future. Many public libraries in the bid to survive work closely with community leaders and influential members of their community to sustain their libraries. Through this, the libraries are woven more closely into the heart of the community. Communities such as these always protect the interest of the library through financial and material support; and advocacy. Commenting on library community relationship, a participant said, if not for community support, public libraries such as mine would have closed. The study is related to that Bhakar (2023) who expressed that libraries are ready to accept symbiotic technology with tradition, coordinating their essentiality, connection and pertinence in community's knowledge hub. In other words, librarians must adopt skills in providing information resources in the community and ensures everyone has access to information to acceptance and interest of them, contrary to that Peter (2024) asserts that there are new services in the research, teaching and learning which include big data, research data management, and open science such as open data, open access, open education resources and open methodology among others. This shows the librarians' new roles and responsibilities as researchers and teachers. Librarians now impacts skills on how information resources are accessed and evaluated in the future libraries.

The study uncovers ranking as the tape with which the reputation of universities is measured and it cannot be achieved without strengthen the capacity of the libraries. This may force university administrators to invest in the University libraries advanced technologies to maintain their reputation in the future.

Conclusion

This study set out to examine the state of Nigerian libraries and the prospects for librarianship in the era of the Fifth Industrial Revolution. The findings present a mixed but insightful picture of a profession at a critical transition point. On one hand, libraries continue to demonstrate enduring relevance through strong user patronage, community engagement, minimal bureaucratic barriers to access and the dedication of young and innovative librarians. These strengths reinforce the continued importance of libraries as knowledge hubs and facilitators of learning, research and cultural preservation. However, deep structural and systemic challenges that threatening the effective transformation of libraries in line with 5IR demands. Chronic under-funding, obsolete infrastructure, inadequate technological tools, erratic power supply, poor internet connectivity and the absence of clear policy frameworks significantly hinder service delivery and innovation. Additionally, gaps in digital skills and resistance to technological change among some professionals further limit the capacity of libraries to evolve.

Despite these challenges, the study identifies promising prospects driven by institutional needs such as accreditation, global university rankings, expansion of higher education and increased community involvement. These factors create opportunities for libraries to attract investment, strengthen their relevance and reposition themselves in the digital knowledge economy.

Theoretically, the findings align with existing literature that emphasizes the complementary role of librarians and emerging technologies, particularly artificial intelligence. Practically, the study highlights the urgent need for reskilling, infrastructural development, and strategic planning. From a policy perspective, it highlights the necessity for coordinated efforts by government agencies, professional bodies and institutional administrators to reposition Nigerian libraries for sustainability and competitiveness in the 5IR era.

Recommendations

The following recommendations are offered based on the empirical findings of this study:

1. Library management and parent institutions should build on the existing strengths of Nigerian libraries by improving user-centred services, sustaining community engagement, and expanding access to ICT facilities.
2. Government and institutional stakeholders should prioritize sustained funding to address infrastructural deficits, obsolete equipment and limited technological facilities.

3. Clear policy frameworks should be developed to guide library operations such as resource acquisition, management of institutional repositories, and computer laboratories.
4. Library management should seek financial assistance beyond the parent body's financial allocations. They can achieve this through engagement in grant writing, resource sharing and other partnerships that will reduce cost for the library while positively influencing availability of library resources.
5. Libraries, especially, university libraries should leverage on the new responsibilities (management of institutional repositories and participation in accreditation and resource verification exercises) entrusted to them to enhance their image before their parent institution. This will give them the opportunity of being favored during budget allocations.

Abstract
Libraries have historically functioned as critical public institutions for knowledge preservation, civic education, and social advancement in Nigeria. However, persistent structural challenges ranging from chronic underfunding and weak policy implementation to the disruptive pressures of digital transformation and shifting user expectations have raised urgent questions about the future relevance of libraries and librarianship in the national development agenda. This paper critically examines the institutional, professional, and policy dimensions that must be urgently addressed if Nigerian libraries are to fulfil their potential as engines of national renewal. Using a qualitative conceptual research design that integrates systematic literature analysis, thematic policy review, and practitioner narratives, the paper interrogates how Nigerian libraries are responding and must further respond to contemporary demands for equitable access, community-centred knowledge services, and professional relevance. The main objective of the paper is to develop an evidence-informed framework for repositioning Nigerian libraries as active, resilient, and professionally dynamic contributors to national development and the knowledge economy. The paper identifies a persistent and widening disconnect between policy intentions and operational realities, and reveals that while isolated institutional innovations demonstrate proof of concept, the transformative repositioning of Nigerian libraries requires deliberate investment in four interlocking pillars: institutional capacity, professional development, policy coherence, and community embeddedness. The paper concludes by proposing the Integrated Library Renewal Framework (ILRF) as a context-responsive model for guiding the institutional and professional renaissance of Nigerian libraries.
Keywords: Nigerian libraries; librarianship; institutional capacity; professional renewal; national development; knowledge services; library policy; digital transformation; community libraries; NLA

Introduction

Libraries occupy a foundational position in the architecture of national development, functioning simultaneously as repositories of collective memory, platforms for lifelong learning, and equalising institutions that bridge socio-economic disparities in access to knowledge. In Nigeria, a country of over 220 million people that hosts the largest university system in Africa with 273 universities as of 2024 alone, more than any other country on the continent (World Education News and Reviews, 2024; Statista, 2024), libraries were once unambiguously central to educational provision, research infrastructure, and civic enlightenment. Yet today, many Nigerian libraries find themselves at a critical crossroads, confronted by a paradox: their mandate has never been more important, yet their institutional standing, public visibility, and professional authority have rarely been weaker. The challenges are well-documented. Chronic underfunding has depleted collections, prevented infrastructure upgrades, and stunted staff development; empirical evidence shows that most Nigerian universities allocate merely 2–5% of recurrent budgets to their libraries, far below the internationally recommended threshold of 10% (Sahabi & Otobo, 2022; Ojobor, Okafor & Ugwuanyi, 2025).

Weak governance structures have insulated libraries from the strategic priorities of their parent institutions and government ministries. The rapid proliferation of digital information through mobile internet penetration, which reached 134.78 million active internet subscriptions in Nigeria as of October 2024, accompanied by a record 870,398 terabytes of data consumed in that month alone (NCC, 2024; BusinessDay, 2024), has shifted public information behaviour decisively away from physical library spaces without a corresponding institutional response to digital service provision. Meanwhile, the professional identity of the Nigerian librarian has been squeezed between an outdated public image rooted in custodianship and an emerging global professional model anchored in information literacy education, research support, data management, and community knowledge facilitation (IFLA, 2024; Igbinovia, Segun-Adeniran & Okuonghae, 2025; Abdullahi et al., 2024). It is against this complex institutional backdrop that this paper has chosen to examine how to reposition Nigerian libraries by developing a framework for institutional change.

This paper is both a diagnosis and a call to action, and also an acknowledgement that the future of libraries cannot be assumed; it must be deliberately constructed through evidence-based policy, professional commitment, and institutional courage. The paper argues that repositioning Nigerian libraries for national renewal is not primarily a technological problem, though technology is indispensable, but a structural, professional, and political one. The central question is not whether Nigerian libraries can adopt new tools and platforms, but whether the institutional frameworks, professional cultures, and policy environments that govern libraries can be sufficiently strengthened and transformed to enable them to fulfil their potential as dynamic agents of national development. To address this question, the paper synthesises current

evidence on the state of Nigerian libraries, examines the conceptual dimensions of institutional capacity and professional identity, and proposes an integrated analytical and action framework grounded in the realities of the Nigerian context (Ojobor, Okafor & Ugwuanyi, 2025; Makinde & Oyekale, 2026).

Statement of the Problem

Despite the acknowledged strategic importance of libraries to Nigeria's education, research, governance, and social development objectives, Nigerian libraries continue to operate within fragile and often dysfunctional institutional environments. The existing body of literature reveals a consistent and deeply troubling pattern: policy documents affirm the importance of libraries, but implementation remains weak; funding is inadequate and irregularly disbursed; professional development opportunities are limited and unevenly distributed; governance structures are centralised and unresponsive; and community engagement models are largely underdeveloped (Sahabi & Otobo, 2022; Okafor et al., 2024). Significant competency gaps persist among library professionals, particularly in emerging technologies and digital information management. Furthermore, the emergence of digital technologies and evolving information behaviours has introduced new pressures without generating corresponding institutional or professional adaptations in most Nigerian libraries (Ojobor, Okafor & Ugwuanyi, 2025; Sadiku & Kasim, 2024). This paper identifies a critical gap: while individual studies have examined specific aspects of Nigerian library challenges, such as funding deficits, digital infrastructure, staff competencies, or policy frameworks, there is an absence of integrated, framework-driven analyses that link these dimensions to concrete pathways for institutional renewal and professional renaissance. Without such integration, responses to library challenges remain fragmented, reactive, and insufficiently anchored in the systemic conditions that perpetuate institutional weakness. As a result, the main objective of this paper is to develop an evidence-informed, context-responsive framework for repositioning Nigerian libraries as active, institutionally resilient, and professionally dynamic contributors to national renewal and the sustainable knowledge economy.

Research Objectives

The main objective of the paper is to determine an evidence-informed framework for repositioning Nigerian libraries as active, resilient, and professionally dynamic contributors to national development and the knowledge economy.

Methodology

This paper adopts a qualitative conceptual research design. Conceptual research is appropriate for this paper because the primary objective is not to generate new primary empirical data, but to synthesise, integrate, and critically interpret existing knowledge in order to develop a theoretical framework and policy-relevant conclusions (Jaakkola, 2020). The qualitative orientation allows for depth, context-sensitivity, and interpretive nuance that quantitative approaches are less equipped to provide in the analysis of complex institutional phenomena. The research design integrates three complementary methodological strands: systematic literature analysis, thematic policy review, and reflective practitioner synthesis. This multi-strand approach ensures that the analysis is anchored in the peer-reviewed knowledge base while remaining responsive to the specific institutional and policy contexts of Nigerian libraries. A systematic review of peer-reviewed literature published between 2016 and 2025 was conducted to identify the current state of knowledge on Nigerian library development, institutional capacity, professional identity, and digital transformation. Databases searched included Google Scholar, JSTOR, LISTA (Library, Information Science and Technology Abstracts), DOAJ, African Journals Online (AJOL), and the NLA Journal of Librarianship. Search terms included combinations of: Nigerian libraries; librarianship in Nigeria; library capacity; library policy in Nigeria; professional development librarians; digital libraries in Africa; library innovation in developing countries. References of retrieved articles were also manually scanned to identify additional relevant sources (backward citation searching). Articles were screened for relevance to the paper's objectives, methodological rigour, and recency of publication. In total, 49 peer-reviewed sources, 7 institutional reports, and 4 national policy documents were incorporated into the analysis. National and institutional policy documents relevant to library development and the knowledge economy in Nigeria were identified and reviewed. These included the National Policy on Education (revised edition), the National Digital Economy Policy for Nigeria 2020-2030, the NLA Strategic Plan (2025), relevant provisions of the Tertiary Education Trust Fund Act, and state library legislation in selected states. Policy documents were examined for consistency of intent, coherence with library development priorities, and evidence of implementation mechanisms. A thematic content analysis approach was applied, using pre-defined themes derived from the conceptual framework (institutional capacity, professional identity, policy alignment, digital transformation, community embeddedness). Insights from practising librarians in Nigerian academic, public, and special libraries were incorporated through three channels: (1) reflective accounts documented in recent NLA conference proceedings (2020–2025); (2) published practitioner commentary in professional association publications including the Nigerian Library Link and NLA Annual Reports; and (3) experience narratives shared in professional online platforms including the NLA WhatsApp Forum and the Nigerian Library and Information Science Educators (NALISE). These sources were treated as practitioner knowledge rather than primary empirical data, and were used to ground and contextualise the conceptual analysis in the lived realities of Nigerian library professionals. The synthesis of systematic literature analysis, policy review, and practitioner perspectives informed the development of the Integrated Library Renewal Framework (ILRF), proposed in Section 6 of this paper. The ILRF was constructed

iteratively through thematic coding of identified patterns and gaps, informed by the three theoretical lenses described in the paper. The framework was refined through intellectual dialogue with the IFLA Global Vision Framework (2021) and UNESCO's Library Development Roadmap (2022) to ensure international relevance while maintaining contextual specificity.

Literature Review

Libraries as Institutions of National Development: Global and African Perspectives

The case for libraries as engines of national development is deeply embedded in international policy frameworks. The IFLA–UNESCO Public Library Manifesto (2022) jointly updated and launched at the 87th World Library and Information Congress in Dublin and endorsed unanimously by UNESCO's Information for All Programme affirms the public library as "a living force for education, culture and information" and explicitly positions libraries as essential agents for advancing the Sustainable Development Goals and constructing more equitable and sustainable societies (IFLA & UNESCO, 2022). Devi, Gupta, and Arahova (2024), in a systematic review of IFLA's mobilisation of libraries toward the SDGs, demonstrate that public libraries, when adequately resourced and strategically aligned with community needs, serve as platforms for social integration, digital inclusion, and lifelong learning, functions that are critical in societies characterised by high inequality. The record year of 2023, in which over half of all UN Voluntary National Reviews referenced libraries' contributions to SDG implementation for the first time, further underscores the growing international recognition of libraries as cross-sectoral development assets (IFLA, 2023). In the African context, studies document the dual role of libraries as both mirrors and agents of development. Boakye-Achampong and Samb (2021), examining African libraries as development partners, found that libraries in Ghana contribute to SDG 3 (good health and well-being) and SDG 4 (quality education) through community outreach and information literacy programming, while being constrained by persistent perceptions among local government stakeholders as mere "lenders of books" rather than agents of innovation.

Bouaamri (2024), writing in Prospects, documents how public libraries across Africa, when properly resourced, serve as crucial social anchors for marginalised communities and engines of social inclusion and lifelong learning, while also cautioning that in many African countries, the role of libraries in strengthening the social contract remains largely unrecognised by policymakers. These findings underline the transformative potential of libraries in developing country contexts, a potential constrained, however, by institutional factors that are themselves products of broader political economy challenges. In Nigeria specifically, libraries have a long and significant institutional history. The establishment of the National Library of Nigeria in 1964, the development of public library systems in all 36 states, and the proliferation of academic and special libraries in universities, polytechnics, and research institutes reflect a historical recognition of libraries' national importance (Aguolu & Aguolu, 2002; Aina, 2014). The Tertiary Education Trust Fund (TETFund) has provided critical support to academic library development in federal institutions, and several landmark policy documents, including the National Policy on Education and various educational sector reform frameworks, have identified library development as a priority. Yet the gap between these policy commitments and operational realities has remained stubbornly persistent across decades (Sahabi & Otobo, 2022; Ojobor, Okafor & Ugwuanyi, 2025).

Institutional Capacity and Library Governance

Institutional capacity is a multi-dimensional concept that encompasses the human, financial, technological, and governance resources through which organisations pursue their mandates. DiMaggio and Powell's (1983) seminal work on institutional isomorphism helps explain why Nigerian libraries, despite operating in diverse contexts, tend to exhibit similar structural weaknesses: they are subject to the same regulatory frameworks, funding mechanisms, and professional norms, and have historically responded to similar external legitimacy pressures rather than to locally differentiated user needs. Scott's (2014) institutional framework further illuminates how regulatory, normative, and cultural-cognitive pillars shape organisational behaviour, a perspective that explains why superficial library reforms often fail to produce lasting change without concurrent shifts in governance culture. Recent scholarship has emphasised that genuine institutional capacity in libraries involves more than financial inputs; it requires coherent governance structures, transparent accountability mechanisms, strategic leadership, staff empowerment, and an organisational culture oriented towards continuous improvement and user responsiveness (Keller, 2023; Tariq et al., 2025). Yabanet et al. (2024), examining governance and service delivery in Nigerian university libraries, found that centralised, hierarchical governance structures with limited librarian autonomy were strongly associated with poor service responsiveness and low staff morale.

Similarly, Aghoghovwia and Ekereuche (2023) and Posigha and Idjai (2022) documented that institutional capacity constraints in Nigerian university libraries, including inadequate staffing, deteriorating physical infrastructure, and the absence of open-access policy frameworks, directly undermined operational effectiveness; notably, of the 19 institutional repositories from Nigeria identified in one review, only four were supported by any formal policy framework (Ejikeme & Ezema, 2024). The funding deficit is particularly acute. While no single authoritative national figure exists for library budget allocations across all Nigerian institutions, empirical evidence consistently indicates that most Nigerian universities allocate merely 2–5% of their recurrent budgets to libraries, far below the internationally recommended threshold of 10%, with severe adverse consequences for collections, staffing, and ICT infrastructure

(Sahabi & Otobo, 2022; Ojobor, Okafor & Ugwuanyi, 2025). The situation in public libraries is comparably dire, with state governments often treating library services as a low-priority recurrent expenditure subject to discretionary reduction during budget austerity periods. Nigeria's federal education budget allocation of only 7.9% of total government expenditure in 2024, well below UNESCO's recommended threshold of 15–20% for developing economies, compounds the crisis by restricting the overall envelope within which library subventions are determined (World Education News and Reviews, 2024). These funding realities severely constrain collection development, digital infrastructure investment, staff training, and community outreach, the very activities through which libraries demonstrate their value to stakeholders.

Professional Identity and the Evolving Role of the Librarian

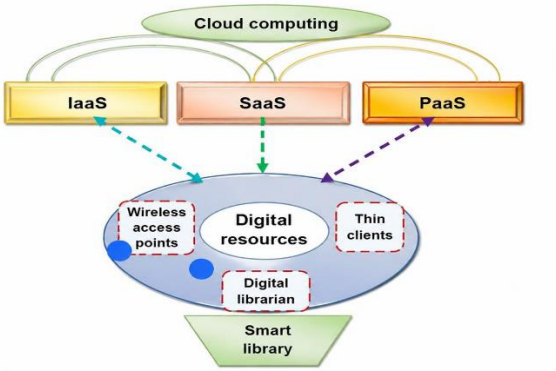
The concept of professional identity in librarianship has undergone significant theoretical and practical evolution. Traditionally anchored in custodianship, the preservation and organisation of physical collections librarian identity has progressively expanded to encompass information literacy instruction, research data management, scholarly communication support, digital preservation, and community knowledge facilitation (Corrall, 2014; Cox & Pinfield, 2022). This expanded role reflects the broader transformation of information environments and the growing recognition that librarians possess specialised competencies in the organisation, retrieval, evaluation, and communication of information that are increasingly valuable in knowledge-intensive social and economic contexts. Igbinovia, Segun-Adeniran, and Okuonghae (2025), writing specifically on university libraries, argue that data literacy and technological infrastructure have become prerequisites for the successful implementation of research data management services, positioning the contemporary librarian as an active knowledge intermediary, research partner, and community advocate rather than a passive keeper of resources. The IFLA–UNESCO Public Library Manifesto (2022) has similarly repositioned the professional identity of librarians within the SDG framework, emphasising their roles as trusted information guides, advocates for information equity, and community empowerment agents operating at the nexus of education, civic participation, and digital inclusion.

In the Nigerian context, professional identity transformation has been uneven and frequently obstructed by structural barriers. A 2024 study on competency needs among Nigerian library and information service providers found significant gaps in emerging technologies and digital information management, particularly among professionals in academic, public, and school libraries, indicating a pressing need for targeted and sustained professional development interventions. Makinde and Oyekale (2026) found that while digital literacy skills among Nigerian university library personnel jointly predicted social media use and community engagement, awareness and practice remained constrained by infrastructural deficits and inadequate institutional support. The Nigerian Library Association has made important contributions through its annual conferences, workshops, and certification programmes; however, these interventions have not yet been sufficient to produce a sector-wide professional transformation (Sahabi & Otobo, 2022). Critically, professional identity in librarianship is also shaped by public perception and institutional recognition. Where librarians are perceived by university administrators, government officials, and communities as peripheral support staff rather than strategic knowledge professionals, their capacity to advocate for institutional resources and policy recognition is severely constrained. Building a more assertive, visible, and strategically engaged professional identity is therefore not merely a matter of individual professional development; it requires a collective, institutionally supported, and politically aware professional project (Boakye-Achampong & Samb, 2021; Devi et al., 2024).

Digital Transformation and Nigerian Libraries

Digital transformation has profoundly reshaped the information landscape in which Nigerian libraries operate. Nigeria's digital infrastructure has expanded rapidly in recent years: active internet subscriptions reached 134.78 million in October 2024, and data consumption hit a record 870,398 terabytes in that month, a 28.9% increase from the same period in 2023, driven by expanding 4G coverage, smartphone proliferation, and growing consumer demand for digital connectivity (NCC, 2024; BusinessDay, 2024). Broadband penetration rose to 42.24% by October 2024, and the ICT sector contributed 19.78% of Nigeria's real GDP in Q2 2024 (NCC, 2024; U.S. International Trade Administration, 2024). These developments have created both a challenge and an opportunity for libraries. The challenge is that users increasingly expect information access to be seamless, digital, and on-demand, a standard that many Nigerian libraries, with their limited digital infrastructure and collection backlogs, cannot yet meet. The opportunity is that digital tools, including open-access repositories, digital collections, online reference services, and mobile library applications, offer cost-effective pathways to dramatically expanded service reach if libraries can acquire the requisite infrastructure and skills.

Studies on digital service provision in Nigerian academic libraries present a mixed picture. Yabanet et al. (2024) found that digital transformation remained far from fully embraced in Nigerian university libraries, with no significant change in the use of digital technologies in service deployment pre- and post-COVID-19, the greatest barriers being paucity of funds and inadequate infrastructure. Ejikeme and Ezema (2024), examining institutional repositories in South-East Nigeria, noted that most implementations had proceeded without policy frameworks, significantly constraining repository sustainability and low submission rates. In contrast, a developing open-access ecology is emerging: the LIBSENSE initiative published a model open science policy for Nigeria in 2024, and Nigeria has grown its institutional



repository infrastructure incrementally, albeit unevenly, since the launch of the Covenant University Repository in 2008 (MDPI Blog, 2025). Idhalama, Oredo, and Makori (2025), in a comprehensive assessment of digital resources in Nigerian public university libraries, documented persistent challenges of inadequate digital acquisition, limited e-resource licensing, and low librarian digital literacy, while identifying strategic partnerships and open-access integration as viable pathways to expanded service capacity. The COVID-19 pandemic, despite its devastating consequences, served as an inadvertent catalyst for digital engagement in Nigerian libraries; institutions suspended from physical operations were compelled to develop virtual reference services and digital collection access, with some libraries leveraging social media platforms, particularly Telegram, WhatsApp, and Twitter/X to disseminate information resources to users (Sahabi & Otobo, 2022; Idhalama, Oredo & Makori, 2025).

Policy Environment and National Development Alignment

The policy environment governing Nigerian libraries is characterised by ambition without implementation capacity. The National Policy on Education (revised 2014) explicitly mandates the provision of adequate library services at all levels of education. The National Library Act, the Nigerian Library Association Act, and various state library laws establish the regulatory framework for library operations. The National Digital Economy Policy and Strategy 2020–2030 (Federal Ministry of Communications and Digital Economy, 2020), built on eight pillars including digital literacy and skills, solid infrastructure, and digital society and emerging technologies, creates an enabling legislative context for digital library development. Yet the gap between legislative intent and operational reality persists, with the 2024 federal budget allocating only 7.9% of government expenditure to education, well below UNESCO's recommended threshold (World Education News and Reviews, 2024). A fundamental problem is that library policy in Nigeria exists primarily within the education sector, without meaningful cross-sectoral integration into national development planning, poverty reduction strategies, digital economy implementation, or health literacy frameworks (Sahabi & Otobo, 2022; Ojobor, Okafor & Ugwuanyi, 2025). This silo effect deprives libraries of opportunities to position themselves as contributors to agricultural information dissemination, financial inclusion, entrepreneurship support, and civic education functions that international evidence shows libraries can perform effectively when appropriately resourced and strategically positioned (IFLA & UNESCO, 2022; Devi, Gupta & Arahova, 2024). Building the policy case for libraries as cross-sectoral national development assets, rather than education-sector appendages, is an urgent advocacy priority for the Nigerian Library Association and its institutional partners.

Emerging Models of Library Innovation in Africa and Nigeria

Despite persistent structural challenges, there is evidence of innovative library practice emerging across Africa and within Nigeria that offers instructive models for institutional renewal. The concept of the library-as-community-hub has gained traction across sub-Saharan Africa, with libraries being repurposed as multi-function community spaces hosting digital literacy training, entrepreneurship workshops, health information sessions, and civic engagement programmes (Boakye-Achampong & Samb, 2021; Bouaamri, 2024). In Kenya and Namibia, public library systems have been transformed into community access points for digital inclusion and e-government services, with capacity-building programmes reaching over 2,300 librarians across six African countries through 2024 under EIFL's Public Library Innovation Programme (EIFL, 2024). Academic libraries in South Africa have been documented as active contributors to SDG 4 through information literacy instruction extended beyond their institutional walls to surrounding communities (Bangani, 2024). Within Nigeria, isolated but instructive examples of innovation are emerging. The Kenneth Dike Library at the University of Ibadan has developed an institutional repository infrastructure for open-access scholarly communication; LIBSENSE published a Nigerian Open Science Roadmap in 2021 and a model open science policy in 2024, signalling growing national commitment to open access (MDPI Blog, 2025). Several academic libraries have established partnerships with academic departments to deliver embedded information literacy instruction within curricula. Some university libraries have leveraged social media platforms to extend reference and information services during disruptions (Sahabi & Otobo, 2022). These examples, though insufficient in scale to characterise systemic transformation, demonstrate that institutional renewal is achievable within Nigerian constraints and provide benchmarks for replication and scaling (Ojobor, Okafor & Ugwuanyi, 2025; Idhalama, Oredo & Makori, 2025).

The Institutional Realities of Nigerian Libraries

Funding inadequacy emerges consistently across the literature as the single most pervasive constraint on Nigerian library development. Empirical evidence indicates that most Nigerian universities allocate merely 2–5% of recurrent budgets to their libraries, far below the internationally recommended threshold of 10% set by the National Council of Higher Education, with severe consequences for collections, staffing, and ICT infrastructure (Sahabi & Otobo, 2022; Ojobor, Okafor & Ugwuanyi, 2025). In absolute terms, Nigeria's 2024 federal education budget of approximately N1.59 trillion representing just 7.9% of total federal expenditure, well below UNESCO's recommended 15–20% has been further skewed by the fact that over 65% of education spending is absorbed by personnel costs, leaving minimal capital investment for infrastructure, digital tools, and library development (BusinessDay, 2025; World Education News and Reviews, 2024). Public library systems face comparable and, in some states, worse funding environments, with several state library boards operating without approved budgets in recent fiscal years, a consequence of the sustained subordination of library provision to more politically visible expenditure lines. The consequences of chronic underfunding are multi-generational: collections have not kept pace with knowledge production, leaving many academic libraries holding outdated textbooks and reference works; digital infrastructure, including internet connectivity, e-resource subscriptions, and institutional repository platforms, remains underdeveloped; physical library buildings are often in states of significant disrepair; and staff training budgets are negligible (Idhalama, Oredo & Makori, 2025; Ejikeme & Ezema, 2024). TETFund interventions have provided critical support to federal university libraries with its ICT support intervention scaled from N15 million to N100 million per university from 2022 onwards, and 607 infrastructural projects completed between January and October 2022 alone, yet this impact is uneven and does not extend to state institutions or public libraries (Ogunode et al., 2024; Onyeneke & Ahaneku, 2021). The absence of a dedicated, sustained library development fund at the federal and state levels, independent of the fluctuating TETFund cycle, represents a critical structural gap.

The governance structures within which Nigerian libraries operate are characterised by centralisation, limited autonomy, and weak accountability. University library directors frequently lack decision-making authority over staffing, budgets, and strategic direction; these powers are concentrated in vice-chancellors' offices or bursary departments with a limited understanding of library operational requirements (Sahabi & Otobo, 2022). Public library boards, where they function at all, are typically politically appointed bodies without library professional representation, generating governance decisions disconnected from operational realities. At the policy level, a persistent implementation gap exists between the formal recognition of library importance in national policy documents and the actual allocation of resources and political will necessary to fulfil this recognition. Libraries are mentioned in the National Policy on Education but are largely absent from the National Digital Economy Policy and Strategy 2020–2030, poverty reduction frameworks, and national health literacy strategies, a policy silo that constrains their perceived relevance and limits opportunities for cross-sectoral resource mobilisation (Federal Ministry of Communications and Digital Economy, 2020; Ojobor, Okafor & Ugwuanyi, 2025). The Nigerian Library Association has made important advocacy advances through its professional development programmes and strategic engagements with government, but professional association advocacy requires sustained governmental uptake and institutional response to produce systemic change.

Physical library infrastructure across Nigerian institutions ranges from adequate in a small number of flagship universities to severely dilapidated in most polytechnics, colleges of education, and public library systems. Overcrowded reading rooms, inadequate power supply compounded by Nigeria's chronic electricity challenge, limited accessibility facilities, and deteriorating furniture create learning environments that actively deter physical library use, particularly among younger, digitally connected students who have alternative study options (Ogunode et al., 2024; Nakaziba & Ngulube, 2025). Digital infrastructure presents a similarly uneven picture. While all federal universities now have internet connectivity, supported in part by TETFund and the National Information Technology Development Agency (NITDA), bandwidth is frequently insufficient for reliable digital service delivery (Yabanet et al., 2024). E-resource subscriptions, the lifeblood of contemporary academic library services, are available in only a small subset of Nigerian universities through institutional licences. The Research4Life consortium (comprising HINARI, AGORA, OARE, GOALI, and ARDI), a public-private partnership coordinated by the World Health Organization, FAO, UNEP, and WIPO, provides qualifying Nigerian institutions with free or very low-cost access to tens of thousands of peer-reviewed journals and books from over 150 publishers across health, agriculture, environment, law, and the social sciences; however, awareness and systematic use of this resource among Nigerian researchers, librarians, and library users remains suboptimal, representing a significant missed opportunity for expanding access without additional expenditure (Research4Life, 2024; Idhalama, Oredo & Makori, 2025).

Despite these challenges, the literature documents pockets of institutional innovation that provide proof of concept for library renewal. Several Nigerian academic libraries have established functional institutional repositories, including the University of Ibadan's IR, Covenant University's library digital services (established in 2008 as one of Nigeria's first institutional repositories), and the LIBSENSE-supported open science infrastructure (MDPI Blog, 2025; Ejikeme & Ezema, 2024), demonstrating that open access infrastructure can be developed within Nigerian resource constraints.

Several polytechnic and university libraries have pioneered embedded librarianship models, in which library professionals are integrated into academic department teams to provide tailored research support. Community library initiatives, including the Lekki Public Library model in Lagos and mobile library outreach programmes in Edo and Ogun states, have demonstrated that public libraries can become vibrant community spaces when provided with adequate resources and community-responsive leadership (Ojobor, Okafor & Ugwuanyi, 2025). These innovations share common enabling factors: visionary institutional leadership, active professional development within the library team, external partnerships with NGOs, international organisations, or corporate sponsors, and a deliberate orientation towards community responsiveness rather than administrative compliance. They provide an instructive evidence base for the framework proposed in the following section.

Professional Identity and the Nigerian Librarian

The global redefinition of the librarian's professional role from passive custodian to active knowledge facilitator has created both an opportunity and an obligation for Nigerian library professionals. Contemporary librarianship demands competency across multiple domains: information literacy instruction, systematic research support, scholarly communication and open access advocacy, research data management, digital curation, community outreach, and institutional strategic leadership (Cox & Pinfield, 2022; IFLA & UNESCO, 2022; Igbinovia, Segun-Adeniran & Okuonghae, 2025). These expanded competencies reflect the recognition that libraries and, by extension, librarians are not peripheral to knowledge production and use but are central to it. In Nigeria, evidence of role transformation is growing but uneven. Librarians in well-resourced academic settings are increasingly engaging in information literacy instruction, bibliometric analysis support, and research data management (Igbinovia, Segun-Adeniran & Okuonghae, 2025). Library schools in Nigerian universities have progressively updated curricula to incorporate digital librarianship, data science, and knowledge management, and the LIBSENSE initiative's 2024 Nigerian Open Science Roadmap has created a framework for libraries to engage substantively in open access policy and scholarly communication (MDPI Blog, 2025). However, the majority of practising Nigerian librarians, particularly those in polytechnics, colleges of education, special libraries, and public library systems, continue to operate in environments where outdated role perceptions, inadequate staffing, and limited access to continuing professional development (CPD) constrain professional transformation (Nakaziba & Ngulube, 2025).

Four interlocking barriers to professional renewal emerge consistently from the literature. First, inadequate access to continuing professional development — a function of limited institutional CPD budgets, geographic barriers to professional events, and restricted internet access for online learning prevents many Nigerian librarians from acquiring the updated competencies their expanded roles require (Nakaziba & Ngulube, 2025; Osiesi et al., 2022). Second, weak institutional recognition of library professionals as strategic knowledge workers, manifested in low pay grades, limited career progression pathways, and exclusion from institutional decision-making, reduces motivation and capacity for professional investment (Appiah et al., 2024). Third, the absence of a strong mentorship culture within Nigerian librarianship creates professional isolation, particularly for early-career librarians in under-resourced institutions, a gap identified as especially acute in studies of CPD in sub-Saharan African academic libraries (Nakaziba & Ngulube, 2025). Fourth, the legacy perception of libraries as administrative rather than academic units in many institutions constrains how librarians are perceived by peers, administrators, and communities, a perception that professional advocacy and demonstrated impact must actively and persistently challenge (Boakye-Achampong & Samb, 2021)

Where professional renewal is occurring, it is driven by identifiable enablers. Participation in the Nigerian Library Association's activities, in regional networks such as the African Library and Information Associations and Institutions (AfLIA), which provides courses on open access, open educational resources, and early literacy through regular cohort programmes and in international professional communities, including IFLA and CILIP, provides access to global knowledge, peer networks, and professional development resources that partly compensate for limited institutional CPD investment (AfLIA, 2024; EIFL, 2024). The growing availability of free and low-cost online professional development resources, including IFLA's continuing professional development guidelines and training materials, AfLIA's Openness for African Librarians short courses, and Research4Life's information literacy training modules, is enabling a cohort of technologically motivated Nigerian librarians to self-develop competencies in digital services, data management, and open access (Research4Life, 2024; AfLIA, 2024). Mentorship relationships with internationally connected senior colleagues and participation in Commonwealth, Carnegie, and Mortenson Centre CPD programmes have also been identified as important catalysts for professional transformation in Nigerian and African librarianship contexts (Nakaziba & Ngulube, 2025; IFLA, 2016). These enablers suggest that professional renewal in Nigerian librarianship is not dependent solely on institutional funding; it can be fostered through deliberate professional community building, peer learning networks, and self-directed development strategies, provided that the enabling infrastructure (reliable internet access, professional association membership, exposure to innovation communities) is made broadly accessible.

Theoretical Framework

Institutional Theory (DiMaggio & Powell, 1983; Scott, 2014). A sociological framework explaining how organisations are shaped by their regulatory, normative, and cultural-cognitive environments. Applied to Nigerian libraries, it explains

why institutional weaknesses persist despite policy pronouncements, and how external legitimacy pressures can substitute for genuine performance improvement, Capacity Development Theory (Morgan, 2006). A development framework that identifies five core capabilities: the capability to commit and engage, execute, relate and attract resources, adapt and self-renew, and achieve coherence as the foundation of sustainable organisational performance. Applied to Nigerian libraries, it provides a multi-dimensional lens for assessing what genuine institutional renewal requires. Professional Identity Theory (Ibarra, 1999; Hallam et al., 2022). A theoretical perspective emphasising that professional identity is constructed through practice, narrative, and social recognition rather than being a fixed attribute. For Nigerian librarians, this implies that professional renewal requires not only training but also changes in institutional culture, public advocacy, and professional community. These three theoretical lenses, Institutional Theory, Capacity Development Theory, and Professional Identity Theory, provide the conceptual architecture through which this paper analyses the challenges and opportunities facing Nigerian libraries. They direct attention to the structural, organisational, and individual dimensions of library renewal simultaneously, preventing the analytical reductionism that occurs when any single dimension is treated as the primary or exclusive explanation for institutional performance.

The Integrated Library Renewal Framework (ILRF): Repositioning Nigerian Libraries

Drawing on the systematic literature analysis, policy review, theoretical framework, and institutional findings presented in the preceding sections, this paper proposes the Integrated Library Renewal Framework (ILRF) as a context-responsive, evidence-based model for repositioning Nigerian libraries as active contributors to national renewal. The ILRF is structured around four interlocking pillars, each addressing a critical dimension of library development identified in the analysis, and supported by specific enabling strategies.

Table 1: The Integrated Library Renewal Framework (ILRF)

NO	Pillar	Core Focus	Key Enabling Strategies	Expected Outcome
1.	Institutional Capacity	Strengthening the material, human, and governance foundations of library operations	Dedicated library development funding; governance reform; infrastructure upgrading; e-resource consortia; strategic planning mandates	Libraries with adequate resources, capable leadership, and accountable governance structures
2.	Professional Renaissance	Rebuilding the professional identity, competence, and strategic agency of Nigerian librarians	Structured CPD programmes; mentorship networks; revised LIS curricula; professional certification pathways; international partnerships	A confident, competent, and community-responsive library professional workforce
3.	Policy Coherence	Aligning library development with national education, digital economy, and social development priorities	Cross-sectoral library policy mainstreaming; NLA-led advocacy; legislative updates; SDG-library alignment frameworks	Libraries positioned as central to national development across multiple sectors, not only education
4.	Community Embeddedness	Repositioning libraries as inclusive, responsive, and trusted community knowledge partners	Community needs assessments; mobile and outreach library services; health, financial, and civic information programmes; digital inclusion initiatives.	Libraries that actively serve marginalised communities and are perceived as relevant, accessible, and trustworthy

Institutional Capacity: Strengthening the Foundation

No meaningful library renewal is possible without addressing the material and governance foundations of institutional capacity. This pillar calls for the establishment of a dedicated National Library Development Fund, jointly administered by the Federal Ministry of Education, TETFund, and the National Library of Nigeria, to provide sustained capital and recurrent grant support to all categories of libraries: academic, public, special, and school. Allocation criteria should be transparent, performance-linked, and calibrated to institution size and developmental need. Governance reform is equally essential. Academic library directors should be accorded institutional status equivalent to deans of academic faculties, with direct access to university management and inclusion in institutional strategic planning processes. Public library boards should be professionally constituted, with library scientists in leadership positions, and should operate under performance contracts that specify service delivery targets and accountability mechanisms. Every library, be it academic, public, or special, should be required to maintain and publish a three-year strategic plan, subject to periodic independent review.

1. Professional Renaissance: Rebuilding the Librarian

Professional renaissance requires a multi-pronged strategy targeting individual competency development, collective professional identity, and institutional recognition. The NLA, in partnership with library schools, should develop a mandatory Continuous Professional Development (CPD) framework that specifies minimum annual CPD hours for professional librarians across competency domains: digital services, research support, community engagement, leadership, and information ethics. CPD participation should be a condition of the Library and Registration Council of Nigeria (LRCN) licence renewal, creating a structural mechanism for sustained professional development. Library schools in Nigerian universities should urgently revise their curricula to align with the competency framework proposed by IFLA (2021) and Hallam et al. (2022), incorporating digital librarianship, data science for libraries, research data management, scholarly communication, and community information services as core curricular components. Mentorship programmes should be institutionalised within the NLA, pairing early-career librarians with experienced mentors in Nigeria and through international partnerships with practising professionals in Ghana, Kenya, South Africa, the United Kingdom, and the United States.

2. Policy Coherence: From Education Silo to National Asset

The repositioning of libraries as cross-sectoral national development assets requires deliberate and sustained policy advocacy. The NLA should develop and actively promote a Nigerian Libraries and National Development Policy Brief directed at the National Assembly, the Federal Executive Council, state governments, and development partners that articulates the evidence base for library investment across the SDGs, the digital economy agenda, and national health, agricultural, and financial inclusion programmes. This advocacy should be coordinated with sister organisations, including the Library Council of Nigeria, NALISE, and international bodies, including IFLA and AfLIA. At the legislative level, the National Library Act and state library laws require updating to reflect contemporary library service realities, digital infrastructure mandates, and professional standards. Legislative advocacy should prioritise the inclusion of library infrastructure targets in the national budget framework and the digital economy action plan, and should seek mandatory library services provisions in education sector compacts at all levels.

Community Embeddedness: Libraries for the People

The fourth pillar repositions libraries, particularly public libraries, as actively embedded partners in community life rather than passive repositories of resources waiting to be visited. This requires a fundamental reorientation of service models from "come to us" to "we come to you", implemented through mobile library services, outreach programmes in markets, health centres, and community meeting spaces, digital literacy workshops for community members of all ages, and co-designed library spaces that reflect community identity and priorities. Community embeddedness also means that libraries actively curate and disseminate locally relevant information, agricultural extension advice, public health information, voter education resources, small business regulatory guidance, and indigenous knowledge documentation in local languages and accessible formats. Partnerships with NGOs, civil society organisations, community-based organisations, state ministry extension services, and the private sector can provide resources, content expertise, and community networks that expand library reach and impact beyond what institutional budgets alone could support.

Conclusion

This paper has argued that repositioning Nigerian libraries for national renewal is simultaneously one of the most urgent and most achievable institutional development challenges facing Nigeria's knowledge sector. The analysis confirms that the challenges confronting Nigerian libraries, chronic underfunding, governance dysfunction, professional identity erosion, policy marginalisation, and digital infrastructure deficits, are deep and systemic, and cannot be addressed by piecemeal technological or programmatic interventions alone. But the analysis also confirms that the resources necessary for renewal professional commitment, institutional knowledge, international partnerships, proven innovation models, and a vibrant professional association already exist within the Nigerian library ecosystem, awaiting the institutional frameworks, policy support, and strategic leadership to deploy them at scale. The ILRF proposed in this paper provides a structured, theoretically grounded, and evidence-informed roadmap for this renewal. Its four pillars, Institutional Capacity, Professional Renaissance, Policy Coherence, and Community Embeddedness, are mutually reinforcing: progress on any one pillar creates enabling conditions for the others, and neglect of any pillar weakens the entire renewal project. Implementation of the ILRF requires engagement from multiple actors: federal and state governments, university administrations, the Nigerian Library Association, library schools, the LRCN, development partners, and individual library professionals. The future of libraries in Nigeria is not written. It will be shaped by the decisions, investments, and advocacy of this generation of library professionals. There is reason for cautious optimism: the professional awareness, global connectivity, and institutional knowledge of today's Nigerian librarians are greater than at any previous point in the profession's history. The question is whether this generation will harness these assets within the framework of a coherent, sustained, and politically engaged renewal strategy to build the libraries that Nigeria's future demands and deserves.

Recommendations

Based on the gap identified in the paper, the paper therefore recommended that;

1. The government should establish a dedicated National Library Development Fund, administered jointly by the Federal Ministry of Education, TETFund, and the National Library of Nigeria, to provide sustainable capital and recurrent grant support to academic, public, special, and school libraries across all states.
2. The NLA should develop and officially adopt the Integrated Library Renewal Framework (ILRF), or a comparable integrated policy platform, as the professional association's official strategic advocacy agenda for the 2026–2030 cycle, with clear implementation milestones, monitoring indicators, and annual progress reporting.
3. Library administrators should implement embedded librarianship models in academic institutions, integrating library professionals into research teams, academic departments, and student learning support systems to demonstrate and deliver expanded professional roles.
4. Library Educators should urgently revise undergraduate and postgraduate LIS curricula to incorporate digital librarianship, data science for libraries, scholarly communication and open access, research data management, community information services, and library advocacy as core, not elective, modules. As well as building stronger curriculum connections between library schools and practising library institutions, through internship programmes, practitioner guest lecture series, action-research partnerships, and co-designed continuing education programmes for working librarians.
5. Librarians should invest proactively in self-directed professional development through free and low-cost online platforms, including IFLA's training programmes, Coursera, edX, and YouTube tutorial channels, to acquire digital, research support, and community engagement competencies independently of institutional CPD budgets.

Abstract

This paper examines the contemporary funding challenges and future sustainability strategies for Nigerian academic libraries generally situating the Air Force Institute of Technology (AFIT) Kaduna Library, within the broader landscape of Nigerian library funding. This study is an empirical literature review of current publications not older than ten (10) years aimed at exploring the funding sources, challenges related to technology adoption, and current sustainability approaches in Nigerian Libraries, aiming to create a practical model for financial resilience and service continuity. Based on the review of relevant empirical literature, the study revealed that the Libraries in Nigeria, despite benefiting from institutional funding and TETFund interventions, faces systemic constraints such as bureaucratic allocation processes, limited budgetary prioritization, and infrastructural deficits that hinder technological advancement. The study further revealed the need for multidimensional strategies, including smart library applications, green library initiatives, strategic partnerships, and diversified funding streams to enhance sustainability and innovation. The study concluded by recommending the implementation of a phased sustainability framework that would include: the institutionalization of a Library Development Levy (LDL); Broaden the Funding Model Beyond Institutional Allocation; Leverage Consortia and Open Access to Cut Costs; to Integrate Library Funding Advocacy into Institutional Strategy and to provide actionable pathways for transforming the AFIT Library into a model of financial innovation and technological excellence within Nigeria's military academic institutions, while also contributing to broader discussions on sustainable library funding in resource-constrained environments.

Keywords: AFIT Kaduna, Library Funding Challenges, Military Academic Libraries, Nigeria, Resource Allocation, Specialized Libraries, Sustainable Funding Models.

Introduction

In Nigeria, funding for libraries has historically been a vital but frequently neglected aspect of educational progress. Although libraries are recognized as essential for teaching, learning, and research, numerous academic libraries in Nigeria function with significantly limited budgets, frequently receiving funding that is lower than the suggested percentage of institutional spending. This persistent lack of funding has led to a series of problems for academic libraries, such as insufficient physical collections, outdated information resources, inadequate infrastructure, and difficulty in retaining professional staff. As a result, these libraries face challenges in meeting their primary responsibility of delivering timely, relevant, and thorough information services to their users (Nwali, 2016).

Funding academic libraries in Nigeria has experienced some changes thanks to the Tertiary Education Trust Fund (TETFund), which allocates specific resources for library development, such as acquiring books, journals, and ICT facilities. (NUC (National Universities Commission, 2017 & Agboola, 2015).

In light of this context, the current study is clearly needed and justified. Although there is considerable research on the funding of traditional Nigerian university libraries, there are limited studies that have directly explored the funding dynamics, barriers to technology adoption, and sustainability strategies specific to military-related academic libraries such as AFIT. This research, consequently, aims to explore through empirical reviews the funding sources, challenges related to technology adoption, and current sustainability approaches of libraries in Nigeria that will in turn assist the Air Force Institute of Technology Library to create a practical model for financial resilience and service continuity.

Literature Review

Funding Patterns in Nigerian Academic Libraries

Research has consistently highlighted the unstable funding situation of Nigerian academic libraries over the last seven years. Aboh (2025) carried out a descriptive survey of seven federal university libraries in Nigeria's North Central area, which includes the Federal Capital Territory, and discovered that government grants, especially TETFund special needs assessment grants, were the primary source of funding for these institutions. The research, which utilized a complete enumeration of 88 library personnel through questionnaires, observation checklists, and structured interview schedules, indicated that library registration fees, service charges from tailored offerings, and penalties from lost books or user tickets surfaced as additional sources of income.

Baranzan and Achie (2024) investigated library advocacy as a funding tactic in academic libraries within Kaduna State, Nigeria, by surveying 217 librarians through a quantitative survey research approach. The results indicated that recognizing and seeking opportunities like grants, partnerships, and philanthropic support are central to advocacy as a funding strategy, whereas funding and budgeting—crafting plans to obtain and oversee library funding including grants, donors, and budget distribution—emerge as the key areas of advocacy in academic libraries in the area.

Adequate Funding for Library Development and Service Delivery

Research findings highlight the vital connection between sufficient funding and successful library service provision. Aboh (2025) highlighted that TETFund financing has become an essential support for library functions, as university libraries would encounter major difficulties in upholding fundamental services without it. The research found that existing funding streams are inadequate to equip libraries with the modern amenities required for ICT compliance, emphasizing the critical necessity for diversifying funding.

Government Allocation and Dependence on Public Funding

Research shows a continual dependence on government allocation as the main source of funding for academic libraries in Nigeria. Aboh (2025) noted that federal university libraries are largely reliant on government funding, with TETFund support acting as the primary source of external financial assistance. The research observed that although library registration fees and service charges generate additional revenue, these other sources are still not fully developed in comparison to government funding levels.

Baranzan and Achie (2024) discovered that academic libraries in Kaduna State need targeted advocacy initiatives to enhance funding results. The research suggested that library administrators should uphold and enhance advocacy initiatives, as this would boost the efficiency of library and information service provision. The study highlighted funding and budgeting as essential areas that need advocacy attention.

Challenges of Library Funding

Inadequate Budgetary Allocation

Studies indicate that insufficient budget distribution is a major challenge for Nigerian academic libraries. Aboh (2025) highlights that while TETFund is a crucial funding source, its current funding levels are inadequate for modern ICT facilities, leading libraries to seek alternative funding options.

The effective use of available resources is challenged by difficulties in securing those resources (Okwu, 2021).. Research on Nigerian research institute libraries reveals inefficiencies due to centralized financial management that often excludes librarians from budgeting processes. This disconnect between funding entities and operational needs results in misaligned spending priorities, ignoring essential library requirements (Omolade & Owoeye, 2023).

The impact of inadequate budgetary allocation affects both immediate operations and long-term strategic development in libraries. Insufficient funding hampers collection development, technology acquisition, and staff retention. Irenoa, Emilia, and Eru (2019) highlighted that a significant issue for Nigerian academic libraries is their failure to access government funds, indicating systemic barriers that worsen the funding crisis.

Inflation and Rising Cost of Information Resources

Although no empirical study in the search results directly quantifies inflation's impact on library purchasing power within the past seven years, multiple studies indirectly reference the erosion of library budgets. Adekoya (2022) noted that the procurement of library information resources and infrastructure that are germane to current trends in education and industry requires substantial financial commitment, implying that static budgets cannot keep pace with rising costs.

Even when funds are distributed, their actual worth is quickly diminished by Nigeria's ongoing inflation and the increasing expense of information resources. The costs of academic journals, e-books, and databases—many of which are priced in foreign currencies—have consistently surpassed general inflation rates. The Nigerian naira's devaluation worsens this issue, resulting in the same nominal budget obtaining fewer resources annually. Ojukwu (2020) observed in her doctoral research that even with government support from TETFund, "EIRs services funding was ineffective," as inflationary pressures diminished the purchasing power of the distributed funds.

Bureaucratic Bottlenecks in Fund Disbursement

Bureaucratic bottlenecks in fund disbursement constitute a significant operational challenge for Nigerian academic libraries. Even when funds are approved, multi-layered approval processes, procurement regulations that favor low-bid contracts, and the absence of delegated spending authority for librarians delay disbursement, sometimes by an entire academic session. Irenoa, Emilia and Eru (2019) identified that "corruption and mismanagement of available resources/funds, poor leadership and culture of free services" are among the problems that hamper the development of university libraries, with bureaucratic inefficiencies compounding the funding crisis

These procedural barriers are particularly acute when accessing intervention funds from agencies such as TETFund. Onyeneke and Ahaneku (2021) recommended that "TETFund should be mandated to make the processes simpler" and that the agency should "organize conferences to educate institutions on the need and processes to access funding". The complexity of application and reporting requirements often requires specialized expertise that small or remote libraries lack, creating inequitable access to available funds.

Limited Technological Advancement

Financial limitations directly restrict technological progress in Nigerian academic libraries. Although certain libraries have gained from e-library initiatives funded by TETFund, numerous others do not have the ongoing financial resources to sustain hardware, refresh software, cover internet bandwidth costs, or employ ICT-skilled personnel (Tella & Issa, 2018). Automation initiatives are often halted midway because of insufficient funds for technical assistance or spare components. Anunobi and Ezeani (2021) discovered that fewer than 40% of academic libraries in Nigeria possessed fully operational integrated library systems, and fewer than 15% provided remote access to digital resources.

Further studies by Muhammad et al. (2026) reported particular technological issues such as inadequate modern ICT resources, unreliable internet access, obsolete software, and insufficient training for staff. The research suggested improving ICT infrastructure, especially computers and peripherals; increasing internet bandwidth; carrying out regular staff training initiatives; transitioning to open-source Library Management Systems like KOHA; and securing ongoing funding commitments for ICT modernization.

Contributions of TETFund and External Support to Academic Libraries

The acronym TETFund refers to the Tertiary Education Trust Fund, which is another funding source for public tertiary institutions establishments and their libraries. This is a government agency under the Federal Ministry of Education created to support public higher education institutions (universities, polytechnics, and colleges of education) in securing financial resources as a means of praising government initiatives in financing education progress. TETFund assist public tertiary institutions and specifically their libraries in obtaining and providing information resources and services accessible to users via service provision alongside initiating projects, rehabilitation and the establishment of library amenities and buildings respectively (Abdullahi, Saka & Udoudoh, 2023).

Furthermore, Empirical data supports TETFund as the primary external funding provider for academic libraries in Nigeria. Aboh (2025) discovered that TETFund special needs assessment grants serve as a significant funding source for federal university libraries in North Central Nigeria, characterizing TETFund funding as "an essential lifeline for maintaining library functions." The research indicated that in the absence of TETFund assistance, university libraries would encounter considerable difficulties in sustaining essential services.

Strengths and Limitations of Intervention Funding

Research studies show the advantages and drawbacks of TETFund intervention financing. Aboh (2025) noted that although TETFund grants offer essential assistance, existing funding sources are inadequate for delivering modern ICT-compliant facilities. The research found that varying funding sources is crucial for maintaining the sustainability and efficiency of library services at federal universities.

Although TETFund intervention funding offers undeniable benefits, it has considerable shortcomings. Initially, it is project-oriented instead of continuous, implying that although a library might obtain funding for buying computers or setting up an e-library, it does not get assistance for recurring expenses like electricity, internet bills, or employee wages. Ojukwu (2020) discovered in her doctoral study that "even with government initiatives, EIRs services funding was ineffective," and sustainability continued to be a significant issue.

Need for Alternative and Sustainable Funding Models

Due to the constraints of government funding and TETFund support, researchers are increasingly advocating for alternative and sustainable financing approaches for academic libraries in Nigeria. Agbanu and Ezekwibe (2024) asserted that "university libraries should urgently seek alternative funding sources to enhance traditional ones," emphasizing that "existing funding is insufficient for obtaining the modern infrastructure necessary for ICT compliance."

Suggested alternative funding sources consist of grants from global donors, partnerships with technologically developed nations, internal revenue through fee-for-service offerings, and the creation of support groups for the library. Irenoa, Emilia, and Eru (2019) urged for "an evaluation of the culture of entirely free services, investigation into alternative funding sources beyond budget allocations, enhanced advocacy and lobbying of decision-makers, and innovative utilization of resources for efficient service delivery."

Additionally, Baranzan and Achie (2024) discovered that recognizing and seeking opportunities like grants, collaborations, and charitable backing is fundamental to advocacy as a funding approach. The research suggested that academic library management should concentrate on the critical aspects of library advocacy that assist in obtaining additional funding, thus improving the delivery of efficient library and information services.

Technology and Library Sustainability: Smart Library Technologies

Intelligent library technologies—such as radio-frequency identification (RFID) for managing circulation, Internet of Things (IoT) sensors for monitoring environments, and artificial intelligence (AI)-driven systems—are revolutionizing library functions worldwide. Nonetheless, the uptake in Nigerian academic libraries is still in its early stages because of significant implementation expenses and insufficient technical knowledge. Okuonghae and Achugbue (2021) discovered that although the most frequently utilized open access technologies include social media tools, open

source integrated library systems, and Google Cloud Platforms, the overall "extent of digital librarianship practice in university libraries for sustainable development is low."

The integration of smart library technologies in higher education shows both encouraging developments and notable deficiencies that guide strategic decisions for academic libraries. Recent studies analyzing eight libraries of tertiary institutions in Kaduna State evaluated eight different types of technology through 285 responses, offering significant benchmarks for comparative evaluation. The results show that mobile apps and self-service tools are the most commonly used technologies (15.44% adoption rate), with automation and cloud computing systems following closely (15.09% adoption rate), indicating a primary emphasis on improving user accessibility and operational effectiveness (Dada et al. 2025). These adoption trends, as noted by Bi, Zhang, and Wang (2022), demonstrate a practical reaction to user demands for easy, on-demand access to library resources and administrative requirements for efficient operations amidst limited staffing conditions.

Nonetheless, the same research conducted by Dada et al. (2025) uncovers significant differences in the implementation of more sophisticated technologies. Artificial Intelligence and chatbot technologies exhibit the minimum adoption rate at only 10.18%, with Internet of Things (IoT) integration not far behind at 10.88% adoption. This technological delay probably arises from the significant infrastructure needs and specialized skills necessary to implement these systems successfully—resources that are frequently limited in Nigerian academic libraries.

Digital Transformation and Automation

Digital transformation involves the transition from print-focused to digital-first library services, which include integrated library systems (ILS), institutional repositories, discovery services, and platforms for managing electronic resources. Nonetheless, the obstacles to successful automation are significant. Data from a field survey conducted by Ogor, Karaye, and Magoi (2025) in Kaduna State academic libraries revealed several obstacles to ILMS usage, such as "absence of maintenance and support agreements" (42.7%), "insufficient ICT infrastructures" (55.6%), "inadequate ICT skills among library personnel" (51.9%), and "insufficient training of library staff" (50%).

Empirical evidence reveals that digital transformation is inconsistent among academic libraries in Nigeria. Uhegbu et al. (2025) discovered that merely 34.4% of federal and state universities in South-East and South-South Nigeria possess institutional repositories, all of which are under 10 years old. Theses and dissertations were recognized as the primary information resources located in the repositories, whereas the research output of lecturers and their online presence due to IR use stayed minimal. The research determined that although IR has turned into a significant resource for research and online exposure, coordinated actions are required to secure rapid and lasting development.

ICT Infrastructure and Innovation in Library Services

Dependable ICT infrastructure, comprising servers, networking devices, computers, and backup power solutions, serves as the basis for all technology-reliant library services. The field study conducted by Ogor, Karaye, and Magoi (2025) found "erratic power" (50%) and "fluctuating network" (59.4%) to be significant obstacles impacting ILMS usage in academic libraries of Kaduna State. These infrastructure shortcomings greatly limit libraries' capacity to provide innovative services like remote electronic resource access, virtual reference, or online teaching.

Okuonghae and Achugbue (2021) highlighted that although digital librarianship can foster sustainable development, the education sector still grapples with "chronic issues including insufficient funding for education, low-quality educational infrastructure, and mismanagement of educational finances, among others." Library service innovation is mostly aspirational until these basic infrastructure issues are resolved.

Relationship between Technology Adoption and Sustainability

Research findings indicate a positive link between the adoption of technology and the sustainability of libraries. Asifor and Ogbomo (2024) found Pearson correlation coefficients of 0.535 for Edo State and 0.706 for Delta State, both significant at the 5% and 1% levels respectively, indicating a positive and significant link between technology adoption and service effectiveness.

Strategic technology investments can lower long-term expenses (e.g., by automating repetitive tasks), boost income (e.g., via fee-based digital services), and broaden user access (e.g., through remote connectivity), thereby improving sustainability (Owolabi & Idowu, 2019). Conversely, adopting technology necessitates initial capital investment and continuous operational costs—exactly what poorly funded libraries don't have. This establishes a detrimental loop: lacking funding, libraries are unable to implement technologies that would enhance their sustainability; without sustainability, they cannot garner the financial support necessary for technology (Omekwu & Echezona, 2020). Disrupting this cycle necessitates intentional policy measures and innovative funding strategies.

Muhammad et al. (2026) suggested that ongoing funding commitments for ICT modernization are crucial for enhancing the efficiency of resource procurement, organization, and distribution in academic libraries, underscoring that technology sustainability relies on persistent financial support.

Sustainability Strategies for Libraries

Diversified Funding Sources

The most commonly suggested sustainability strategy is to diversify funding sources beyond government funding and TETFund interventions. Owolabi and Idowu (2019) suggest that libraries can also generate revenue by renting out meeting spaces, offering continuing education programs, and providing information literacy training to external organizations. While these income streams are unlikely to fully replace public funding, they can provide a buffer against budget cuts and fund discretionary improvements.

Baranzan and Achie (2024) noted that grants, collaborations, and charitable support represent vital opportunities libraries should seek via focused advocacy initiatives. The research revealed that creating strategies to obtain and oversee library funding, such as grants, donations, and budget distribution, is the most essential aspect of advocacy in academic libraries.

Irenoa, Emilia, and Eru (2019) urged for the investigation of "grant sourcing and exploration, heightened advocacy and lobbying of policymakers and the political class, and innovative utilization of resources for efficient service delivery."

Strategic Partnerships and Collaborations

Strategic collaborations provide an alternative route to sustainability. These consist of consortium agreements enabling libraries to split the expenses of costly journal subscriptions and database access, collaborations with tech firms for reduced or contributed hardware and software, and partnerships with alumni associations and library support groups to rally volunteer assistance and contributions.

Ochogwu and Ugah (2018) specifically recommend that special libraries, including military-affiliated libraries, leverage their unique institutional connections to secure resources unavailable to conventional academic libraries. Such partnerships can provide not only financial resources but also technical expertise, training opportunities, and access to global networks of practice.

Green Library Initiatives

The idea of green libraries signifies an ethical obligation and a practical approach for improving the sustainability of library functions. Green library practices involve eco-friendly methods for managing facilities, using resources, and providing services that adhere to global sustainability standards. A research conducted by Dada (2025) exploring the implementation of International Federation of Library Associations and Institutions (IFLA) Green Library practices in Nigerian federal university libraries revealed insufficient funding as the main obstacle, along with elevated retrofitting expenses and reluctance to operational interruptions. In spite of these obstacles, incorporating sustainability practices provides academic libraries numerous advantages, such as lower operational expenses, improved institutional reputation, and conformity with worldwide best practices.

Green library initiatives, such as energy-saving lighting, solar energy installation, rainwater collection, and waste minimization programs, fulfill two roles: they cut operational expenses and showcase environmental accountability (Owolabi & Idowu, 2019). Due to Nigeria's inconsistent grid electricity, solar energy is especially pertinent for academic libraries, offering a sustainable substitute for diesel generators. Although the initial expense of solar installation is high, the savings over time on fuel and generator upkeep can be allocated to development of collections and staffing (Omekwu & Echezona, 2020).

Income-Generating Services

In addition to conventional fee-based services, certain Nigerian academic libraries have ventured into more entrepreneurial activities that generate income. This encompasses providing digitization services to outside clients, publishing and selling textbooks written locally, running campus bookstores, offering information brokerage services to companies, and organizing paid workshops and conferences.

Irenoa, Emilia, and Eru (2019) observed that "novel services for the 21st-century academic library and alternative funding sources to enhance the delivery of library services to users" are crucial for achieving the vision and mission of their parent institutions. Nevertheless, the writers warned that services aimed at generating income should enhance, not divert from, the library's primary educational purpose, suggesting "innovative resource utilization" instead of commercial exploitation.

Resource Sharing and Institutional Support

Arrangements for resource sharing, including interlibrary loan and collaborative collection development, can greatly enhance the impact of constrained budgets. Instead of individual libraries acquiring costly, infrequently utilized resources, cooperative purchasing and shared access agreements distribute expenses among several institutions. Ojukwu (2020) highlighted the significance of "strategic planning and policy execution to influence the sustainable delivery of EIRs" and observed that "the policy framework for EIRs' service provision was also inadequate" in the libraries examined, implying that resource sharing structures necessitate intentional policy formulation.

Baranzan and Achie (2024) discovered that institutional backing via advocacy initiatives is essential for obtaining funding. The research suggested that library administrators should prioritize essential aspects of library advocacy to obtain additional funding, thus improving the delivery of effective library and information services.

The AFIT Kaduna Library Context

Nature and Role of the AFIT Library within Military Academic Institutions

The Air Force Institute of Technology (AFIT) in Kaduna is a distinctive academic entity in Nigeria's higher education system, founded with a focused aim to cultivate skilled graduates in aerospace engineering, aviation, and associated technical disciplines while fulfilling the operational requirements of the Nigerian Air Force. The AFIT Library acts as the intellectual foundation of this mission, offering vital resources and services to aid advanced research in fields such as aerospace technology, materials science, robotics, artificial intelligence, and cybersecurity. Nonetheless, similar to numerous academic libraries in Nigeria, it functions in a difficult financial environment marked by conflicting priorities, constrained resources, and growing calls for technological integration.

The AFIT Library serves a dual constituency: military personnel undergoing technical and professional training, and civilian students pursuing undergraduate and postgraduate degrees in engineering, environmental sciences, and management courses.

A field survey examining Integrated Library Management Software utilization in Kaduna State academic libraries by Ogor, Karaye, and Magio (2025) included AFIT alongside other institutions such as the Nigerian Defense Academy (NDA), Kashim Ibrahim Library (KIL), and Kaduna State University (KASU) affirming its academic status.

Existing Funding Realities and Operational Challenges

The financial foundation of AFIT Library primarily derives from institutional allocations and targeted interventions from national funding bodies. The most significant external funding source is the Tertiary Education Trust Fund (TETFund), which has supported various aspects of AFIT's development, including library projects, physical infrastructure, ICT enhancement, and human capacity development.

Beyond TETFund, AFIT Library benefits from direct institutional allocations within the broader Nigerian Air Force budget. However, evidence from similar research institute libraries in Kaduna State suggests that library services typically receive extremely limited portions of institutional budgets, averaging only 0.41% according to one comprehensive study by Adekoya,. (2023). This pattern likely extends to AFIT, where competing priorities for laboratory equipment, simulation technologies, and specialized training facilities may further constrain library allocations despite its critical support role for both academic programs and military research initiatives.

Table 1: Current Funding Sources for AFIT Library

Funding Source	Nature of Support	Strengths	Limitations
TETFund Interventions	Project-based funding for infrastructure, ICT, collections	Substantial capital injections; Aligned with institutional priorities	Competitive application process; Limited to specified categories
Institutional Allocation	Annual budgetary allocation from Nigerian Air Force	Predictable base funding; Integrated with institutional planning	Typically minimal percentage; Subject to broader budget constraints
Special Military Appropriation	Targeted funding for defense-related research resources	Supports specialized collections; Aligns with national security priorities	Bureaucratic procurement processes

Source: AFIT, 2018

The efficient use of resources is as major a challenge as obtaining those resources (Okwu, 2021). Studies on libraries of Nigerian research institutes indicate significant usage inefficiencies due to centralized financial management systems that frequently omit librarians in the processes of budget preparation and allocation. This structural gap between funding bodies and operational requirements often leads to misaligned budget priorities that do not meet the library's most urgent needs Omolade & Owoeye (2023). At AFIT, these challenges can be exacerbated by military purchasing procedures that, although they guarantee accountability, may lead to delays and administrative challenges that clash with fast-changing technological demands.

Infrastructure constraints represent another major limitation on the use of funds. An examination of federal university libraries in Nigeria's southwestern area revealed that insufficient facilities serve as a major obstacle to adopting sustainable practices, while substantial retrofitting expenses and opposition to operational interruptions further hinder infrastructure advancements. The challenges faced by the AFIT Library are especially significant due to the technical focus of AFIT's academic programs, which necessitate specialized information resources, sophisticated technological platforms, and customized learning environments that surpass what conventional library facilities can offer.

Need for Present and Future Sustainability Strategies

An effective funding strategy for AFIT Library necessitates a comprehensive approach that targets various aspects of financial stability at the same time. This method must acknowledge the intertwined relationships among funding sources, technological abilities, human resources, and institutional objectives, forming a unified framework

instead of a series of separate initiatives. The suggested framework integrates short-term stabilization tactics, medium-term development projects, and long-term transformation plans to establish a forward-looking route to sustainable funding (Adekoya, 2022).

The core of this framework lies in varied revenue generation that lessens reliance on a single funding source while supporting AFIT's focused mission. Possible revenue sources could consist of fee-based specialized offerings for external researchers or entities, grant-supported projects tackling particular technological or educational issues, corporate funding for specific collections or facilities, and partnership income from joint ventures with industry or other organizations. Every revenue source must be assessed not just for its monetary impact but also for its strategic fit with AFIT's mission and its ability to improve rather than disrupt the library's essential services.

Methodology

This study employed an empirical literature review methodology of current publications not older than ten (10) years which is aimed at exploring the funding sources and challenges related to technology adoption, and current sustainability approaches in Nigerian Libraries, aiming to create a practical model for financial resilience and service continuity for AFIT, Kaduna.

Findings of the Study

1. Inadequate and Unpredictable Institutional Funding - The library's primary funding sources are AFIT's annual budget allocation and TETFund intervention, which is insufficient, irregular, and often diverted to other institutional priorities.
2. Over-Reliance on a Single Funding Stream – TETFund and institutional Subvention are the main sources of AFIT library Funding and there is no formal policy mandating a fixed percentage of AFIT's budget for the library, making funding vulnerable to administrative changes.
3. Severe Gaps in Information Resources and Infrastructure - Due to funding shortages, the library suffers from: Lack of a functional institutional repository or integrated library system.
4. Low Awareness and Utilization of Alternative Funding Opportunities - There is no structured relationship with external partners (e.g., aviation industry stakeholders).
5. Absence of a Strategic Sustainability Plan - The library operates on a year-to-year survival basis without a medium- or long-term funding strategy. Also, No documented sustainability framework exists that addresses digital transformation, consortia membership, or income generation (e.g., fee-based document delivery, binding services, photocopying).

Table 2: Phased Implementation Framework for AFIT Library Sustainability

Phase	Timeframe	Key Initiatives	Success Indicators
Stabilization	1-2 years	Baseline assessment; Operational efficiencies; Initial partnerships	Reduced cost per service; Increased user satisfaction; Diversified funding sources
Development	2-4 years	Technology integration; Green retrofits; Expanded partnerships	Adoption rates of new services; Operational cost savings; Increased external funding
Transformation	4-6 years	Advanced smart systems; Sustainable operations; Strategic leadership	Benchmarks against international standards; Recognition for innovation; Financial self-sufficiency

Recommendations

The effective execution of this sustainability framework will necessitates organized procedures, defined responsibility, and ongoing assessment. A staged implementation strategy could start with a thorough needs evaluation that pinpoints key investment areas by considering user needs, organizational priorities, and current resource deficiencies. This evaluation must involve various stakeholder groups, such as students, faculty, researchers, library personnel, and institutional leaders, to guarantee a comprehensive grasp of needs and expectations (United Nations, 2015). Specific recommendations include:

1. To Broaden the Funding Model Beyond Institutional Allocation

The article recommends a multi-stream funding framework that reduces over-reliance on AFIT's central budget. This could include: a. Public-private partnerships (PPPs) with ICT and book vendors. b. Alumni and corporate donations through structured "Friends of the Library" schemes.

2. Institutionalize a Library Development Levy (LDL)

A practical recommendation is to propose a small, mandatory library fee (e.g., ₦500–1,000 per student per session) and a voluntary staff contribution scheme. These funds should be ring-fenced in a dedicated library account, with transparent annual reporting to stakeholders to ensure accountability and buy-in.

3. Leverage Consortia and Open Access to Cut Costs

Given AFIT's specialized focus (aviation and technology), this article recommends joining or forming a Nigerian technology libraries consortium to: a. Negotiate affordable bundled subscriptions to databases (e.g., IEEE, ScienceDirect). b. Adopt open access institutional repositories to reduce spending on commercial journals. c. Share digital infrastructure and staff training costs with nearby military and polytechnic libraries.

4. Develop a Sustainable Digital Transformation Roadmap

Future sustainability requires moving from ad-hoc digitization to a costed 6-year digital plan that includes: a. Low-cost, energy-efficient servers or cloud-based library management systems (e.g., Koha). b. Solar power backup to mitigate high electricity costs. c. Digitization of AFIT's unique technical reports and past exam papers to create local, reusable content.

5. Integrate Library Funding Advocacy into Institutional Strategy

This paper recommends that AFIT library leadership embed funding requests in the institute's strategic development plan, linking library services directly to accreditation (e.g., NUC, COREN, ICAO standards) and research output. This includes: a. Annual budget defense using usage statistics and impact data. b. Proposal writing training for librarians. c. Engaging AFIT's command structure through evidence of return on investment (e.g., improved student performance).

Conclusion

This research review has examined the complex funding landscape confronting academic Libraries and proposed a comprehensive framework for enhancing financial sustainability. The review reveals that while AFIT benefits from certain advantages—including TETFund support and alignment with national security priorities—it also faces systemic challenges common to Nigerian academic libraries, including limited budgetary allocations, infrastructure constraints, and technological adoption gaps. The proposed sustainability strategy addresses these challenges through integrated approaches that combine technological innovation, operational efficiency, strategic partnerships, and diversified funding streams.

Training for Life, not just Skills: Why Continuous Professional Development is Essential for 21st-century Librarians in University Libraries

Oke Ighozino UMUKORO, CLN
Delta State College of Health Sciences and Technology Ughelli, Delta State
oke2001ng@yahoo.com

Abstract

This study examines Continuous Professional Development (CPD) as a framework for training for life among librarians a selected federal university in Delta State, Nigeria. The research questions bother on the level of awareness and participation in CPD, types of CPD activities academic librarians engage in, CPD influence on librarians' professional competence and service delivery; and challenges hindering effective participation in CPD among academic librarians. The study adopted survey research and a descriptive survey design. Data were collected from 16 librarians using structured questionnaires and semi-structured interviews, and analyzed using descriptive statistics and thematic analysis. Findings revealed high levels of awareness and participation in CPD, with workshops, seminars, and conferences being the most commonly utilized forms. Librarians perceive CPD as essential for lifelong learning, adaptability, and professional growth rather than mere skill acquisition. The study further demonstrates that CPD significantly enhances service delivery, digital competencies, and innovation in library services. However, challenges such as inadequate funding, lack of institutional support, and time constraints limit effective participation in CPD activities. The study concluded that while CPD is widely recognized and practiced, its full potential as a strategy for training for life is constrained by systemic barriers. It recommends the institutionalization of CPD policies, increased funding, flexible learning opportunities, and stronger professional collaboration frameworks. The study contributes to the discourse on academic librarianship by providing localized empirical evidence and reinforcing the need for continuous learning as a strategic imperative in the digital age.

Keywords: Continuous professional development; Lifelong learning; Digital competencies; Professional relevance; Capacity building; Change management

Introduction

The 21st century has witnessed unprecedented transformations in the global information environment, fundamentally reshaping the nature and practice of academic librarianship. The rapid advancement of digital technologies, the proliferation of electronic information resources, the emergence of artificial intelligence, and the growing emphasis on research productivity have significantly altered the expectations placed on university libraries and librarians. Academic librarians are no longer viewed merely as custodians of printed materials; rather, they are increasingly expected to function as digital information specialists, research support professionals, educators, and innovation facilitators within knowledge-driven institutions. Consequently, the competencies required for effective librarianship have expanded beyond traditional cataloguing and reference services to include digital literacy, data management, research analytics, artificial intelligence literacy, and instructional support (Moonasar, 2024).

This evolving landscape has intensified the need for Continuous Professional Development (CPD) among academic librarians. CPD refers to the ongoing process through which professionals maintain, upgrade, and broaden their knowledge, skills, and competencies throughout their careers. In contemporary librarianship, CPD has become essential not only for improving professional performance but also for ensuring adaptability and long-term relevance in a rapidly changing information ecosystem. As technological innovations continue to redefine library operations and user expectations, librarians must continuously acquire new competencies to remain effective in supporting teaching, learning, and research activities within universities (Rehman, Bhat, & Ganaie, 2024).

The growing importance of CPD reflects a broader conceptual shift from "training for skills" to "training for life." Training for skills traditionally emphasizes the acquisition of specific competencies for immediate job performance, whereas training for life focuses on lifelong learning, adaptability, critical thinking, and continuous professional growth. In the context of 21st-century librarianship, this distinction is particularly important because technological changes and evolving user demands require librarians to engage in continuous learning rather than rely solely on static professional qualifications. Lifelong learning equips librarians with the resilience and flexibility needed to navigate emerging challenges, integrate new technologies, and respond proactively to changing academic environments (Sacchanand et al., 2024).

One of the most significant outcomes of effective CPD is the enhancement of digital competencies among librarians. Digital competence encompasses the ability to use, manage, evaluate, and create information using digital technologies. Modern academic librarians are increasingly expected to support digital scholarship, manage institutional repositories, provide information literacy instruction, and assist researchers with data management and bibliometric analysis. These responsibilities require continuous technological upskilling and familiarity with emerging digital tools. The adoption and utilization of such technologies can be understood through the Technology Acceptance Model (TAM), which posits that individuals are more likely to adopt technologies when they perceive them as useful and easy to use. CPD therefore serves as a critical mechanism for increasing librarians' confidence and competence in the use of digital technologies.

Beyond enhancing digital competencies, CPD also contributes significantly to improved service delivery in academic libraries. Librarians who engage regularly in professional development activities are better equipped to provide innovative, user-centered, and technology-driven services. Studies have shown that CPD enhances librarians' ability to support research activities, deliver effective information services, and respond to the evolving information needs of users (Oladokun & Mooko, 2022). Consequently, investment in librarian development aligns with Human Capital Theory, which emphasizes that investments in education and training improve individual productivity and organizational performance.

In Nigeria, particularly within federal university libraries, the need for continuous professional development has become increasingly urgent due to ongoing technological disruptions, changing patterns of information access, and rising expectations for digital service delivery. The Federal University of Petroleum Resources, Effurun, operate within an academic environment characterized by both opportunities and challenges. While digital technologies have expanded access to information resources and innovative library services, librarians in these institutions often face infrastructural limitations, inadequate funding, and insufficient institutional support for professional development.

Statement of the Problem

The emergence of digital technologies, artificial intelligence, electronic information resources, and data-driven research practices has significantly transformed the operational landscape of academic libraries in the 21st century. Contemporary academic librarians are increasingly expected to function beyond their traditional roles as custodians of information resources to become digital information managers, research support specialists, data curators, and facilitators of knowledge creation. Consequently, librarians are required to possess diverse competencies in areas such as digital literacy, information technology, research support services, data management, and user-centered service delivery.

Despite these changing professional expectations, many academic librarians in Nigerian federal universities continue to face challenges in adapting to the evolving information environment. In several institutions, professional development opportunities remain irregular, inadequately funded, and insufficiently aligned with emerging technological realities. As a result, there exists a growing gap between the competencies required for effective 21st-century librarianship and the actual professional capacities of many librarians. This gap has implications for digital competence, innovation in library services, and the overall quality of service delivery in university libraries.

Although Continuous Professional Development (CPD) has been widely recognized as an essential strategy for enhancing librarians' competencies and professional relevance, CPD practices in many Nigerian university libraries still appear largely episodic and skill-centered rather than holistic and lifelong in orientation. Most professional development activities are often limited to occasional workshops and conferences, with limited emphasis on sustained learning, digital transformation, adaptive capacity, and professional resilience. Consequently, librarians may struggle to effectively respond to rapidly changing technologies, evolving user expectations, and the increasing demand for innovative digital library services.

Furthermore, institutional challenges such as inadequate funding, insufficient administrative support, heavy workload, poor infrastructural facilities, and limited access to advanced training opportunities continue to hinder effective participation in CPD activities among librarians. These constraints not only affect librarians' professional growth but may also weaken the ability of university libraries to support teaching, learning, and research effectively within contemporary higher education environments.

While previous studies have examined Continuous Professional Development among librarians in Nigeria, many of such studies have focused primarily on training needs, skill acquisition, or general professional development practices without critically examining CPD as a framework for lifelong learning and "training for life" in the context of 21st-century librarianship. In addition, limited empirical attention has been given to the relationship between CPD, digital competencies, lifelong learning, and service delivery among librarians in federal universities located in Edo and Delta States.

It is against this background that this study investigates why Continuous Professional Development is essential for 21st-century librarians in federal university libraries in Edo and Delta States, with particular emphasis on lifelong learning, digital competencies, professional adaptability, and effective service delivery.

Research Questions

To achieve these objectives, the study is guided by the following research questions:

i. What is the level of awareness and participation in continuous professional development among librarians in Federal Universities?
ii. What types of CPD activities do academic librarians engage in?
iii. How does CPD influence librarians' professional competence and service delivery?
iv. What challenges hinder effective participation in CPD among academic librarians?

Overall, this study situates continuous professional development not merely as a tool for skill acquisition, but as a holistic, lifelong learning strategy essential for sustaining the relevance, adaptability, and effectiveness of 21st-century academic librarians.

Literature Review

Theoretical Framework

This study is anchored on an integrative theoretical framework that combines the Technology Acceptance Model (TAM), Human Capital Theory, Lifelong Learning Theory, and the Communities of Practice. Together, these perspectives provide a comprehensive lens for understanding why Continuous Professional Development (CPD) is indispensable for 21st-century librarians, particularly in the context of Federal Universities in Nigeria.

Technology Acceptance Model (TAM): Adoption of Emerging Tools

The Technology Acceptance Model (TAM), originally developed by Fred Davis, explains how users come to accept and use new technologies. The model posits that two primary constructs: 'perceived usefulness' and 'perceived ease of use', determine an individual's intention to adopt technological innovations. In academic libraries, TAM is highly relevant given the increasing deployment of digital systems such as institutional repositories, artificial intelligence tools, discovery platforms, and research analytics software. Within the context of CPD, TAM provides a framework for understanding how continuous training influences librarians' attitudes toward emerging technologies. Librarians who engage in CPD are more likely to perceive new tools as useful and manageable, thereby increasing their willingness to integrate such technologies into service delivery. Empirical studies have shown that professional development significantly enhances technology acceptance by reducing anxiety, improving competence, and fostering positive behavioral intentions (Ajuwon & Popoola, 2023). In Federal Universities where technological infrastructure is gradually expanding, CPD plays a critical role in bridging the gap between technology availability and effective utilization. Without adequate training, even well-funded technological systems may remain underutilized. Thus, TAM underscores the importance of CPD as a catalyst for technology adoption and innovation in academic libraries.

Human Capital Theory: Investment in Librarian Capacity

Human Capital Theory, associated with scholars such as Gary Becker, posits that investments in education and training enhance the productivity, efficiency, and economic value of individuals. Applied to librarianship, this theory conceptualizes CPD as a strategic investment that enhances the intellectual and professional capacity of librarians. Academic libraries are knowledge-intensive organizations, and their effectiveness largely depends on the competencies of their personnel. CPD initiatives, such as workshops, certifications, and advanced training, serve as mechanisms for building human capital by equipping librarians with relevant skills in digital literacy, research support, and information management. These enhanced competencies translate into improved service delivery, user satisfaction, and institutional performance. Recent studies affirm that continuous investment in librarian training leads to higher levels of innovation, adaptability, and organizational competitiveness (Moonasar, 2024). In the Nigerian context, where resource constraints often limit infrastructural development, investing in human capital becomes even more critical. Skilled and adaptable librarians can maximize available resources and introduce innovative services despite systemic limitations.

Lifelong Learning Theory: Continuous Adaptation and Growth

Lifelong Learning Theory emphasizes that learning is an ongoing process that extends beyond formal education and continues throughout an individual's life. It is grounded in the idea that professionals must continuously update their knowledge and skills to remain relevant in a rapidly changing world. This theory aligns closely with the concept of *training for life*, which prioritizes adaptability, resilience, and sustained intellectual growth over short-term skill acquisition. In the context of academic librarianship, Lifelong Learning Theory highlights the necessity of continuous professional development as a means of coping with technological disruptions, evolving user expectations, and emerging knowledge domains. Librarians are required to engage in self-directed learning, reflective practice, and continuous skill enhancement to effectively perform their roles as information specialists, educators, and research partners. Scholarly evidence indicates that librarians who embrace lifelong learning are better equipped to navigate change, adopt innovative practices, and contribute meaningfully to institutional goals (Sacchanand et al., 2024). For librarians in Federal Universities, this approach is particularly important given the dynamic nature of the academic environment and the increasing demand for digital and research-oriented services.

Communities of Practice (Wenger): Collaborative Learning and Knowledge Sharing

The concept of Communities of Practice (CoP), developed by Etienne Wenger, complements the aforementioned theories by emphasizing the social and collaborative dimensions of learning. CoP refers to groups of individuals who share a common professional interest and engage in collective learning through interaction, knowledge sharing, and mutual support. In academic libraries, Communities of Practice manifest through professional networks, library associations, collaborative projects, and informal peer learning groups. These platforms enable librarians to exchange ideas, share experiences, and co-create knowledge, thereby enhancing their professional competence. CoP is particularly relevant for informal CPD, as it fosters experiential learning and continuous engagement with emerging trends in librarianship. The integration of CoP into CPD strategies can significantly enhance learning outcomes by promoting collaboration, mentorship, and innovation. Studies have shown that participation in professional communities strengthens problem-solving skills, enhances knowledge dissemination, and fosters a culture of continuous improvement (Wenger-Trayner & Wenger-Trayner, 2022).

Conceptual Reviews

Continuous Professional Development (CPD) has become increasingly important in academic librarianship due to the dynamic nature of information technologies, digital scholarship, and changing user expectations in higher education institutions. The level of awareness and participation in CPD among librarians in federal universities has attracted considerable scholarly attention in recent years. Awareness of CPD refers to librarians' understanding of the importance, objectives, and benefits of continuous learning in enhancing professional competence and relevance. Participation, on the other hand, involves actual engagement in professional development activities designed to improve knowledge, skills, and performance. Studies have shown that academic librarians generally exhibit high awareness of CPD because of the rapidly changing information environment and the increasing demand for technologically driven library services. Chukwusa (2024) observed that librarians in Nigerian academic institutions increasingly recognize CPD as essential for maintaining professional relevance and responding effectively to technological changes in library operations. Similarly, Rehman, Bhat, and Ganaie (2024) found that librarians demonstrate strong interest in professional development because of the growing need for digital competencies and research support services in modern academic libraries. Despite high awareness levels, actual participation in CPD activities often varies depending on institutional support, financial resources, and access to training opportunities. In many developing countries, librarians are aware of the importance of CPD but are constrained by organizational and structural limitations that reduce consistent participation.

Academic librarians engage in different types of CPD activities aimed at enhancing their professional competencies and adapting to evolving library environments. These activities may be formal or informal in nature. Formal CPD activities include workshops, seminars, conferences, academic degree programmes, professional certification courses, and organized institutional training sessions. Informal CPD activities involve self-directed learning, peer mentoring, professional networking, online tutorials, webinars, and participation in communities of practice. Among academic librarians, workshops and conferences remain the most commonly utilized forms of professional development because they provide opportunities for knowledge sharing, exposure to emerging trends, and interaction with professional colleagues. Sacchanand et al. (2024) noted that librarians increasingly participate in online learning programmes, webinars, and virtual conferences due to the growing integration of digital technologies in professional development practices. Similarly, Moonasar (2024) reported that CPD activities in contemporary academic libraries increasingly emphasize digital literacy, research support skills, data management, and artificial intelligence competencies. The emergence of online learning platforms has further expanded access to professional development opportunities, allowing librarians to engage in flexible and self-paced learning activities irrespective of geographical barriers. These diverse forms of CPD collectively contribute to lifelong learning and professional adaptability among librarians.

Continuous Professional Development significantly influences librarians' professional competence and service delivery in academic libraries. Professional competence refers to the knowledge, technical skills, attitudes, and abilities required for effective performance in librarianship. Through CPD, librarians acquire updated knowledge and practical competencies needed to function effectively in digitally driven information environments. CPD enhances librarians' ability to manage electronic resources, provide information literacy instruction, support digital scholarship, and deliver innovative user-centered services. Oladokun and Mooko (2022) found that librarians who actively participate in CPD demonstrate improved confidence and efficiency in the use of digital technologies and electronic information systems. In the same vein, Rehman et al. (2024) observed that CPD contributes significantly to librarians' communication skills, technological competence, and research support capabilities. The influence of CPD on service delivery is particularly evident in the quality of reference services, user education programmes, research assistance, and access to digital information resources provided by librarians. Furthermore, CPD fosters innovation by exposing librarians to emerging trends, technologies, and best practices in global librarianship. This aligns with the assumptions of the Technology Acceptance Model (TAM), which suggests that continuous exposure to training increases individuals' confidence and willingness to adopt emerging technologies in professional practice.

Despite the recognized importance of CPD, several challenges hinder effective participation among academic librarians. One of the major barriers identified in the literature is inadequate funding. Many university libraries operate under limited financial resources, making it difficult for librarians to attend conferences, pursue advanced training programmes, or participate in international professional development activities. Chukwusa (2024) emphasized that inadequate sponsorship and poor funding structures significantly affect librarians' participation in CPD activities in Nigerian academic institutions. Another major challenge is the lack of institutional support and administrative commitment toward professional development. In some universities, CPD is not prioritized within organizational policies, resulting in limited opportunities for structured training and career development. Time constraints and heavy workload also constitute significant obstacles to CPD participation. Academic librarians often combine administrative, technical, and user service responsibilities, leaving little time for sustained professional learning. Rehman et al. (2024) further identified infrastructural deficiencies, inadequate access to digital technologies, and limited internet connectivity as barriers affecting participation in online and technology-based CPD activities. These challenges collectively limit librarians' ability to continuously update their competencies and remain professionally competitive in the digital age.

To enhance Continuous Professional Development in federal university libraries, several strategies have been proposed in the literature. One important strategy is the establishment of institutional CPD policies that formally recognize professional development as a core organizational responsibility. Such policies should include structured training plans, sponsorship opportunities, and incentives for participation in professional learning activities. Increased funding for CPD is equally essential for enabling librarians to attend conferences, pursue certifications, and access advanced training opportunities. Moonasar (2024) emphasized that sustainable investment in librarian development is critical for ensuring innovation and service quality in academic libraries. Another important strategy involves the integration of flexible and technology-driven learning opportunities such as webinars, virtual workshops, online certification programmes, and digital learning platforms. These approaches reduce geographical and financial barriers while promoting continuous learning. Professional collaboration through associations such as the Nigerian Library Association and the International Federation of Library Associations and Institutions can also strengthen CPD by facilitating networking, mentorship, and knowledge sharing among librarians. Furthermore, university administrations should create enabling environments by reducing workload pressures, granting study leave, and encouraging self-directed learning among librarians. The promotion of lifelong learning cultures within academic libraries is essential for ensuring that librarians remain adaptive, innovative, and professionally relevant in the rapidly evolving information society.

Methodology

The study adopts a survey research and descriptive survey design. The population of the study comprises professional and para-professional librarians working in a selected federal university in Delta State. Specifically, the study focuses on all the 29 librarians from Federal University of Petroleum Resources Effurun. Given the relatively manageable size of the target population, the study adopts a total enumeration sampling technique. Data for the study are collected using two primary instruments: structured questionnaire. Data obtained from the questionnaire were analyzed using descriptive statistics such as frequencies, percentages, mean scores (with a benchmark of 2.50), and standard deviation.

Presentation of Results

The questionnaire was distributed to the respondents and retrieved after one (1) week. 24 copies were retrieved and found usable for analysis. This makes it 82.75% retrieval rate. That data analysis is carried out with the 19 copies of the retrieved questionnaire.

Awareness and Participation in CPD

Table 1: Awareness of CPD and Types of CPD Activities Engaged In

Response	Frequency (n=24)	Percentage (%)
Aware	24	100.0
Not aware	0	0.0
CPD Activities	**Frequency (n=24)**	**Percentage (%)**
Workshops/Seminars	22	91.67
Conferences	21	87.5
Online Courses/Webinars	18	75.0
In-House Training	15	62.5
Professional Certification		33.33

All respondents indicated awareness of Continuous Professional Development, reflecting widespread recognition of its importance.

Workshops and seminars (91.67%) are the most commonly attended CPD activities, followed by conferences (87.5%). Participation in professional certification programmes is relatively low (33.33%).

Perceived Importance of CPD

Table 2: Perception of CPD as Training for Life vs. Skill Acquisition

Statement	Strongly Agree (%)	Agree (%)	Disagree (%)	Strongly Disagree (%)	Mean
CPD enhances lifelong learning	62.5	37.5	0.0	0.0	3.63
CPD is mainly for skill acquisition	18.8	50.0	31.2	0.0	2.88
CPD improves adaptability to change	56.2	43.8	0.0	0.0	3.56

The results indicate strong agreement that CPD promotes lifelong learning (Mean = 3.63) and adaptability (Mean = 3.56), supporting the concept of "training for life" rather than mere skill acquisition.

Impact of CPD on Professional Practices

Table 3: Impact of CPD on Service Delivery, Digital Competence, and Innovation in Library Services

Service Delivery	Frequency (n=24)	Percentage (%)

High Impact	16	66.67
Moderate Impact	8	33.33
Low Impact	0	0.0
Digital Competencies	**Frequency (n=24)**	**Percentage (%)**
High Impact	1	62.5
Moderate Impact	9	37.5
Low Impact	0	0.0
Innovation in Library Services	**Frequency (n=24)**	**Percentage (%)**
High Impact	14	58.33
Moderate Impact	10	41.67
Low Impact	0	0.00

Most respondents (68.8%) reported that CPD has a high impact on service delivery.
A majority (62.5%) indicated that CPD significantly improves their digital competence.
The findings suggest that CPD contributes positively to innovation in library services, with 56.2% reporting a high impact.

Challenges Affecting CPD Participation

Table 4: Challenges to CPD Participation

Response	Frequency (n=24)	Percentage (%)
Inadequate funding	21	87.5
Lack of institutional support	18	75.0
Time constraints/workload	20	83.33
Limited access to training opportunities	14	58.33
Lack of motivation/incentives	12	50.0

The major challenges identified include inadequate funding (87.5%), time constraints (83.33%), and lack of institutional support (75.0%), indicating systemic barriers to effective CPD participation.

Discussion of Findings

Awareness and Participation in CPD

The study found that all respondents demonstrated awareness of Continuous Professional Development, indicating that CPD is widely recognized among librarians in selected federal universities in Edo and Delta States. This high level of awareness suggests that academic librarians increasingly understand the importance of continuous learning in maintaining professional relevance within a rapidly changing information environment. This finding aligns with Chukwusa (2024), who reported that librarians in Nigeria generally possess strong awareness of CPD and perceive it as necessary for enhancing professional effectiveness and adapting to technological changes.

In terms of participation, the study revealed that librarians predominantly engage in workshops, seminars, and conferences, while participation in professional certifications and advanced online courses remains comparatively low. This pattern supports findings by Rehman, Bhat, and Ganaie (2024), who observed that librarians across academic institutions often prefer short-term, institutionally accessible CPD activities due to cost effectiveness, convenience, and administrative approval. However, the relatively lower participation in certification programmes suggests that while librarians are active in CPD, engagement is still largely transactional and event-based rather than deeply structured or strategically developmental.

This finding also reflects the assumptions of the Lifelong Learning Theory, which emphasizes that learning should be continuous and multidimensional. Although awareness is universal, the limited diversification of CPD formats indicates that the transition from episodic training to fully embedded lifelong learning cultures is still incomplete.

Perceived Importance of CPD: Training for Life vs. Skill Acquisition

One of the central findings of this study is that respondents overwhelmingly perceive CPD as more than a tool for acquiring job-specific skills. Librarians strongly agreed that CPD promotes lifelong learning, adaptability, and continuous growth, reinforcing the study's conceptual framing of "training for life."

This finding is significant because it demonstrates an evolution in professional mindset among librarians. Rather than viewing professional development as an isolated intervention for immediate job performance, respondents recognize CPD as a broader process of intellectual renewal and career sustainability. This result corroborates Sacchanand et al. (2024), who found that contemporary librarians increasingly associate CPD with resilience, innovation, and long-term professional relevance in digitally disrupted environments.

The findings are equally consistent with the principles of Human Capital Theory, which posits that investments in education and training enhance the productivity and value of workers over time. In this context, librarians view CPD as an investment not only in current competence but also in future adaptability. This suggests a progressive understanding of professional growth, particularly important in academic libraries where technological and pedagogical changes are continuous.

Impact of CPD on Professional Practice

The study found that CPD significantly enhances librarians' professional practice, particularly in service delivery, digital competence, and innovation in library services. Most respondents reported that participation in CPD has positively influenced their ability to support users, manage digital resources, and implement new service models.

This finding aligns with Moonasar (2024), who argues that CPD is fundamental to the transformation of academic libraries from traditional information repositories to dynamic, technology-driven service environments. Similarly, Oladokun and Mooko (2022) found that librarians who engage regularly in CPD demonstrate stronger confidence in digital service delivery, information literacy instruction, and electronic resource management.

The improvement in digital competence reported by respondents is particularly relevant to the Technology Acceptance Model. TAM suggests that users are more likely to adopt new technologies when they perceive them as useful and easy to use. Through CPD, librarians acquire the knowledge and confidence necessary to engage with emerging technologies such as institutional repositories, digital databases, AI-assisted search tools, and research analytics platforms. Consequently, CPD reduces technological anxiety and increases both perceived usefulness and ease of use, thereby facilitating technology adoption.

Additionally, the finding that CPD fosters innovation in library services suggests that professional development extends beyond competence acquisition to creative transformation. Librarians who are continuously exposed to new ideas, practices, and technologies are better positioned to introduce innovative services that respond to changing user expectations.

Challenges Affecting Participation in CPD

Despite the positive outcomes associated with CPD, the study identified several barriers limiting effective participation, including inadequate funding, time constraints, heavy workload, and insufficient institutional support. Inadequate funding emerged as the most significant challenge, indicating that many librarians face financial barriers in accessing advanced training, conferences, and certification opportunities.

This finding is consistent with prior Nigerian and African studies. Chukwusa (2024) identified financial limitations as a recurring challenge affecting librarians' participation in CPD, particularly in institutions where professional development is not adequately budgeted for. Likewise, Rehman et al. (2024) found that institutional barriers, including lack of sponsorship and administrative encouragement, significantly constrain librarians' ability to participate in meaningful CPD activities.

Time limitations and workload pressures were also identified as major barriers. This suggests that even when librarians are motivated to engage in professional development, organizational structures may not provide sufficient flexibility for learning. This finding highlights a practical contradiction: institutions expect librarians to remain professionally current while simultaneously imposing work conditions that hinder sustained learning.

From a theoretical perspective, these barriers weaken the realization of both Human Capital Theory and Lifelong Learning Theory. If institutions fail to invest adequately in librarians' professional growth, the organizational benefits associated with CPD, improved productivity, innovation, and service quality, may remain suboptimal.

Implication for 21st-Century Academic Librarianship

The findings of this study have important implications for contemporary academic librarianship. First, they reinforce the argument that librarianship is no longer a static profession anchored solely in traditional information management. Instead, librarians must function as digital facilitators, research partners, educators, and innovation agents.

Second, the findings suggest that CPD should be institutionalized as a strategic organizational priority rather than treated as an optional or peripheral activity. Universities that fail to invest in librarian development risk weakening their libraries' ability to support teaching, research, and knowledge dissemination effectively.

Third, the emphasis on lifelong learning underscores the need to reframe librarians' professional identity. Librarians must increasingly see themselves as adaptive lifelong learners whose relevance depends on continuous renewal of competencies and perspectives.

Overall, the study confirms that CPD is not merely a pathway to acquiring isolated skills but a comprehensive strategy for professional sustainability. In the context of Federal Universities in Edo and Delta States, CPD represents an essential mechanism for ensuring that librarians remain responsive, innovative, and effective within the evolving demands of 21st-century higher education.

Conclusion

This study examined Continuous Professional Development (CPD) as a framework for training for life among librarians in selected federal universities in Edo and Delta States, Nigeria. Drawing on empirical findings, the study concludes that CPD is widely recognized and actively practiced among academic librarians, with high levels of awareness and participation in conventional professional development activities such as workshops, seminars, and conferences. Librarians perceive CPD not merely as a mechanism for acquiring discrete skills but as a continuous process that enhances adaptability, professional relevance, and lifelong learning.

The findings further demonstrate that CPD has a significant positive impact on librarians' professional practice. Specifically, it improves service delivery, strengthens digital competencies, and fosters innovation in library services. These outcomes affirm the strategic value of CPD as a driver of institutional effectiveness and user satisfaction in contemporary academic libraries. The results also reinforce the applicability of key theoretical perspectives, particularly the Technology Acceptance Model, Human Capital Theory, and Lifelong Learning Theory, in explaining how professional development enhances technological adoption, capacity building, and continuous learning among librarians.

However, despite these positive outcomes, the study identifies persistent challenges that limit the effectiveness of CPD. These include inadequate funding, lack of institutional support, and time constraints arising from heavy workloads. Such barriers restrict librarians' ability to engage in more advanced and sustained forms of professional development, thereby constraining the full realization of CPD as a holistic, lifelong learning strategy.

In essence, the study concludes that while CPD is well-established in principle and practice, its transformative potential as *training for life* remains partially unrealized due to systemic and institutional limitations. Addressing these constraints is essential for positioning librarians as adaptive, innovative, and future-ready professionals in the 21st-century knowledge economy.

Recommendations

In line with the research questions and findings, the following recommendations are proposed:

Awareness and Participation in CPD: University library management should organize regular orientation programmes, sensitization workshops, and institutional campaigns to sustain and improve librarians' awareness and active participation in Continuous Professional Development activities.

Types of CPD Activities Engaged In: Federal university libraries should diversify CPD opportunities by integrating online courses, webinars, mentorship programmes, professional certifications, and technology-driven learning platforms alongside traditional workshops and conferences.

Influence of CPD on Professional Competence and Service Delivery: University administrations should provide sustained support for CPD initiatives that enhance digital competencies, research support skills, and innovative service delivery, particularly in areas such as artificial intelligence, data management, and digital librarianship.

Challenges Hindering Effective Participation in CPD: Institutions should address barriers to CPD participation by increasing funding allocation, reducing workload pressures, granting study leave, and establishing supportive institutional policies for professional development.

Abstract
The global climate crisis necessitates a rapid transition from carbon-intensive practices to sustainable alternatives, with higher education institutions serving as critical agents of change. Academic libraries, the "engine rooms" of research, face unique challenges as they manage energy-intensive digital infrastructures and physical preservation requirements amidst chronic grid instability and diesel dependence in Sub-Saharan Africa. This study conducts a scoping review, following the PRISMA-ScR framework, to examine the transition of academic libraries in Nigeria toward renewable energy (RE) to support climate mitigation and enhance research support. A comprehensive search of databases, including Scopus, Web of Science, and DOAJ, reveals that while Global North libraries focus on carbon neutrality, those in Sub-Saharan Africa prioritise energy autonomy and reliability. Legislative reforms in Nigeria, such as the Electricity Act 2023 and Tax Act 2025, have fundamentally altered the landscape, allowing libraries to function as "prosumers" through microgrids and Power Purchase Agreements (PPAs). Technical audits suggest that adopting high-specification LiFePO4 storage and DC-inverter cooling is essential to achieve a 99.9% uptime for digital repositories. The findings indicate that the transition to RE is no longer an "environmental luxury" but a survival strategy for protecting digital assets and supporting high-performance computing. The review recommends a Recommended Standard Specification (RSS) to guide future procurement, emphasising that sustainable infrastructure is a prerequisite for resilient research. Conclusively, integrating renewable energy allows libraries to drastically reduce Scope 2 emissions, aligning with UN SDGs 7 and 13 while modelling sustainable leadership for their local communities.
Keywords: *Academic libraries; Renewable energy; Climate change mitigation; Sustainable infrastructure; Research support services*.

Introduction

The natural processes associated with climate change are rapidly accelerating due to the excessive use of fossil fuels, which generate greenhouse gas emissions and increase the temperature of the Earth. Climate change causes more frequent droughts, wildfires, floods, heatwaves and extreme storms. Melting permafrost layers, rising sea levels, and irreversible damage to ecosystems are further consequences of climate change (United Nations, 2021).

Growing concerns about climate change and the urgent need to reduce greenhouse gas emissions have led to an increased interest in renewable energy sources on the part of higher education institutions (HEI) (Araújo et al, 2024). The global climate crisis has reached a critical juncture, with the Intergovernmental Panel on Climate Change (IPCC, 2023) warning that immediate and deep emissions reductions across all sectors are necessary to limit global warming to 1.5°C. As the world seeks to decouple economic and institutional growth from carbon-intensive practices, the transition from fossil fuels to renewable energy (RE) has become a primary objective. Within the higher education landscape, universities are increasingly recognised not just as centres of learning, but as significant energy consumers and influential agents of societal change (Leal Filho et al., 2021).

Academic libraries naturally look to their parent institutions and sector policymakers for strategic leadership and direction regarding external political, economic, and social drivers, and it could be argued that they have done the same in seeking leadership on environmental concerns. At the local institutional level, a focus on sustainability and climate action has been measuring and reducing carbon emissions. Academic libraries have rightly been able to contribute to this through the development of more sustainable physical spaces and operations (Appleton and Woolley, 2023).

Academic libraries serve as the intellectual "engine rooms" of these institutions. However, their traditional and modern operations are inherently energy-intensive. To preserve physical collections, libraries must maintain precise Heating, Ventilation, and Air Conditioning (HVAC) standards 24/7. Simultaneously, the digital transformation of academia has shifted the library's burden toward massive data centres, server farms, and high-density computing hubs required for digital repositories and online resource access (Chowdhury, 2022).

Historically, these operations have relied heavily on national grids powered by coal, gas, and oil. Jankowska (2017) argues that while libraries have championed "green" initiatives—such as reducing paper waste and utilising natural light—the fundamental issue of energy sourcing remains largely unaddressed. The carbon footprint of a modern library's digital infrastructure is now a significant contributor to the institutional greenhouse gas (GHG) inventory.

The shift toward renewable energy, solar photovoltaics (PV), wind, and geothermal systems offers a dual pathway for academic libraries: climate mitigation and operational resilience. Fossil fuel dependence exposes libraries to volatile energy prices and potential outages, jeopardising sensitive digital archives and research data.

According to research by Antonelli (2008) and later expanded by Sahavirta (2020), the concept of the "Green Library" must evolve beyond sustainable architecture to include energy autonomy. Transitioning to RE allows libraries to model sustainable behaviour for their parent institutions and local communities. By integrating renewable energy sources, libraries can drastically reduce their Scope 2 emissions, aligning with the United Nations Sustainable Development Goals (SDGs) 7 (Affordable and Clean Energy) and 13 (Climate Action).

Beyond environmental benefits, the transition to renewable energy is intrinsically linked to the library's mission of research support. Reliable, sustainable energy is the bedrock of contemporary research infrastructure. Modern research increasingly relies on:

i. Big Data Analytics: Requiring constant server uptime and cooling.
ii. Digital Preservation: Ensuring the long-term survival of digitised cultural heritage.
iii. Open Access Repositories: Providing global access to scholarly output without interruption.

As academic institutions face increasing pressure to demonstrate commitment to Environmental, Social, and Governance (ESG) criteria, the library's energy profile becomes a focal point. A library powered by renewable energy not only preserves the past but also secures the future of research by ensuring that the infrastructure supporting scientific inquiry is sustainable and carbon-neutral (Brodie, 2012).

Problem Statement

Despite the growing body of literature on sustainable campus management, there is a distinct lack of empirical research focusing specifically on the technical, financial, and institutional frameworks required to transition library-specific energy loads to renewable sources. Most existing studies are localised or limited to building design (e.g., LEED certification) rather than to the systemic energy transition and its direct correlation with the reliability of research support services. This study seeks to bridge this gap by investigating the barriers and drivers for adopting renewable energy in academic libraries, ultimately proposing a robust model for a fossil-fuel-free library infrastructure that supports the evolving needs of the global research community.

Objective of the Study

The primary objective of this study is to do a scoping review that synthesises international and regional data to examine the transition of academic libraries in Sub-Saharan Africa (SSA), particularly Nigeria and South Africa, from fossil fuel-based energy systems to renewable energy sources, evaluating its impact on climate change mitigation and the enhancement of sustainable research support services.

Methodology and Search Strategy

The study adopted a scoping review (ScR) of literature to comprehensively examine the transition of academic libraries from fossil fuel-based energy systems to renewable energy sources, evaluating its impact on climate change mitigation and the enhancement of sustainable research support services. This approach was informed by the dearth in the literature on the subject matter and the emerging nature of AI research. Scoping review of literature is a preferable approach in investigating phenomena that have not yet been widely researched (Hanneke et al., 2017) or in examining emerging evidence and trends (Munn et al., 2018). Therefore, the scoping review is expected to bring together studies that met specified criteria on the subject matter to proffer answers to questions that are asked as a framework for the study. This review was conducted in accordance with the guidelines outlined in the Preferred Reporting Items for Systematic Reviews and Meta-Analyses extension for Scoping Reviews (PRISMA-ScR) checklist, as established by Tricco et al. (2018). PRISMA provides an evidence-based framework that sets minimum criteria for systematically reporting scoping reviews and meta-analyses. While originally developed for evaluating randomised trials, PRISMA has become a widely accepted standard for structuring and reporting scoping reviews.

Following the PRISMA-ScR (Preferred Reporting Items for Systematic reviews and Meta-Analyses extension for Scoping Reviews) framework, a comprehensive search was conducted across five major databases:

- Scopus & Web of Science: For high-impact, peer-reviewed energy and library science literature.
- SCImago (SJR): To identify top-tier journals in the African context.

- Crossref & DOAJ: To capture open-access research and grey literature specific to African institutional repositories.

The Energy Footprint of Academic Libraries

International data from the International Energy Agency (IEA, 2022) and the International Renewable Energy Agency (IRENA,2024) highlights a global surge in "Green Libraries." While European and North American libraries focus on LEED-certified architecture and energy efficiency, the SSA context focuses on Energy Autonomy.

Table 1: Energy Footprint of Academic Libraries in the Global North and Sub-Saharan Africa

Feature	Global North Libraries	Sub-Saharan Africa Libraries
Primary Goal	Carbon Neutrality / LEED	Reliability / Access / Research Continuity
Grid Status	Stable, Feed-in Tariffs	Unstable, Off-grid/Hybrid priority
Storage Need	Peak Shaving	24/7 Autonomy for Digital Assets
Finance	Public Grants / Green Bonds	PAYG / Private Partnerships / Donor Funding

Source: International Energy Agency (2022) and International Renewable Energy Agency (2024)

The Transition to Renewable Energy

Nigeria's decentralised energy framework, backed by the Electricity Act 2023, empowers academic libraries to bypass failing grids. By securing captive power permits, institutions can deploy independent solar-hybrid solutions to achieve 24/7 power, transforming libraries into energy "prosumers" that cut carbon emissions and guarantee uninterrupted digital operations (Mondaq, 2026).

The Shift to Institutional Energy Autonomy

The transition from relying heavily on the national grid and carbon-intensive diesel generators to localised renewable power is reshaping how Nigerian academic institutions operate:

- The Legal Framework**:** The Electricity Act 2023 radically decentralises the power sector. It formally allows institutions to legally generate and manage their own intrastate electricity without restrictive federal bureaucracy.
- Captive Power Generation**:** Universities and large commercial entities are increasingly securing captive power permits. These licenses permit institutions to exclusively generate and consume their own power (such as megawatt-scale solar installations) to ensure non-stop operations (ESI Africa,2025; Mondaq, 2026; and Rural Electrification Agency, 2023)

Real-World Progress in Nigerian Universities

- **NERC Approvals:** The Nigerian Electricity Regulatory Commission has actively granted multi-megawatt captive power generation permits to several major federal universities. Recent beneficiaries of these regulatory licenses include the University of Abuja (3MW), University of Maiduguri (12MW), and the University of Calabar (7MW).
- **Energy-as-a-Service:** Flagship programs like the World Bank-backed Energising Education Programme (EEP) have seen successful campus installations, such as the EM-ONE-built solar-hybrid plant at UniAbuja. These initiatives directly provide stable, reliable power to university library servers, digital repositories, and high-speed internet hubs. (ESI Africa, 2025, Dataphyte, 2026; University World News, 2025)

Why the Transition is Essential

- **Library Operations:** With the shift toward digital scholarly resources, open-access repositories, and e-learning, academic libraries in Sub-Saharan Africa require guaranteed, uninterrupted power to support teaching and research without downtime.
- **Cost and Carbon Reduction:** Shifting away from costly, volatile diesel generators towards decentralised renewable options helps institutions drastically reduce their carbon footprints while mitigating the long-term operational costs of emergency power generation (PricewaterhouseCoopers (PcW), 2024; Axxela Group, 2023; Mondaq, 2026).

The Narrative of Policy Reform: Nigeria's Path to Green Libraries

The narrative begins in 2015 with the National Renewable Energy and Energy Efficiency Policy (NREEEP). At this stage, the government first formally acknowledged that the centralised grid was insufficient for the nation's developmental goals. For academic institutions, NREEEP was the first document to suggest that "educational and research institutions should lead by example" in adopting renewable energy (RE).

However, early implementation was hampered by a lack of legal teeth; while the policy encouraged solar adoption, libraries remained tethered to the Nigerian Electricity Regulatory Commission's (NERC) rigid centralised pricing and distribution rules. This era was characterised by "pilot projects"—often donor-funded—that frequently failed due to a lack of integrated maintenance policies (National Renewable Energy and Energy Efficiency Policy, 2015).

A pivotal turning point occurred with the signing of the Electricity Act 2023. Before this, power generation and distribution were exclusively federal concerns. The 2023 Act effectively "de-federalised" the power sector, granting states and, crucially, private and educational entities the right to generate and distribute their own electricity.

For the Nigerian academic library, this was a legislative liberation. It provided the legal basis for microgrids. Libraries were no longer just rooms within a building; they could now be the "Anchor Tenants" of a campus-wide solar system. Under this Act, a library could legally enter into a Power Purchase Agreement (PPA) with a private provider, allowing for the installation of large-scale solar arrays on campus grounds without the bureaucratic bottleneck of federal grid approval (PLAC, 2023).

Fiscal Realism: The Tax Act 2025 and the "Diesel Penalty"

By late 2025, the narrative shifted from legal permission to economic necessity. The Nigeria Tax Act 2025 introduced a decisive fiscal "shove" toward renewables. By removing VAT from renewable energy equipment—including the high-specification LiFePO4 batteries required for server room stability—the government lowered the capital entry barrier.

Simultaneously, the Act imposed a carbon-mitigation surcharge on industrial-scale diesel consumption. For academic libraries already struggling with the removal of fuel subsidies, the cost of running a diesel generator for 12 hours a day became mathematically unsustainable. This fiscal pressure catalysed the adoption of the Pay-As-You-Go (PAYG) financial model. In this narrative, the library's energy transition is no longer seen as an "environmental luxury" but as a survival strategy to protect digital assets and research continuity (Binder Dijker Otte (BDO) Global, 2026).

Current State (2026): The Era of Institutional Autonomy

Today, the focus has moved to Technical Standardisation. Following the lessons of the previous decade, the Standards Organisation of Nigeria (SON) and NERC have introduced specific codes for "Institutional Green Buildings." These codes mandate that new library infrastructures must include integrated solar-ready roofs and dedicated, climate-controlled battery bays.

This policy evolution has transformed the Nigerian libraries' environment. The reliability concerns that once plagued digital repositories are being mitigated by policies that prioritise "Critical Load Autonomy", ensuring that even if the rest of the campus goes dark, the library server room (the heart of the institution's research support) remains powered by stabilised LiFePO4 storage systems (AfDB, 2026).

Barriers to Transition

Despite progress, the "Nigeria in Focus" analysis reveals critical bottlenecks:

- **Import Duties:** While VAT is zero-rated, import duties on solar batteries and inverters remain high (estimated at 20%). The Centre for the Promotion of Private Enterprise (CPPE) has formally urged the Federal Government to slash these to 5% to accelerate adoption (Nairametrics, 2026).
- **Quality Control:** The Standards Organisation of Nigeria (SON) continues to struggle with the influx of sub-standard solar panels, which can degrade by 30% in efficiency within the first two years (Centre for International Governance Innovation, 2026).

The Road Ahead: Standardising the "Nigerian Green Library"

Standardising the concept of the "Nigerian Green Library" requires a systematic harmonisation of architectural, technological, and legislative frameworks. As public utility and information infrastructures, academic and national libraries in Sub-Saharan Africa are uniquely positioned to spearhead environmental sustainability and decouple from carbon-intensive grids (Ebhota, 2024). Standardising this framework involves transition milestones that bridge technical deployment with institutional policy.

The Core Dimensions of the Nigerian Green Library Standard

To shift from isolated, reactive adoptions to a nationally recognised institutional standard, the "Nigerian Green Library" archetype must integrate three foundational pillars:

1. The Legislative & Regulatory Catalyst

Historically, decentralised green energy deployments across Nigerian universities were hindered by restrictive microgrid policies and complex federal energy monopolies.

i. **The Power Shift:** The enactment of the Electricity Act 2023 serves as a foundational legal driver. By de-federalising and decentralising electricity generation, transmission, and distribution, it empowers state governments and individual institutions to generate their own power.

ii. **Anchor Tenants:** This legislative breakthrough provides the exact statutory framework required for academic libraries to act as "anchor tenants" of campus-wide solar microgrids, trading excess power across university faculties.

iii. **Fiscal Realism:** Simultaneously, macroeconomic policies like the Nigeria Tax Act 2025 act as financial catalysts. Raising the cost burdens on import-dependent fossil fuel operations, it transforms traditional diesel

generation into an immediate fiscal penalty. This shifts institutional focus toward alternative operational financing, such as Power Purchase Agreements (PPAs) and Pay-As-You-Go (PAYG) solar options.

2. Technical Infrastructure & Architectural Design

A standardised green library transcends basic energy conservation; it dictates eco-friendly structural parameters alongside climate-resilient engineering (Kolawole & Oladokun, 2025).

i. **Energy Optimisation:** Standardised layouts require heavy implementation of low-voltage DC-powered cooling systems and high-efficiency LED configurations. This is structurally optimised using architectural shading protections from direct solar heat loads (Okpidi-Urhibo, 2024).
ii. **Resilient Storage:** Transitioning to Lithium Iron Phosphate ($LiFePO_4$) battery banks coupled with Hybrid Renewable Energy Systems (HRES) ensures the structural mitigation of toxic waste common to older lead-acid storage setups (Adetoro et al., 2023).
iii. **Sustainable Materials:** Standard construction and renovation guidelines emphasise localised, sustainable materials, including precast concrete slabs, bamboo, and reclaimed timber, to significantly lower embodied carbon values (Kolawole & Oladokun, 2025).

3. Safeguarding the Scholarly Mission

Ultimately, standardising the green library framework directly supports modern academic workflows. Unreliable municipal grids in developing territories severely restrict administrative functions and information access (Shittu, 2026). Decoupling from volatile fossil fuel dependencies guarantees the 99.9% power uptime necessary to secure digital repositories, sustain big data analytics, and preserve continuous global access to the nation's scholarly output (Okpidi-Urhibo, 2024).

Discussion

The primary goal of the RE transition is the reduction of the library's carbon footprint while maintaining 100% uptime for research repositories. In Sub-Saharan Africa, mitigation should not be just about gases; the concern should revolve around the resilience of knowledge.

Academic libraries in Sub-Saharan Africa (SSA), especially Nigeria are currently at a crossroads. As centres of knowledge and research, their operations are increasingly digital, requiring 24/7 power for server rooms, digital repositories, and high-speed internet. However, the region's energy landscape is characterised by chronic grid instability and a heavy reliance on carbon-intensive diesel generators.

The narrative of energy policy reform in Nigeria is one of a slow-burning evolution that has recently accelerated into a radical decentralisation. For academic libraries, this shift represents a move from being passive consumers of a failing national grid to becoming active "prosumers" within a legalised framework of institutional energy autonomy

A transition to RE should directly impact research productivity and carbon footprint reduction in the following ways:

i. Digital Preservation and Repository Uptime Percentage**:** Stable power should make Institutional Repositories (IRs) accessible 24/7 to the global research community. The percentage of time the Institutional Repository (IR) remains accessible to global researchers. The metric for 2026 "Green Libraries" in Nigeria should be above 90% uptime, a benchmark that was previously unattainable under diesel-grid hybrid models.
ii. Data Science: High-performance computing (HPC) required for modern African research (genomics, climate modelling) requires the "clean" power provided by RE to prevent hardware damage from grid surges.
iii. Climate Leadership and Literacy Index**:** By adopting RE, academic libraries will serve as "Living Labs," providing data for local climate mitigation studies and demonstrating the feasibility of the Green Economy to students and policymakers. This should be measured via annual surveys of library users to track the library's success in using its own RE transition as a "living lab" and teaching tool.

Conclusion

The transition of Sub-Saharan African academic libraries from fossil-fuel dependence to renewable energy represents a critical shift toward institutional autonomy and research resilience. While the technical roadmap is well-defined via Lithium Iron Phosphate (LiFePO4) storage and DC-powered cooling integration, successful implementation hinges on aligned policy and financial innovation. In Nigeria, legislative evolution from the NREEEP 2015 to the Electricity Act 2023 has decentralised power, legally enabling libraries to act as anchor tenants for campus-wide solar microgrids. Concurrently, fiscal realism catalysed by the Nigeria Tax Act 2025 has penalised reliance on diesel, accelerating the adoption of Pay-As-You-Go (PAYG) and Power Purchase Agreement (PPA) models. Ultimately, these transitions extend beyond carbon mitigation to safeguard the 99.9% uptime essential for digital preservation, big data analytics, and uninterrupted global access to scholarly output.

However, critical bottlenecks such as high import duties and variable equipment quality remain significant hurdles. Ultimately, moving academic libraries beyond fossil fuels is not merely a technical upgrade but a prerequisite for a resilient, research-intensive future that safeguards African scholarship in a climate-constrained world.

Recommendation

Based on the findings from the literature, the following recommendations are made:

1. Awareness campaign about the importance of adopting renewable energy systems among academic librarians, information professionals and higher education policy makers should be intensified, to disorient the old idea of dependence on fossil fuels.
2. Critical bottlenecks, such as high import duties and variable equipment quality, should be done away with by way of removing the tax burden on renewable energy products and services.
3. To ensure long-term sustainability of renewable energy transition, institutions must adopt Standard Specifications (RSS) and rigorous Measurement, Reporting, and Verification (MRV) protocols based on current market standards and the Electricity Act 2023 mandates, to prevent the "procurement of obsolescence. "
4. It is necessary to develop more financial mechanisms as a buffer for funding for all forms of sustainable energy within the higher education sector.
5. Research should be prioritised, and advocacy is needed on how to plan pocket-friendly, climate-friendly, renewable energy-powered academic libraries.

The Status of Libraries and Librarians in Academic Institutions across Jigawa State

Fatahullahi A. M.
[1]Public Service Department, National Library of Nigeria Jigawa State Branch Dutse.
fathullahizainab@gmail.com. 08133024874.

Abstract

This study investigated the status of libraries and librarians in academic institutions across Jigawa State Nigeria. The research assessed the availability and adequacy of library resources, examined the roles, responsibilities and working conditions of librarians, and identified the major challenges affecting library services in the state. A descriptive survey design was adopted, involving students and librarians from five tertiary institutions in the state: Su Sule Lamido State University Kafin Hausa, Federal University Dutse (FUD), Jigawa State Polytechnic Dutse, College of Education Gumel, and Bilyaminu Usman Polytechnic Hadejia. Data were collected through a structured questionnaire administered via Google Forms, yielding 187 valid responses. The data were analyzed using descriptive statistics and mean scores. The findings revealed that the availability and adequacy of library resources were generally low (mean 2.2).it further highlight infrastructural deficits: Over 55% of academic libraries in Jigawa suffer from insufficient space, unreliable power, and poor ventilation, reducing user satisfaction and access hours. Low resource allocation (< 10%) of institutional budgets (72.7%), leading to outdated collections and limited electronic resources. The study further indicates gap in librarian competencies as 77% (mean 3.0) hold basic qualifications but their professional roles, responsibilities, and working conditions were rated below expectation (mean 2.19), with limited training in digital librarianship, impairing information retrieval and research support services. In addition, respondents strongly agreed that libraries and librarians face significant challenges including technological constraints, outdated resources (3.1). the study concludes that academic libraries in Jigawa State face substantial resource, infrastructural and professional challenges that hinder effective service delivery. It recommends increased funding, improved technological and physical infrastructure, and enhanced professional development to strengthen library services and support academic excellence in the state.
Keywords: Academic Libraries, Librarian, Library resource, Professional status, Challenges.

INTRODUCTION

Libraries are recognized as the intellectual hub of academic institutions, providing access to information resources that support teaching, learning, research, and community service. Academic libraries play a crucial role in facilitating knowledge creation and dissemination by acquiring, organizing, preserving, and providing access to scholarly information resources (Haridasan, 2014). In contemporary higher education, libraries have evolved from traditional repositories of books to dynamic information centers that utilize digital technologies to meet the changing information needs of users (Adams, 2019). Consequently, librarians have also expanded their roles beyond information custodianship to include information literacy instruction, research support, digital resource management, and scholarly communication services (Furfuri, 2025).

The effectiveness of academic libraries depends largely on the availability of adequate resources, qualified personnel, modern technologies, and institutional support. However, many academic libraries in Nigeria continue to face challenges such as inadequate funding, poor technological infrastructure, insufficient information resources, and limited opportunities for staff development (Rosenberg, 2006). These challenges have affected the quality of library services and the ability of librarians to contribute effectively to institutional goals (Adedeji et al., 2020; Saka et al., 2023).

In addition, concerns have been raised regarding the professional status and recognition of librarians within academic institutions. Although librarians are expected to contribute to teaching, research, and knowledge dissemination, their roles are often undervalued in institutional governance and decision-making processes. Studies have shown that the status of librarians in Nigerian universities has gradually diminished, thereby affecting their participation in academic and administrative activities (Ola and Oyelude, 2021)

Jigawa State host several tertiary institutions including Sule Lamido State University Kafin Hausa, Federal University Dutse (FUD), Jigawa State Polytechnics College of Education Gumel, Bilyaminu Usman Polytechnic Hadejia. The growth of these tertiary institutions has increased the demand for efficient library and information services. Nevertheless, available evidence suggests that academic libraries in the state face challenges related to technological adoption, infrastructure, funding, and staff capacity development. For instance, the integration of emerging technologies such as artificial intelligence in tertiary institution libraries in Jigawa State remains slow due to inadequate infrastructure, funding constraints, and shortages of digital competencies among library personnel (Kazaure and Ahmad, 2026).

Despite the importance of libraries and librarians in promoting academic excellence, there is limited empirical information on their current status across academic institutions in Jigawa State. Understanding the condition of library facilities, information resources, technological infrastructure, staffing, and the professional standing of librarians is essential for developing strategies that will enhance service delivery and support educational development. Therefore, this study seeks to examine the status of libraries and librarians in academic institutions across Jigawa State with a view to identifying existing strengths, challenges, and opportunities for improvement.

Problem Statement

Libraries and librarians play a critical role in supporting teaching, learning, and research activities in academic institutions. Despite their importance, many academic libraries in Nigeria continue to face challenges such as inadequate funding, insufficient information resources, poor technological infrastructure, and limited professional recognition of librarians, which hinder effective service delivery (Aina, 2013; Issa, Omopupa & Salman, 2014). In Jigawa State, there is limited empirical evidence on the current status of libraries and librarians across academic institutions, creating a gap in understanding their capacity to support academic excellence and research productivity. Therefore, this study seeks to assess the status of libraries and librarians in academic institutions across Jigawa State in order to identify existing challenges and provide recommendations for improving library services and the professional standing of librarians.

Objectives of the Study

1. To assess the availability and adequacy of library resources in academic institutions across Jigawa State.
2. To examine the roles, qualifications, and working conditions of librarians in academic institutions in Jigawa State.
3. To identify the major challenges affecting library services and librarianship in various academic institutions in Jigawa State.

Research Questions.

1. Are there available library resources are in your academic institutions, and how adequate are they?
2. What are the roles, qualifications and working conditions of librarians in your institutions?
3. What challenges do libraries and librarians faced in your academic institutions?

LITERATURE REVIEW

Availability and Adequacy of Library Resources

The availability and adequacy of library resources remain critical indicators of the effectiveness of academic libraries in Nigeria. Academic libraries are expected to provide relevant print and electronic resources that support teaching, learning, and research activities. However, studies have shown significant disparities in resource availability across institutions due to differences in funding, infrastructure, and management practices.

Recent research indicates that while many Nigerian academic libraries have expanded their collections through electronic databases, institutional repositories, and digital services, the adequacy of these resources remains a challenge. A study conducted across academic libraries in North-Central Nigeria found that digital literacy programmes, library orientation services, and access to electronic resources were available in many institutions, but implementation and access were inconsistent due to infrastructural limitations and inadequate digital facilities (Olawale and Kehinde, 2024). Similarly, research on the preservation and availability of information resources in academic libraries in the South-South region of Nigeria revealed that although libraries maintain substantial collections of print and electronic materials, issues related to preservation, accessibility, and collection management affect the adequacy of available resources. The study emphasized that resource availability alone does not guarantee effective utilization unless materials are properly organized, preserved, and made accessible to users (Obi, 2024).

The increasing adoption of electronic resources has improved information access in many institutions. However, studies show that utilization is often constrained by inadequate subscriptions, unstable internet connectivity, limited computer facilities, and low awareness among users. For instance, an evaluation of e-resource use in Nigerian academic libraries reported that despite the availability of electronic databases and online resources, many students and researchers experienced difficulties accessing and effectively utilizing them (Simeon et al., 2023).

Overall, the literature suggests that Nigerian academic libraries have made progress in expanding information resources, particularly digital collections, but challenges relating to adequacy, accessibility, preservation, and sustainable funding continue to affect their effectiveness.

Roles, Professional Status and Workplace of Librarians in Nigerian Academic Libraries

Academic librarians play essential roles in supporting education, research, and knowledge dissemination within higher institutions. Librarians are expected to perform beyond traditional custodial functions (collection development, cataloguing, classification, and reference services), as technological advancements have expanded their professional responsibilities significantly, engaging them in activities such as advocacy, information literacy instruction, and research support. However, recent literature highlights the emergence of new roles for academic librarians in Nigeria, particularly in the digital environment. Librarians now serve as information literacy instructors, digital content managers, research support specialists, institutional repository managers, and technology facilitators. They assist students and researchers in navigating electronic databases, evaluating information sources, managing research data, and enhancing digital literacy skills (Furfuri, 2025). Likely, Onyema and Aguolu (2017) also argue that academic librarians need to be not just information managers but also instructional partners, facilitators of research, and strategic contributors to institutional goals.

The professional status of librarians in Nigerian universities has evolved over time. In many universities, librarians enjoy academic status comparable to teaching staff, enabling them to participate in research, publication, promotion exercises,

and institutional governance. Nevertheless, variations still exist among institutions regarding recognition, career progression, and involvement in decision-making processes. The evolving digital landscape has further strengthened the professional identity of librarians as knowledge managers and information specialists rather than custodians of books alone (Adewojo and Tella, 2026).

Regarding workplace responsibilities, academic librarians operate in various units, including reference services, technical services, circulation departments, digital libraries, institutional repositories, archives, and information technology sections. The integration of emerging technologies has also increased collaboration between librarians, ICT professionals, faculty members, and researchers. Consequently, modern academic librarians are increasingly expected to possess competencies in information technology, digital resource management, data analytics, and artificial intelligence applications (Agboke and Oladokun, 2024).

The literature therefore portrays librarians as multifaceted professionals whose roles continue to expand in response to technological innovation and changing user expectations.

Challenges Facing Academic Libraries and Librarians in Nigeria

Despite their strategic importance in higher education, academic libraries and librarians in Nigeria face numerous challenges that limit their effectiveness and service delivery.

One of the most frequently reported challenges is inadequate funding (Abubakar, 2015). Limited financial allocation affects collection development, subscription to electronic databases, acquisition of ICT facilities, staff development, and maintenance of library infrastructure. Funding constraints often result in outdated collections and inadequate technological resources (Esse and Haliso, 2024). Another major challenge is poor technological infrastructure. Many academic libraries struggle with unreliable internet connectivity, unstable electricity supply, insufficient computer systems, and inadequate digital platforms. These deficiencies hinder access to electronic resources and reduce the effectiveness of digital library services. Studies on institutional repositories and emerging technologies consistently identify infrastructure deficits as significant barriers to service delivery (Ogunbote and Abimbola 2025). Human resource challenges also affect library performance. Academic librarians are increasingly required to possess advanced ICT competencies, yet opportunities for continuous professional development remain limited in some institutions. A studies by Adewojo and Tella (2026) shows that rapid emergence of technologies such as artificial intelligence, digital repositories, and automated library systems has created additional training needs. Knowledge management and information-sharing challenges have also been documented. These include inadequate organizational support, resistance to change, poor collaboration among staff, and insufficient investment in modern information systems. Such factors hinder innovation and the effective management of institutional knowledge resources (Aniebo, 2024). Furthermore, studies have identified challenges related to user awareness and utilization of library services. Many students remain unaware of available electronic resources or lack the skills necessary to utilize them effectively, resulting in underutilization of valuable information resources (Nworie et al., 2023). In summary, the major challenges confronting Nigerian academic libraries and librarians include inadequate funding, poor ICT infrastructure, unstable electricity supply, limited professional development opportunities, insufficient staffing, low user awareness, and difficulties associated with technology adoption and knowledge management.

METHODOLOGY

The study is aimed at exploring the status of libraries and librarians in academic institutions for effective services across Jigawa State academic institutions The survey encompasses 200 students and 80 Librarians from five academic institutions including Sule Lamido State University Kafin Hausa, Federal University Dutse (FUD), Jigawa State Polytechnics Dutse, College of Education Gumel, Bilyaminu Usman Polytechnic Hadejia. Google form questionnaire were used for data collection yielding a total of 187 responses which were analyze using Statistical Package for Social Sciences (SPSS) and descriptive statistics. The total enumeration sampling technique was adopted to select the entire population of the study for accuracy and to eliminate sampling errors. Analysis values were assigned to the four response categories and the mean was interpreted using the 4-point scale ranging from highest (4) to lowest (1). A standard mean of 2.5 was used in decision making and any factor above the criterion mean is considered a determinant.

RESULT

Research Question 1: Are there available library resources in your academic institution and how adequate are they?

Table 1: Availability and adequacy of Library resources in your academic institution

S/N	ITEM	SA (%)	A (%)	D (%)	SD (%)	MEAN
1.	We have available resources in the library (books, journals, e-books, databases, audiovisual materials)	22 (11.7)	38 (20.3)	77 (41.2)	50 (26.7)	2.2
2.	The available resources are sufficient to meet students' and staff's academic needs	11 (5.9)	37 (19.8)	92 (49.2)	47 (25.1)	2.1

3.	The library resources are up-to-date in terms of publication date and relevance	14 (7.5)	52 (27.8)	85 (45.5)	36 (19.3)	2.2
4.	The available resources are specific to each department and/or faculty	20 (10.7)	42 (22.5)	76 (40.6)	49 (26.2)	2.2
5.	The library resources are easily accessible to students (both physical and online access)	37 (19.8)	48 (25.7)	43 (23.0)	59 (31.5)	2.3
6.	The library provide resources in digital formats for remote access	13 (6.9)	35 (18.7)	89 (47.6)	50 (26.7)	2.1
7.	specialized resources are available for research purposes (theses, dissertations, reference books)	53 (28.3)	82 (43.9)	31 (16.6)	21 (11.2)	2.9
8.	Library in your institution is having a standard power supply to boost libraries capabilities and promote efficient services delivery.	03 (1.6)	14 (7.5)	28 (14.9)	142 (75.9)	1.3
	Aggregate mean					**2.2**
	Criterion mean					**2.5**

Key: SA = strongly agree, A= Agree, D = Disagree, SA = strongly disagree

The availability and adequacy of library resources of institution in Jigawa State are presented in table 1. The findings revealed an overall mean score of 2.2 slightly less than the criterion mean (2.5). The highest respondent value was found in "specialized resources is available for research purposes (theses, dissertations, reference books)" with a mean of 2.9, We have available resources in the library (books, journals, e-books, databases, audiovisual materials) = 2.2, the library resources are easily accessible to students (both physical and online access) =2.3, the library resources are up-to-date in terms of publication date and relevance, The available resources are specific to each department and/or faculty (2.2), the library provide resources in digital formats for remote access (2.1) and a least mean of 1.3 for "provision of constant power supply to boost libraries capabilities and promote efficient services delivery". The findings therefore disagreed with the 4-point likert scale which state that mean score above 2.5 mark is positive and hence indicating shortage of library resources in Jigawa state academic libraries.

Research question 2. What are the roles, qualifications, and working conditions of libraries in your institution?
Table 2: Roles, qualifications and working conditions of librarians in your institutions

	S/N	**ITEM**	**SA (%)**	**A (%)**	**D (%)**	**SD (%)**	**MEAN**
Roles & Responsibilities	**1.**	Staff and students supports the main functions of the library in teaching, learning, and research	72 (38.5)	98 (52.4)	11 (5.9)	6 (3.2)	3.3
	2.	Librarians in your institution perform their roles effectively	8 (4.3)	21 (11.2)	89 (47.6)	69 (36.9)	1.8
	3.	Librarians provide adequate support to students and faculty in accessing resources	31 (16.6)	71 (37.9)	53 (28.3)	32 (17.2)	2.5
	4.	Librarians are involved in organizing and managing learning programs or work	15 (8.0)	22 (11.8)	63 (33.7)	87 (46.5)	1.8
	5.	Librarians in your institution are involved in curriculum development or research guidance	9 (4.9)	28 (14.9)	81 (43.3)	69 (36.9)	1.9
		Mean					2.26
Qualifications & Professional Background	**6.**	Librarians in your institution possess the necessary academic qualifications for their effective roles	76 (40.6)	59 (31.6)	35 (18.7)	17 (9.1)	3.0
	7.	Besides academic qualification, Librarians possesses relevant	20 (10.7)	23 (12.3)	80 (42.8)	64 (34.2)	1.9

		professional training and certification					
		Mean					2.45
Working Conditions	**8.**	The physical workspace and facilities for librarians are adequate	5 (2.7)	23 (12.3)	94 (50.3)	65 (34.6)	1.8
	9.	The workspace for Librarians are well ventilated and fully equipped	8 (4.3)	29 (15.5)	83 (44.4)	67 (35.8)	1.9
	10.	Librarians have equal representation in all college or university governance.	14 (7.5)	19 (10.2)	87 (46.5)	67 (35.8)	1.9
		Mean					1.9
Aggregate mean							**2.19**
Criterion mean							**2.5**

Key: SA = strongly agree, A= Agree, D = Disagree, SA = strongly disagree

Table 2 depicts the result for roles, qualifications, and working conditions of libraries in your institution. It is shown from the table that the roles and responsibilities of these librarians was poor with an average mean of 2.26 on a 4 point Likert scale. Qualifications and professional background had a mean of 2.45 with Librarians possess the necessary academic qualifications for their effective roles (3.0) and possesses relevant professional training and certification (1.9), and working conditions have an aggregate mean of 1.9 below the margin mean (2.5) which was showing poor working conditions.

Research question 3. What are the challenges faced by libraries and librarians in your academic institution?

Table 3: Challenges faced by libraries and librarians in your academic institution

S/N	ITEM	SA (%)	A (%)	D (%)	SD (%)	MEAN
1	Financial or budgetary constraints is the major challenge affecting the library	82 (43.9)	57 (30.6)	20 (10.7)	25 (13.5)	3.0
2.	There are challenges related to outdated or insufficient library resources	77 (41.2)	59 (31.5)	40 (21.4)	11 (5.9)	3.0
3.	Inadequate staffing affect library services in your institutions	62 (33.2)	90 (48.1)	17 (9.1)	18 (9.6)	3.0
4.	Technological challenges are affecting library management and digital resources	75 (40.1)	86 (45.10)	15 (8.0)	11 (5.9)	3.2
5.	User behaviors or low library usage affect operations	91 (48.7)	54 (28.9)	15 (8.0)	27 (14.4)	3.1
6.	Infrastructural issues, such as inadequate space, unreliable power, and poor ventilation affects your library	83 (44.5)	62 (33.1)	10 (5.3)	32 (17.1)	3.0
7.	Professional development or training are not easily accessible in your institutions	69 (36.9)	84 (44.9)	14 (7.5)	20 (10.7)	3.1
8.	Difficulties in maintaining and preserving library resources are a setback to your institution library	76 (40.6)	64 (34.2)	37 (19.8)	10 (5.3)	3.1
9.	Library received low funding (< 10%) of institutional budgets	71 (37.9)	65 (34.8)	23 (12.3)	28 (14.9)	3.0
	Aggregate mean					**3.1**
	Criterion mean					**2.5**

Key: SA = strongly agree, A= Agree, D = Disagree, SA = strongly disagree

Responses in table 3 outlines the notable challenges faced by libraries and librarians with a strong agreement by respondents (mean 3.1). The most critical items are technological challenges are affecting library management and digital resources (3.2), difficulties in maintaining and preserving library resources are a setback to your institution library(3.1), professional development or training are not easily accessible in your institutions (3.1) and Infrastructural issues, such as inadequate space, unreliable power, and poor ventilation affects your library (3.1), infrastructural issues, such as inadequate space, unreliable power, and poor ventilation affects your library; inadequate staffing affect library services in your institutions; there are challenges related to outdated or insufficient library resources; financial or

budgetary constraints is the major challenge affecting the library (3.0) and Libraries receiving low funding (< 10%) of institutional budgets.

Discussion

1. Availability and Adequacy of Library Resources in Academic Institutions in Jigawa State.

The findings revealed that the availability and adequacy of library resources in academic institutions across Jigawa State were generally inadequate, as indicated by the aggregate mean score of 2.2, which falls below the criterion mean of 2.5. Respondents particularly disagreed that libraries possessed sufficient and up-to-date resources, department-specific collections, digital resources for remote access, and reliable power supply. This finding is consistent with studies conducted by Aina (2021), who reported that many Nigerian academic libraries continue to experience shortages of current information resources due to inadequate funding and poor collection development practices. Similarly, Nwalo and Oyedum (2020) found that most academic libraries in northern Nigeria lacked sufficient electronic databases and current scholarly materials needed to support teaching, learning, and research activities.

The finding also agrees with the report of the National Universities Commission that many tertiary institution libraries face challenges in maintaining adequate collections because budget allocations to libraries are often insufficient. Furthermore, the poor rating of digital resources and remote access facilities supports the findings of Omeluzor et al. (2022), who observed that limited ICT infrastructure and unstable electricity supply hinder effective digital library services in Nigerian institutions. The issue of inadequate power supply (mean = 1.3) aligns with findings by Ezeani and Ugwu (2021), who identified erratic electricity as a major barrier to efficient library operations and access to electronic resources in Nigerian academic libraries.

2. Roles, Qualifications, and Working Conditions of Librarians

The study revealed that librarians' roles and responsibilities were perceived as being performed below expectation (mean = 2.26), while working conditions were rated poor (mean = 1.9). This is in contrast with the studies by Olorunsola (2012) reported a high level of job performance and working conditions by administrative staff in government-owned universities in South-West, Nigeria Although respondents agreed that librarians possessed the necessary academic qualifications (mean = 3.0), they disagreed that librarians had adequate professional training, effective involvement in curriculum development, or favorable working environments. The finding regarding academic qualifications agrees with the study of Afolabi and Abdulsalami (2022), who found that most librarians in Nigerian tertiary institutions possess relevant academic qualifications such as Bachelor's, Master's, and PhD degrees in Library and Information Science.

However, the inadequate professional development opportunities reported in this study corroborate the findings of Okiy (2020), who noted that many librarians in Nigerian academic institutions have limited access to continuing professional education, workshops, and certifications necessary for coping with emerging technologies. The poor working conditions identified in the study are also consistent with findings by Adetoro and Bello (2021), who reported inadequate office facilities, poor ventilation, lack of equipment, and exclusion of librarians from institutional decision-making processes. Similar observations were made by Nigerian Library Association, which has repeatedly advocated for improved welfare packages and professional recognition for librarians in higher institutions. The finding that librarians are rarely involved in curriculum development and research guidance also agrees with the work of Popoola (2021), who argued that librarians in many Nigerian institutions remain underutilized despite their potential contributions to teaching, information literacy, and research support services.

3. Challenges Facing Libraries and Librarians in Jigawa State.

The study identified several significant challenges affecting libraries and librarians, with an aggregate mean score of 3.1 indicating strong agreement among respondents. The major challenges included technological constraints, inadequate funding, insufficient staffing, outdated resources, poor infrastructure, lack of professional development opportunities, and difficulties in preserving library materials. These findings strongly align with numerous studies conducted in Nigerian academic libraries. For example, Aina (2021) identified inadequate funding as the root cause of many library challenges, including poor collection development, insufficient ICT facilities, and inadequate staffing. Similarly, Obiozor-Ekeze (2022) found that technological challenges significantly affect the implementation of digital library services, particularly in institutions located in developing regions.

The finding on inadequate staffing agrees with the study of Ocholla (2020), who reported that many African academic libraries operate with insufficient professional librarians, thereby reducing service effectiveness and user satisfaction. Furthermore, the finding regarding poor infrastructure and unreliable power supply corroborates the findings of Ezeani and Ugwu (2021), who observed that infrastructural deficiencies remain one of the most persistent obstacles to library development in Nigeria. The challenge of limited professional development opportunities also agrees with the findings of Okiy (2020), who emphasized that continuous training is essential for librarians to remain relevant in the digital information environment.

Overall, the findings demonstrate that academic libraries in Jigawa State face challenges similar to those reported in many other Nigerian states. The recurring issues of inadequate funding, poor infrastructure, insufficient digital

resources, and limited professional development suggest a need for increased government and institutional support to improve library services and enhance librarians' effectiveness.

Conclusion

Based on the findings of this study, the study revealed that libraries and librarians in Jigawa State academic institutions are faced by inadequacy and availability of library resources, satisfied qualifications yet majority lacks training and certification in modern library technologies and poor working conditions. there is a dire need to look in the direction of work conditions in other to influence librarians 'job performance in Jigawa State academic libraries. The researcher also found out that there are many challenges affecting the libraries and librarians including inadequate space, unreliable power, and poor ventilation, work tools and information and communication technology (ICT) facilities which in turn affect libraries performance in Federal Universities in North Central Nigeria. These may be part of the factors responsible for the low job commitment of librarians reported in the country (Ajibare et al., 2023).

Recommendations

To improve the status of libraries and librarians in Jigawa State's academic institutions, there is a need for increased funding, improved infrastructure, and professional development opportunities for librarians. Libraries need to adopt innovative technologies and services skills in areas such as digital literacy, information literacy, and technology management to meet the global standards and user expectations. Libraries need to market and promote their services to users, to increase awareness and usage). Furthermore, there is a need for collaboration and partnership between libraries, academic institutions, and other stakeholders to improve the status of libraries and librarians This can include partnerships to provide access to resources, training and development opportunities for librarians, and support for library development, and the librarian needs to have members of his staff on committees for planning, curriculum, development, and so on, in order to discover, amend, and operate effectively within the new policies of the institution.

User Experience Design, Accessibility, and Website Visibility in Higher Education Institutions in Low- and Middle-Income Settings

By
Esther Gani,
Department of Library and Information Science
Kaduna State University
esther.gani@kasu.edu.ng +2347068166410

Abstract

User Experience Design, accessibility, and website visibility in higher education institution in low-and middle-income setting is a matter of concern. HEI websites are essential for institutional representation and knowledge sharing; however, user experience and accessibility challenges often hinder their visibility and effectiveness in low- and middle-income settings. This study examines how user experience (UX) design influences the accessibility and visibility of HEI websites, using low- and middle -Income settings. Five UX dimensions, which are user centricity, user interface, user requirements, website security, and website usability, were investigated to determine their effects on website visibility and users' ability to access institutional web resources. A quantitative research method was adopted, involving non-probability sampling of respondents from Nigerian universities with over 10 years of existence and functional websites. Data were collected using semi-structured questionnaires and analyzed with Statistical Package for the Social Sciences (SPSS) and Analysis of Moment Structures (AMOS) version 26 through multilevel statistical analysis. Key findings indicate significant correlations between UX features and website visibility. Specifically, user-centricity increases visibility by 1.277 users, user interface by 0.855 users, user requirements by 1.267 users, website security by 1.778 users, and usability by 1.473 users. These results highlight the importance of optimizing UX features to enhance visibility. In conclusion, the study recommends adopting a visibility decision model focused on UX improvements to optimize higher education institution websites in Nigeria. This approach ensures better accessibility, functionality, and engagement, leading to more effective utilization and visibility of academic websites

Keywords: User experience design; Website accessibility; Website visibility; Higher education institutions; Low- and middle-income settings.

Introduction

What if a university's website exists but remains invisible to its audience? Globally, there are about 1.5 billion websites, yet only around 17–18% (190–200 million) are active, accessible, and capable of attracting meaningful traffic (Masamba, 2024). Although 71% of organizations worldwide reported owning a website in 2023, and a significant proportion still struggles with poor visibility, usability, and engagement (Masamba, 2024).

In Nigeria, web hosting, domain renewal, and content management cost tens to hundreds of thousands of naira annually (Amadiume, 2024). These challenges are particularly pronounced among institutions operating under resource constraints. The establishment of the National Information Technology Development Agency (NITDA**)** in 2001 marked Nigeria's commitment to integrating ICT into all sectors. NITDA's mandate requires every organization to maintain a functional and sustainable website (Ochala, 2024). In Nigeria, national ICT initiatives such as those promoted by the National Information Technology Development Agency (NITDA) emphasize the importance of functional and sustainable institutional websites. Despite these efforts, many HEI websites remain difficult to navigate and insufficiently optimized for user needs. This study, therefore, examines the role of UX design in influencing website accessibility and visibility of higher education institutions in low- and middle-income settings, with Nigeria serving as an empirical case.

Against this background, this study focuses on bridging the digital divide by developing an optimum user experience feature model for higher education institution websites in low- and middle-income settings, with Nigeria as a case study. By linking UX design to visibility and accessibility, the research contributes to ongoing conversations on digital inclusion and equality in access to academic information, key pillars for achieving sustainable knowledge dissemination in the information society.

Statement of the Problem

Websites have become indispensable tools for information dissemination, research visibility, and institutional reputation in the 21st century. However, in many low- and middle-income countries (LMICs), particularly Nigeria, Higher Education Institutions (HEIs) websites continue to suffer from poor visibility, low traffic, and limited accessibility. The effort by NITDA to promote ICT integration and inclusive website development in HEI websites remains inactive, poorly designed, and non-responsive (NITDA, 2024).

Studies reveal that poor user experience (UX) significantly affects website engagement. For example, 90% of users abandon websites within three seconds of loading delays, 88% exit slow-loading pages, 73% reject non-responsive designs, and 75% judge credibility based on aesthetics. These global statistics mirror the Nigerian context, where

challenges such as poor navigation, weak content optimization, and low search engine ranking hinder visibility. Consequently, websites meant to foster open knowledge, innovation, and collaboration often fail to engage users by widening digital inequality.

While existing studies have established links between user experience and website performance in developed contexts, empirical evidence from low- and middle-income settings remains limited. There is therefore a need to examine how specific UX design features influence accessibility and visibility of higher education institution websites within resource-constrained environments. Addressing this gap provides insights into improving institutional web performance through context-sensitive UX design strategies.

Research Hypotheses

The following hypotheses were tested:

- **H_1:** User-centric design features significantly influence the visibility and perceived accessibility of higher education institution websites.
- **H_2:** Quality user interface design positively influences the visibility and accessibility of higher education institution websites.
- **H_3:** User requirements and needs have a significant effect on the visibility and perceived accessibility of higher education institution websites.

Literature Review

User Experience Design in Higher Education Websites

User experience (UX) refers to users' overall perceptions and responses resulting from interaction with a website, including ease of use, satisfaction, and effectiveness. In higher education contexts, effective UX design supports information discovery, task completion, and sustained engagement. UX design encompasses multiple dimensions, including user centricity, interface design, usability, security, and responsiveness, all of which influence how users interact with institutional websites (Tewari, 2025).

User Centricity and Website Performance

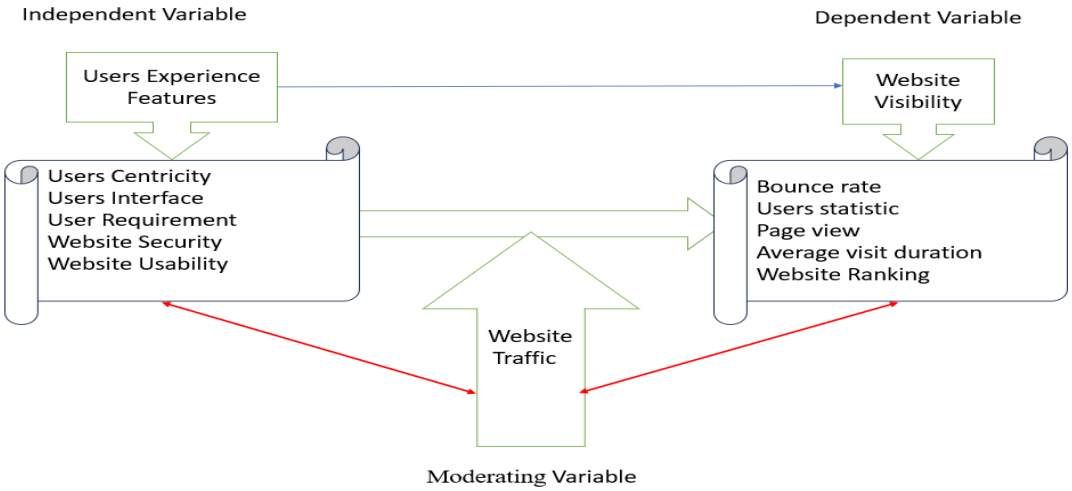
User centricity emphasizes designing websites around users' needs, preferences, and expectations. When effectively implemented, user-centric features enhance navigation, personalization, and engagement (Lemola, 2024). However, overly complex personalization or poorly structured user-centered elements may increase cognitive load, particularly for users with limited digital skills, thereby reducing accessibility and engagement.

User Interface Design and Accessibility

User interface (UI) design shapes how users interact visually and functionally with websites. Clear layouts, intuitive navigation, consistent design elements, and responsive interfaces improve accessibility and encourage sustained interaction. In higher education websites, effective UI design has been shown to enhance traffic, reduce abandonment, and improve institutional visibility (Masamba, 2024).

User Requirements, Content, and Visibility

User requirements relate to the relevance, organization, and clarity of website content. Content that aligns with users' expectations enhances accessibility by enabling efficient information retrieval. When institutional websites meet user content needs, they are more likely to attract repeat visits and sustained traffic, thereby improving visibility (Fagbemi et al., 2024).



Website Security and Usability

Website security and usability contribute to user trust and confidence. Secure and usable websites encourage users to engage with institutional platforms without fear of data. Usability, defined by ease of navigation and task completion, directly affects accessibility and plays a crucial role in shaping user satisfaction and visibility outcomes (Onatuyeh et al., 2025).

Conceptual Framework

The study conceptualizes user experience design as the independent construct comprising user centricity, user interface, user requirements, website security, and website usability. Accessibility is reflected through users' perceived ease of access, navigation, and interaction with institutional websites. Website visibility represents the dependent outcome, influenced by accessibility and user engagement. Website traffic functions as a supporting mechanism linking UX design and visibility.

Researcher's idea

Methodology

Research design, population, and sample

A quantitative research methodology was adopted using deductive reasoning (Liang et al., 2025). Using a cross-section survey sampled 10 out of 48 higher education institutions in Kaduna State, Nigeria. Kaduna was selected because it hosts the highest number of tertiary institutions in the country (Yusuf, 2016), attracting diverse learners from across Nigeria. The target population of 412 including learners, administrators, and other individuals associated with higher education institutions in the northern, central, and southern senatorial districts as shown on table 1.

S/N	Institution	Abbreviation	Website
KADUNA NORTH SENATORIAL DISTRICT			
1	Ahmadu Bello University, Zaria	ABU	abu.edu.ng
2	Nuhu Bamalli Polytechnic, Zaria	NBP	nubapoly.edu.ng
3	Shehu Idris College of Health Sciences and Technology, Makarfi	SHCHST	courseseye.com
KADUNA CENTRAL SENATORIAL DISTRICT			
4	Good Shepherd Major Seminary, Kaduna	GSMSK	guardian.ng
5	Nigerian Defense Academy, Kaduna	NDA	nda.edu.ng
6	Kaduna State University, Kaduna	KASU	kasu.edu.ng
7	Kaduna Polytechnic, Kaduna	KADPOLY	kadunapoly.edu.ng
KADUNA SOUTH SENATORIAL DISTRICT			
8	NOK University, Kachia	NUK	nuk.edu.ng
9	Federal School of Statistics, Manchok	FSSM	fssmanchock.com
10	Kaduna State College of Education, Kafanchan	KDCOE	slsomzonkwa.org

Participants were aged 21 years and above and categorized by demographic variables such as age, gender, educational level, institution, internet access, and ownership of technological devices (phones, laptops, or computers).

Table 2

Distribution of Questionnaire Responses Across Selected Institutions in Kaduna State

Institution	n	%
ABU	89	21.0
GSMSK	68	16.5
KADPOLY	43	10.4
KASU	116	28.2
NBP	74	18.0
NDA	22	5.3
Total	**412**	**100.0**

Note. *n = frequency; % = percentage.*

This population was considered appropriate for addressing the study's objectives, questions, and hypotheses. However, insecurity in Kaduna, marked by kidnapping, banditry, and armed attacks, restricted access to some respondents. Consequently, questionnaires were administered in six institutions, and data were aggregated accordingly. A total of 412 responses were obtained, distributed as follows: ABU (89; 21%), GSMSK (68; 16.5%), KADPOLY (43; 10.4%), KASU (116; 28.2%), NBP (74; 18%), and NDA (22; 5.3%). The response rate was sufficient to support valid data analysis, as reflected in Table 1

Table 3: Institution of Affiliation

Institution	Frequency	Percent (%)	Valid Percent (%)	Cumulative Percent (%)
ABU	89	21.6	21.6	21.6
GSMSK	68	16.5	16.5	38.1
KADPOLY	43	10.4	10.4	48.5
KASU	116	28.2	28.2	76.7
NBP	74	18.0	18.0	94.7
NDA	22	5.3	5.3	100.0
Total	**412**	**100.0**	**100.0**	—

Table 3: Distribution of Respondents by Institutional Affiliation (N = 412)
Interpretation: The majority of respondents were affiliated with **KASU (28.2%)**, followed by **ABU (21.6%)** and **NBP (18.0%)**. Respondents from **GSMSK** accounted for **16.5%**, while **KADPOLY** and **NDA** represented **10.4%** and **5.3%**, respectively. This distribution indicates broad representation across the selected higher education.

Measurement of variables
The researchers measured the influence of users' experience in terms of user-centricity (Laborde et al., 2020), user interface (Agarina et al., 2019), users requirement (Franzini et al., 2019), website security (Tian et al., 2020) and website usability (Sauro, 2015) on visibility (Strzelecki, 2020) of the HEI's website as shown in Table 2 below:

Table 4: Operationalization of Research Variables

Dependent Construct	Latent Dependent Indicators	Sources
Visibility	Search engine/web browser	Tsuei et al., 2020)
	Rich and clear content (media format, and images)	Zhang et al., 2022
	Information sharing	Cho et al., 2023
	Tagging of pages/ Easy Link	Mardani et al., 2020
	Social media	Kay & Kamalovna, 2019
	High Internet/fast loading	Dahiya et al., 2021
	Search skills	Fadeyi et. al 2020

Data collection procedures

The study focused on learners, administrators, and associates of higher education institutions in Nigeria. The survey questionnaire was shared through a purposive and snowball sampling of the higher education institutions. A total of four hundred [450] questionnaires were distributed, 11 were not returned, 439 were returned, 27 were not completed, and four hundred and twelve [412] responses were analyzed. This implies that after cleaning and filtering, 412 responses were considered valid for analysis, as shown in Table 3.

Table 3: Questionnaire Response Rate

	Total Questionnaire Analysed	Total Questionnaire Not Completed	Total questionnaire returned	Total Questionnaire Not Returned	Total Questionnaires Distributed
Series 1	412	27	439	11	450

Source: Field data

The high response rate of 91% is attributed to familiarity and the adoption of a self-administered technique in questionnaire distribution. To ensure a high response rate, competent research assistants capable of reaching the respondents were recruited. Because of the high response rate, the sample size was deemed adequate for the investigation.

Demographic and descriptive profile of the sample

From the findings of this study, The following parameters were used for the study: Gender = [Male & Female], institution = [ABU, KADPOLY, KASU, GSMSK, NBP, NDA], Age range = [21-25, 26-30, 31-35, 36 and above], affiliation = [learner, administrator, associate], Faculty = [Social science, Medical Science], Administrator = [Teaching and non-Teaching], associate = [parent and non-parent] and how long have been using your institution's website = [less than 5 years, 5 to 10 years, 10 years and above]. This specification was used by the sample frame to eliminate bias and invalid samples, indicating that the demographic profile is suitable for analysis as detailed in Table 4 below:

Table 4: Demographic profile

Statistics					
	N		Median	Mode	Sum
	Valid	Missing			

What is your gender?	412	0	2.00	2	650	
What is your age range?	412	0	2.00	1	842	
Which institution are you affiliated with?	412	0	4.00	4	1320	
What category is your affiliation?	412	0	3.00	3	1006	
For the learner, choose your faculty	412	0	2.00	2	742	
For the administrator, choose one	412	0	2.00	3	864	
For the associate, choose one	412	0	2.00	3	888	
For how long have you been using your institution's website?	412	0	2.00	2	760	

Source: Field Data

The findings revealed that Gender is made up of 174 [42.2%] females and 238 [57.8%] males, for a total of 412 [100%], age range is 21-25 (41.3%), 26-30 (29.6%), 31 -35 (12.6%) and 36 and above (16.5%), The sample representation for each higher education institution was as follows: ABU 89 [21%], GSMSK 68 [16.5%], KADPOLY 43 [10.4], KASU 116 [28.2%], NBP 74 [18.0%], and NDA 22 [5.3], The participants were associated with each of the higher education institutions in various ways, including 88 [21.4%] as administrators, 54 [13.1%] as Associates, and 270 [65.5%] as Learners. This study's faculty was measured utilizing three [3] medical sciences, 218 (52.9%], social science, 138 (33.5%], and others 56 [13.6%], The capacity to determine the level of engagement of administrators is significant in this study. 144 [35%] are non-teaching, 84 [20.4%] are teaching, and 184 [44.7%] choose not to say. The study's association sequence is non-parents 137 [33.3%], parents 74 [18.0%], and refer not to mention 201 [48.8%]. Lastly, the participants spent varying amounts of time on the website, with 288 [69.9%] spending less than 5 years, 94 [22.8%] spending 5 to 10 years, and 30 [7.3%] spending more than 10 years.

Correlation Matrix and Descriptives

In order to understand whether multicollinearity occurs between the independent variables showing significant association Baird & Bieber, 2016), the data were then evaluated to ensure that there was no multicollinearity in the hypothesized model. In this study, multicollinearity was assessed using the tolerance value (TV) and the variance inflation factor (VIF). The common cutoff value is a tolerance value of 0.10 and a VIF of 10 (Morrissey & Ruxton, 2018). The table below shows that multicollinearity did not exist among the independent latent constructs, as VIF was all < 10 and Tolerance > 0.1. Therefore, as suggested by Hair et al. (2011), there is no evidence of multicollinearity as shown in Table 5 below for all five specific latent dependent constructs measuring website visibility.

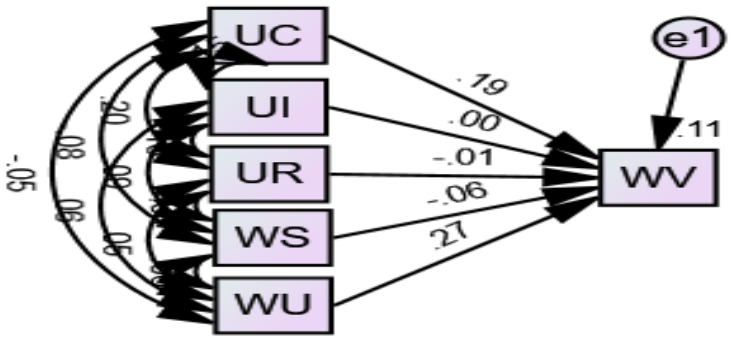
Table 5: Existence of Multicollinearity

Coefficients[a]

	Unstandardized Coefficients		Standardized Coefficients			Collinearity Statistics	
Model	B	Std. Error	Beta	t	Sig.	Tolerance	VIF
1 (Constant)	1.590	.104		15.332	<.001		
Users Centricity	.205	.021	.188	9.539	<.001	.932	1.073
Users Interface	-.004	.026	-.003	-.159	.874	.942	1.062
Users Requirement	-.012	.022	-.011	-.566	.572	.933	1.072
Website Security	-.054	.018	-.058	-3.038	.002	.981	1.020
Website Usability	.278	.019	.274	14.326	<.001	.987	1.013

a. Dependent Variable: Website Visibility

Structural Equation Modelling and specification parameters



The Levene test was utilized in this investigation to evaluate equal variance dispersion. Srinivasan et al. (2017) suggested that if the Levene statistic is non-significant [p>.05], the data are homogeneous. As such, the results suggested a non-significant Levene statistic [p>.05], with all variables supporting the statistical assumption of homogeneity of variance, as shown below. According to Hair et al. (2010), important model fit tests include baseline indices like the Goodness of Fit Index (GFI) (>.95), the Standardized Root Mean Square Residual (SRMR) (>.95), Chi-square statistic (>.05), Comparative Fit Index (CFI) (> .95), Increment Fit Index (IFI) (>.95), and the Root Mean Square Error Approximation (RMSEA). The structural model developed was examined using the regression weights relating to each variable and path coefficients explained by the standardized estimates (β coefficients) to determine the extent to which the independent variables affect user experience features on website visibility. That is, Users Centricity [UC], User Interface

[UI], Users' Requirements [UR], Website Security [WS], and Website Usability [WU] affect website visibility [WV]. The following hypotheses were tested;

- H_1: User-centric design features significantly enhance the visibility and digital inclusiveness of higher education institution websites in Nigeria.
- H_2: Quality user interface (UI) design positively influences the visibility and accessibility of higher education institution websites in Nigeria.
- H_3: User requirements and needs have a significant positive effect on the visibility and digital inclusiveness of higher education institution websites in Nigeria.

Figure 2 and Table 6 reveal the Structural Equation Modelling and Specification Parameters and Regression Weights (Group number 1 - Default model)

Figure 2: Structural Equation Modelling and Specification Parameters

CMIN = 149.284, DF = 6, P = .000, CMIN/DF =24.881, GFI =.890, IFI = .496, TLI = -.301, CFI = .480, RMSEA = .248

Table 6: Regression Weights: **(Group number 1 - Default model)**

Dependent variable	Effects	Latent Constructs	Estimate	S.E.	C.R.	P	Label
WV	<-----	UC	1.277	0.036	35.15	***	
WV	<-----	UI	0.855	0.024	35.15	***	
WV	<-----	UR	1.267	0.036	35.15	***	
WV	<-----	WS	1.778	0.051	35.15	***	
WV	<-----	WU	1.473	0.042	35.15	***	
WV	<-----	EL	1.35	0.038	35.15	***	

Based on the analysis of the combined effects of all predictors involved in the model, Users Centricity [UC], User Interface [UI], Users' Requirements [UR], Website Security [WS], and Website Usability [WU] explain 11.2% of the variation in website visibility [WV]. The harmonized test of the hypothesis result is presented in Table 7 below.

The harmonized test of hypotheses result is presented in Table 7.

Hypothesis	Decision Rule	Conclusion
H_o: There is no relationship between user centricity and website visibility. H_1: There is a relationship between user centricity and website visibility	Reject H_o if p-value < 0.05, otherwise do not reject H_o	Since the p-value = < 0.05, we therefore reject H_o. There is a relationship between user centricity and website visibility to the extent that an increase in user centricity will lead to a 1.277 units increase in website visibility and vice versa
H_o: There is no relationship between user interface and website visibility. H_1: There is a relationship between the user interface and website visibility	Reject H_o if p-value < 0.05, otherwise do not reject H_o	Since the p-value = < 0.05, we therefore reject H_o. There is a relationship between user interface and website visibility to the extent that an increase in user interface will lead to a 0.855 unit increase in website visibility and vice versa

H_o: There is no relationship between users' requirements and website visibility. H_1: There is a relationship between users' requirements and website visibility	Reject H_o if p-value < 0.05, otherwise do not reject H_o	Since the p-value = < 0.05, we therefore reject H_o. There is a relationship between users' requirements and website visibility to the extent that an increase in user requirements will lead to a 1.267 unit increase in website visibility and vice versa

Discussion

The findings indicate that user centricity (UC) has a statistically significant relationship with the visibility of higher education institution (HEI) websites in Nigeria. While the coefficient suggests a negative effect, this result does not diminish the importance of user-centered design principles. Rather, it highlights the complexities associated with balancing user preferences, institutional objectives, and technical optimization strategies. User-centric websites are generally designed to meet the information needs, expectations, and behaviors of diverse stakeholders, thereby promoting engagement, satisfaction, and inclusiveness. Recent studies have emphasized that institutions that prioritize user-centered digital environments achieve better accessibility outcomes, stronger stakeholder trust, and improved online engagement metrics (Abbas et al., 2025; Zhang & Li, 2025). Consequently, HEIs should continue to invest in user-centered design while ensuring alignment with search engine optimization (SEO) and visibility-enhancing strategies.

The study further demonstrates that user interface (UI) significantly influences website visibility. A well-structured interface improves navigation, reduces cognitive load, and enhances the overall user experience, leading to increased user retention and website traffic. Conversely, poorly designed interfaces discourage interaction and negatively affect discoverability. This finding aligns with recent evidence showing that intuitive navigation structures, responsive layouts, and visually appealing interfaces contribute significantly to user engagement and search engine rankings (Kumar & Singh, 2025).

Similarly, user requirements (UR) emerged as an important determinant of website visibility. When website content, functionality, and services are developed based on the actual needs of users, institutions create more relevant and useful digital environments. User participation during the design and evaluation stages ensures that websites remain responsive to changing information needs, thereby improving both usability and visibility. Recent research has shown that incorporating user feedback into website development significantly enhances website effectiveness and stakeholder satisfaction (Rahman et al., 2025).

Furthermore, website security (WS**)** contributes positively to website visibility by fostering trust and confidence among users. Secure websites protect users from cyber threats, data breaches, and unauthorized access, encouraging continued usage and engagement. Search engines increasingly prioritize secure websites, making security an essential factor for online visibility (Alotaibi & Hassan, 2025). Finally, website usability promotes accessibility, efficiency, and user satisfaction, enabling visitors to accomplish tasks with minimal effort. Usable websites attract repeat visits, increase engagement, and strengthen institutional online presence, thereby enhancing overall website visibility.

Conclusion

In conclusion, this study provides empirical evidence that user experience features are critical determinants of the visibility of higher education institution websites in Nigeria. Specifically, user centricity, user interface design, user requirements, website security, and website usability collectively shape the effectiveness with which institutional websites attract, engage, and retain users. Although user centricity exhibited a significant negative relationship with visibility, the finding underscores the need for institutions to strategically balance user-focused design considerations with technical visibility requirements such as search engine optimization, content architecture, and performance optimization.

The positive contributions of user interface quality, user requirements, website security, and usability demonstrate that website visibility extends beyond technological infrastructure to encompass the overall quality of user experience. Websites that are intuitive, secure, accessible, and responsive to stakeholder needs are more likely to achieve higher levels f engagement, trust, and discoverability. These findings reinforce the growing recognition of institutional websites as strategic communication and service delivery platforms that support teaching, learning, research, community engagement, and global visibility.

Therefore, university administrators, web developers, librarians, and ICT professionals should adopt a holistic user experience framework that integrates accessibility standards, participatory design approaches, robust cybersecurity measures, and continuous usability evaluation. Such efforts will not only enhance website visibility but also promote digital inclusion, institutional competitiveness, and sustainable access to information in Nigeria's higher education sector. Ultimately, improving user experience features represents a strategic pathway toward strengthening the global online presence and impact of Nigerian higher education institutions.

Recommendations

Based on the findings of this study, the following recommendations are proposed:

H_1: User-Centric Design Features and Website Visibility/Accessibility

1. Higher education institutions should adopt user-centered design approaches that actively involve students, staff, researchers, alumni, and other stakeholders in the planning, development, and evaluation of institutional websites.
2. Institutions should regularly assess user needs and expectations through surveys, feedback mechanisms, and usability testing to ensure that website services remain relevant, inclusive, and responsive to diverse user groups.
3. Website administrators should provide personalized and responsive digital services that enhance user engagement, satisfaction, and accessibility.
4. End users should actively report instances of poor usability, inaccessible content, or outdated information to facilitate continuous website improvement.

H_2: User Interface Design and Website Visibility/Accessibility

5. Institutions should prioritize the development of intuitive, visually appealing, and easily navigable user interfaces that minimize user effort and improve information retrieval.
6. Website designers should ensure compliance with international accessibility standards, such as the Web Content Accessibility Guidelines (WCAG), to accommodate users with diverse abilities and technological capabilities.
7. Higher education institutions should optimize website responsiveness across multiple devices, including smartphones, tablets, and desktop computers, to enhance user experience and visibility.
8. Interactive features, clear navigation structures, and fast-loading web pages should be incorporated to improve user engagement, retention, and website discoverability.

H_3: User Requirements and Needs, and Website Visibility/Accessibility

9. Institutions should establish formal mechanisms for gathering and integrating user requirements into website design, content development, and service delivery processes.
10. Website content should be regularly updated to reflect the evolving information needs of users and to ensure accuracy, relevance, and credibility.
11. Website developers should employ data-driven approaches, including user analytics and feedback systems, to identify emerging user needs and improve website functionality.
12. Users should be encouraged to engage actively with institutional websites and provide constructive feedback that supports continuous enhancement of website services.

General Recommendation on Security and Usability

13. Institutions should implement robust website security measures, including secure authentication protocols, regular vulnerability assessments, and data protection practices, to strengthen user trust and confidence.
14. End users should adopt good cybersecurity practices, such as the use of strong passwords and secure browsing habits, to support a safe online environment.
15. Continuous monitoring and evaluation of website usability, accessibility, security, and visibility should be institutionalized as part of digital governance and quality assurance frameworks in higher education institutions.

These recommendations will assist higher education institutions in improving website visibility, accessibility, inclusiveness, and overall user experience, thereby strengthening their digital presence and global competitiveness.

Using Artificial Intelligence to Improve Information Services in Nigerian Libraries: Challenges and prospects

Ezenwa, Nkechinyere Ezinne
Federal University of Technology Owerri, Nigeria
Corresponding Author: ezinnee72@gmail.com
08051604110

Abstract

Libraries remain essential institutions for knowledge preservation, information dissemination, education, and community development. However, Nigerian libraries continue to face several challenges, including inadequate funding, poor ICT infrastructure, shortage of skilled personnel, outdated information resources, and resistance to technological change. These challenges have limited the effectiveness of library and information service delivery and hindered the transition from traditional to modern digital library systems. The paper explored the concept of information services, the current state of AI adoption in Nigerian libraries, the applications of AI in library operations, and the barriers affecting its implementation. The paper adapted the Toulmin method of argumentation, whereby literature drawn from past recent and relevant studies obtained from the internet were reviewed and relevant facts extracted to support claims or arguments. Findings revealed that AI technologies such as chatbots, machine learning, natural language processing, recommendation systems, robotics, and automated cataloguing tools can significantly improve library services by enhancing information retrieval, automating routine tasks, supporting personalized services, improving digital repositories, and increasing user engagement. findings further shows that although awareness of AI is gradually increasing among librarians in Nigeria, actual implementation remains limited compared to global practices due to infrastructural and financial constraints. The paper stressed the need for planned investment in ICT infrastructure, routine training and capacity building for librarians, supportive government policies, and institutional commitment toward innovation. It concluded that the integration of AI into library and information services is essential for the modernization, sustainability, and global competitiveness of Nigerian libraries. With proper implementation and support, AI can reposition libraries in Nigeria as intelligent, efficient, and user-centered knowledge hubs capable of meeting contemporary information demands.

Keywords: Artificial Intelligence, libraries, library operations, information services, digital technologies.

Introduction

The services of libraries have remained vital to human civilization, serving as storage of knowledge, culture and intellectual growth. A library is a well-organized, carefully chosen collection of media, books, and digital resources that are available to a specific community for study, reference, or borrowing. According to Ebehart (2010) a library can be viewed as a collection of resources in a variety of formats that is organized by information professionals or other experts who provide convenient physical, digital, bibliographic or intellectual access and offer targeted services and programmes aimed at educating, informing or entertaining different audience, with the objective of stimulating individual learning and advancing society as a whole. A library can also be defined as a collection of books and non-books material, which have been carefully selected and organized for patrons or community of users (Habibu et al., 2024). Libraries exist in different forms which are categorized according to their purpose. They include public, private, academic, special, school, community, and national libraries. Adeniran (2017) added that libraries could be physical or virtual.

Libraries are known for playing important functions in society. They bridge the gap between people and knowledge by serving as important hubs for education, cultural preservation, and free information access. Lomanchinskiy et al. (2025) opined that library are becoming crucial in promoting open access to information, conforming to sustainable development goals.

However, the core functions of libraries are preservation, organization and community support. Adeniran (2017) summarized the functions of a library as acquisition and organization, information access and retrieval, education and support, knowledge preservation, community engagement and promotion of reading.

Information services are synonymous with libraries. They are structured, user-focused activities that supply, evaluate and distribute information, going beyond merely offering materials to include proactive user support. They encompass reference services, current awareness, selective dissemination of information and digital access tools to connect users with knowledge, frequently covered in library and information science (Ranjan, 2023). Information services are vital in contemporary societies, serving as pillars for knowledge dissemination, decision-making and economic growth. They transform traditional libraries into knowledge hubs, using ICTs to facilitate global communication, enabling online businesses or banking and empowering educated societies by ensuring access to accurate information, education, health and research.

The roles of libraries are continuously changing. It has been observed that information is no longer limited by physical collections, time, or location, and that the information environment of the twenty-first century is dynamic and fluid, connective and interactive, diverse, ambiguous, and unpredictable and one is no longer limited by physical

collections, time, place and national borders (Oriogu et al., 2015). Furthermore, traditional libraries are characterized by certain drawbacks which reduce the effectiveness of libraries in the provision of information services. Such challenges include the lack of space and operational limitations, staffing and professional burnout and funding and resource constraints (Reji, 2025). For these reasons, libraries need to undergo transformations to improve the quality of information services they provide.

Digital technologies are complex, multidimensional information systems that transcend basic objects like bitstring. They involve artifact delineation and coalescence, which provide unique interfaces and integrate multiple IT architectural layers to enhance user experience (Saeed & Sidorova, 2023). These technologies include a broad range of tools and systems that support digital transformation and innovation rather than just basic digital representations. They play vital roles in modern business operations, socioeconomic development, and the digitalization of industries. These technologies encompass basic electronic tools and sophisticated computing environments, which support various functions such as application development and network administration (Russell, 2019).

Digital technologies have significantly improved efficiency, accessibility, and user involvement in the delivery of library and information services across numerous industries. They have equally advanced libraries from traditional repositories into dynamic centres for learning, cultural preservation and community engagement. This evolution is driven by the integration of various digital tools that promote access to information, improve service delivery and foster innovative educational practices. Akhtar et al. (2025) observed that digital technologies facilitate improved access to information, allowing users to engage with resources remotely and efficiently. Akhtar et al. (2025) further noted that digitalization promotes the preservation of cultural heritage, making it accessible to a global audience and addressing issues of physical decay. Highlighting the significant roles of digital technologies in library and information services across sectors, the Central Scientific Agricultural Library for instance has developed databases such as 'AGROS; to provide comprehensive information, facilitating independent user engagement with digital resources (Prinmova, 2022).

Recently playing notable roles in advancing library and information services is Artificial Intelligence. Their integration in these services has remodeled the way these libraries operate, which has promoted efficiency, personalization and overall service quality. Libraries currently adopt AI technologies to meet the emerging needs of users. Amalia et al. (2024) noted that AI enables libraries to tailor services to individual user preferences, improving user satisfaction. Automation of routine tasks with AI technologies allows librarians to perform complex inquiries, enhancing service quality. Also, AI tools help in organizing and managing library collections, facilitating better resource discovery (Amalia et al., 2025).

Library and information services in Nigeria are faced with numerous challenges which retard its operations and quality of services. Okafor (2020) and Amanze et al. (2024) pointed out inadequate funding and poor infrastructure as major drawbacks to the provision of library and information services in Nigeria. Outdated or insufficient collections and limited skill gaps/digital resources are another major setback to the evolution of library and information services in Nigeria. Onuoha et al. (2021) observed that most libraries in Nigeria face such challenges as poor preservation, inadequate resources and very limited internet facilities. They observed further that most rural libraries in Nigeria function mainly as study rooms for user' own books, with little use of collections. Although, the increasing integration of ICTs/digital technologies in library and information services in Nigeria has been reported (Oyedokun et al., 2023; Sadiku et al, 2024), adoption remains uneven. Many libraries in Nigeria are yet to be fully automated (Abdulssalam et al., 2021). ICT proficiency and policy somersaults are other issues that have stagnated the full-scale integration of ICTs and digital technologies into library and information services in Nigeria. Library and Information Science personnel in Nigerian libraries possess digital skills;however, they lack broad up-skillingand professional development (Olusanya et al., 2024).

While libraries in developed societies have increasingly benefited from the integration of AI and other technologies in library and information services for service optimization, those in Nigeria are still struggling to fully harness these technologies in their operations. Improving library and information services in Nigeria through the integration of AI technologies is expected to revolutionize the quality of services they provide, optimizing their operations. The integration of AI into library and information services can enhance the automation of routine tasks such as cataloging, indexing and circulation, leading to faster and more accurate user access to information. AI tools such as chatbots and AI-enabled search interfaces allow libraries to provide uninterrupted responses to user queries, enhancing information retrieval and reference. AI tools can assist in the creation of accurate metadata, cataloguing materials and managing collections more efficiently, thereby reducing manual workload. This will enhance automated cataloguing and technical processing. The implementation of smart operations like Radio Frequency Identification (RFID) and robotics for shelving, book tracking and circulation can ensure better organization. However, the successful integration of AI tools in library and information services in Nigeria will require the dismantling of certain drawbacks such as infrastructure issues, lack of digital skills and funding constraints.

This paper therefore focuses on how artificial intelligence can be used to revitalize library and information services in Nigeria. It specifically addresses the concept of AI, the current state of information and library services in Nigerian libraries, potential applications of AI in library services and the challenges to AI adoption in Nigerian libraries.

Literature Review

Literature review covers such issues as concept of information services, challenges of library and information service in Nigeria, application of AI in information and library services, current state of AI adoption in Nigeria libraries and strategies of improving AI integration in Nigerian libraries.

Concept of information service

Information services encompass a range of systems and processes, designed to provide users with access to relevant information suitable for their needs. Satija (2017) described information services as a service intended to provide information for a client or user, or help a client or user in finding information. Hence, it may include any service provided by a library or information centre such as reference service and document lending service. In the context of specialist users, information service means documentation service. Information service therefore aims at disseminating information to users. According to the American Library Association, information service has the goal of providing the information sought by the user. It should therefore anticipate and meet users' needs. It should encourage users' awareness of potential information resources to fulfill individual information needs (Stojanovski Papic, 2012). The basic functions of information services in libraries include provide, locate and disseminate information to users, which range from basic reference assistance to advanced, specialized documentation services. They close the gap users and resources through physical and digital means. The basic types of information services include – reference services, current awareness services (CAS), selective dissemination of information (SDI), document delivery services and information literacy/user education. The key components of information services are information personnel, information resources and information technology.

Information services have significantly changed over-time. The major aspects of modern information services include – user-centric design, responsive and anticipatory services, specialized services and digital transformation.

Challenges of library and information services in Nigeria

Key challenges undermining library and information services in Nigeria include:

I. **Inadequate funding:** Many libraries in Nigeria, particularly public one's struggle with numerous financial constraints like low budgetary allocation, non-release of funds and poor financial support from the government. This has led to severe deficits in services, marked by outdated materials, poor infrastructure and low staff motivation. It has also hindered the adoption of modern technologies and has reduced operational capacity. Patrick (2021) argued that over-reliance on inadequate government subventions causes reduced operational hours and lack of modern technological infrastructure, thereby preventing libraries from fulfilling their educational roles, leading to the provision of poor, irrelevant and outdated information to users.

II. **Infrastructure and Technology Deficits**: Many libraries in Nigeria face lack of modern facilities such as reliable internet connectivity, steady power supply, and adequate space for users. Many find it difficult to upgrade from physical to digital services. These have hindered information delivery, forcing dependence on analog methods. These limitations lead to low user satisfaction, restricted access to digital repositories, reduced research quality and increased librarian turnover as result of frustration with old manual processes (Omeluzor et al., 2017).

III. **Lack of Skilled ICT Staff**: Lack of modern ICT skills among librarians has remained a significant challenge to library and information services in Nigeria. These have prevented the adoption of automated systems and digital/online resources in libraries. It had also led to inefficient information retrieval, and inability to meet users' needs. This deficiency limits the transition from traditional to modern library services. According to Oyovwe-Tinuoye et al. (2021) the lack of digital skills among library staff has hindered the adoption of essential tools like online databases, IRs, and OPACs. It has equal job performance and efficiency for library staff.

IV. **Poor Maintenance and Management:** Poor maintenance of existing infrastructure and lack of proactive management strategies are dominant features of libraries in Nigeria, particularly public libraries. These have led to broken, dilapidated, or inaccessible physical infrastructure, failed technology adoption due to poor IT maintenance, and limited access to current information, significantly crippling effective service delivery (Okafor, 2020).

V. **Outdated Information Resources:** The lack of current books, journals, and electronic databases is a common sight among public libraries in Nigeria. Thus, has rendered many libraries ineffective. These deficiencies hinder research, reduce user patronage, and promote reliance on unreliable, non-academic sources.

Applications of AI in information and library services

Artificial intelligence is transforming library and information services in a variety of ways. AI tools make library services faster, smarter, more personalized and more accessible. Instead of replacing librarians, AI automates repetitive tasks and augments human expertise, allowing staff to concentrate on complex user needs, community engagement and strategic planning. The various applications of AI in library and information services include:

Reference and user support services: AI tools support these services by providing 24/7 virtual reference support (chatbots) by handling repetitive lookups. They also manage multiple user inquiries; enhanced information retrieval and semantic search, personalized recommendations and discovery, automated cataloging and metadata generation, academic support and content creation and accessibility and inclusivity. These services increase productivity, improve user services and role definition. However, the challenges associated with this service include data privacy and ethics, accuracy concerns and infrastructure and skills gap (Agrawal, 2026).

1. **Cataloguing and metadata generation** – AI support this by automating the extraction of data (authors, ISBNs and summaries) from materials, generating descriptive tags and suggesting subject headings using machine learning and large language models. Specialized AI tools like DataHub or specialized bibliographic AI speed up workflows by creating drafts in seconds, enabling humans to shift from manual creation to verification. AI can also facilitate cataloguing and metadata generation through intelligent subject analysis, semantic data classification, entity resolution reduplication, legacy data enhancement and human-in-the-loop' workflow. However, the risks in using AI cataloguing are hallucination, model training and standard adherence.
2. **Information Retrieval and discovery systems**: AI tools achieve these through enhanced query understanding (Natural Language Processing, semantic search and query expansion and reformulation), intelligent ranking and matching (semantic vector encoding, learned sparse retrieval and reranking), personalized discovery recommendation (recommendation systems and content curation), advanced data processing and management (automated indexing and metadata generation, multimodal retrieval and document structuring) and conversational and interactive tools (AI chatbots/virtual **assistants, interactive learning).**
3. **Collection development and management** – AI does this by analyzing user behavior and circulation data to make data-driven acquisition recommendations, predicting future demand and automating routine tasks such as cataloguing and metadata creation. It enhances collection management via predictive analytics for inventory, identifying collection gaps and optimizing budget.
4. **User behavior analysis and personalized services**: AI supports this by changing traditional passive spaces into active, personalized and data-driven centres. AI promotes user behavior analysis through bibliomining and facilitates personalized services using machine learning and natural language processing. This allows libraries to understand users' needs, reading habits and search behaviors which improves collection development and resource allocation. Like steaming platforms, AI recommendation engines can suggest books, articles or resources that align with individual user profile. Smart search engines understand user intent, promoting intuitive queries instead of rigid keyword matching, providing more relevant search results. Through customized content creation, AI tools can generate summaries, abstracts or metadata for users, enabling them to understand key information faster. Ai also enhances services for disabled users, by providing text-to-speech tools, real-time translation and image description.
5. **Digital libraries and institutional repositories**: AI improve digital libraries and institutional repositories by automating metadata generation, enhancing searchability and offering individualized user experiences. These technologies facilitate the discovery of research results in institutional repositories by simplifying content management, improving accessibility for a variety of users and enhancing semantic search. Souza (2025) reported that the integration of AI in digital libraries enhances the preservation of digital resources and enhanced search.
6.

Current state of AI adoption in Nigeria libraries

The adoption of artificial intelligence in Nigerian libraries is still at its infant stage and is mostly being driven by academic institutions rather than public ones. Generally, the adoption is low, with most universities still at the awareness stage. Although some universities have started using chatbots, RFID and AI-enabled chat engines, extensive adoption is hindered by several challenges like infrastructure deficits, limited funding and a shortage of technical skills. Yusuf et al. (2022) found that the adoption of AI in Nigerian universities is still low. Ogbogbaidi et al. (2025) reported that there is still a low awareness of AI, with limited understanding of applications and minimal exposure to training in Nigeria. Suleiman et al. (2024) reported that the integration of AI in libraries in Nigeria is still limited compared to global trends. They observed that many universities are exploring AI potentials but

progress is limited by financial and infrastructural constraints. Okeke et al. (2022) reported that while many Nigerian universities have started experimenting with AIs in such areas as automated cataloguing and virtual reference services, there exist gaps in their full deployment. Afolabi and Olayinka (2021) noted that inadequate infrastructure and lack of skilled personnel are major drawbacks to the full-scale deployment of these systems. Ogbogbaidi et al. (2025) found that perceptions of AI in Nigeria are positive, as librarians studied acknowledged AIs potential to improve service delivery, efficiency, accessibility and cost-effectiveness. A high level of willingness to adopt AI was also observed in Nigeria, with librarians expressing willingness to participate in pilot projects and attend training.

Comparing AI use in Nigerian libraries against global trends, studies indicate that while awareness is growing slowly, actual application remains low and selective compared to what obtains at the global level. The adoption is basically limited to basic tools instead of fully integrated AI systems. However, global practices focus on advanced AI integration like predictive analytics, sophisticated robotics and personalized learning algorithms, within a fully developed digital infrastructure. In terms of adoption level, Nigerian libraries are mostly at the awareness and implementation stages using AI for basic tasks like chat bots and plagiarism check, global libraries have advanced toward mature strategic integration of AI to create intelligent, autonomous and personalized user environments (Iwu-James & Abah, 2025).

Benefits of Artificial intelligence in library services in Nigeria

The integration of AI tools in library and information services in Nigeria offers the following potential benefits:

i. **Improved information retrieval and access:** AI-enabled search engines can help patrons sift out the relevant information from large amounts of information faster and with much ease. Contrary to traditional **search engines, AI systems** can understand context and user intent, offering more precise and personalized search results (Jang & Zhang, 2021). This can save time and increase the effectiveness of academic research (Suleiman et al., 2024). Mansoor and Rahman (2022) noted that AI also permits advanced filtering options, enabling users to search across multiple databases and resources concurrently.

ii. **Personalized learning and research support**: AI systems do this by analyzing user behavior and preferences to provide tailored content. Relying on this, AI systems can recommend books, Articles and research materials that correspond to a specific user's need (Kaur & Singh, 2022). By leveraging machine learning, natural language processing (NLP), and generative AI, libraries can offer tailored experiences, 24/7 support, and advanced research tools that adapt to individual user needs.

iii. **Automating Library Processes: Cataloguing, Indexing, and Archiving:** Inlibrary management, AI could automate labor intensive tasks such as cataloging, indexing, and archiving, making these processes more efficient and accurate.AI- powered tools can automatically categorize and tag resources with minimal human intervention, ensuring consistency and accuracy (Smith,2021).

iv. **Improving User Engagement with AI-Powered Interface:** AI enabled interfaces, such as chatbots and virtual assistants, enhance user engagement by providing quick responses to user queries, guiding them through library's services. Libraries can discover deficiencies and launch specialized programming. This encourages lifelong learning, boosts patronage and loyalty, ignites innovation through co-creation, and transforms the library's image into a cutting-edge, dynamic center.

Challenges of Implementing AI in Nigerian Libraries

Integrating AI technologies into library services in Nigeria is very urgent and essential particularly in this cotemporary era. However, its successful integration can be hindered by the following barriers:

Inadequate funding: Ajani et al. (2022) pointed out inadequate funding as among the challenges that could hinder successful implementation of AI in Nigerian libraries. Libraries in Nigeria are mostly funded by their parent institutions. In the case of public university libraries, they are funded by either the state or federal government. These libraries are meant to receive 10% of the annual university budget. However, this is rarely fully implemented, resulting in significant underfunding. Dada and Atte (2025) argued that poor funding can limit investment in AT technologies.

Poor ICT infrastructure: Infrastructural deficit seriously hampers successful implementation of AI in Nigeria libraries. Insufficient and outdated infrastructure is not compatible with AI and hence cannot support AI integration in libraries. This has kept many libraries on the exploratory stage. Epileptic power supply, weak internet connectivity, and obsolete computer hardware have characterized most public libraries in Nigeria. This poor state of infrastructure is not robust enough to drive AI implementation in the libraries (Ajani et al., 2022), thus limiting adoption of such tools among librarians.

Lack of skilled personnel: This shortage of expertise—spanning AI, machine learning, and data analytics—limits the adoption of advanced services like chatbots, automated cataloging, and predictive analytics. The lack of skilled personnel creates skills gap, where awareness of AI potential exists, but practical application is limited. This shortage slows AI adoption of AI by librarians and consequently their effective integration into library services, leading to low utilization.

Resistance to change: Some library staff are resistant to adopting innovations, usually, manifesting as anxiety, fear of job displacement or reluctance to adopt new digital workflows. Most universities are reluctant to integrate AI tools in their services because they fear this will render traditional librarians obsolete. This makes staff resist as against embracing the innovation. Even when they are installed, resistant staff will not fully utilize AI tools, thereby making investment in technology wasteful. Furthermore, resistance to adopting AI technology can lead to skill gaps among the hesitant staff, hindering libraries from developing digital capacities.

Strategies for promoting the integration of AI in Nigerian libraries

Successfully integrating AI into library and information services in Nigeria requires a multifaceted approach. They include:

i. **Infrastructure development**: Investing in power, high-speed internet and modern computing hardware are very essential for effective integration of AI into library services in Nigeria. Establishing local data centres or high-speed access to cloud computing services allows libraries to host AI-driven discovery tools and large-scale digital repositories. Installing more reliable and renewable energy sources like solar can help overcome the power challenge that is common in Nigeria.

ii. **Capacity building and training of librarians**: In this context of Fifth Industrial Revolution (5IR) when Nigerian libraries are transiting from traditional repositories to 'intelligent hubs' capacity building and training becomes a bridge between the advanced technological possibilities and practical service delivery. Enhancing the capacities of Nigerian librarians in such areas as prompt engineering and data literacy (generative AI) and Algorithm awareness can promote integration of AIs in libraries. Hence, routine professional training is important.

iii. **Fostering the culture of innovation and adaptability:** Training is not sufficient. However, changing the institutional mindset is also important. This can be achieved by overcoming resistance by making librarians understand that AI is not coming to replace or displace them from their jobs but serving as collaborative partners. Similarly, ongoing professional development prepares librarians as the 5IR technologies emerge, ensuring that library facilities are relevant. Introduction of chatbots and virtual assistants can help customize and provide uninterrupted library services. This can assist students and other patrons in remote areas with limited physical access to physical libraries, thereby improving user services and engagement.

iv. **Government and institutional support**: This is crucial as it provides the necessary funding, infrastructure, training and policy frameworks needed to overcome high adoption costs and skills gaps. Support initiatives aimed at improving library services can be put in place. Governments can formulate policies and regulatory frameworks that address data privacy, algorithm bias and intellectual property. Building collaborations between libraries and tech partners to share knowledge and facilitate technology transfer can encourage the integration of AI technologies in library services.

Conclusion and Suggestions

Artificial intelligence has emerged as a transformative technology with the capacity to improve the quality, efficiency, and accessibility of information services in libraries. This paper has shown that Nigerian libraries continue to face numerous challenges such as inadequate funding, poor ICT infrastructure, shortage of skilled personnel, outdated resources, and resistance to technological change. These challenges have limited the ability of libraries to fully meet the evolving information needs of users in the digital age. The paper further revealed that AI technologies such as machine learning, natural language processing, chatbots, robotics, recommendation systems, and automated cataloguing tools can significantly enhance library operations and service delivery. Through AI integration, libraries can improve information retrieval, automate repetitive tasks, provide personalized user services, strengthen digital repositories, and support research and learning more effectively. Although AI adoption in Nigerian libraries is still at a developing stage compared to global practices, there is growing awareness and willingness among librarians and institutions to embrace these technologies.

For Nigerian libraries to benefit fully from AI-driven services, deliberate efforts must be made by government, institutions, and stakeholders to address infrastructural deficits, increase funding, and promote continuous training and capacity building for librarians. Equally important is the development of supportive policies and a culture of innovation that encourages adaptability to emerging technologies. The integration of artificial intelligence into Nigerian libraries is no longer optional but essential for the modernization and sustainability of library and information services. With adequate support and strategic implementation, AI can reposition Nigerian libraries as dynamic, intelligent, and user-centered knowledge hubs capable of meeting the information demands of the twenty-first century.

Abstract

The increasing volume of digital information and the growing demand for fast, personalized, and efficient information services have created new challenges for libraries in the 21st century. Traditional library systems, which largely rely on manual processes, often struggle to meet the expectations of contemporary users in an increasingly digital environment. Consequently, artificial intelligence (AI) has emerged as a promising technology for improving library operations and enhancing service delivery. This study was carried out to examine the role of artificial intelligence in transforming library and information services, with particular emphasis on its applications, benefits, challenges, and implications for the future of librarianship. The study adopted a qualitative narrative literature review design. Relevant scholarly publications were sourced from databases including Google Scholar, Scopus, Web of Science, ScienceDirect, Emerald Insight, and Library and Information Science Abstracts (LISA). The selected literature was critically reviewed and analyzed thematically to identify major trends and developments in the application of AI within library environments. The findings reveal that AI technologies, particularly machine learning, natural language processing, predictive analytics, and chatbots, are significantly enhancing information retrieval, cataloguing, metadata generation, user support services, and library decision-making processes. The review also shows that AI contributes to improved operational efficiency, personalized user experiences, and more effective resource management. However, challenges such as algorithmic bias, data privacy concerns, inadequate technological infrastructure, limited funding, and shortages of skilled personnel continue to hinder widespread adoption, especially in developing countries. The study concludes that artificial intelligence has considerable potential to improve the quality and effectiveness of library and information services. However, its successful and sustainable integration requires strategic investment, ethical governance frameworks, and continuous professional development for library personnel.

Keywords: *Artificial intelligence, library services, information retrieval, machine learning, digital transformation, librarianship.*

Introduction

The rapid advancement of digital technologies has significantly transformed the global information landscape, reshaping how information is created, organised, stored, accessed, and disseminated. As key institutions facilitating access to knowledge, libraries have undergone substantial changes in their operations and service delivery models. Traditionally regarded as repositories of printed materials, libraries are increasingly evolving into dynamic, technology-driven information centres that provide a range of digital services to meet users' changing needs in the information age (Cox et al., 2023). The exponential growth of digital information and the increasing expectations of users for fast, personalized, and seamless access to information have created new challenges for libraries. Traditional library systems, which largely depend on manual processes and conventional information management techniques, often struggle to cope with the volume, complexity, and speed of contemporary information demands. Consequently, libraries are adopting innovative technologies to improve operational efficiency, enhance user experiences, and deliver more responsive information services.

Among these emerging technologies, Artificial Intelligence (AI) has become one of the most transformative innovations influencing library and information services. AI refers to the ability of computer systems to perform tasks that typically require human intelligence, including learning, reasoning, pattern recognition, language processing, and decision-making (Brynjolfsson and McAfee, 2022). Through technologies such as machine learning, natural language processing, predictive analytics, and intelligent automation, AI enables libraries to manage information resources more effectively and deliver services that are increasingly user-centred.

The application of AI in libraries has enhanced several core library functions. Machine learning algorithms improve information retrieval by increasing the relevance and accuracy of search results (Jiang and Liu, 2023). Natural language processing facilitates more intuitive interactions between users and library systems, enabling conversational search and intelligent query handling (Shiri, 2023). Similarly, AI-powered automation supports metadata generation, document classification, and cataloguing processes, reducing the time and effort required for routine tasks (Zhou and Zhang, 2022). Furthermore, chatbots and virtual assistants provide continuous user support, improving accessibility to library services while reducing the workload of library personnel (Kim & Abbas, 2023). Beyond operational improvements, AI also supports data-driven decision-making by enabling libraries to analyse user behaviour, predict information needs, and optimize resource allocation (Maurantonio and Ganis, 2023).

Despite these benefits, the integration of AI into library services is accompanied by significant challenges. Ethical concerns such as algorithmic bias, data privacy, transparency, and accountability have emerged as critical issues that require careful consideration (Floridi et al., 2022). In addition, inadequate technological infrastructure, limited financial resources, and insufficient digital competencies among library professionals continue to hinder the successful implementation of AI technologies, particularly in developing countries (Akinola, 2024). These challenges highlight the need for strategic planning and appropriate governance frameworks to ensure responsible and sustainable AI adoption.

Importantly, the growing use of AI should not be viewed as a replacement for librarians. Rather, AI serves as a complementary tool that enhances professional practice by automating repetitive and routine tasks, thereby enabling librarians to focus on higher-level responsibilities such as research support, information literacy instruction, knowledge organization, and user engagement (Liu and Luo, 2021). The successful integration of AI, therefore depends on balancing technological innovation with the professional expertise and ethical responsibilities that remain central to librarianship. Although existing studies have examined various applications of AI in libraries, there remains a need for a comprehensive understanding of its broader implications for library services, professional practice, and user experiences. This study therefore examines the role of artificial intelligence in contemporary library and information services, with particular emphasis on its applications, benefits, challenges, and the strategies required for its ethical and sustainable integration in modern library environments.

Statement of the Problem

Artificial intelligence (AI) is quickly changing the creation, access and sharing of information, putting libraries in a position to develop into cutting-edge service hubs. Even though AI technologies have a lot of potential to improve library operations, use engagement and decision-making, their usage in library services is still restricted and inconsistent among institutions. Inadequate technology infrastructure, especially in poor nations, is a major obstacle that limits the application of AI systems. Effective adoption and administration of these technologies are further hampered by a lack of technical skills among library staff. AI integration is made more difficult by ethical issues including data privacy, security and algorithm bias, particularly when there are unclear governance structures.

Furthermore, a lot of libraries lack strategic guidance and complete policies for the use of AI, which leads to dispersed and unsustainable implementation initiatives. The purchase and upkeep of AI technology are likewise restricted by financial limitations. Even though AI has the ability to supplement rather than replace human expertise, professional resistance motivated by concerns about losing their jobs adds to the complication. As a result, there is a big disconnect between AI's acknowledged promise and its actual use in libraries. Therefore, this study aims to investigate the prospects and difficulties of integrating AI and to pinpoint methods for its ethical and successful implementation in contemporary library services.

Objectives of the Study

The main objective of this paper is to examine how artificial intelligence can enhance library services in the 21st century. Specifically, the study seeks to:

1. Examine the emerging role of AI in modern library environments.
2. Identify key AI technologies currently used in library services.
3. Analyze the benefits of AI-driven information services for libraries and users.
4. Explore the challenges and ethical concerns associated with AI adoption in libraries.
5. Propose strategic recommendations for sustainable AI integration in library systems.

Theoretical Framework.

This study is anchored on two theories. Technological Acceptance Model (TAM) and Diffusion of Innovative Theory (DIT). The Technology Acceptance Model (TAM) contends that people are more inclined to adopt new technologies when they believe they are practical and simple to use. The effectiveness of AI systems in library settings is mostly dependent on how users and librarians view these technologies' advantages and usefulness. While the Diffusion of innovation theory, describe how new technology gradually permeate societies and organizations. The theory state that the rate at which innovations are adopted is influenced by elements such as organizational preparedness, leadership support, technology infrastructure and user awareness (Rogers, 2003). For the context of this study, if librarians in university libraries perceive AI Applications as useful to their service delivery to users it would influence their decision to favorably adopt and use them to a great extent. If librarians find the use of AI easy, they may likely adopt it for use to boost their service delivery drive. And also, while AI will be compared to innovation in university libraries, the diffusion of innovation theory or model aims to explain the factors that influence librarian's willingness to accept an innovation rapidly or slowly.

These theoretical frameworks emphasise the significance of institutional support, professional training and strategic planning in promoting successful technology integration and offer insightful information about the elements influencing AI adoption in libraries.

Methodology

This study adopted a qualitative research approach, using a narrative literature review design, to examine the role of artificial intelligence in enhancing library and information services in the 21st century. The narrative review approach was considered appropriate because it allows for a comprehensive synthesis and critical interpretation of existing scholarly works on a broad and evolving topic such as artificial intelligence in libraries. The study employed a descriptive and analytical design, focusing on synthesizing existing literature on artificial intelligence applications in library and information services. The aim was to identify key themes, trends, benefits, challenges, and ethical issues associated with AI adoption in libraries. Data for this study were obtained from peer-reviewed journal articles, conference papers, books, and reputable online academic sources. Key databases consulted include Google Scholar, Scopus, Web of Science, Emerald Insight, ScienceDirect, and Library and Information Science Abstracts (LISA). These sources were selected due to their relevance and credibility in the field of library and information science. A systematic search was conducted using relevant keywords and Boolean operators. The key search terms included:

- Artificial Intelligence in libraries
- Machine learning in library services
- Natural language processing and libraries
- Chatbots in academic libraries
- Digital libraries and AI
- Information retrieval systems and AI

The selection of literature was guided by the following criteria:

Inclusion Criteria:

- Studies published between 2020 and 2025
- Peer-reviewed journal articles and academic publications
- Research focusing on AI applications in library and information services

Exclusion Criteria:

- Non-academic articles, blogs, and opinion pieces
- Studies not directly related to library and information science
- Duplicate publications or incomplete studies

The selected literature was analyzed using **thematic analysis**. Relevant findings were coded and grouped into themes such as AI technologies in libraries, applications of AI, benefits of AI adoption, ethical concerns, and challenges in implementation. This thematic approach enabled a structured synthesis of existing knowledge and helped in identifying gaps in the literature. Since this study is based on secondary data, no human participants were involved. However, proper academic integrity was maintained by ensuring accurate citation of all sources and adherence to ethical standards of scholarly writing.

Literature Review

Artificial Intelligence and the Transformation of Libraries

Artificial intelligence (AI) has become a transformative force in the evolution of modern library and information services. AI refers to computational systems capable of performing tasks that typically require human intelligence, such as learning, reasoning, perception, and language understanding (Russell and Norvig, 2021). In recent years, AI has moved beyond theoretical computing into practical applications across information-intensive environments, including libraries. Brynjolfsson and McAfee (2022) argue that AI is a central driver of the fourth industrial revolution due to its ability to process large-scale data and support decision-making. Similarly, Davenport and Ronanki (2018) emphasize that AI systems are increasingly being used in organizations to automate complex tasks, improve service delivery, and enhance productivity.

In library settings, Cox et al. (2023) observe that AI is reshaping traditional library services by enabling intelligent, adaptive, and user-centred systems. Bawden and Robinson (2022) further note that while digital transformation has expanded access to information, it has also created challenges such as information overload and retrieval inefficiencies, thereby increasing the need for intelligent systems.

Machine Learning and Intelligent Information Retrieval

Machine learning (ML), a subset of AI, plays a significant role in improving library information retrieval systems. ML algorithms analyze large datasets to detect patterns and generate predictive outputs that improve system performance

over time. Xu and Chen (2023) found that machine learning enhances recommendation systems in digital libraries by analyzing user behaviour, search history, and engagement patterns to deliver personalized content. Jiang and Liu (2023) similarly report that AI-based retrieval systems improve search accuracy by moving beyond keyword-based approaches toward semantic and intent-based search models. Agbo et al. (2021) add that machine learning improves digital asset management, classification accuracy, and predictive collection development in academic libraries. These findings collectively suggest that ML is central to improving both efficiency and user satisfaction in modern library systems.

Natural Language Processing and Conversational Systems

Natural Language Processing (NLP) enables machines to interpret and respond to human language in meaningful ways. In libraries, NLP enhances user interaction by allowing natural language queries instead of structured search commands. Shiri (2023) explains that NLP makes library systems more accessible by enabling conversational search interfaces. This reduces the complexity of information retrieval for users who may lack advanced search skills. Balog (2021) further notes that NLP improves semantic search by interpreting user intent rather than relying solely on keyword matching. Additionally, recent studies show that NLP-driven systems form the foundation of intelligent chatbots and virtual assistants that support user engagement and service delivery in libraries.

Chatbots, Virtual Assistants, and User Engagement

AI-powered chatbots are increasingly being deployed in academic and public libraries to enhance user services. Kim and Abbas (2023) found that chatbots significantly improve user engagement by providing 24/7 reference support and assisting users in navigating digital resources. Similarly, Oke and Idiogho (2022) report that chatbot systems reduce the workload of library staff by handling routine inquiries such as opening hours, database access, and catalogue navigation. These systems improve service responsiveness while allowing librarians to focus on more complex user needs.

Chatterjee and Kundu (2021) also highlight that virtual assistants enhance accessibility and inclusivity in library environments, particularly for remote users.

Predictive Analytics and Data-Driven Library Management

Predictive analytics is another important AI application in libraries, enabling institutions to make data-driven decisions based on historical usage patterns. Maurantonio and Ganis (2023) argue that predictive analytics helps libraries forecast resource demand, optimize acquisitions, and improve collection development strategies. Similarly, Singh and Mehta (2022) note that predictive models can identify usage trends in digital libraries, enabling better allocation of limited resources. These findings suggest that libraries are transitioning from reactive service models to proactive, and data-informed decision-making systems.

Automation of Cataloguing and Metadata Generation

AI technologies are increasingly used to automate cataloguing and metadata creation processes. Zhou and Zhang (2022) found that machine learning algorithms can automatically extract bibliographic metadata from documents, significantly reducing manual workload and improving consistency. According to Park and Kim (2021), automation in metadata generation enhances the scalability of digital libraries and improves retrieval accuracy. These systems also reduce human error and improve standardization across library databases.

Ethical, Technical, and Institutional Challenges

Despite the benefits of AI, several challenges hinder its full adoption in libraries. Floridi et al. (2022) highlight concerns such as algorithmic bias, lack of transparency, and accountability issues in AI systems, which may affect fairness in information access. Akinola (2024) identifies infrastructural limitations, inadequate funding, and lack of technical expertise as major barriers in developing countries. Similarly, Ifijeh and Yusuf (2022) emphasize that many libraries struggle with digital readiness, which limits effective AI integration. Privacy concerns also remain critical, as AI systems rely heavily on user data to function effectively, raising ethical questions about data protection and surveillance.

Although existing literature has examined various applications of AI in libraries, most studies focus on isolated technologies such as chatbots, recommendation systems, or metadata automation. There is limited integrated analysis that examines how these technologies collectively transform library systems. Furthermore, empirical studies from developing countries remain limited, despite the fact that these regions face the greatest infrastructural and capacity challenges. This study addresses these gaps by providing a comprehensive synthesis of AI applications, benefits, challenges, and implications for modern library services.

Findings

AI-Driven Transformation of Library Information Retrieval

The reviewed literature indicates that artificial intelligence has significantly improved information retrieval systems in modern libraries. Traditional keyword-based search systems are increasingly being replaced by intelligent, context-aware retrieval models. Jiang and Liu (2023) observe that machine learning algorithms enhance search accuracy by analysing semantic relationships between user queries and available resources, thereby improving relevance in search results.

Similarly, AI-powered recommendation systems contribute to more personalized information discovery. Xu and Chen (2023) report that by analysing user behaviour, search history, and reading preferences, AI systems can anticipate user needs and deliver tailored content, thereby improving the efficiency of information access in digital libraries.

Automation of Library Operations and Resource Management

The findings also reveal that AI plays a critical role in automating core library operations, particularly in cataloguing, metadata generation, and document classification. Zhou and Zhang (2022) note that machine learning tools can automatically extract bibliographic metadata from digital documents, significantly reducing the time and labour associated with manual cataloguing processes. This automation enhances consistency, accuracy, and efficiency in library resource management. It also allows librarians to redirect their efforts toward more complex intellectual tasks such as research support and knowledge organization.

Enhancement of User Services and Engagement

Another major finding is that AI technologies are improving user experience and engagement in library environments. Natural Language Processing (NLP) enables users to interact with library systems using conversational language rather than complex search syntax. Shiri (2023) explains that this development makes library systems more accessible, especially for users with limited information literacy skills.

In addition, AI-powered chatbots and virtual assistants provide continuous user support. Kim and Abbas (2023) found that chatbots enhance service delivery by offering 24/7 assistance, answering frequently asked questions, and guiding users through digital library platforms. This significantly improves accessibility and responsiveness of library services.

Predictive Analytics and Data-Driven Decision Making

The literature also shows that predictive analytics is increasingly used to support strategic decision-making in libraries. Maurantonio and Ganis (2023) argue that by analysing historical usage data, libraries can predict future resource demands and optimize collection development strategies. This data-driven approach allows libraries to allocate resources more efficiently, improve acquisition decisions, and better align services with user needs. Consequently, libraries become more proactive rather than reactive in-service delivery.

Ethical, Technical, and Institutional Challenges

Despite the benefits of AI integration, several challenges persist. A key concern is algorithmic bias, which may lead to unfair or skewed information retrieval outcomes. Floridi et al. (2022) emphasize that biased training data can negatively influence search results and recommendation systems, thereby affecting equitable access to information.

In addition, Akinola (2024) identifies infrastructural limitations, inadequate funding, and lack of technical expertise as major barriers to AI adoption, particularly in developing regions. These challenges limit the scalability and sustainability of AI-based library systems.

Changing Role of Librarians in AI-Enabled Environments

The findings further indicate that AI does not replace librarians but reshapes their professional roles. Liu and Luo (2021) argue that while AI can automate routine tasks, librarians remain essential for critical functions such as information literacy training, ethical evaluation of information sources, and research support. This suggests a shift in librarianship from operational tasks toward more analytical, instructional, and user-centred roles. AI therefore functions as a supportive tool that enhances professional practice rather than replacing it.

Discussion of Findings

The findings of this study indicate that artificial intelligence is significantly reshaping library and information services, particularly in areas such as information retrieval, automation, user engagement, and decision-making. These developments suggest a clear shift from traditional, manually driven library systems to intelligent, data-driven service environments. The enhancement of information retrieval systems through machine learning and semantic search confirms the argument of Jiang and Liu (2023), who emphasize that AI improves search relevance by interpreting user intent rather than relying solely on keyword matching. This indicates a transition toward more user-centred and context-aware library systems.

AI and Transformation of Library Services

The findings also show that AI technologies are redefining core library operations such as cataloguing, metadata creation, and resource management. This aligns with Zhou and Zhang (2022), who found that automation significantly reduces the workload associated with manual cataloguing while improving accuracy and consistency. Similarly, the use of predictive analytics for resource allocation supports the view of Maurantonio and Ganis (2023), who argue that data-driven decision-making enables libraries to anticipate user needs and optimize collection development. This suggests that libraries are increasingly adopting proactive rather than reactive service models.

Enhancement of User Experience and Engagement

The results further reveal that AI contributes to improved user experience through personalization and conversational interfaces. The use of Natural Language Processing (NLP) enables users to interact with library systems more naturally, which supports the findings of Shiri (2023), who reported that NLP reduces barriers associated with traditional search systems.

In addition, AI-powered chatbots enhance accessibility and responsiveness of library services. This is consistent with Kim and Abbas (2023), who found that chatbots improve service delivery by providing continuous support and reducing dependence on physical reference desks. These developments indicate a shift toward more interactive and user-friendly library environments.

Ethical and Structural Challenges

Despite these advancements, the study confirms that several challenges hinder effective AI adoption in libraries. One of the most significant issues is algorithmic bias, which may compromise fairness in information retrieval systems. Floridi et al. (2022) similarly caution that biased datasets can lead to unequal access to information, raising concerns about transparency and accountability. Infrastructure and capacity limitations also remain major barriers, particularly in developing countries. This supports the findings of Akinola (2024), who highlights inadequate funding, poor technological infrastructure, and limited digital skills as key obstacles to AI implementation in library systems. These challenges suggest that technological advancement alone is insufficient without institutional and policy support.

Implications for Library Practice

The findings imply that libraries must reposition themselves as hybrid institutions that integrate both human expertise and artificial intelligence. While AI enhances efficiency and automation, librarians remain essential for tasks requiring ethical judgment, critical thinking, and human interaction. This supports Liu and Luo (2021), who argue that AI should be viewed as a complementary tool rather than a replacement for librarians.

Consequently, the professional role of librarians is evolving toward more analytical and user-centred responsibilities such as information literacy training, research support, and digital curation. This transformation requires continuous professional development and institutional investment in digital skills. Overall, the discussion demonstrates that AI is not merely a technological enhancement but a transformative force reshaping library service delivery models. However, its successful integration depends on addressing ethical concerns, infrastructural challenges, and capacity gaps. The study therefore contributes to the growing body of literature by synthesizing how AI collectively impacts library operations, user experience, and professional practice, particularly in the context of digital transformation.

Conclusion

This study examined the role of artificial intelligence in enhancing library and information services in the 21st century. Through a thematic review of existing literature, the study demonstrated that AI is significantly transforming library operations, particularly in areas such as information retrieval, cataloguing, user services, and decision-making. Technologies such as machine learning, natural language processing, predictive analytics, and chatbots are increasingly being integrated into library systems to improve efficiency, accessibility, and user experience.

Contribution of the Study

This study contributes to existing literature by providing an integrated and thematic synthesis of artificial intelligence applications in library and information services. Unlike studies that focus on isolated AI tools, this research brings together multiple AI technologies and explains how they collectively reshape library operations, user engagement, and professional practice. It also highlights the interrelationship between technological advancement and the evolving role of librarians in AI-driven environments.

Despite its contributions, the study has some limitations. First, it is based solely on secondary data derived from existing literature, which may limit the inclusion of emerging real-time developments in AI applications. Second, the study did not include empirical data from librarians or library users, which could have provided deeper insights into practical implementation challenges. Third, the review is limited to English-language publications, which may exclude relevant studies published in other languages.

Recommendations for Future Research

Future studies should adopt empirical or mixed-method approaches to investigate the actual implementation of AI in library environments. There is also a need for comparative studies between developed and developing countries to understand contextual differences in AI adoption. Furthermore, future research should explore user perception, ethical governance frameworks, and the long-term sustainability of AI-driven library systems.

In conclusion, artificial intelligence presents significant opportunities for improving library and information services. However, its successful integration depends on addressing ethical concerns, infrastructural limitations, and capacity-building needs while maintaining the core professional values of librarianship.

Abstract

This study investigated the utilization of health information resources and services for clinical decision-making among healthcare professionals in Aliyu Magatakarda Wamakko Medical Library complex Usmanu Danfodiyo University Teaching Hospital (UDUTH) Sokoto Nigeria. The objectives of the study was to examine healthcare professionals level of awareness about the available health information resources and services, to ascertain the extent of utilization for clinical decision-making and the challenges faced by healthcare professionals in accessing and utilizing health information and services in Aliyu Magatakarda Wamakko Medical Library complex Usmanu Danfodiyo University Teaching Hospital Sokoto Nigeria. A quantitative research approach using descriptive survey research design was adopted for this study. The population of the study were1245 healthcare professionals which consisted of doctors, nurses, pharmacists and medical laboratory scientists in Usmanu Danfodiyo University Teaching Hospital Sokoto Nigeria. A sample size of 297 was determined and selected. Self-developed closed ended questionnaire was used for data collection with 276 valid responses returned representing response rate of 92.9%. The data collected was analyzed using descriptive statistics mean and standard deviation. This study revealed a high level of awareness of traditional printed health information resources among respondents, while awareness on information services was moderate. The utilization of traditional printed resources was found to moderate whereas the utilization of specialized information services among the respondents was generally low. The major challenges identified includes lack of internet facilities, lack of e-library infrastructure, limited access to online medical databases, e-books, e-journals lack of wireless connectivity and outdated textbooks and medical journals in the medical library among others. This study concluded that there is a significant gab in the use of electronic health information resources in the medical libraries. This study recommended that the management of Usmanu Danfodiyo University Teaching Hospital Sokoto should increase funding for the development of e-library, subscription to relevant health electronics resource and databases, e-books, e-journals and provision of wireless connectivity in the medical library, and also acquisition of current medical textbooks, and journals that support evidence-based clinical making and provision of quality healthcare delivery by healthcare professionals in Usmanu Danfodiyo University Teaching Hospital Sokoto Nigeria.

Keywords: Clinical Decision-Making, Health Information Resources, Information Services, Utilization

INTRODUCTION

Clinical decision-making is the process by which healthcare professionals assess and interpret patient medical information to make informed choices about diagnosis, and develop treatment plans integrating evidence-based practice into patient care. This process involves evaluating clinical data, considering the patient history and preferences and applying medical knowledge, experience, clinical expertise, and using evidence-based relevant health information resources and services to determine the best course of action, such as evidence based decisions and more effective treatment and interventions leading to better health outcomes for patients (Dusin, Melanson& Mische-Lawson; Berne & La Lande, 2016). Effective clinical decision-making aims to improve patient outcome and enhance quality of care which help in reducing unnecessary test and providing best treatment option which also aid in allocating resources more efficiently. Evidence-based clinical decision- making can also enhanced patient safety, by carefully assessing effective use of relevant health information resources healthcare professionals can reduce the risk of medical errors and adverse events of uncertainties enhancing high quality healthcare delivery. Health information resources and services play a

vital role in clinical decision-making by healthcare professionals. These resources and services provide healthcare professionals with access to accurate, reliable and up-to-date information through medical research studies, systematic reviews and clinical guidelines enabling them to make informed clinical decisions about patient care (WHO, 2024).

Health information resources are the various materials and sources that provide information about health and medical topics. These resources includes websites, databases, textbooks, articles and other materials that offer valuable insights into different aspects of healthcare, medical conditions, treatments, and general well-being. Health information resources also include medical literatures, databases, research articles, multimedia resources and online platforms that provide relevant health information (WHO, 2024). Medical personnel rely on a variety of health information resources and services to make informed clinical decisions and to provide quality healthcare delivery.

Information services are the assistance or services provided by the library to its users in order for them to access and use relevant information resources. This can include how to access and use health information resources in the library. Information services also includes circulation service, reference service, online reservation of books, recommendation of library materials, current awareness service, inter library loan service or document delivery, and selective dissemination of information. Information services can also include literature searches, information literacy programs, providing evidence-based resources, current awareness alerts, clinical queries resources, and user education (Smith, & Jones 2018). Information services play a crucial role in enhancing access to timely and accurate health information resources thereby simplifying healthcare delivery by healthcare professionals (Yogesh & Karthikeyan, 2022). This is made possible through access to comprehensive and accurate information. It directly helps healthcare professionals to make critical decisions regarding diagnosis, treatment and patient management. Similarly, utilization of information resources enhances quality of care provided to patients (Beauchemin, Cohn & Shelton 2019).Utilizing up to date medical literatures, clinical guidelines and best practices ensures the delivery of quality healthcare by professionals based on latest evidence and current trends and optimized care coordination among professionals (Donalson, Richard, Shendun & Cascinr, 2021). This paper tends to examine the utilization of health information resources and services for clinical decision-making among healthcare professionals on patients care outcomes using evidence-based research and clinical guidelines in the overall patient management and provision of quality healthcare delivery in Usmanu Danfodiyo University Teaching Hospital Sokoto. Nigeria.

Statement of the Problem

Health information resources and services have been an alternative means of learning, research and keeping up-to-date with evidence-based medical research especially in medical environment integrating evidence-based practices into clinical decision-making and patient management is paramount in order to enhance quality of care by healthcare professionals. Medical library has essential responsibilities for providing and dissemination of health information resources and services such as medical databases, textbooks, journals, multimedia materials, clinical guidelines, and other relevant materials and reference assistance for research and academic support incorporating evidence-based practices in the face of uncertainty becomes vital on daily basis towards enhancing informed clinical decision-making by healthcare professionals in teaching hospital setting for provision of quality healthcare delivery (Sutton, et al 2020) The authors observed that the teaching hospital has a diverse community of healthcare professionals who are among the categories of users in the medical library. However, based on the current library statistics of usage as contained in the statistics record of the medical library 2024-2025 showed that, these health information resources and services seemed to be underutilized by healthcare professionals which may contribute to clinical errors and reduced the quality of care provided to patients and increase healthcare cost which may lead to poor patient outcomes. It is based on this threshold that the researchers carry out this study with the view of identifying gabs and challenges in order to make recommendations that will inform interventions for establishing its impact towards enhancing informed evidence-based clinical decision-making and provision of quality care by the healthcare professionals in Usmanu Danfodiyo University Teaching Hospital Sokoto, Nigeria.

Objectives of this Study

1. To determine the level of awareness by healthcare professionals on health information resources and services available in the Aliyu Magatakarda Wamakko medical library complex Usmanu Danfodiyo University Teaching hospital, Sokoto, Nigeria.
2. To ascertain the level of utilization of health information resources and services by healthcare professionals for clinical decision-making in Aliyu Magatakarda Wamakko Medical Library complex Usmanu Danfodiyo University Teaching Sokoto, Nigeria.
3. To find out the challenges faced by healthcare professionals in accessing and utilizing health information resources and services in Aliyu Magatakarda Wamakko medical complex Usmanu Danfodiyo University Teaching hospital Sokoto, Nigeria.

Review of Related Literature

Health library information resources and services are essential for clinical decision-making, providing healthcare professionals with reliable and up-to-date health information to guide patient care. These resources include books, journals, databases, and electronic health records that support evidence-based practice. According to Nelson and Staggers (2021), well-organized health libraries facilitate access to critical information, enabling clinicians to stay updated with evidence, based knowledge to diagnose accurately and develop effective treatment plans. A study by Popescu, El-Chaarani, El-Abiad, and Gigauri (2022) highlights that healthcare professionals who utilize health information resources improved confidence and accuracy in decision-making. Awareness of health information resources and services among healthcare professionals is crucial for enhancing clinical decision-making and improving patient outcomes. Health information resources, including textbooks, journals, databases, and online platforms, provide evidence-based data to guide diagnosis and treatment. According to Zulfikar Ghose and Sardar (2024), increased awareness of these information resources empowers clinicians to integrate the latest medical advancements into practice and enhance efficiency in patient care. Agure, Miyeso, and Abdullahi (2024) emphasize that a well-informed healthcare workforce significantly reduces errors and improves the quality of care. Increased awareness of health information services fosters evidence-based decision-making among healthcare professionals. Services such as reference consultations, interlibrary loans, and access to online medical databases like PubMed, Clinical Key, and HINARI provide vital support for clinical queries.

Utilisation of health information resources and services is crucial for healthcare professionals towards enhancing evidence-based clinical decision-making. In the present-day healthcare setting, the utilisation of diverse information resources is essential for informed clinical decision-making in healthcare delivery and improved patient outcomes. These resources include peer-reviewed journals, databases, textbooks, clinical guidelines, and medical conferences. Each of these resources serves a unique role in shaping healthcare practices. As healthcare professionals navigate through this wealth of health information resources, it becomes imperative to critically assess the relevance, accessibility, and quality of these resources to ensure their effective integration into clinical practice and patient management (Al-Assaf, Bahroun, & Ahmed, 2024). The importance of utilising various Health information resources in healthcare is profound, influencing clinical decision-making processes and ultimately patient outcomes. Access to current research through journals facilitates evidence-based practice, thereby improving patient care (Connor et al., 2023). According to Ekere, Igwe, & Omekwu, (2017), healthcare professionals faced significant challenges in accessing and utilising health information resources and services, which hinder their ability to make evidence-based clinical decisions. One of the primary issues is inadequate infrastructure in medical libraries, such as limited seating, outdated facilities, and unreliable internet connectivity. Adekoya, et al. (2024), highlight that many medical libraries in Nigeria lack essential digital tools, making access to online databases and health information portals difficult by healthcare professionals. It also emphasize that the absence of modern technologies reduces the efficiency of information retrieval. These challenges create barriers for healthcare professionals seeking timely and relevant information to support clinical care. According to Bala, Underwood, and Moyane, (2025) inadequate promotion of information services by medical libraries exacerbates the problem of underutilization leaving healthcare professionals reliant on limited personal networks or outdated health information resources. Godwill, Rose & Ekemini (2024) stated that the high patient-to-doctor ratio and clinical engagements among healthcare professionals in many Nigerian hospitals leaves most healthcare professionals with limited time for library use and extensive health literature review in most cases. Limited funding for health libraries leads to a lack of subscriptions to up-to-date journals and electronic databases, as noted by Popescu, El-Chaarani, El-Abiad, and Gigauri, (2022). Overcoming these challenges is essential to empower healthcare professionals and also equip medical libraries with current and up-to-date health information resources and services for enhancing informed clinical decision-making and provision of quality (Poopola et al (2020).

Methodology

A quantitative research approach descriptive survey research design was adopted for this study. The population of the study were 1245 healthcare professionals which consisted of doctors, nurses, pharmacists and medical laboratory scientists in Usmanu Danfodiyo University Teaching Hospital Sokoto Nigeria. A sample size of 297 was determine and selected. Self-developed closed ended questionnaire was used as instrument for data collection. The instrument was validated using faced and content by three lecturers in the Department of Library and information Science Ahmadu Bello University Zaria. A pilot study was conducted at the Ahmadu Bello University Teaching Hospital, Shika-Zaria and the reliability co-efficient index obtained using Cronbach's Alfa was 0.85 which indicated that the instrument was reliable. The valid responses of 276 was returned representing response rate of 92.9%. The data collected was analysed using descriptive statistics mean and standard deviation.

Result and Discussion

Source*:* FIELD SURVEY*, 2025.* n=276

Table 1.1 provide a detailed breakdown of the level of awareness among healthcare professionals regarding various health information resources. The highest levels of awareness were recorded for medical books with mean value of 4.13, medical journals 4.07 and WHO publications 4.02, clinical handbooks 4.02 indicating strong familiarity with traditional and reputable health information sources. High level of awareness was also recorded for medical dictionary with mean value of 3.95, public health guidelines, Anatomy atlases the mean value is 3.91, Heath organizations annual reports the mean value is 3.77, clinical practice guidelines the mean value is 3.69, conference proceedings on health the mean value is 3.69, health organizations annual reports has the mean value of 3.60, health statistics reports the mean value is 3.41.This align with Alissa, & Alwargash, (2024) in health education promotion who emphasized that increase in level of awareness of health information resources can empower healthcare professionals to integrate the latest advancement in medical research into practice. While e- resources health information resources have negative mean value which is below the bench mark of 3.0. Notably, awareness was particularly low multimedia resources 2.96, hospital knowledge repositories 2.91, health information portals, 2.08, e-books 2.08, e-journals 2.04 and online medical databases 1.93. This finding aligns with previous study of Ikolo, Kolawole & Ekoko, (2025) which states that digital health information resources often suffer low engagement due to limited access to modern digital facilities in medical libraries in Nigeria.

The finding implies that healthcare professionals such as doctors, nurses, pharmacists and medical laboratory scientists are well-informed about conventional print health information resources. Substantial need for capacity building and sensitization on digital and online health information resources and electronic health information platforms will be crucial in improving evidence-based clinical decision-making. Healthcare institutions and medical libraries should consider targeted awareness campaigns and training programs to bridge the digital health information utilization of the library under the study tailored towards enhancing clinical decision-making and provision of quality care.

Source*:* FIELD SURVEY, 2025 *n*=276

Table 1.2 presents the level of awareness of information services available in the Aliyu Magatakarda Wamakko Medical Library Complex, UDUTH Sokoto. The level of awareness was high on circulation services with mean value of 4.05, follow by reference services 3.94, current awareness services 3.81, readers advisory services 3.76, the mean value of information literacy is 3.72 and research assistance 3.45. Indicating that, most of the library services are well-known by the respondents. High recognition likely stems their fundamental role in daily library operations, making them more visible to the user. However, a majority of respondents showed low awareness on others services with mean value below the bench mark of 3.0. Such as Selected dissemination of information the mean value is 2.91, specialized reading room services 2.89, document delivery 2.89 Interlibrary loan services the mean value is 2.76 which indicate negative value below the bench mark of 3.0. Similarly, this finding showed that healthcare professionals in the teaching of such Doctors, Nurses Pharmacists and medical laboratory scientists are mostly aware about the core information services available in Aliyu Magatakarda Wamakko medical library complex UDUTH, Sokoto.

This implies that a strong familiarity with basic library functions, but a critical gap in awareness regarding advanced and value-added services that could significantly enhance information access and research support. To address this, the library should intensify outreach and orientation programs to promote underutilized services, particularly those that support collaborative research and evidence-based clinical decision-making that impact patient care.

Source: FIELD SURVEY, 2025 ***n276***

Table 1.3 reveals that the level of utilization of health information resources and services among healthcare professionals in UDUTH Sokoto is predominantly moderate, with a significant proportion of doctors and nurses reporting only partial engagement with the available resources, other than pharmacists and medical laboratory Scientists across all 18 listed health information resources, the majority of respondents consistently selected unutilized, indicating moderate level of utilization. For clinical practice guidelines, the mean value is 3.49, followed by health organization annual reports which the mean value is 3.45, conference proceedings on health the mean value is 3.46, public health guidelines 3.42, clinical handbooks 3.41, medical dictionaries 3.37, health organizations newsletters 3.35 anatomy atlases 3.32, medical journals 3.32 health statistics 3.26, WHO publications 3.18 and medical textbooks 3.13. This finding aligns with Popescu, El-Chaarani, El-Abiad, & Gigauri (2022), who noted that healthcare professionals often prioritise resources like clinical guidelines and public health guidelines because they align more closely with national standards and protocols. These results highlight that when health information resources are adequate, accessible and utilized, it will promote informed clinical-making by healthcare professionals (Nwafor-Orizu, 2020).

Digital resources such as e-books, indicating negative value of 2.98 hospital repositories 2.86, e-journals 2.80, multimedia resources 2.71 health information portals 2.67 and online medical databases 2.64. For these resources the mean values were below the bench mark of 3.0 indicating noticeable gab in their utilization rates. This might stem from inadequate digital infrastructure in the medical library at UDUTH Sokoto.This finding supports Uzoagba, Egneti & Oyam (2017), who identified poor internet connectivity, inadequate digital infrastructure, lack of e-resources, lack of institutional subscriptions, and low digital literacy as major barriers to accessing and utilization of e- resources in Nigerian tertiary hospitals.

This implies unavailability of e-resources can hinder the utilization of evidence-based research articles which is vital in clinical decision-making practices meaningful improve patient outcomes. It is essential that healthcare institutions not only provide access to health information resources but also implement structured training programs, foster a research-informed culture, for enhancing healthcare professional engagement through tailored digital platforms relevant to the specific roles in clinical decision-making that impact patient care. When such strategies are put in place, medical libraries can be transformed into hubs of clinical excellence, reinforcing the link between health information and evidence-based practices.

Source: FIELD SURVEY, 2025 n276

The analysis of Table 2.2 shows that the level of utilization of health information services for clinical decision-making at UDUTH, Sokoto is moderate for most services, such circulation services with mean value of 3.45 followed by information literacy 3.48, reference services 3.49, research assistance 3.41 and current awareness services 3.39, and reader advisory services 3.01. While services like selected dissemination of information is indicating negative value of 2.92, specialized reading room services 2.92, document delivery services 2.86, readers advisory services 2.85 and inter library loan services has the mean value of 2.70 all these are below the bench mark of 3.0. These results suggest that most of the respondents indicated low level of underutilization of these services in clinical decision-making contexts.

This finding implies that the underutilization of these vital information services can hinder evidence-based clinical decision-making, especially in complex cases requiring in-depth consultation of diverse sources of health information resources. A possible explanation is that health professionals may not be fully aware of the potential of library services in supporting clinical decisions or face time constraints that prevent in-depth engagement with these services (Ocheibi & Lawal, 2021). There is a clear need to strengthen awareness, and accessibility to these information services through targeted information literacy programs and digital integration. Libraries must also evolve to become more user-centered, supporting research and real-time clinical application of knowledge into clinical practice (Osaro & Garrick, 2024).

TABLE: 3: CHALLENGES FACED BY HEALTHCARE PROFESSIONALS IN ACCESSING AND UTILIZING HEALTH INFORMATION RESOURCES AND SERVICE IN ALIYU MAGATAKARDA WAMAKKO MEDICAL LIBRARY MEDICAL LIBRARY COMPLEX UDUTH SOKOTO

S/N	CHALLENGES	DOCTORS (F)	NURSES (F)	PHAMACISTS (F)	MED. LAB SCI. (F)	TOTAL	%

KEY: F=FREQUENCY, (%) PERCENTAGE

FIELD SURVEY, 2025 n276

The analysis of Table 3: revealed that the most common challenges faced by healthcare professionals in accessing and utilizing health information resources and services is a lack of time due to clinical engagements, which refers to the duration of time spend in clinics attending to patients especially doctors and nurses than other healthcare professionals. This aligns with previous finding Godwill Rose & Ekemini (2024) who states that the high patient-to-doctor ratio in many Nigerian hospitals leaves healthcare professionals with little time for extensive literature review or library use. A significant number of respondents had indicated by 93.5%. This is followed closely by infrastructural and digital access issues such as lack of wireless connectivity (90.9%), lack of e-books and e-journals (90.2%), and lack of e-library facilities (89.1%), indicating a severe gap in digital health information access. These limitations point to a broader issue of digital resource insufficiency, confirming the assertions of Ajuwon and Popoola (2015) that many health libraries in Nigeria are under-digitized, despite the global shift toward e-resources in clinical decision-making. A considerable number of respondents also cited the outdated nature of available health information resources (85.9%) and the lack of online medical databases (85.7%) as major barriers. On the other hand, challenges such as nonchalant attitudes of library staff (18.8%), frequent power outages (21.0%), insufficient skills in using health information resources (17.8%), and poor reading environments (27.2%) were identified by fewer respondents, suggesting they are less prevalent. Overall, the data highlights that the key challenges revolve around time constraints, digital resource inadequacies, and outdated or insufficient information infrastructure, which significantly hinder effective utilization of health information services.

The implications of these findings are significant for the improvement of health information services in tertiary healthcare centers. The dominance of time constraints due to clinical engagements suggests a need for more flexible, user-friendly, and on-demand access to health information resources. The overwhelming lack of digital infrastructure including e-library facilities, online databases, and reliable internet connectivity indicates that healthcare institutions must prioritize digital transformation and investment in e-health information resources to enhance access to up-to-date medical knowledge. This implies a pressing need for regular updates of information resources and subscriptions to current and evidence-based materials to support clinical decision-making. Addressing these challenges is essential not only for improving information utilization among health professionals but also for promoting evidence-based practice, patient safety, and overall healthcare quality.

Conclusion

This study concluded that there is a notable gap between awareness and actual utilization of electronic health information resources for clinical decision-making by healthcare professionals such as e-journals, e-books, online medical data bases, health information portals, and hospital knowledge repositories due to limited access to digital health information resources, in the medical library as well as lack of wireless connectivity in the medical library and inadequate health information resources. This study also uncovered lack of time due clinical engagements and interaction with patients on daily basis by healthcare professional that affect time for library use and literature searches. To bridge this gab targeted interventions are needed for provision of digital health information resources and wireless connectivity in the medical library and the teaching hospital environment to enable easy access and utilization of electronic health information resources including promotion of information services addressing these issues will support evidence-based clinical decision-making and enhance quality of patient care outcome.

Recommendations

1. The Usmanu Danfodiyo University Teaching hospital management and stakeholders should ensure that the medical library create library committee to facilitates communication between librarians and healthcare professionals, the medical library should also create awareness on the available information services that support evidence-based clinical decision-making, there should be a collaborative relationship between librarians and healthcare professionals in Aliyu Magatakarda Wamakko medical Library complex, Usmanu Danfodiyo University teaching Hospital Sokoto, Nigeria.
2. The Usmanu Danfodiyo University teaching hospital management should increase resource allocation to the medical library to enable the medical library develop e-library and provide strong and reliable internet infrastructure to facilitate easy access to online health information resources and subscription of relevant databases, e-books and e-journals in Aliyu Magatakarda Wamakko medical library complex UDUTH for enhancing evidence-base clinical decision-making and provision of quality care by healthcare professionals
3. To breach the gab of challenges faced by healthcare professionals on the utilization of information resources the medical library should also acquire current and up-to date medical textbooks and Journals that supports evidence-based clinical decision-making and integrate internet facilities and wireless connectivity including automated alerts and mobile notifications to heads of clinics on any development on health information resources available in the medical library that will enhanced evidence-based clinical decision-making by healthcare professionals in Aliyu Magatakarda Wamakko medical library complex Usmanu Danfodiyo University Teaching Hospital Sokoto Nigeria.
