Preface

The global information ecosystem is undergoing a profound revolution. Driven by rapid technological disruption, changing user demographics, and shifting socio-economic realities, the traditional boundaries of the library have dissolved. Today, libraries are no longer mere storehouses of books; they are dynamic innovation hubs, centers for community empowerment, and the vital infrastructure upon which the knowledge economy is built.

For centuries, libraries have served as the custodian of knowledge, the arbiters of information, and the vibrant hubs of community engagement. From the scrolls of Alexandria to the digital repositories of today, their fundamental mission has remained constant: to connect people with the information they need to learn, grow, and thrive. But as the 5th Industrial Revolution gather pace, the very definition of "information" and "service" is undergoing a radical re-evaluation in library and information profession. In response to the above, the Nigerian Library Association hosts her 64rd National Conference at Minna, Niger State from 12th to 17th July, 2026 culminating in this landmark two-volume book of proceedings with the Theme *"Our Future, Our Hope: The State of Libraries and Librarianship in Nigeria"*. It is a theme that is considered very apt in the face of rising competitiveness in the information market and the quest for professional identity and relevance among library and information professionals in Nigeria. This collection stands as a testament to the resilience, adaptability, and intellectual vigor of Nigerian information professionals at a defining moment in our history.

This book is an invitation to librarians, information professionals, educators, policymakers, and indeed, anyone invested in the future of knowledge, creation, access, and use to contemplate the profound implications of this new era. The proceedings provide a comprehensive reflection on contemporary developments, emerging trends, persistent challenges, and future directions for libraries and librarianship in Nigeria. It has also encouraged scholarly engagement with strategies for building resilient, innovative, and inclusive library systems. Collectively, the papers demonstrate that although libraries in Nigeria continue to face challenges associated with funding, infrastructure, technology adoption, policy implementation, and human capacity development, there are numerous opportunities for renewal through research, innovation, strategic partnerships, and professional collaboration.

The conference tagged "Minna 2026", attracted 292 papers on the various sub-themes of the conference theme. Each submission was reviewed by selected experts/professionals in the relevant areas of Librarianship and Information Science. After each paper was subjected to scrutiny by the reviewers, 220 papers were selected and presented at the Conference. The selected papers were assembled in this book of proceedings. The contributions span diverse thematic areas, including Artificial Intelligence and emerging technologies in libraries, the state and of school libraries, public library development in Nigeria, academic and special library services, information and knowledge management, digital preservation, information literacy, collection development, professional ethics, capacity building, library and information science education and the role of professional associations in promoting excellence and sustainability within the library profession. These themes underscore the multidisciplinary nature of Library and Information Science and highlight the evolving responsibilities of libraries in supporting education, research, innovation, lifelong learning, and national development.

We specially thank the participants of the 64th NLA National Conference 2026, for their unalloyed cooperation, loyalty, support and contributions over the years. Gratitude is also extended to the reviewers for their valuable time, expertise, and constructive evaluations, which ensured the academic quality and integrity of the published papers. Their collective efforts have contributed significantly to the success of this publication.

It is hoped that these proceedings will serve as an important resource for researchers, librarians, educators, students, policymakers, and other stakeholders in the information sector. Beyond documenting the scholarly contributions presented at the conference, the volumes are expected to stimulate further research, encourage professional dialogue, inform policy development, and inspire innovative practices that will strengthen libraries and librarianship in Nigeria and beyond

Dr. Juliet C. Alex-Nmecha
Vice President & Chairman, National Organizing Committee

Table of Content

Academic Libraries as Catalysts for Climate Resilience and Security for Sustainable Development in South-South, Nigeria- Millie Nne Horsfall, PhD, CLN, FCAI, James F. Ndaeyo & Lauretta John Obisung	**1**
Academic Library Advocacy and Marketing Practices for Sustainable Development Goals in Nigeria: A Study of Federal Universities - Muhammad Salihu Zubair, Ph.D	**9**
Access to Law, Access to Hope: Reframing the Role of Law Libraries in Legal Information Acquisition and Use in Nigeria - Dr. Mbuotidem Odudu Umoh *Esq*. CLN	**19**
ACCESSIBILITY AND UTILIZATION OF SCHOOL LIBRARY INFORMATION RESOURCES FOR ACADEMIC PREPAREDNESS AMONG FINAL-YEAR SECONDARY SCHOOL STUDENTS IN OFFA LOCAL GOVERNMENT, KWARA - Loretta Odiri Daniel, Leah Yebo Gana, Juliana Bolatito Adetunji & Dorcas Shaba	**26**
Adoption and Use of the Nigeria Education Repository and Databank (NERD) for Research by Academic Staff of Universities in Jigawa State, Nigeria = BABA ABDU	**34**
ADOPTION OF INSTITUTIONAL REPOSITORY IN NIGERIAN HIGHER EDUCATION: A SYSTEMATIC REVIEW - Joshua Olaoluwa JEGEDE	**42**
ADOPTION OF LIBRARY APPLICATION SOFTWARE PACKAGES FOR LIBRARY OPERATIONS IN COLLEGE OF EDUCATION LIBRARIES IN KATSINA STATE, NIGERIA - Hakeemat Salahudeen Bello Ph.D CLN	**50**
ADVOCACY FOR FUNCTIONAL LIBRARIES IN STATE OWNED MEDIA ORGANIZATIONS IN SOUTH EAST NIGERIA = Chidimma V. Igwilo	**57**
An Analysis of Resources Adequacy in Specialised University Libraries: Staffing, Collections, Facilities, and Finance - Ogagbe Blessing Akpofure, Demesi Evi Progress & Umukoro Ighozino Oke	**63**
APPRAISAL OF THE ADEQUACY OF STAFF MANAGING SCHOOL LIBRARIES IN NIGERIA - Lbrn. Ibrahim Haruna (CLN MNLA) & Lbrn.Dr. Adelusi James Olatunde (CLN,MNLA)	**73**
Assessing Medical Libraries Digital Skills Training in Identifying Health Misinformation among Clinical Medical Students at University of Lagos, Nigeria - Gladys Omolola IBIKUNLE (Ph.D.), Oludare Adebanji SHORUNKE (Ph.D.) & Adedokun, Aderonke Olubukola PhD	**80**
ASSESSING THE LEVEL OF LIBRARIANS' PREPAREDNESS FOR THE ADOPTION OF ARTIFICIAL INTELLIGENCE FOR INFORMATION SERVICES PROVISION IN UNIVERSITY LIBRARIES IN NASARAWA STATE - AMIDU, Godwin Ph.D CLN, UMAR, Jamilu Alhaji CLN & IBRAHIM Umma Kaltumi CLN	**91**
ASSESSING THE STATE OF SCHOOL LIBRARIES IN GOVERNMENT SECONDARY SCHOOLS IN JIGAWA STATE, NIGERIA - Dr Adamu Sa'ad Madaki	**98**
Assessment of Professional Development Programmes and Librarians' Innovative Service Delivery Outcomes in Public University Libraries in Rivers State - Eruchi Brown Akpelu *CLN*	**105**
Assessment of the Status of Public Libraries in Niger State, Nigeria - Umar Muhammad Babamini (MNLA), Yusuf Muhammad Sani (MNLA), Lbrn. Ibrahim Haruna (LCN, MNLA) & Lbrn. Umaru Lawal (MNLA)	**112**
AUGMENTED LIBRARIANSHIP: REPOSITIONING AI AS A COLLABORATIVE TOOL IN 21ST CENTURY INFORMATION SERVICES - Aribatise, Helen Omolara (PhD, CLN), Eweama, Uju Rosemary (PhD, CLN & Azuka O. Chegwe, (PhD, CLN)	**117**
Automation, Smart Technologies and the Future of Sustainable Information Service Delivery in Academic Libraries in Developing Economies - Dr Adebola Aderemi OLATOYE & Olaninhun Marvellous Rejoice	**124**
Autonomy of Academic Library and Institutional Support in Public Universities in Abia State, Nigeria - Igbo Harriet U. (PhD), Funminiyi Pius Adeniran, Ajogwu Promise Ebube & Nwachukwu Polycarp Ifeanyi	**132**

AVAILABILITY AND ADEQUECY OF LIBRARY RESOURCES AND SERVICES FOR PEOPLE WITH DISABILITES IN EBONYI STATE LIBRARY BOARD - Jonathan N. Chimah (Ph.D), Mary Chinasa Samuel & Obinna C. Ejimonye **139**

Advocacy and Marketing as Strategic Tools for Enhancing Visibility and Impact of the National Library of Nigeria - Aziyma Rasheedah Hassan & Mohammed Nma Baba **148**

Advocacy and Marketing of the National Library of Nigeria: Strategies for Increased Visibility and Engagement - Egwuibe, Martina Okwuchi (CLN) & Azu, Ngozi Faith **155**

Assessing the Readiness of Nigerian Librarians for Emerging Technologies in Academic Libraries - OMALI, Theresa O. (Ph.D), OFODU, Patricia Ngozi (Ph.D, CLN) & ODINAKA, Winifred Anyanechi **162**

Assessment of Librarians' Readiness for Innovative Library Services - Usuka, Enweremadu Isaac (Ph.D, CLN) **173**

Beyond School Age: Rethinking the Age Categories in the study of Children's Information Behavior in Library Services - Sekinat Temilade Yusuf (Ph.D), Jimoh, Amina Oiza (PhD) & Atte Sadiat Lola **180**

BUILDING LIBRARIANS' CAPACITY FOR GRANT-WINNING RESEARCH: STRATEGIES IN A COMPETITIVE RESEARCH ENVIRONMENT - Vincent C. Opara, Hope Ebereamaka Chiekezie CLN **186**

Capacity-Building of Librarians in the Use of Electronic Research Tools and Quality of Library Service Delivery in Academic Libraries in Rivers State - Queen Nnenna Irechukwu, Funminiyi Pius Adeniran & Nwokeoma Chinua Prince **194**

CAREER PROGRESSION AND PROFESSIONAL RECOGNITION AS MOTIVATIONAL TOOLS FOR SERVICE DELIVERY IN PUBLIC UNIVERSITY LIBRARIES IN NORTH-CENTRAL NIGERIA – Rita Otibhor Salami, Lami Akawu & Eruvwe Ufuoma **200**

Challenges Affecting public Libraries and Public Service Librarians in Niger State, Nigeria - Adebayo, Remilekun Damilola & Buhari Yakubu **208**

Contributions of School Librarians and Library Services to Students' Academic Achievements in Primary and Secondary Schools in Kano State, Nigeria - Ashiru Muhammad (CLN) & Haruna Audu Mamman (CLN) **215**

Curriculum Gaps: Library and Information Science Programs vs Industry Needs in Nigerian Universities - Aborisade Mariam Oyinda (PhD), Dr. Atsenokhai Omoh (Hons) CLN, FCIPG & Nwambu Rita Chinenye CLN **225**

Catch Them Young Through Information Resources in Selected Secondary Schools in Kuje Area Council, Abuja - Afolabi, A. N., Ailakhu, U. V., Salihu T. Salihu & Obasi, Ijeoma Jessica **230**

Data Curation Training: Preparing Librarians for Research Data Management in Nigerian Universities - ABAH, Anthonia Titi (PhD, CLN, MNLA), DANGWARAN, Tabawa Yusuf CLN. & ADEJO, Alhaji Augustine (PhD, CLN) **236**

Digital Competencies: Preparing LIS Graduates for AI-Driven Library Services - ONAH, Ebere Edith (PhD, CLN) & OBI, Anulika (CLN) **243**

Digital Literacy Bootcamps: Reskilling Academic Librarians for AI-Integrated Research Support Services - MADU, Ijeoma I. (CLN), OKONU, Kate Nnenne (CLN) & EGUONO, Tadaferua, (CLN) **250**

DIGITAL LITERACY SKILLS OF LIBRARIANS AS DETERMINANT OF AI ADOPTION IN RAMAT LIBRARY, UNIVERSITY OF MAIDUGURI – Anthonia Peace, Joel, Ibrahim Vandi & Jonah Emmanuel **256**

Effects of Climate Change on Library Resources Management in University Libraries in Rivers State, Nigeria - Mercy Ekenma Echem (PhD, CLN), Ngozi Perpetua Osuchukwu (PhD, CLN) & Boma Praise Abraham **265**

EQUIPPING LIBRARIANS AND INFORMATION PROFESSIONALS FOR INNOVATIVE LIBRARY SERVICES IN FEDERAL UNIVERSITY OF TECHNOLOGY OWERRI LIBRARY IN THE 21st CENTURY - Vivian Chinazo Ukawuba (CLN) & Chuka Christian Uzokwe (CLN) **274**

Evaluating the State of Libraries in Ministries, Departments and Agencies of Government - Nura Mohammed Musa Abubakar Usman **282**

EXPLORING THE PLACE OF LIBRARIES AND LIBRARIANS IN PRIMARY AND SECONDARY EDUCATION - Itokighi, Bridget Okon **287**

Abstract

Climate change causes floods, droughts, and heat waves leading to food and water insecurity, displacement, economic losses, infrastructure damage, and health risks, particularly in South-South Nigeria. Climate awareness and engagement within the academic communities seems low, despite the vulnerability of the region, underscoring the need for reliable information resources, advocacy, digital platforms, and community engagement led by academic libraries. This paper investigates the role of academic libraries in promoting climate resilience and security for sustainable development in South-South, Nigeria. Four (4) specific objectives and four (4) research questions were formulated to guide this study. A descriptive survey design was adopted for the study. The population of the study consists of 185 academic librarians from twelve public universities across the six (6) states in the study area, comprising six (6) federal and six (6) state-owned universities. A Census sampling Technique was adopted. Data were collected using structured digital questionnaires of 20 items. Data were analysed using descriptive statistics of mean and Standard deviation. A benchmark score of 2.50 was used for decision making. The study found that access to climate-related information in academic libraries improved climate literacy among users. Librarians reported that advocacy and digital platforms increased awareness of climate risks, while community-focused services supported local adaptation and resilience. The findings indicate that academic libraries play a key role in addressing climate information gaps and promoting sustainable development. The study recommends adequate funding, greater institutional support, enhanced digital infrastructure, and increased community engagement to strengthen their contribution to climate resilience and security in South-South Nigeria.

Keywords: Academic Libraries; Climate Literacy; Climate Security; Sustainable Development; South-South Nigeria.

Introduction

Climate change poses serious risks to environmental stability, human security, and sustainable development worldwide. Its consequences are no longer distant or abstract. Climate resilience refers to the capacity of systems and institutions to anticipate, adapt to, and recover from climate-related disruptions. Climate security on the other hand is concerned with the protection of livelihoods and social stability from climate-induced threats. Climate literacy is the key to both, it helps to understand the knowledge, skills, and critical awareness required to make informed decisions about climate action (Saini, 2025). Universities are expected to cultivate this literacy. Academic libraries, as knowledge hubs within these universities, are strategically positioned to support that mandate. Academic libraries have moved beyond traditional collection management to become active contributors to sustainability discourse. Studies has identified academic libraries as important actors in climate action, sustainability advocacy, and climate literacy development. Academic libraries now support environmental awareness through climate information services, green library practices, digital engagement, and sustainability education initiatives (Appleton & Woolley, 2023; Ajani *et al.,* 2024). Studies have also shown that libraries contribute to climate communication and sustainable development by improving access to credible environmental information and supporting informed public participation in climate issues. Through credible information resources, digital platforms, research support, and advocacy initiatives, they strengthen institutional responses to climate challenges (Mensah & Eshun, 2022). Libraries provide access to climate research, policy documents, and data, while also promoting awareness through seminars, repositories, and online engagement tools. These functions enhance informed participation and build adaptive capacity within academic communities.

Conceptually, climate resilience refers to the ability for institutions and communities to adapt to climate-related disruptions, while climate security focuses on reducing threats to livelihoods and social stability caused by environmental change. Academic libraries contribute to both through climate literacy programmes, environmental information services, advocacy, and community engagement activities that strengthen awareness and adaptive capacity (Hamada *et al.*, 2024).

In South-South Nigeria, this role is especially urgent as the region faces recurrent flooding, coastal erosion, and environmental degradation associated with industrial activities. These realities threaten livelihoods, infrastructure, and educational continuity. Academic libraries in this context can strengthen climate literacy and promote climate security through improved information availability, advocacy, digital engagement, and community-focused services. Yet evidence indicates that climate-focused services remain insufficiently institutionalized in many developing settings, often constrained by infrastructure gaps, funding limitations, and weak strategic integration (Khan & Ayoade, 2024). Existing literature has focused largely on green library practices and sustainability awareness, with limited empirical attention to how academic libraries specifically promote climate resilience and climate security within vulnerable communities, particularly in developing regions (Adeyemi *et al*., 2024; Ayoung *et al*., 2025). Despite growing recognition of libraries within sustainability and climate action discussions, limited studies have examined how academic libraries in South-South Nigeria integrate information availability, advocacy, digital platforms, and community engagement to improve climate literacy and strengthen climate resilience and security. Empirical evidence on these relationships within environmentally vulnerable academic communities remains limited, thereby creating the need for this study. In particular, the combined influence of information availability, advocacy, digital platforms, and community engagement on climate literacy remains under-explored. This gap demands systematic investigation. Accordingly, this study examines academic libraries as catalysts for climate resilience and security for sustainable development in South-South Nigeria.

Statement of the Problem: South-South Nigeria continues to experience significant climate-related vulnerabilities that undermine sustainable development. Universities generate climate research, yet mechanisms for translating this knowledge into literacy and community resilience remain weak. Academic libraries provide access to diverse information resources, though the extent to which these resources advance climate literacy and security in the region is unclear. Advocacy initiatives, digital platforms, and community engagement programmes that could strengthen adaptive capacity are not consistently integrated into library services. Limited funding, technological constraints, and competing institutional priorities further restrict effectiveness. Recent studies and policy discussions continue to emphasize the growing role of libraries in climate communication and sustainability advocacy, yet evidence from developing regions shows that climate-related library services remain weakly institutionalized and under-researched (IFLA, 2024; Connaway *et al*., 2023). This lack of empirical evidence limits policy direction and institutional *commitment* toward integrating climate resilience initiatives into academic library services. Without empirical evidence on these dynamics, academic libraries' potential to promote climate resilience and security may not be fully utilized. This gap underscores the significance of the study; hence, it focuses on the following objectives.

Objectives of the Study: The purpose of this study is to examine academic libraries as catalysts for climate resilience and security for sustainable development in South-South Nigeria. Specifically, the study seeks to:

1. Determine the influence of information availability on climate literacy in academic libraries for sustainable development in South-South Nigeria.
2. Assess the effect of academic library advocacy and digital platforms on improving climate literacy for sustainable development in South-South Nigeria.
3. Investigate the contribution of community engagement to climate security through academic library services for sustainable development in South-South Nigeria.
4. Highlight the major challenges faced by academic libraries in advancing climate resilience and security in South-South Nigeria.

Research Questions

1. Does information availability on climate literacy influence academic libraries for sustainable development in South-South, Nigeria?
2. What is the effect of academic library advocacy and digital platforms on improving climate literacy for sustainable development in South-South, Nigeria?
3. How does community engagement contribute to climate security through academic library services for sustainable development in South-South, Nigeria?
4. What are the major challenges faced by academic libraries in advancing climate resilience and security in South-South Nigeria?

1.0 Literature

Theoretical Framework: This study adopted two theories; the Knowledge-to-Action (KTA) Framework by Graham *et al*. (2006) and the Diffusion of Innovations (DOI) Theory by Rogers (2003). Both the KTA Framework and DOI Theory

explain how academic libraries contribute to the translation and adoption of climate information in ways that promote climate literacy, resilience, and sustainable development in South-South Nigeria. The KTA Framework provides the basis for understanding the role of information in improving climate literacy for sustainable development. It shows how knowledge is generated, organised, and translated into practical use through services of academic libraries. Diffusion of Innovations theory on the other hand supports the KTA framework as it explains how climate information circulated through library advocacy and digital platforms is communicated and adopted by library users over time. The theory accounts for the influence of communication channels and social systems on users' acceptance to climate knowledge.

The Concept of Climate Literacy: Climate literacy refers to an understanding of climate, climate change, and the ability to use climate information to support sustainable development decisions. It involves knowledge about the climate system and its change processes, as well as the ability for individuals to critically select and use climate data to inform decision-making for sustainable responses to changes in climate (Leve *et al*., 2023). Climate literacy refers to the understanding of climate systems and the ability to apply climate knowledge in making informed and sustainable decision for society and the environment (OECD, 2025). It enables one to interpret climate information and use the knowledge for sustainability. The levels of civic climate knowledge are associated with more-informed and active responses to climate change, such as increased concern over issues related to climate change and support for policies in response, which underpins both how sustainable development progress is achieved (Pan *et al*., 2023). Academic libraries play an important role in promoting climate literacy by providing access to climate information and supporting learning through advocacy and digital platforms. The availability of information in academic libraries helps users to access current and credible climate-related resources. By offering access to information on climate change and educational materials, academic libraries help promote users' understanding of environmental challenges and the various dimensions of sustainability (Appleton & Meschede, 2023). Also, library advocacy initiatives facilitate climate literacy by promoting access and use of climate-related information. Databases, institutional repositories, and social media enable libraries to share climate knowledge beyond physical spaces.

Information Availability and Climate Literacy in Academic Libraries: The commitment with which climate-related information is recognized in academic institutions improves climate literacy. Empirical evidence demonstrates that academic libraries, whose resources on climate information are timely, credible, and diverse, significantly improve users' comprehension of climate-related risks and practices for sustainable development. Libraries' proactive provision of climate change and sustainability resources positively impacts users' climate-related challenges' awareness and comprehension (Appleton & Meschede, 2023). Likewise, access to information and availability of resources on the environment and sustainability in academic libraries, improves students' comprehension of the sustainability construct and drives climate adaptation (Ma & Shahzad, 2025).
The findings are consistent with Hamad *et al.* (2024), who stated that the provision of climate information and associated library services fosters sustainable development by helping people understand climate risks and strengthening community resilience. Taken together, these studies highlight that the availability of information is not simply about having it; it is also about the purposeful structuring and circulation of climate information. The majority of the available literature, however, has concentrated on general educational environments and has very little empirical evidence on the extent to which information availability affects climate literacy within academic libraries in South-South Nigeria. This discrepancy illustrates the need for contextual studies.

Advocating for Academic Libraries, Using Digital Tools, The Role of Libraries in Climate Education: Horsfall (2023) emphasizes that librarians must change and adapt their roles to remain effective change agents by ensuring that digital information services stay relevant and sustainable in a rapid technological society. Advocating for academic libraries has proved useful in the improvement of climate literacy, apart from the availability of information. According to Ajani, *et al.* (2024), academic libraries, for most of the time, undertake advocacy through partnerships and advocacy community seminars and workshops. The above-mentioned activities raise climate change and sustainability awareness among users. This transforming role means that libraries should not be regarded solely as information providers. The use of digital tools also supports this advocacy in relation to the libraries, as they make climate-related information available from outside the physical location of the libraries.
Hajj-Hassan *et al*. (2024) state that digital tools and online academic resources help students to engage in and understand climate and sustainability-related information. In support of this, Appleton and Woolley (2023) affirm that social media and other digital tools help users engage in discussions about climate change and also advocate for the use of tools to spread climate-related information (Saini, 2025). While these studies underscore the effectiveness of advocacy and digital platforms in promoting climate literacy, they largely reflect experiences from developed or generalized higher education contexts. There remains insufficient empirical evidence on how academic library advocacy and digital platforms influence climate literacy within academic libraries in South-South Nigeria, thereby justifying the focus of the present study. Although previous studies have established the importance of climate information, advocacy, and digital platforms in promoting climate literacy, most studies focus largely on general educational settings and developed countries. Few studies critically examine how academic libraries in developing regions, particularly South-South

Nigeria, integrate these strategies within local socio-economic and environmental realities. In addition, existing literature rarely connects climate literacy initiatives with resilience-building frameworks and SDG-driven sustainability practices in academic libraries. This gap highlights the need for more context-specific empirical studies.

Community Engagement and Climate Security through Academic Libraries

According to Carnegie Foundation for the Advancement of Teaching (2015), community engagement involves collaboration between higher education institutions and their larger communities for the mutually beneficial exchange of knowledge and resources in a context of partnership and reciprocity. Community engagement is crucial for climate security in south-south Nigeria, and academic libraries play a significant role in this effort. By partnering with local communities, libraries can promote sustainable development, enhance maintenance and enhance climate resilience (Okoye *et al.* 2024). Climate security refers to the link between climate change impacts and human or community stability including threat to food, water, livelihood security, social cohesion, and overall resilience.

In Nigeria (including the south-south geopolitical zone), climate change effects such as sea-level rise, coastal erosion, flooding, and changing rainfall patterns are documented challenges that affect livelihoods and development pathways, making climate security a pressing concern. Academic libraries can play a role in addressing this by building capacity and resilience through information, education and community partnership (UNDP, 2023). Academic libraries are centres of information access and community connectivity, and they can catalyse climate action in multiple ways:

1. **Climate Literacy and Awareness**: Academic libraries offer information resources, workshops, and awareness campaigns on climate change, enabling community members, students, and researchers to better understand climate risks and mitigation/adaptation strategies. This contributes to climate security by empowering communities to make informed decisions (Usang, *et al*., 2024).
2. **Sustainable Development Advocacy**: Academic libraries support knowledge dissemination linked to the United Nations Sustainable Development Goals (SDGs) especially SDG 13 (Climate Action), but also SDG 4 (Quality Education) and SDG 11 (Sustainable Communities) (Israel, 2024; David-West and Wali, 2024).

Major challenges faced by academic libraries in advancing climate resilience and security.

Despite these opportunities, several challenges limit the full potentials of community engagement via academic libraries in South-South Nigeria and they include the following:

1. **Inadequate Climate Change and Disaster Preparedness Policies:** Nigerian academic libraries lack climate security in strategic plans. There are no tailored policies for climate change preparedness, limiting resource allocation and sustained action. This gap affects disaster risk management for floods, heat and humidity, threatening collections and services. Without formal policies, libraries struggle to provide climate data, education, and resilient services for local adaptation.
2. **Funding Constraints and Financial Limitation:** Funding shortages challenges Nigerian academic libraries, especially in the South-South zone. Limited budgets restrict resilient infrastructure, climate programs, and IT investments. Libraries struggle to acquire digital resources and climate data and this limits research, climate education, and community engagement.
3. **Limited Technology Infrastructure and Digital Capacity:** libraries need robust digital services to advance climate security, climate education, data sharing, and remote access to research. However, Nigerian libraries face inadequate ICT infrastructure, unstable internet, and equipment deficits. These challenges hinder adoption of emerging technologies and digital services.
4. **Lack of Professional Expertise and Capacity Building:** Climate security needs librarians trained in climate information and sustainability. Staff training on climate change impacts and eco-friendly operations is inadequate, hence limited climate literacy weakens research support and resources curation. It also reduces engagement with climate action stakeholders.
5. **Limited Research Focus on Climate Security Roles of Libraries:** Nigerian library studies rarely address climate security. South-South Nigeria lacks region-specific strategies for climate risks and very few studies explore libraries' roles in climate action. Without local research, policymakers lack guidance for climate-responsive services.
6.

3.0 Methodology

A descriptive survey design was adopted for this study which was conducted in South-South Nigeria. Two (2) states and two (2) federal universities were selected from each of the six (6) state in the region making it a total of twelve (12) academic libraries. Hence the population of the study comprised 185 professional librarians drawn from the 12 academic libraries in the region as shown below in the table:

TABLE 1: Population of the study

SN	University	State	Type	Population
1	University of Uyo (UNIUYO),	Akwa Ibom	Federal	24

2	Akwa Ibom State University (AKSU)	Akwa Ibom	State	9
3	Federal University, Otuoke (FUO)	Bayelsa	Federal	11
4	Niger Delta University (NDU)	Bayelsa	State	13
5	University of Calabar (UNICAL)	Cross River	Federal	13
6	University of Cross River State	Cross River	State	9
7	Federal University of Petroleum Resources (FUPRE)	Delta State	Federal	13
8	Delta State University, Abraka (DELSU),	Delta State	State	9
9	University of Benin (UNIBEN)	Edo state	Federal	41
10	Ambrose Ali University, Ekpoma (AAU)	Edo State	State	13
11	University of Port Harcourt (UNIPORT)	Rivers State	Federal	18
12	Rivers State University (RSU).	Rivers State	State	12
TOTAL POPULATION				**185**

Census sampling was adopted to collect responses from all the population of the study, this sampling was appropriate for this study since the total population is well defined and controllable. A digital questionnaire was designed for data collection. A total of 159 questionnaires were Completed and valid. Data collected were analysed using mean and standard deviation. Mean scores from 2.50 and above for any item were accepted, while scores below 2.50 were rejected. The questionnaire items were developed from the objectives of the study. The instrument was examined by experts in Library and Information Science and research methodology, and their corrections were effected before administration to ensure validity. A pilot test was also carried out to confirm the reliability of the instrument. Ethical considerations were properly observed. Only descriptive statistics were used in this study as it was considered suitable because the study focused on describing respondents' views rather than testing hypotheses.

4.0 Data analysis and Discussion of Findings:

TABLE 2: Does information availability on climate literacy influence academic libraries for sustainable development in south-south Nigeria?

S/N	Items	SA	A	D	SD	$\overline{X}$	σ	Decision
1	My library provides adequate books, journals, and reports on climate change for academic use.	55	78	8	18	3.1	1.75	Agree
2	My Library Patrons can easily access up-to-date digital resources on climate and environmental security in our library.	48	67	16	28	2.8	1.69	Agree
3	How the climate-related resources in our library are shelved makes it easy to locate and use.	63	54	10	32	1.9	1.17	Disagree
4	Availability and use of climate-related information in the library helps patrons' understanding of climate issues.	58	57	17	27	2.9	1.71	Agree
5	My library regularly updates its climate-related collections to support research and teaching.	18	61	41	39	2.4	1.54	Disagree

Table 2 shows that the availability of climate-related information resources in academic libraries improves climate literacy for sustainable development in South-South Nigeria. Respondents agreed that libraries provide books, journals, and digital resources that enhance understanding of climate issues. However, the low rating on regular updating of collections suggests that many libraries still operate with outdated environmental resources due to funding and institutional limitations. This finding supports the Knowledge-to-Action (KTA) framework, which stresses that relevant and current knowledge is necessary for informed action. The result agrees with Appleton and Meschede (2023); Ma and Shahzad (2025), although the present study further shows that resource availability alone is insufficient without continuous updating and institutional support.

TABLE 3: What is the effect of academic library advocacy and digital platforms on improving climate literacy for sustainable development in South-south Nigeria academic libraries?

S/N	Items on Services rendered.	SA	A	D	SD	$\overline{X}$	σ	Decision

1	My library conducts awareness programs or workshops on climate change for staff and students.	45	55	14	45	2.6	1.62	Agree
2	My library website or social media are used to disseminate climate information.	42	58	21	38	2.7	1.63	Agree
3	Library advocacy initiatives have increased patrons' engagement with climate change issues.	51	49	19	40	2.7	1.64	Agree
4	The use of e-resources, online guides, and databases improves patrons' climate knowledge.	56	56	21	26	2.9	1.7	Agree
5	Our library collaborates with other institutions to promote climate literacy through digital channels.	49	54	19	37	2.7	1.65	Agree

Table 3 indicate that advocacy initiatives and digital platforms strengthen climate literacy among library users. E-resources, online databases, websites, and social media platforms were positively rated because they expand access to climate information beyond the physical library space. This supports the Diffusion of Innovation (DOI) framework, which explains how digital channels encourage the spread and adoption of knowledge. The finding aligns with Ajani, Tella and Enakrire (2024) and Hajj-Hassan, Chaker and Cederqvist (2024), but the present study highlights that digital advocacy is becoming increasingly important in Nigerian academic libraries where physical access to information may be limited. The implication is that libraries and policymakers should prioritize digital sustainability education and ICT investment.

TABLE 4: How does community engagement contribute to climate security through academic library services for sustainable development in south-south Nigeria?

S/N	Items	SA	A	D	SD	$\overline{X}$	σ	Decision
1	My library organizes outreach programs to educate academic communities on climate change.	58	53	12	36	2.8	1.68	Agree
2	Climate-related information resources from my library are shared with schools, NGOs, and community groups.	47	14	50	48	2.4	1.54	Disagree
3	Community-focused library activities have improved awareness of climate risks among the public.	54	57	18	30	2.8	1.69	Agree
4	Library staff participate in initiatives that strengthen local climate adaptation and resilience.	39	16	56	48	2.3	1.51	Disagree
5	Academic library services play a role in supporting community-level responses to climate-related challenges.	56	58	13	32	2.9	1.69	Agree

Table 4 reveal that community engagement contributes to climate security through academic library services. Outreach programmes and awareness activities improved public understanding of climate issues, showing that libraries can support community resilience. However, weak collaboration with schools, NGOs, and environmental groups limits the broader impact of these efforts. This suggests that climate literacy initiatives in many academic libraries remain institution-based rather than community-driven. The finding agrees with Okoye, Peter and David (2024), who noted that partnerships improve environmental awareness and local adaptation efforts. Greater collaboration with external stakeholders is therefore necessary for sustainable climate action in Nigeria.

TABLE 5: What are the major challenges faced by academic libraries in advancing climate resilience and security in South-South Nigeria?

S/N	Items	SA	A	D	SD	$\overline{X}$	σ	Decision
1	Inadequate funding limits my library's ability to acquire climate-related information resources and support climate resilience initiatives.	65	50	22	22	3	1.73	Agree

2	Lack of regular training and capacity-building opportunities for librarians affects effective delivery of climate change and sustainability information services.	64	54	27	14	3.1	1.75	Agree
3	Poor ICT infrastructure in my institution constrains access to digital climate-related information resources and platforms.	52	53	17	37	2.8	1.66	Agree
4	Insufficient institutional and policy support reduces my library's effectiveness as a hub for climate resilience, security, and sustainable development initiatives.	56	57	17	29	2.9	1.7	Agree
5	Weak partnerships with government agencies, NGOs, research institutions, and local communities limit the library's contribution to climate security and sustainable development.	60	60	18	21	3	1.73	Agree

Table 5 show that lack of librarian training, inadequate funding, weak partnerships, and poor ICT infrastructure hinder academic libraries from promoting climate resilience. These barriers reduce the effectiveness of climate information services and slow the adoption of innovative practices. From the KTA and DOI perspectives, institutional and technological support are essential for translating climate knowledge into practice and encouraging wider adoption of sustainability initiatives. The finding supports Khan and Ayoade (2024) and further demonstrates that climate literacy programmes in Nigerian academic libraries require stronger policy commitment, professional training, and infrastructural development to remain effective.

4.0 Conclusion

Academic libraries contribute significantly to climate literacy and resilience through the provision of climate information resources, awareness programmes, and community engagement initiatives. This study establishes the strategic relevance of academic libraries in advancing climate awareness and sustainable development in South-South Nigeria, thereby contributing to Library and Information Science scholarship on climate-focused information services. Despite this potential, inadequate funding, weak ICT infrastructure, and limited professional training constrain effective service delivery. Future research and policy should therefore prioritize innovative climate information services, stronger institutional support, and collaborative frameworks that will enhance the capacity of academic libraries to support long-term climate resilience and sustainable development.

6.0 Recommendations

The following are observed about academic libraries as catalysts for climate resilience and security for sustainable development in South-South Nigeria.

1. University management and relevant government agencies should provide adequate funding for academic libraries to strengthen the availability and currency of climate-related resources. Expanding collections across print and digital formats will support better access to reliable information and, in turn, enhance climate literacy among users.
2. Library management should increase advocacy efforts through seminars, workshops, and targeted awareness programmes. At the same time, greater use of library websites, institutional repositories, and social media should be encouraged to widen the reach of climate information and sustain engagement within academic communities.
3. Academic libraries should deepen their involvement in community-based activities by organizing outreach programmes and forming active partnerships with government agencies, Non-Governmental Organizations (NGOs), and community groups. Such collaboration will improve public awareness of climate risks and support broader climate resilience efforts.
4. Efforts should be made to tackle key constraints like inadequate funding, limited professional training, weak ICT infrastructure, and low institutional support. Investing in staff capacity development, improving technological facilities, and building stronger institutional and external partnerships will position academic libraries to contribute more effectively to climate resilience and security.

Academic Library Advocacy and Marketing Practices for Sustainable Development Goals in Nigeria: A Study of Federal Universities

By
Muhammad Salihu Zubair, Ph. D
University Library
Bayero University, Kano
mszubair.lib@buk.edu.ng
+2348036557705

Abstract
Academic libraries play a vital role in promoting sustainable development goals by supporting teaching, learning, research, and community engagement. This study examined the role of academic library advocacy and marketing practices in promoting the achievement of Sustainable Development Goals (SDGs) in federal universities in Nigeria. A descriptive survey research design was adopted. The population comprised 77 federal universities across Nigeria's six geopolitical zones, from which 18 universities were selected. The study involved 1,850 librarians in the sampled universities, with 270 librarians selected using disproportionate stratified random sampling. Data were collected through a structured questionnaire and analyzed using frequencies and percentages. The findings revealed that academic libraries in Nigerian federal universities engage in advocacy and marketing practices through collaborative, interactive, and technology-based strategies. Social media campaigns, departmental collaborations, outreach programmes, and library events were identified as the most effective approaches. These practices contribute to the promotion of SDGs, particularly SDG 4 (Quality Education), SDG 5 (Gender Equality), SDG 9 (Industry, Innovation and Infrastructure), SDG 10 (Reduced Inequalities), and SDG 16 (Peace, Justice and Strong Institutions). However, inadequate funding, poor infrastructure, limited awareness, and weak collaboration were identified as major challenges hindering effective advocacy and marketing efforts. The study concludes that strengthening advocacy and marketing practices through policy support, capacity building, managerial commitment, and effective use of digital platforms is essential for improving the visibility, relevance, and sustainability of academic libraries in Nigeria.
Keywords: *Academic libraries, library advocacy, library marketing, Sustainable Development Goals, federal universities, Nigeria*

Introduction

Academic libraries have evolved from traditional repositories of knowledge to strategic partners in teaching, research, innovation, and community engagement. Driven by technological advancements and changing user needs, they increasingly support digital services, information literacy, research activities, open access initiatives, and sustainable development goals (Bangani & Dube, 2024). Their contribution extends beyond providing information resources to promoting knowledge access, capacity building, and sustainable development.

In Nigeria, academic libraries play a vital role in higher education by providing access to information resources and services that support teaching, learning, and research. However, their effectiveness depends not only on resource availability but also on their visibility and recognition within the university system. Consequently, advocacy and marketing have become essential for demonstrating library value, increasing awareness of services, strengthening institutional support, and demonstrating library contributions to university goals (Okuonghae & Igbinovia, 2019).

Despite ongoing efforts to improve service delivery through digitization, online platforms, and user-centered services, federal university libraries continue to face challenges such as inadequate funding, limited infrastructure, and insufficient staffing (Odunlade & Ojo, 2023). Strategic advocacy and marketing can help address these challenges by enhancing library visibility, promoting resource utilization, and strengthening stakeholder engagement. These activities also support SDGs by improving access to knowledge, promoting quality education, encouraging innovation, and strengthening inclusive development (Adekoya et al., 2023).

Although advocacy, marketing, and sustainable development have gained attention in academic librarianship, limited empirical evidence exists on how these elements intersect in Nigerian federal universities. This study therefore examines academic library advocacy and marketing practices for sustainable development goals in federal universities in Nigeria, focusing on existing strategies, their effectiveness, challenges, and opportunities for strengthening the role of academic libraries in sustainable development.

Statement of the Problem

Academic libraries in Nigerian federal universities support teaching, learning, research, and national development through information services. However, they face challenges such as low resource utilization, limited visibility, inadequate recognition, weak collaboration, poor networking, and insufficient staff development, partly due to ineffective advocacy and marketing practices (Okuonghae & Igbinovia, 2019; Obi, 2023). With the adoption of the Sustainable Development Goals (SDGs), academic libraries are expected to promote quality education, innovation, access to information, and lifelong learning. Despite this role, limited empirical evidence exists on how advocacy and

marketing practices are used by federal university libraries in Nigeria to advance the SDGs, creating the need for this study.

Research Objectives

The main objective of this study is to examine the role of academic library advocacy and marketing practices in promoting the achievement of Sustainable Development Goals (SDGs) in federal universities in Nigeria.

The specific objectives are to:

1. Identify the advocacy strategies used by academic libraries in federal universities in Nigeria to promote Sustainable Development Goals
2. Assess the marketing practices used by academic libraries in federal universities in supporting Sustainable Development Goals.
3. Examine the role of academic libraries in federal universities in supporting sustainable development goals in Nigeria.
4. Determine the challenges encountered by academic libraries in implementing advocacy and marketing practices to support Sustainable Development Goals.
5. Propose strategies for improving advocacy and marketing practices in academic libraries in federal universities in Nigeria.

Review of Related Literature

Conceptual Overview of Advocacy and Marketing Practices in Academic Libraries

Advocacy and marketing are strategic functions that enhance the visibility, relevance, and sustainability of academic libraries in higher education. Advocacy involves deliberate efforts to influence policies, secure funding, demonstrate library value, and engage stakeholders in support of institutional goals (Mariano, 2023). Marketing focuses on identifying user needs and promoting library services through channels such as websites, email, and social media, with digital transformation enabling more targeted and personalized approaches (Hauminlun & Singh, 2024; Odunlade & Ojo, 2023).

Both practices are interconnected, as marketing provides evidence of library impact through usage data and engagement, while advocacy helps secure resources and institutional support. They promote knowledge access, educational equity, sustainable development, and improved service delivery. Despite challenges such as limited funding and expertise, integrating advocacy, marketing, digital tools, and stakeholder engagement strengthens academic libraries' institutional relevance (Acharya & Vagdal, 2023).

Advocacy Strategies Used by Academic Libraries

Empirical studies from both developed and developing countries reveal that academic libraries employ a variety of advocacy strategies to enhance visibility, demonstrate institutional value, and secure stakeholder support. For instance, Thorpe & Gunton (2022) observed that academic libraries across several developed countries, including the USA, the UK, Ireland, and the Netherlands, increasingly adopt strategic collaboration, stakeholder engagement, and institutional alignment initiatives to strengthen their relevance within higher education institutions. Nguyen (2023) found that academic libraries in Australia actively use Twitter, Facebook, blogs, and other digital communication platforms to engage users, promote services, and communicate library achievements.

Similarly, Rabatseta et al. (2021), in a study conducted in South Africa, found that Facebook, Twitter, YouTube, and blogs were the most widely used social media platforms for library promotion and advocacy, while emerging platforms included Instagram, Skype, WhatsApp, Dropbox, and RSS. These digital advocacy strategies were found to improve user interaction and enhance the visibility of academic library services.

Marketing Practices in Academic Libraries

Marketing practices in academic libraries refer to the systematic activities used by librarians to promote their resources, services, and value to users. These practices aim to increase awareness, improve service utilization, and demonstrate the library's contribution to teaching, learning, research, and institutional goals. According to Tomar (2024) marketing practices in academic libraries include user orientation programmes, publicity and promotion of library services, social media engagement, library websites, exhibitions, newsletters, user education, feedback mechanisms, and collaboration with academic departments.

Ihejirika et al. (2021) found that Nigerian academic libraries use social media platforms as marketing tools to promote library services and engage users. However, the study revealed that many libraries lack clear marketing objectives, strategic planning, and structured approaches for managing social media engagement.

In Kenya, studies have shown that digital marketing approaches, particularly the use of institutional websites and electronic communication platforms, improved awareness and accessibility of library services in university libraries (Mutula & Wamukoya, 2019). Likewise, Rabatseta et al. (2021) reported that academic libraries in South Africa that adopted social media and integrated online communication strategies experienced improved user engagement and increased awareness of electronic resources.

Role of Academic Libraries in Supporting Sustainable Development Goals

Academic libraries play a significant role in supporting sustainable development goals by facilitating **equitable access to information, promoting lifelong learning, and supporting research and innovation.** Academic libraries contribute to the achievement of the Sustainable Development Goals (SDGs), particularly in areas such as **quality education, reduced inequalities, and innovation** (International Federation of Library Associations and Institutions (International Federation of Library Associations, 2021).

Evidence from developed countries further reinforces the role of academic libraries in sustainable development goals. In the United States and other developed nations, Connaway et al. (2023) reported that libraries support sustainability through digital inclusion initiatives, open access services, community engagement, and partnerships that promote equitable access to information. Similarly, studies in the United Kingdom and Canada have shown that academic libraries contribute to sustainable development goals through green library practices, research data management services, and collaborative learning environments that foster innovation and lifelong learning.

Empirical evidence from Africa demonstrates the growing contribution of academic libraries to sustainable development initiatives. A recent study by Odede & Unachukwu (2025) found that academic libraries in Nigeria support sustainable development goals through **digital literacy programmes, open access initiatives, and research support services.** However, the extent of this contribution is often limited by systemic challenges such as **inadequate funding, outdated infrastructure, and low awareness of the SDGs among library staff and users** (Mashroofa, 2022).

In Ghana, Odoom et al. (2024) found that academic libraries support the attainment of Sustainable Development Goal 4 through information literacy instruction, provision of electronic resources, and support for teaching and learning activities. Furthermore, Bangani and Dube (2024), in South Africa, observed that academic libraries contribute to the realization of several SDGs through research support services, sustainability awareness programmes, and equitable access to information resources.

Challenges in Implementing Advocacy and Marketing Practices for Sustainable Development Goals

Empirical studies have identified several challenges affecting the implementation of advocacy and marketing practices in academic libraries, particularly in developing countries such as Nigeria. One of the major challenges is inadequate funding, which limits the ability of libraries to organize promotional activities, acquire modern technologies, and sustain effective user engagement programmes. Studies have shown that insufficient financial support negatively affects library visibility and service delivery (Adeogun, 2022; Obi, 2023).

Another significant challenge is poor information and communication technology (ICT) infrastructure, including unstable internet connectivity and inadequate digital facilities, which hinder the effective use of online marketing platforms and electronic library services (Obi, 2023).

Human resource challenges also affect advocacy and marketing implementation. Many librarians possess limited skills in marketing, public relations, and digital communication, thereby reducing their ability to effectively promote library resources and services. Obi (2023) observed that inadequate training and low technological competencies among librarians constrain innovative service promotion and outreach efforts. These challenges collectively reduce awareness, patronage, and the overall impact of academic libraries within their institutions and communities.

Methodology

Research Design

This study adopted a descriptive survey research design. This design is considered appropriate because it enables the collection of data from a defined population to describe existing conditions, opinions, and practices relating to advocacy and marketing strategies. The practices enhance the role of academic libraries in achieving sustainable development goals in Nigerian federal universities.

Table 1: Population and Sample of the Study

S/N	**Geopolitical Zone**	**University (Population)**	**University (Sample Size)**	**Librarians (Population)**	**Librarians (Sample Size)**
1	North Central	13	3	266	45
2	North East	9	3	204	45
3	North West	19	3	641	45
4	South East	7	3	414	45
5	South-South	15	3	182	45
6	South West	14	3	143	45
	Total	**77**	**18**	**1,850**	**270**

Sources: Preliminary Survey, 2026

The study population consisted of 77 federal universities in Nigeria, with 18 universities selected as the sample. From a total of 1,850 librarians in the sampled universities, 270 librarians were selected using disproportionate stratified random

sampling. The universities were stratified into six geopolitical zones, with three universities randomly chosen from each zone, and 15 librarians selected from each sampled university to ensure representation across all zones. The disproportionate approach ensured adequate representation of all geopolitical zones despite variations in the number of universities and librarians across the strata. According to Creswell and Creswell (2018), stratified sampling is suitable when a population contains distinct subgroups requiring representation.

Instrument for Data Collection

The instrument for data collection was developed using Google Form and it was titled "Advocacy and Marketing Practices for Sustainable Development Goals in Academic Libraries Questionnaire (AMPSDGALQ)". The questionnaire was structured based on the objectives of the study. The instrument was subjected to face and content validation by two experts in Library and Information Science and three practicing librarians. Their observations, corrections, and suggestions were incorporated to enhance the clarity, relevance, and adequacy of the instrument. This process was guided by established procedures for assessing content validity and ensuring that research instruments adequately measure the intended constructs. The questionnaire designed in Google Form was administered electronically to research assistants in each of eighteen selected universities for sharing with respondents. Data collected were analyzed using descriptive statistics, including frequencies and percentages.

Results and Discussion

Background Information of Respondents

The response rate of 15 responses were retrieved from each of eighteen (18) universities selected, totaling two hundred and seventy (270) responses. The background data of the 270 respondents provides useful insight into the demographic and professional composition of respondents involved in the study.

Table 1: Background information of respondents

1	**Gender**	**Frequency**	**Percentage**
	Male	145	**53.7%**
	Female	125	**46.3%**
	Total	**270**	**100%**
2	Role		
	Academic Librarian	182	67.4%
	Non-Academic Librarian	76	28.2%
	System Staff	12	4.4%
	Total	**270**	**100%**
3	Experience		
	Less than 2 years	12	4.4%
	2-5 years	34	12.6%
	6-10 years	40	14.8%
	More than 10 years	184	68.2%)
	Total	**270**	**100%**

The gender distribution shows that 145 respondents (53.7%) were male, while 125 (46.3%) were female, indicating a slightly higher representation of males, although both genders were adequately represented.

Regarding respondents' roles, the majority were Academic Librarians, accounting for 182 respondents (67.4%), suggesting that the study was largely informed by professionals directly involved in library service delivery, advocacy, and marketing practices. Non-Academic Librarians constituted 76 respondents (28.2%), while System Staff recorded the lowest representation with 12 respondents (4.4%).

The distribution by years of experience reveals that most respondents were highly experienced, with 184 (68.2%) having more than 10 years of professional experience. Respondents with 6–10 years of experience accounted for 40 (14.8%), those with 2–5 years were 34 (12.6%), and only 12 (4.4%) had less than 2 years of experience.

The demographic profile indicates that the study was largely informed by experienced academic librarians, enhancing the credibility and reliability of the findings.

Advocacy Strategies Used by Academic libraries to support Sustainable Development Goals

The data presents respondents' views on the use of various advocacy strategies in academic libraries to support sustainable development goals.

Table 2**: Advocacy Strategies Used**

S/N	Item	Frequency (Yes)	%	Frequency (No)	%
1	Social media promotion	240	88.9	30	11.1
2	Library events and programs	250	92.6	20	7.4

3	Outreach to faculty and students	256	94.8	14	5.2
4	Collaborations with other departments	258	95.6	12	4.4
5	Newsletter	195	72.2	75	27.8
6	Library webpage	246	91.1	24	8.9

The findings reveal that collaborations with other departments and outreach to faculty and students were the most widely used advocacy strategies, each recording 258 responses (95.6%) and 256 responses (94.8%) respectively. This was followed by library events/programs with 250 responses (92.6%), library webpage with 246 responses (91.1%), and social media promotion with 240 responses (88.9%). These results indicate that academic libraries largely rely on collaborative, outreach-based, and digital engagement strategies to promote their services and increase visibility among users.

Newsletter publication was the least utilized strategy, with 195 responses (72.2%) indicating use and 75 respondents (27.8%) indicating less-use. This comparatively lower adoption suggests that newsletters are less preferred than faster and more interactive communication channels such as social media and institutional web platforms.

The findings show that academic libraries in Nigerian federal universities predominantly employ collaborative, interactive, and technology-driven advocacy approaches. The declining relevance of traditional tools like newsletters indicates a transition toward digital platforms that promotes sustainable library services and development.

Frequency of Advocacy Activities in Academic Libraries

The data presents the frequency with which various advocacy activities are carried out in academic libraries, categorized into daily, weekly, monthly, quarterly, and occasionally.

Table 3: Frequency of Advocacy Activities

S/N	Item	Daily	Weekly	Monthly	Quarterly	Occasionally
1	Library orientation programmes	14	7	25	31	193
2	Information literacy training	15	21	22	22	190
3	Workshops and seminars	2	6	37	28	197
4	Library exhibitions	8	8	37	17	200
5	Library week	3	11	28	20	208
6	Collaboration with faculty	17	16	87	19	131
7	Social media advocacy	169	24	25	12	40
8	Advocacy through professional association	19	19	39	13	180
9	Library new arrivals display	65	17	105	9	74

The Table shows that social media advocacy recorded the highest daily engagement with 169 responses and weekly use with 24 responses, indicating that libraries increasingly rely on digital platforms for continuous communication and outreach. Library new arrivals display also showed relatively consistent use, particularly monthly (105) and daily (65), reflecting efforts to promote newly acquired resources. Collaboration with faculty was mostly occasional (131) and monthly (87), suggesting moderate but irregular engagement. Information literacy training was mainly occasional (190), with monthly and quarterly responses each recording 22, while library orientation programmes were largely occasional (193) and quarterly (31), indicating that user education activities are often event-based.

Workshops and seminars were mostly occasional (197) and monthly (37), while library exhibitions (200) and library week (208) were predominantly occasional activities, confirming that they are largely tied to special events. Advocacy through professional associations also showed moderate participation, with occasional responses (180) and monthly responses (39).

The findings indicate that academic libraries in Nigerian federal universities rely on a mixed but largely irregular pattern of advocacy activities. While digital advocacy and resource promotion are conducted more frequently, most traditional advocacy programmes remain occasional and event-driven, although the growing use of social media reflects a shift toward more continuous and technology-driven advocacy practices.

Marketing Practices in Academic Libraries

The data presents respondents' views on the marketing practices adopted in academic libraries, highlighting both mainstream strategies and a few emerging or alternative approaches.

Table 4: **Marketing Practices**

S/N	Item	Response
1	Social media marketing	230
2	Email marketing	189
3	Print materials (posters, brochures, etc.)	225
4	Library website	233
5	Collaborations with other departments	228
	Other	
6	Physical enlightenment	1
7	Information visualization techniques	1
8	Games, light reading	1
9	Dissemination QR codes on notice boards	1

The findings show that academic libraries predominantly rely on digital and institutional marketing channels, particularly the library website (233 responses), social media marketing (230 responses), collaborations with other departments (228 responses), and print materials such as posters and brochures (225 responses). This indicates that libraries adopt a blended marketing approach that combines digital platforms with traditional promotional tools. Email marketing recorded 189 responses, making it the least utilized among the major marketing strategies, suggesting that it is less preferred compared to websites and social media platforms.

Under the "Other" category, innovative practices such as physical enlightenment, information visualization techniques, games and light reading, and dissemination of QR codes on notice boards each recorded only 1 response, indicating minimal adoption.

The findings suggest that academic libraries in Nigerian federal universities rely heavily on digital platforms and institutional collaboration as their primary marketing strategies, while innovative approaches such as QR codes and gamified engagement remain at an early stage of adoption.

Effectiveness of Marketing Practices in Academic Libraries

The data presents respondents' perceptions of the effectiveness of various marketing practices in academic libraries using a four-point scale: Very effective, Somewhat effective, Not very effective, and Not at all effective.

Table 5: Effectiveness of Marketing Practices

S/N	Item	Very effective	Somewhat effective	Not very effective	Not at all effective
1	Social media marketing	225	31	7	7
2	Email marketing	100	142	18	10
3	Print materials (posters, brochures, etc.)	210	45	10	5
4	Library website	210	40	16	4
5	Collaborations with other departments	199	51	11	9

The Table shows that social media marketing is the most highly rated strategy, with 225 respondents (very effective) and 31 (somewhat effective), totaling 256 positive responses (94.8%). The library website is also highly effective, with 210 (very effective) and 40 (somewhat effective), giving 250 positive responses (92.6%). Print materials performed strongly as well, with 210 (very effective) and 45 (somewhat effective), totaling 255 positive responses (94.4%).

Collaboration with other departments recorded 199 (very effective) and 51 (somewhat effective), totaling 250 positive responses (92.6%), though with 11 "not very effective" and 9 "not at all effective" responses. Email marketing recorded the lowest effectiveness, with 100 (very effective) and 142 (somewhat effective), but also higher negative ratings of 18 "not very effective" and 10 "not at all effective," indicating weaker overall impact (10.4% negative responses).

The findings show that academic library marketing is most effective when it combines digital platforms especially social media and websites with print materials and institutional collaboration, while email marketing appears comparatively less effective due to lower user engagement.

Sustainable Development Goals (SDGs) Supported by Academic Libraries

The data presents respondents' perceptions of the Sustainable Development Goals (SDGs) that academic libraries contribute to, with multiple responses indicating areas of impact.

Table 6: **Sustainable Development Goals (SDGs) Supported**

S/N	**Sustainable Development Goals (SDGs)**	Response
1	Quality Education (SDG 4)	255
2	Gender Equality (SDG 5)	226
3	Industry, Innovation and Infrastructure (SDG 9)	232
4	Reduced Inequalities (SDG 10)	227
5	Peace, Justice and Strong Institutions (SDG 16)	228
6	Partnerships for the goals (SDG 17)	201

The findings show that academic libraries are most strongly associated with SDG 4 (Quality Education), with 255 responses, indicating near-universal recognition of their central role in supporting teaching, learning, research, and information literacy.

Several SDGs recorded relatively similar and moderate recognition levels: Gender Equality (SDG 5) with 226 responses, Industry, Innovation and Infrastructure (SDG 9) with 232 responses, Reduced Inequalities (SDG 10) with 227 responses, and Peace, Justice and Strong Institutions (SDG 16) with 228 responses and Partnerships for the Goals (SDG 17) with 201 responses. This suggests that libraries are also perceived as contributing to broader social and institutional development through access to information, research support, and inclusive learning environments.

The strong association with SDG 4 (Quality Education) highlights the effectiveness of library advocacy in promoting teaching, learning, research support, and information literacy services. The moderate recognition of SDGs such as Gender Equality (SDG 5), Industry, Innovation and Infrastructure (SDG 9), Reduced Inequalities (SDG 10), and Peace, Justice and Strong Institutions (SDG 16) indicates that academic libraries' marketing and advocacy efforts also promote inclusive access to information, innovation, and institutional development.

Challenges Facing Library Advocacy and Marketing in Academic Libraries

The data presents respondents' views on the key challenges affecting the implementation of advocacy and marketing practices in academic libraries.

Table 7: **Challenges**

S/N	Item	Response
1	Inadequate funding	249
2	Poor technological infrastructure	227
3	Inadequacy of Digital Skilled Personnel	220
4	Limited access to information resources and databases	210
5	Low awareness and perception of library advocacy and marketing	227
6	Inadequate collaboration with stakeholders	225
	Other:	
7	Poor sponsorship to acquire more skills in marketing and advocacy	1
8	Internet access	1
9	Inadequate interest and motivation by library and university management	1

The findings show that inadequate funding, with 249 responses, is the most critical challenge affecting advocacy and marketing in academic libraries, as it limits staffing, training, technology acquisition, and promotional activities, thereby reducing service visibility and effectiveness.

Other major challenges include poor technological infrastructure (227 responses) and low awareness and perception of library advocacy and marketing (227 responses). Inadequate collaboration with stakeholders recorded 225 responses, while inadequacy of digital skilled personnel recorded 220 responses, indicating combined infrastructural, human capacity, and institutional support limitations. Limited access to information resources and databases, with 210 responses, also emerged as a significant challenge, affecting research support and user engagement.

The "Other" category recorded minimal issues such as poor sponsorship for skills development (1), internet access problems (1), and inadequate management support and motivation (1).

The findings show that structural, technological, and institutional challenges particularly inadequate funding, infrastructure, awareness, and collaboration limit effective advocacy and marketing practices in academic libraries for supporting sustainable development goals.

Strategies for Enhancing Library Advocacy and Marketing Practices to Support Sustainable Development Goals

The data presents respondents' views on strategies for improving advocacy and marketing practices in academic libraries.

Table 8: **Strategies for improvement**

S/N	Item	Response
1	Increased funding for library resources and services	256
2	Improvement of technological infrastructure	240
3	Training and capacity building for library staff in digital skills	242
4	Expansion of access to information resources and databases	228
5	Awareness campaigns on the importance of library advocacy and marketing	240
6	Strengthening collaboration with stakeholders (faculty, administration, partners)	238
	Other	
7	Increased sponsorship of staff	1
8	Show of more interest and motivation by library leadership and university management	1

The findings in Table 8 show that increased funding for library resources and services (256 responses**)** is the most supported strategy for improving library advocacy and marketing, highlighting funding as the key driver of effective service delivery and consistent with the earlier identified challenge of inadequate funding. This is followed by training and capacity building for library staff in digital skills (242 responses), indicating the importance of strengthening staff competencies in digital literacy and modern marketing tools.

Improvement of technological infrastructure (240 responses) and awareness campaigns on library advocacy and marketing (240 responses) are jointly ranked next, showing equal emphasis on ICT development and stakeholder awareness as essential for improving visibility, communication, and support for library services. Strengthening collaboration with stakeholders (238 responses) also received strong support, reflecting the importance of partnerships in integrating library services into academic activities and enhancing their relevance and usage.

In contrast, expansion of access to information resources and databases (228 responses) received comparatively lower support, suggesting that respondents prioritize funding, infrastructure, skills development, and awareness over resource expansion. The "Other" category, including increased sponsorship of staff (1 response) and improved leadership motivation and interest (1 response), was minimally represented but highlights the influence of institutional commitment on overall effectiveness.

The results indicate that improving library advocacy and marketing requires a multi-dimensional approach focused on funding, infrastructure, staff development, awareness creation, and stakeholder collaboration, reflecting a clear alignment between identified challenges and proposed solutions.

Discussion of Findings

Advocacy Strategies Used in Academic Libraries

The findings indicate that academic libraries in Nigerian federal universities increasingly rely on collaborative, interactive, and technology-based advocacy strategies, with social media campaigns, departmental collaboration, outreach programmes, and library events emerging as the most effective approaches. This aligns with Rabatseta et al. (2021), who reported that social media adoption in academic libraries enhances communication, user engagement, and the visibility of library services. Similarly, Rehman et al. (2022) emphasized that integrating social media into marketing communication improves audience reach, interaction, and institutional branding.

Marketing Practices in Academic Libraries

The findings indicate that academic libraries in Nigerian federal universities adopt a combination of digital platforms, traditional promotional tools, and institutional collaborations to market their services, with newer approaches such as QR codes, gamification, and visualization techniques still developing. This supports Horsfall (2020), who highlighted that effective library marketing in the digital age requires the integration of innovative technologies and diverse promotional strategies to enhance service visibility and user awareness.

Effectiveness of Marketing Practices in Academic Libraries

The findings reveal that academic library marketing is most effective when digital and traditional approaches are combined, with social media, library websites, print resources, and institutional collaborations contributing significantly to service awareness and user engagement. This supports Okusaga et al. (2021), who found that social media applications enhance the promotion of library and information services by improving communication and interaction with users in tertiary institutions.

Sustainable Development Goals (SDGs) Supported by Academic Libraries

The findings demonstrate that academic libraries contribute significantly to the achievement of multiple Sustainable Development Goals (SDGs), with the strongest contribution associated with Quality Education through support for teaching, learning, research, and information access. This supports Onwubiko (2021), who identified librarians and libraries as important contributors to SDG implementation through access to reliable information and community empowerment.

Challenges Facing Library Advocacy and Marketing in Academic Libraries

The findings reveal that library advocacy and marketing challenges are influenced by funding limitations, inadequate technological infrastructure, limited digital skills, low awareness, and weak stakeholder collaboration. This aligns with Annan-Aggrey et al. (2021), who identified resource constraints, capacity gaps, and institutional challenges as major barriers to effective SDG implementation in African contexts.

Strategies for Enhancing Library Advocacy and Marketing

The findings indicate that enhancing library advocacy and marketing requires a combination of improved funding, digital innovation, staff capacity building, stakeholder collaboration, and increased awareness creation. This aligns with Odede and Unachukwu (2025), who emphasized that strengthening academic libraries' contributions to sustainable development requires adequate resources, effective partnerships, and improved service visibility. The findings also support Horsfall (2020), who highlighted that successful marketing of library services in the digital age depends on the adoption of appropriate technologies, skilled personnel, and user-focused promotional strategies. Therefore, addressing these strategic areas is essential for improving library advocacy, increasing user engagement, and enhancing the overall impact of academic library services.

Conclusion

The findings demonstrate that academic libraries in Nigerian federal universities are increasingly adopting digital, collaborative, and user-centred advocacy and marketing approaches to improve visibility, service awareness, and engagement. While strategies such as social media, library websites, departmental collaborations, and direct user outreach have proven effective, challenges including inadequate funding, poor technological infrastructure, limited digital skills, and low stakeholder awareness continue to constrain their impact. The study further confirms that academic libraries contribute significantly to sustainable development goals, particularly through supporting quality education, research, innovation, and equitable access to information. Strengthening advocacy and marketing therefore requires coordinated efforts in funding, technology adoption, staff development, and institutional support.

Recommendations

1. Increase funding support: University management and relevant stakeholders should provide adequate financial resources to support library advocacy, marketing activities, technology acquisition, and service improvement.
2. Enhance digital infrastructure: Academic libraries should invest in modern ICT facilities, digital platforms, and innovative communication tools to strengthen online engagement and service promotion.
3. Develop staff digital competencies: Continuous training should be provided for library staff in digital marketing, social media management, data analytics, and emerging technologies.
4. Strengthen stakeholder collaboration: Libraries should establish stronger partnerships with academic departments, university management, student bodies, and external organizations to improve awareness and support.
5. Adopt integrated marketing approaches: Libraries should combine digital strategies (social media, websites, and online campaigns) with traditional methods (posters, exhibitions, and outreach programmes) to reach diverse user groups effectively.
6. Promote SDG-focused library initiatives: Academic libraries should align advocacy and marketing programmes with Sustainable Development Goals to highlight their contributions to education, innovation, inclusion, and research development.

Abstract

Access to legal information is fundamental to legal literacy, legal empowerment, and access to justice. Despite the important role of law libraries in organising and disseminating legal knowledge, structural and technological barriers continue to limit their effectiveness in Nigeria. This study examines the role of law libraries in the acquisition and use of legal information and analyses their contribution to legal empowerment and access to justice. Drawing on Access to Justice and Information Behaviour Theories, the study explores how access to legal information conditions legal participation. The study adopted a qualitative, doctrinal, and analytical approach. Data were obtained mostly from peer-reviewed journal articles, institutional repositories, and electronic databases. Literature published between 2010 and 2025 was reviewed, while earlier studies were included to provide a theoretical base. The relevant materials were systematically analysed in relation to the role of law libraries, barriers to access, and emerging models of legal information delivery. Findings reveal that inadequate funding, weak digital infrastructure, limited resource-sharing mechanisms, and restrictive access policies continue to constrain the effectiveness of law libraries in Nigeria. These limitations affect legal research, legal education, judicial decision-making, and broader access to justice. The study argues that law libraries should progress beyond their traditional custodial role and function as active mediators of legal information. Through digital innovation, collaborative networks, public legal information services, and integration with legal aid initiatives, law libraries can strengthen legal empowerment and expand access to justice. The study contributes to debates on legal information management, law librarianship, and inclusive justice delivery in Nigeria.

Keywords: Law Libraries; Legal Information; Access to Justice; Legal Empowerment; Nigeria.

Background to the Study

Access to legal information is a fundamental component of access to justice. Beyond its legal significance, access to legal information may, to a great extent, imply access to hope. For many persons, the ability to locate, understand, and use legal information represents the first step towards seeking redress, protecting rights, and participating meaningfully in the judicial process. Across both developed and developing societies, access to reliable legal information supports informed decision-making and participation in legal processes. In Nigeria, however, institutional, technological, economic, and geographical barriers continue to limit equitable access to legal information. Law libraries have traditionally served as the principal institutions for organising, preserving, and disseminating legal knowledge. Through their collections of statutes, law reports, textbooks, journals, and electronic resources, they support legal education, legal research, judicial decision-making, and legal practice. Their role extends beyond the preservation of legal materials to facilitating access to legal knowledge that enables effective engagement with the law.

Despite their importance, Owushi (2024) observed that many law libraries in Nigeria face significant challenges, including inadequate funding, outdated collections, weak digital infrastructure, inconsistent access to electronic databases, and limited resource-sharing arrangements. These constraints affect the quality of legal research, legal education, and access to justice. In some instances, Mundi (2022) argues that limited access to legal information restricts the ability of individuals to understand, assert, and protect their rights.

Against this background, this study examines the role of law libraries in the acquisition and use of legal information in Nigeria. It moves beyond questions of availability to consider how legal information is accessed, used, and facilitated by law libraries. Drawing on access-to-justice and lnformation behaviour theories, the study argues that law libraries should be reconceptualised as active agents of legal participation, inclusion, and access to justice.

Objectives of the Study

More specifically, the study has the following objectives:

1. To examine the current role of law libraries in legal information acquisition and use in Nigeria.
2. To identify structural, technological, and institutional barriers affecting access to legal information.
3. To analyse how these limitations impact legal practice, education, and access to justice.
4. To propose a re-conceptualised framework for law libraries as agents of legal empowerment and inclusive access.

Methodology

This study adopted a qualitative doctrinal and analytical approach. Data were obtained from peer-reviewed journal articles, books, policy documents, institutional reports, and electronic databases including Google Scholar, HeinOnline, and JSTOR. Relevant materials were analysed thematically in relation to the role of law libraries, barriers to access, legal empowerment, and access to justice.

Conceptual and Theoretical Framework

Legal information extends beyond statutes and case law to include the full range of materials through which law is interpreted, applied, and contested such as commentaries, law digests, statute books, law reports, and increasingly, digital databases. The usability of these materials is paramount as it answers the question of location, interpretation, and application. In this context, access is multifaceted as it involves physical availability, intellectual comprehension, and increasingly, digital connectivity (Mitee, 2017). Law librarianship, then, can be understood as the professional practice that intersects these layers, organising legal knowledge while also facilitating its effective use. Also, legal empowerment connotes the ability of ordinary citizens to understand and use the law to protect their rights and interests (Golub, 2003).

This study draws on Access to Justice (Garth & Cappelleti, 1978) and information behaviour theories (Wilson, 1999) in expatiating on how access to legal information frames user capability and justice outcomes. Traditionally associated with legal aid and procedural fairness, access to justice has evolved to include informational dimensions. Without access to legal information, the formal right to justice remains futile. Finally, information behaviour theory helps to explain why the mere presence of resources does not guarantee their use. It draws attention to cognitive, institutional, and technological factors that shape how individuals seek and apply information. This study highlights the fact that improving access to legal information requires more than expanding collections; it demands attention to how users interact with those collections.

Literature Review

Access to legal information occupies a critical position at the intersection of law, librarianship, and social justice. Legal information supports legal education, judicial decision-making, legal practice, and citizens' understanding of their rights and obligations. In Nigeria, however, access remains constrained by institutional, technological, and socio-economic challenges. Within this background, law libraries serve as key institutions for organising, preserving, and disseminating legal knowledge. Previous studies generally focused on four interconnected themes: legal information use, structural and technological constraints, access to justice, and information behaviour. A significant body of literature examines the role of law libraries in legal information acquisition and use, particularly within academic environments. Studies consistently demonstrate that access to well-organised legal resources enhances legal research, teaching, and scholarly productivity (Olorunfemi, 2015; Umoh, 2011; Uluocha & Mabawonku, 2014).

Although electronic legal resources have expanded significantly as shown by Ezema and Chizoba (2018), any users continue to rely heavily on print materials due to familiarity, accessibility concerns, and infrastructural limitations. Research further suggests that the effectiveness of legal information services depends not only on resource availability but also on the organisation of collections, research support services, and user guidance provided by librarians. The literature also identifies persistent structural, technological, and institutional barriers affecting access to legal information in Nigeria. Challenges frequently reported include inadequate funding, poor internet connectivity, weak digital infrastructure, limited staff capacity, inconsistent subscriptions to electronic databases, and the absence of effective resource-sharing frameworks (Ali, Owoeye, & Anasi, 2010; Amusa & Atinmo, 2016; Owushi, 2024; Olorunfemi 2015). These limitations reduce the effectiveness of law libraries and contribute to uneven access to legal information across institutions.

While digital technologies have expanded opportunities for information dissemination, existing studies indicate that technological advancement has not eliminated inequalities in access, particularly where digital literacy and infrastructure remain inadequate.

Studies further demonstrate that restricted access to legal information affects legal participation, legal empowerment, and access to justice, particularly among vulnerable populations (Bamgbose, 2018, 2020; Mitee, 2017). However, existing research focuses largely on institutional performance rather than the role of law libraries as agents of legal empowerment.

Studies on information behaviour provide additional insight into the factors influencing legal information use. Research suggests that access alone does not guarantee effective utilisation. Cognitive, technological, and environmental factors influence how users identify, retrieve, evaluate, and apply legal information (Olorunfemi, 2015). This perspective highlights the importance of legal information literacy and the role of librarians as intermediaries who facilitate meaningful engagement with legal resources.

A combined reading of the literature recognises the central role of law libraries within the legal information ecosystem in Nigeria while also documenting significant financial, technological, and institutional constraints. Although growing attention has been paid to issues of legal information access and digital transformation, relatively few studies has examined law libraries as agents of legal empowerment and access to justice. Existing studies largely emphasise resource availability and institutional operations, leaving insufficient attention to the broader societal role of law libraries

in bridging the gap between legal knowledge and social need. It is this conceptual gap that the present study seeks to address.

Law Libraries, Legal Information and Access to Justice in Nigeria

Traditionally, law libraries have served as the principal institutions for the collection, organisation, preservation, and dissemination of legal information. Their core responsibility has been to provide access to statutes, law reports, textbooks, journals, government publications, and other legal materials that support legal education, legal research, judicial decision-making, and legal practice. In this regard, law libraries have remained indispensable to the development and continuity of the Nigerian legal system (Owushi, 2024).

Academic law libraries play a particularly important role in legal education. They provide students and lecturers with access to authoritative legal resources and support the development of legal research skills. The quality of legal education is often linked to the strength and relevance of library collections, since legal research depends heavily on access to current legal information and established legal authorities (Uluocha & Mabawonku, 2014). Beyond maintaining collections, librarians assist users in locating, evaluating, and utilising legal materials, thereby facilitating effective research and information literacy.

Law libraries whether academic, judicial, private, or specialised, share a common objective of facilitating access to legal information. They also support judicial administration and legal practice. Mundi (2022) observed that court libraries provide judges and court personnel with access to legal authorities necessary for informed decision-making, whereas institutional and private law libraries serve the information needs of legal practitioners, government agencies, and specialised legal organisations (Owushi, 2024). These functions are reinforced by technical processes such as cataloguing, indexing, classification, and reference services, which ensure that legal information can be efficiently retrieved and utilised (Lawal et al., 2013). Historically, their services have been directed primarily towards legal professionals, academics, judges, and students. Consequently, the broader legal information needs of the public have received comparatively less attention.

Despite their enduring importance, many law libraries in Nigeria face significant structural, technological, and institutional challenges that limit their effectiveness. Studies consistently identify inadequate funding, outdated collections, poor internet connectivity, weak digital infrastructure, insufficient staffing, and limited access to electronic databases as major constraints affecting legal information services (Ali, Owoeye & Anasi, 2010; Amusa & Atinmo, 2016; Mundi 2022; Owushi, 2024). These challenges undermine legal research, legal education, and judicial efficiency while contributing to uneven access to legal information across institutions and regions. More significantly, these limitations reveal a deeper disconnect between legal information systems and access to justice. While legal information is widely recognised as a prerequisite for legal participation, access remains uneven and often restricted to those already within the legal system.

As Mitee (2017) argues, meaningful access to legal information is an essential component of human rights because individuals cannot effectively assert, protect, or enforce their rights without understanding the legal framework within which those rights operate.

The consequences of this disconnect are particularly evident among vulnerable and marginalised groups. Bamgbose (2018), for example, demonstrates that limited access to legal information within correctional institutions restricts inmates' ability to understand their legal status, pursue appeals, and seek available remedies. Similar challenges confront many members of the public who lack both legal literacy and access to reliable legal information resources. In such circumstances, the law remains formally available but practically inaccessible.

The issue, therefore, extends beyond the existence of legal materials. Access to justice fundamentally depends on the ability of users to locate, understand, and apply that information effectively.

Where legal resources remain difficult to navigate, inaccessible to non-lawyers, or confined within professional institutions, access to legal information does not necessarily translate into meaningful access to justice. This gap constitutes the missing link between the traditional functions of law libraries and their broader societal relevance.

Emerging research increasingly suggests that law libraries should embrace a more active role in promoting legal empowerment and legal inclusion. This move requires viewing law libraries as institutions that facilitate meaningful engagement with legal information. It involves expanding access beyond traditional user groups and developing services that support legal understanding, information literacy, and informed participation in legal processes. (Singh, 2025).

Several developments point towards this broader conception of law librarianship. These include public legal information services, legal information literacy programmes, collaborative resource-sharing networks, and law library-based legal clinics designed to support marginalised populations (Ali, Owoeye & Anasi, 2010; Bamgbose, 2020).

Collectively, these initiatives demonstrate that law libraries can contribute directly to legal empowerment by helping individuals navigate legal information and understand their rights and obligations. Viewed from this perspective, the value of law libraries should equally be assessed by their capacity to facilitate access, understanding, and meaningful use of legal information. This emerging perspective provides the basis for reconceptualising law libraries as active agents of legal empowerment and access to justice.

Reframing the Role: From Access to Law to Access to Hope

The continued existence of legal information barriers suggests that access to legal materials alone does not guarantee meaningful engagement with the law. The critical question, therefore is whether individuals can understand, use, and apply it in ways that advance their legal interests and protect their rights. It is at this point that access to law begins to assume a broader meaning. Where legal information enables individuals to understand their options, challenge injustice, and pursue legal remedies, access to law becomes access to hope; thereby showcasing the possibility of achieving meaningful participation and redress through legal processes.

At the core of this reframing is the recognition that legal information is a form of social power. Accessing it enables individuals to understand their rights, navigate legal processes, challenge unlawful actions, and participate more effectively in civic life. Conversely, where legal information remains inaccessible or difficult to understand, human rights may exist only on paper.

As Mitee (2017) argues, access to legal information is fundamental to the enjoyment of other rights because individuals cannot effectively exercise rights of which they are unaware.

This perspective aligns closely with the concept of legal empowerment. Legal empowerment extends beyond formal access to legal institutions and focuses on the capacity of individuals to understand and use the law to advance their interests. Access to justice, particularly for disenfranchised groups, depends also on the availability of mechanisms that enable people to recognise, interpret, and act upon their rights (Bamgbose, 2020). Within this framework, law libraries possess significant but often underutilised potential. They already manage the resources through which legal knowledge is communicated; the challenge is to ensure that these resources are accessible and meaningful to a broader range of users.

Reframing the role of law libraries therefore requires a shift from resource-centred service delivery to user-centred engagement.

Law libraries should increasingly operate as facilitators of legal understanding. This involves providing public legal information services, supporting legal information literacy, producing simplified legal guides, and assisting users in navigating complex legal resources. Such services recognise that meaningful access requires interpretation and guidance as much as physical or digital availability (Uwaechina & Eze-Onwuzuruike, 2021).

This shift also redefines the role of the law librarian. Traditionally viewed as custodians of legal collections, law librarians are increasingly positioned as mediators of legal knowledge. Their responsibilities as reiterated by Akanbiemu (2024) extend beyond organising information to supporting users in locating, evaluating, and applying legal resources effectively. Experience from academic law libraries demonstrates that guided engagement with legal information improves research competence and user confidence (Cadmus, 2021). Wijerathne (2024) observed that law libraries play a significant role in strengthening legal research competencies among users. Extending this approach beyond academic environments offers important opportunities for strengthening public legal awareness and legal capability.

Technology further expands the possibilities for this transformation. Digital repositories, open-access legal databases, online legal information services, and emerging technology-driven platforms have significantly increased opportunities to access legal information beyond geographical delineations. However, the benefits of digital access remain unevenly distributed. Limited digital literacy, poor internet connectivity, and infrastructural deficiencies continue to restrict effective use of electronic resources, particularly in under-represented communities (Bano & Peerzada, 2026; Bamgbose, 2020). Consequently, technological innovation must be accompanied by user education and inclusive service design if it must contribute meaningfully to legal empowerment.

The transformation of law libraries also requires stronger institutional collaboration. As components of the broader justice ecosystem, law libraries can extend their impact through partnerships with courts, universities, legal aid providers, civil society organisations, and community-based institutions. Such collaborations create opportunities for outreach programmes, legal information clinics, community education initiatives, and other interventions that connect legal information directly with public needs. Evidence increasingly suggests that libraries can contribute to civic participation, governance, and social inclusion when they actively engage with the communities they serve (Bamgbose, 2020). It is within this broader framework that the idea of access to law as access to hope becomes significant. Hope, in this context, being a practical consequence of legal empowerment.

When individuals are able to understand their rights, identify available remedies, and engage confidently with legal institutions, the law becomes a meaningful instrument for participation and redress. Law libraries that facilitate such engagement move beyond their traditional custodial function and become active contributors to legal inclusion, empowerment, and access to justice. In this sense, access to law is transformed into access to possibility, participation, and ultimately, hope.

Innovative Models and Emerging Practices in Law Librarianship

The changing information environment has encouraged law libraries to adopt more responsive and user-centred models of service delivery. These developments reflect a growing recognition that legal information must also be accessible, understandable, and usable if it has to contribute meaningfully to legal empowerment and access to justice. Emerging practices in law librarianship increasingly emphasise technological innovation, institutional collaboration, public engagement, and integration with legal support services.

Table 1: Emerging Models in Contemporary Law Librarianship

Emerging Model	Contribution to Legal Information Access and Use
Digital Libraries and Electronic Resources	Expand access beyond physical collections and improve information availability.
Artificial Intelligence (AI) Tools	Enhance legal research through automated retrieval, analysis, and citation support.
Library Consortia and Resource Sharing	Improve access to legal resources while reducing acquisition costs.
Public Legal Information Services	Promote legal awareness and legal literacy among non-lawyers.
Legal Aid and Clinical Partnerships	Connect legal information directly to legal assistance and justice outcomes.
Mobile and Community-Based Services	Extend legal information services to under-represented and remote communities.

Source: Author

Digital transformation remains one of the most significant developments in contemporary law librarianship. The increasing use of electronic databases, institutional repositories, and online legal information platforms has expanded access to legal materials beyond the physical confines of the library. Studies indicate that digital legal resources improve the speed, scope, and efficiency of legal research, particularly where users possess the skills necessary to navigate digital environments effectively (Bano & Peerzada, 2026). In recent times, the adoption of artificial intelligence tools introduced new possibilities for legal information retrieval, case analysis, citation management, and legal research support; (Owushi, 2024), While these technologies offer significant opportunities, their effectiveness depends on adequate infrastructure, professional oversight, and user competence.

Collaborative models, including consortia and resource-sharing initiatives, improve access to specialised legal resources and reduce duplication, particularly within resource-constrained environments (Folorunso & Mabawonku, 2025).

A further development is the increasing emphasis on public-oriented legal information services. Information desks, community outreach programmes, and legal information literacy initiatives reflect a shift towards broader public engagement (Bilson, Lowenberger, & Sharp, 2018). These services recognise that access to legal information is meaningful only when users can understand and apply it effectively. Partnerships between law libraries, legal aid organisations, and clinical legal education programmes represent another important innovation. Such collaborations connect legal information resources with practical legal assistance, creating opportunities for both experiential learning and enhanced access to justice. Similarly, mobile and community-based legal information services have demonstrated potential for extending access to legal knowledge to populations that may not ordinarily engage with formal library institutions (Akidi & Igbinovia, 2026)

Collectively, these innovations illustrate a gradual shift from traditional custodial models towards more participatory, technology-enabled, and socially responsive forms of law librarianship. Their significance lies in their capability to connect legal information more directly with user needs, which would in turn strengthen legal empowerment and contribute more effectively to access to justice.

Implications for LIS Education and Practice

The reconceptualisation of law libraries as instruments of legal empowerment and access to justice carries important implications for Library and Information Science (LIS) education and professional practice in Nigeria. If law libraries are to move beyond their traditional custodial role, corresponding changes are required in the training, competencies, and professional orientation of law librarians.

1. **Curriculum Reform and Practice-Oriented Education**

Contemporary law librarianship requires a broader range of competencies than those traditionally emphasised in many LIS programmes. While rudimentary areas such as cataloguing, classification, and collection management remain important, emerging realities demand greater attention to legal information systems, digital resource management, legal research support, and user-centred service delivery. LIS curricula should therefore incorporate specialised training in legal information management alongside practical learning opportunities such as internships, clinical placements, and field experiences within law libraries, courts, and legal aid institutions. Such approaches would strengthen the connection between professional education and the realities of legal information practice.

2. **Digital Competencies and Legal Informatics**

The increasing digitisation of legal information has transformed legal research and information delivery. Consequently, law librarians require competencies that extend beyond traditional library operations to include digital legal research, database management, advanced search strategies, data literacy, and familiarity with emerging technologies. The growing relevance of artificial intelligence and legal informatics further highlights the need for professionals who can engage effectively with technology-driven legal information systems. Developing these competencies will enable law librarians to support users more effectively in increasingly complex information environments.

3. Professional Identity and User Engagement

The evolving role of law libraries also requires a redefinition of professional identity. Law librarians are increasingly expected to serve as educators, information mediators, and facilitators of legal knowledge. Their contribution extends beyond resource management to supporting legal literacy, research competence, and informed participation in legal processes. This broader understanding of professional responsibility aligns closely with the emerging view of law libraries as active participants in promoting legal inclusion and access to justice.

4. Continuing Professional Development and Information Ethics

Rapid technological change and evolving user expectations make continuous professional development essential. Law librarians must regularly update their knowledge of legal information resources, digital technologies, and emerging research tools in order to remain effective in contemporary practice. At the same time, increasing reliance on digital information systems raises important ethical concerns relating to information quality, privacy, intellectual property, and equitable access. These considerations underscore the importance of integrating information ethics into both LIS education and professional practice.

At a glance, these developments suggest that the future effectiveness of law libraries depends significantly on the preparation and adaptability of those who manage them. A reformed LIS education system that combines legal information expertise, technological competence, user engagement skills, and ethical awareness will better position law librarians to contribute meaningfully to legal empowerment and access to justice in Nigeria.

Conclusion

This study argued that although law libraries remain essential to legal education, research, and judicial administration in Nigeria, their traditional custodial orientation limits their broader contribution to legal inclusion and access to justice. Persistent challenges, including inadequate funding, weak digital infrastructure, restrictive access practices, and uneven user capacity, continue to restrict the effective acquisition and use of legal information. At the same time, emerging developments such as digital legal information systems, collaborative networks, public legal information services, and partnerships with legal aid initiatives demonstrate the potential for a more responsive and socially engaged model of law librarianship. Drawing on access to justice, legal empowerment, and information behaviour dimensons, the paper contends that the value of law libraries should be measured primarily by their ability to facilitate meaningful engagement with legal information. Repositioning law libraries as active mediators of legal knowledge can strengthen legal literacy, expand access to justice, and bridge the gap between legal systems and the everyday realities of citizens. It is only then, that law libraries can evolve to become institutions through which legal knowledge is translated into practical opportunity; By enabling individuals to understand, navigate, and utilise the law, they transform access to law into access to participation, empowerment, and hope.

Abstract

School library information resources play a critical role in supporting students' learning outcomes and academic preparedness. However, concerns persist regarding the adequacy, accessibility and effective utilisation of these resources in secondary schools, particularly in developing contexts. This study examined the accessibility and utilisation of school library information resources as well as their perceived impact on students' academic preparedness in secondary schools in Offa Local Government Area, Kwara State. A descriptive survey research design was adopted. Population comprised of 505 final-year secondary school students of Offa Grammar School (OGS) and Moremi Secondary School. Sample size of 132 was derived using Taro-Yamane method and randomly selected. A structured questionnaire was used as the instrument for data collection but out of 132 questionnaire distributed, 130 were correctly filled. Data were analysed using frequency counts, percentages and weighted mean to determine trends in responses. Findings revealed that the availability of school library resources was generally low with respect to current textbooks, reference materials and digital resources. Accessibility was high as students reported ease of locating materials, supportive library staff and conducive learning environments. Utilisation of library resources was also high, particularly for academic study, assignments and examination preparation; however, the use of digital resources was low. Major constraints identified include inadequate and outdated materials, limited electronic resources and insufficient user orientation. Despite these challenges, students perceived that library resources positively support their academic preparedness by enhancing understanding, improving examination readiness and fostering effective study habits. The study concludes that although school libraries are accessible and actively utilised, their impact is constrained by insufficient and outdated resources. It is recommended that school management and government authorities improve resource provision, invest in digital facilities and strengthen user education programmes to enhance students' academic preparedness.

Keywords: Academic preparedness, accessibility, library information resources, school library, utilization

Introduction

In secondary education, the school library serves as a strategic academic support system that enhances curriculum delivery, promotes independent learning and fosters information literacy skills. For final year secondary school students who are at a critical transition stage between secondary and tertiary education, the accessibility and utilisation of library information resources become even more essential. School libraries are designed to provide organized collections of print and non-print materials that support teaching and learning (Ochogwu, 2020). These print and non-print materials range from textbooks, reference materials, audio-visual resources and digital information systems. Academic engagement and learning outcomes are opportunities for self-directed study and research offered by school libraries (George, 2020). In Nigeria, school libraries are also expected to align the collections with curricular requirements and

examination standards set by bodies such as the West African Examinations Council (WAEC) and the National Examinations Council (NECO). Academic preparedness among final-year students encompasses examination readiness as well as the development of critical thinking, research skills and independent learning abilities (Prout, 2020). The effectiveness of school libraries in supporting this preparedness depends largely on three interrelated factors: availability, accessibility, and utilisation of information resources. A functional school library supports curriculum delivery by providing access to textbooks, reference materials, digital databases, past examination papers and other instructional resources. When such resources are available and accessible, students are better positioned to engage in self-directed learning and develop independent research skills. These skills that are essential for success in tertiary education.

Education remains a fundamental instrument for national development, social transformation and individual advancement. The quality of an educational system is significantly influenced by the extent to which learners have access to relevant, current and diverse information resources. Therefore, the library widely recognized as a professionally organized collection of print and non-print materials designed to meet the informational, educational and recreational needs of users (Ochogwu, 2020). Beyond being a repository of books, contemporary libraries provide access to journals, government publications, audio-visual materials, digital databases, e-books, and internet-based resources. Ekule and Ogbomo (2024) conceptualizes the library as a dynamic learning institution managed by trained personnel for continuous education, intellectual development and self-improvement. Within the school environment, this definition underscores the library's role as an instructional partner in achieving educational objectives.
Availability refers to the adequacy and relevance of resources, accessibility relates to the ease with which students can locate and obtain them, while utilisation reflects the extent to which students actively engage with these resources for academic purposes. For final-year secondary school students whose academic success largely depends on performance in external examinations, the school library should function as a vital resource centre for revision, research and examination preparation, the impact of a school library on students' academic success is contingent upon three critical and interrelated variables: availability, accessibility and utilisation of information resources (Fakunle, 2023; Ugah, 2022; Oyediran, 2023).

As recognized as the importance of school libraries discussed above are, several challenges persist in secondary schools especially government-owned secondary schools which include inadequate funding, outdated collections, limited digital infrastructure and insufficient professional staffing (Braimol, 2020). These constraints can significantly affect final-year students who depend on library resources for examination preparation and academic advancement. This gap underscores the need for a more integrated analysis. This study therefore investigates the accessibility and utilisation of school library information resources on the relationship with academic preparedness among final-year secondary school students in Offa Local Government, Kwara State with the aim of providing evidence to inform policy and improve school library services.

Statement of the Problem

School libraries are designed to function as instructional support centres that enhance teaching, promote independent learning and foster information literacy among students. At the secondary school level especially among final-year secondary school students access to relevant and current information resources is essential for academic success and preparation for tertiary education. Ideally, library information resources should be sufficiently available, easily accessible and effectively utilized to support curriculum delivery and lifelong learning competencies. Accessibility and utilisation of school library resources by secondary school students is a matter of serious concern to every stakeholder in the secondary school system. It must be bore in mind that the degree of usefulness of any school library resources depends on its maximum utilisation by students otherwise it is as good as wasted. However, empirical evidence (Bankole, 2024) from Nigerian secondary schools suggests persistent deficiencies in the provision and functioning of school libraries. Studies (Nwafor, 2025; Obadiora, 2024) have shown that many secondary schools either lack functional libraries or operate below recommended standards in terms of infrastructure, staffing and resource provision. Oyekale (2017) found that many public secondary schools in Osun State lacked purpose-built library facilities and where libraries existed, these libraries are poorly equipped and inadequately accessible to students. Similarly, Yashim and Odunayo (2025) reported that school libraries in Rivers State were either absent or stocked with scanty and poorly organized materials, thereby limiting effective information service delivery.

Further evidence (George, 2020; Hassan, Emmanuel and Owoeye, 2024) indicate that even where library facilities exist, utilization remains suboptimal due to structural and systemic constraints. Fakunle (2023) identified inadequate collections, lack of modern learning technologies, erratic power supply and insufficient professional staff as significant barriers to effective utilization of school library resources in Osun State. In Ogun State, Udoh (2024) observed low levels of student engagement with available school library resources, attributing this to limited awareness and insufficient integration of library services into classroom instruction. Similarly, Oyedipe, Okewale and Adekunnisi

(2020) reported disparities between resource provision and actual usage patterns in secondary schools in Ogun State, suggesting that availability does not automatically translate into meaningful utilization.
Ndidiamaka, Okonkwo and Alor (2023) found significant deficiencies in the availability of library materials and services in secondary schools in Onitsha North Local Government Area. Additionally, Hassan, Emmanuel and Owoeye (2024) demonstrated that utilization of library information resources significantly influences students' lifelong learning capacity, underscoring the importance of effective library engagement during the secondary school stage. Within Kwara State specifically, Omosibi, Atolagbe and Ajao (2021) identified variations in the availability and utilization of educational resources across public and private secondary schools suggesting possible inequalities in learning environments.
Senior Secondary Class 3 represents a critical educational stage: transitioning from structured secondary education to more independent tertiary-level learning. If senior secondary school graduating students lack adequate access to and engagement with functional library information resources, their preparedness for higher education and lifelong learning may be shaky. Addressing these issues would significantly improve students' academic performance, research skills and overall intellectual development as well as informing policy decisions, guiding school library development strategies and ensuring equitable access to quality information resources for secondary school learners.

Objectives of the Study
The main objective of this study is to investigate accessibility and utilization of school library information resources and their influence on academic preparedness among final-year secondary school students in Kwara State, Nigeria.
Specifically, the study seeks to:

1. determine the level of accessibility of available school library information resources to final-year secondary school students for academic preparedness.
2. ascertain the extent of utilisation of school library information resources for academic preparedness.
3. examine constraints influencing utilisation including infrastructural, technological, administrative and user-related factors for academic preparedness.
4. assess the impact of library on academic preparedness of students.

Literature Review
Adequate provision of library resources remains the foundation upon which effective school library services are built, yet this foundation is often weak in many secondary schools. Inadequate availability of school library information resources remains a recurring issue in secondary education in Nigeria. In practice, the issue is not simply the presence of materials but their relevance, currency and diversity. Libraries are still largely dependent on outdated print collections with limited integration of digital resources needed for contemporary learning (Fakunle, 2023). This limitation is reinforced by findings that inadequate electronic resources and poor internet connectivity reduce students' engagement with information beyond prescribed textbooks (Idhalama, Oredo and Makori, 2025). Similar observations by Agyekum and Filson (2024) suggest that when resources are insufficient or outdated, students' capacity for independent learning and deeper academic exploration is significantly constrained. These patterns indicate that availability, in its practical sense, remains a critical but unresolved challenge.
Even where resources exist, their value is determined by how easily students can access them. Accessibility reflects the extent to which library systems enable or restrict students' interaction with available materials. When library collections are well organized and supported by responsive staff, students are more likely to locate and use relevant information efficiently (Yashim & Odunayo, 2025). In contrast, poorly structured cataloguing systems, limited guidance, and restrictive access conditions can discourage use, regardless of resource availability (Ibenne & Durodolu, 2024). This suggests that accessibility is not a passive attribute of the library but an outcome of deliberate service design, shaping how effectively resources are translated into learning support.
The extent to which students actually engage with library resources provides a more direct indication of their educational value. Utilisation reflects students' study behaviours and their reliance on library materials for academic tasks. Regular use of library resources has been associated with improved study habits, greater academic engagement, and stronger learning outcomes (Bankole et al., 2024). However, patterns of use are uneven. While print materials tend to be more frequently consulted, digital resources remain underutilised due to infrastructural constraints and limited digital competencies (Idhalama et al., 2025). This disparity highlights a disconnect between the expansion of information formats and students' ability to effectively engage with them.
The contribution of library resources to academic preparedness lies in how these factors: accessibility and utilization interact in practice. Academic preparedness extends beyond examination success to include critical thinking, independent learning and effective information use. Access to relevant and well-utilised resources has been linked to improved comprehension and readiness for academic tasks (Agyekum & Filson, 2024; Bankole et al., 2024). However, this relationship is not automatic. Where resources are limited, difficult to access or underutilised, their potential impact on students' preparedness is significantly reduced (Ibenne & Durodolu, 2024). This underscores the need to consider these variables collectively rather than in isolation.

Research methodology

This study used descriptive survey study research design with data collected via questionnaires. The population comprised 505 final year students of Offa Grammar School (OGS) and Moremi Secondary School in SS3. This SS 3 classes are divided into three categories (Science, Arts and Business) with arms of each category running from A-F totaling 465 in OGS and a single arm per each category in Moremi yielding 40. Using Taro-Yamane method to determine the sample size, the sample of 132 was derived and a random sampling method was employed for selection. However, out of the 132 questionnaires distributed, 130 were returned fully completed and usable. Simple frequency, percentage and weighted mean were used to analyse the collected data with the average weighted mean as the benchmark. The study was based on two theories: Uses and Gratifications Theory and the Technology Acceptance Model (Davis, 1989).

Table 1: Level of Accessibility of Available School Library Information Resources for Academic Preparedness

S/N	Items	SA Freq (%)	A Freq (%)	D Freq (%)	SD Freq (%)	Total	Weighted Mean (WM)	Decision
1	I can easily locate the materials I need in the library.	52 (40.0)	46 (35.4)	20 (15.4)	12 (9.2)	130 (100)	3.06	Agree
2	The library is open at convenient times for students.	54 (41.5)	43 (33.1)	22 (16.9)	11 (8.5)	130 (100)	3.08	Agree
3	The library environment is conducive for reading and studying.	38 (29.2)	41 (31.5)	24 (18.5)	27 (20.8)	130 (100)	2.69	Agree
4	Library staff are available to assist students when needed.	46 (35.4)	43 (33.1)	25 (19.2)	16 (12.3)	130 (100)	2.92	Agree
5	There are minimal restrictions when accessing library resources.	50 (38.5)	44 (33.8)	22 (16.9)	14 (10.8)	130 (100)	3.00	Agree
6	The organization of the library makes finding materials easy.	60 (46.2)	42 (32.3)	18 (13.8)	10 (7.7)	130 (100)	3.17	Agree
7	Sufficient time is given to use library facilities.	41(31.5)	53(40.8)	18(13.8)	18(13.8)	130 (100)	2.91	Agree
	Average Weighted Mean						**2.98**	**Agree**

The results in this table shows accessibility of school library resources. The grand weighted mean of 2.98 indicates that respondents agreed with all the items, including ease of locating materials (WM = 3.06), convenient library opening hours (WM = 3.08), conducive reading environment (WM = 2.69), availability of library staff for assistance (WM = 2.92), minimal restrictions in accessing resources (WM = 3.00), proper organization of the library (WM = 3.17) and sufficient time allocated for library use (WM = 2.91). This suggests that despite limited resources available in school libraries, the library services and organization of the collections facilitate access effectively for a better academic preparedness. Also, this indicates a functional library environment where structural and administrative factors do not significantly hinder access.

Table 2: Extent of Utilisation of School Library Information Resources for Academic Preparedness

S/N	Items	SA Freq (%)	A Freq (%)	D Freq (%)	SD Freq (%)	Total Freq (%)	Weighted Mean (WM)	Decision
1	I frequently use the library for academic study.	65 (50.0)	43(33.3)	13 (10.0)	9 (6.9)	130 (100)	3.27	Agree
2	I use the library to complete assignments and projects.	60 (46.2)	46(35.4)	16 (12.3)	8 (6.2)	130 (100)	3.20	Agree
3	I consult library materials when preparing for tests and examinations.	52 (40.0)	48(36.9)	18 (13.8)	12 (9.2)	120 (100)	3.09	Agree
4	I use digital library resources for my studies.	13 (10.0)	16(12.3)	44 (33.8)	57 (43.8)	130 (100)	1.89	Disagree
5	I visit the library regularly during my free time.	47(36.2)	50(38.5)	22 (16.9)	11(8.5)	130 (100)	3.02	Agree
6	I rely on library resources to support classroom learning.	38(29.2)	41(31.5)	27(20.8)	24(18.5)	130 (100)	2.72	Agree
	Average Weighted Mean						**2.87**	**Agree**

Table 2 shows the weighted mean responses on the utilisation of school library information resources. The results indicate that respondents agreed that they frequently use the library for academic study (WM = 3.27), use it for assignments and projects (WM = 3.20), consult library materials when preparing for examinations (WM = 3.09), visit the library during their free time (WM = 3.02) and rely on library resources to support classroom learning (WM = 2.72). However, respondents disagreed on the use of digital library resources (WM = 1.89). This indicates that utilization is high for traditional resources but low for digital resources due to limited availability. The pattern implies that utilisation is influenced not only by student needs but also by digital resource availability.

Table 3: Constraints Influencing Utilisation for Academic Preparedness?

S/N	Items	SA Freq(%)	A Freq(%)f	D Freq(%)	SD Freq(%)f	Total	Weighted Mean (WM)	Decision
1	The library lacks enough current and relevant books for students' use.	54(41.5)	41 (31.5)	22 (16.9)	13 (10.0)	130 (100)	3.05	Agree
2	Insufficient seating and reading space discourage me from using the library frequently.	24(18.5)	14(10.8)	49(37.7)	43(33.1)	130 (100)	2.14	Disagree
3	The library opening hours are not convenient for most students.	24 (18.5)	14 (10.8)	52 (40.0)	40 (30.8)	130 (100)	2.17	disagree
4	There is inadequate provision of electronic resources such as computers and internet access in the library.	52(40.0)	40 (30.8)	24 (18.5)	14 (10.8)	130 (100)	3.00	Agree
5	Poor attitude of some library staff discourages students from visiting the library.	18(13.8)	21 (16.2)	48(36.9)	43(33.1)	130 (100)	2.11	Disagree

6	Noise and distractions in the library environment make it difficult to concentrate.	24(18.5)	30(23.1)	43(33.1)	33(25.4)	130 (100)	2.35	Disagree
7	Lack of proper library orientation limits students' knowledge of available resources and how to use them.	56 (43.1)	41 (31.5)	22 (16.9)	11(8.5)	130 (100)	3.09	Agree
	Average Weighted Mean						**2.56**	**Agree**

Table 3 shows the weighted mean responses on the constraints to the use of school library information resources. The results indicate that respondents agreed that the library lacks current and relevant books (WM = 3.05), that there is inadequate provision of electronic resources (WM = 3.00), and that lack of proper library orientation limits effective use of resources (WM = 3.09). However, respondents disagreed that insufficient seating space (WM = 2.14), inconvenient library opening hours (WM = 2.17), poor staff attitude (WM = 2.11), and noise and distractions (WM = 2.35) do not significantly hinder library use. This suggests that while some constraints exist, they are mainly related to resource adequacy, electronic facilities and user orientation rather than environmental or operational factors.

Table 4: Impact of Library on Academic Preparedness

S/N	Items	SA Freq (%)	A Freq(%)	D Freq(%)	SD Freq(%)	Total Freq(%)	Weighted Mean (WM)	Decision
1	Access to library resources improves my understanding of subjects	54 (41.5)	49 (37.7)	16 (12.3)	11 (8.5)	130 (100)	3.12	Agree
2	The school library helps me prepare better for examinations	52 (40.0)	48 (36.9)	20 (15.4)	10 (7.7)	130 (100)	3.08	Agree
3	Using library resources enhances my academic performance	50(38.5)	49 (37.7)	21 (16.2)	10 (7.7)	120 (100)	3.06	Agree
4	Library facilities support my independent learning	48(36.9)	50 (38.5)	20 (15.4)	12 (9.2)	130 (100)	3.03	Agree
5	The use of library resources has improved my study habits	46 (35.4)	51 (39.2)	22 (16.9)	11 (8.5)	130 (100)	3.00	Agree
	Average Weighted Mean						**3.06**	**Agree**

Table 4 shows the weighted mean responses on the influence of library information resources on academic preparedness. The results indicate that respondents agreed with all the items, including that access to library resources improves their understanding of subjects (WM = 3.12), helps them prepare better for examinations (WM = 3.08), enhances academic performance (WM = 3.06), supports independent learning (WM = 3.03), and improves study habits (WM = 3.00).The consistency of positive responses across items suggests that, despite identified limitations, the library continues to function as an important academic support system. However, the strength of this influence appears to be moderated by the adequacy and quality of available resources, indicating that improvements in resource provision could further enhance students' academic preparedness.

Discussion of Findings

On the level of accessibility of school library Information resources, the results show that accessibility is not limited. Students were generally able to locate materials and make use of library services suggesting that organisational systems and staff support are relatively effective. This supports the position that accessibility enhances user interaction with available resources (Yashim & Odunayo, 2025). However, accessibility is reinforced with adequate content yields limited academic value.

The pattern of utilisation further reveals a selective engagement with printed materials more than digital resources where students rely heavily on traditional materiials due to unavailability of digital resources. High usage for assignments, examination preparation and general study indicates that students recognize the practical value of the library. This is consistent with findings that link frequent library use to improved study habits and academic engagement (Bankole et al., 2024). However, the low utilisation of digital resources suggests underlying constraints related to infrastructure and user competence which affirms observations that technological gaps continue to limit the integration of digital learning tools in school libraries (Idhalama et al., 2025). This imbalance points to a broader issue of uneven adaptation to evolving information environments.

The presence of resource-related constraints further reinforces the central role in shaping library effectiveness. Students identified inadequate materials, limited digital resources and sufficient orientation as key barriers indicating that both structural and user- related factors influence engagement. While environmental factors such as seating arrangements, noise and opening hours were not perceived as major constraints, the prominence of resource deficiencies shows that material provision remains the dominant challenge. This is consistent with broader observations that funding limitations and poor infrastructure continue to undermine library services in many secondary schools (Braimol, 2020).

On the impact of library to academic preparedness, students still perceive library resources as contributing positively to their academic preparedness. This suggests that even within constrained conditions, the library retains its role as an important academic support system. The positive perception of its influence particularly in enhancing understanding, supporting examination preparation and improving study habits aligns with studies that link library use to improved academic outcomes (Agyekum & Filson, 2024; Bankole et al., 2024). However, the strength of this influence is conditional, depending on the extent to which resources are adequate, accessible and effectively utilised.

Overall, the findings point to a disconnect between potential and performance. While accessibility and utilisation levels are relatively encouraging, limitations in resource availability especially in digital formats reduce the overall effectiveness of school libraries in supporting academic preparedness. This underscores the need to move beyond isolated improvements and adopt a more integrated approach that strengthens all three dimensions simultaneously.

Conclusion

The study concludes that school library information resources positively influence students' academic preparedness, but the magnitude of this influence depends largely on the accessibility and utilisation of such resources. While students generally have access to and make use of library services for academic purposes, inadequacies in the provision of current and digital resources limit the full realization of library benefits. The findings therefore suggest that the effectiveness of school libraries as academic support systems is strengthened when information resources are not only accessible and utilised but also adequate, relevant and up-to-date.

Recommendations

1. Since accessibility was found to be relatively high, it is recommended that school authorities should maintain and further improve existing access conditions including proper organization of materials, conducive reading environments and continued availability of library staff to assist students.
2. In view of the low utilisation of digital resources, it is suggested that schools should invest in digital library facilities such as computers and internet access, while also encouraging students to integrate these resources into their academic activities.
3. The study recommended that school management should regularly update library collections and implement structured library orientation programmes to improve students' awareness and effective use of available resources.
4. The state government and school authorities should increase funding and institutional support for school libraries to maximize their role in enhancing students' learning outcomes.

Adoption and Use of the Nigeria Education Repository and Databank (NERD) for Research by Academic Staff of Universities in Jigawa State, Nigeria

BABA ABDU
Department of Library and Information Science, Sule Lamido University, Kafin Hausa, Jigawa State
baba.abdu@slu.edu.ng

Abstract

Despite the recognized potential of the Nigeria Education Repository and Databank (NERD) to enhance institutional research visibility, promote scholarly synergy, and democratize access to indigenous academic outputs, the actual adoption rate and practical utility of this platform among academic staff in universities located in Jigawa State, Nigeria, remain largely unexplored. This study investigates the level of awareness, extent of adoption, and frequency of use of the NERD repository among academic staff, while examining the specific factors that influence its adoption for further research and identifying the critical challenges hindering its effective utilization. The study adopts a descriptive survey research design, utilizing a structured questionnaire instrument developed and validated within the framework of the Technology Acceptance Model (TAM). A stratified random sample of 312 academic staff was drawn from three federal and state universities in Jigawa State. Data were analyzed using descriptive statistics (mean and standard deviation) and inferential statistics (Pearson Product Moment Correlation). Findings reveal a low level of NERD awareness (38.1%), marginal adoption (22.6%), and infrequent use attributable to technical barriers, inadequate institutional training, and a prevailing preference for established global databases. Perceived usefulness and institutional support were found to significantly influence adoption intentions. The study recommends targeted training programs, improved technical infrastructure, and robust policy frameworks by university management, library professionals, and the Federal Ministry of Education to drive meaningful NERD adoption across Nigerian universities.

Keywords: Nigeria Education Repository and Databank (NERD), digital repositories, Technology Acceptance Model (TAM), academic staff, repository adoption, Jigawa State universities

1. Introduction

1.1 Background to the Study

The spread of digital repositories has fundamentally transformed the landscape of academic research and knowledge dissemination. Globally, universities and research institutions have embraced open-access platforms and institutional repositories as strategic tools for preserving, organizing, and amplifying scholarly outputs. In advanced economies, platforms such as JSTOR, PubMed Central, ERIC, and institutional repositories hosted on DSpace and EPrints infrastructure have become integral components of research workflows, supporting discovery, collaboration, and evidence-based decision-making (Bankole & Babalola, 2023; Enakrire & Onyenania, 2024).

In the African context, the shift toward digital knowledge infrastructure has grown considerably over the past decade, driven by continental frameworks such as the African Open Science Platform, African Joarnal Online (AJOL) and national open-access policies. Countries like South Africa, Ghana, and Kenya have established robust national research repositories that aggregate and disseminate locally produced knowledge. However, sub-Saharan Africa continues to battle with persistent infrastructural shortages, capacity gaps, and policy inconsistencies that limit the transformative potential of these systems (Mutula, 2023; Ocholla & Odera, 2024).

Nigeria, as Africa's most populous nation and largest economy, has made notable shifts toward establishing a sound national research infrastructure. The establishment of the Nigeria Education Repository and Databank (NERD) by the Federal Ministry of Education represents a landmark initiative in this direction. NERD was designed to serve as a centralized digital platform for archiving, accessing, and disseminating research outputs generated by Nigerian scholars across tertiary institutions. By aggregating research data, theses, dissertations, journal articles, and academic reports, NERD aspires to position Nigeria as a knowledge economy and reduce the over-reliance of Nigerian researchers on foreign databases (Federal Ministry of Education [FME], 2022).

In Jigawa State, a state in the Northwest geopolitical zone of Nigeria with four universities: Sule Lamido University (SLU), Kafin Hausa; Federal University Dutse (FUD), Jigawa State University of Medical and Allied Science, Majia (JSUMAS) and Federal University of Technology, Babura (FUTB) online research productivity remains critical to institutional accreditation, regional development, and national knowledge advancement. Despite the availability of NERD and the growing awareness of open-access scholarship globally, observations indicated that academic staff in these institutions demonstrate limited awareness and usage of the platform. This situation raises substantive concerns about the effectiveness of NERD's outreach, the state of digital literacy among academic staff, and the adequacy of institutional support structures.

1.2 Overview of Digital Repositories and NERD

Digital repositories are organized, searchable collections of digital objects, including research papers, datasets, multimedia content, and administrative records, managed by institutions or consortia to facilitate open access and long-

term preservation. Institutional repositories (IRs) represent a specific category of repositories hosted and maintained by academic or research institutions for the purpose of capturing and preserving the intellectual output of their communities (Bankole & Babalola, 2023).

NERD, established under the Federal Ministry of Education's Digital Education Transformation Strategy, functions as Nigeria's national educational repository. It aggregates scholarly outputs from accredited tertiary institutions, providing a searchable interface for researchers, policymakers, and students. Its mandate includes ensuring that research produced by public institutions remains publicly accessible, supporting the visibility of Nigerian scholarship globally, and enabling inter-institutional research collaboration (NERD Policy, 2025).

1.3 Statement of the Problem

Despite the institutional mandate and design features of NERD, empirical evidence on its actual adoption and utilization by academic staff remains scarce. Preliminary observations and informal consultations with academic staff at universities in Jigawa State reveal low awareness and marginal use. The factors underlying this gap, whether attributable to technical barriers, inadequate training, poor internet infrastructure, or preference for alternative global databases have not been systematically investigated. This gap in knowledge limits the ability of university administrators, library professionals, and policymakers to design effective interventions to improve NERD adoption.

1.4 Objectives of the Study

The specific objectives of this study are to:

1. Determine the level of awareness of NERD among academic staff of universities in Jigawa State.
2. Assess the level of adoption of NERD for further research among academic staff.
3. Examine the frequency of NERD utilization among academic staff.
4. Identify the factors influencing the adoption of NERD for research purposes.
5. Identify the challenges hindering effective utilization of NERD.

1.5 Research Questions

The study is guided by the following research questions:

RQ1: What is the level of awareness of NERD among academic staff of universities in Jigawa State?
RQ2: To what extent have academic staff adopted NERD for further research?
RQ3: How frequently do academic staff of universities in Jigawa State use NERD?
RQ4: What factors influence the adoption of NERD for research by academic staff?
RQ5: What challenges hinder the effective use of NERD by academic staff?

1.6 Research Hypotheses

H_{01}: Perceived usefulness does not significantly influence the adoption of NERD for research by academic staff of universities in Jigawa State.

H_{02}: Perceived ease of use does not significantly influence the adoption of NERD for research by academic staff of universities in Jigawa State.

H_{03}: Institutional support does not significantly influence the frequency of NERD utilization among academic staff of universities in Jigawa State.

2. Literature Review

2.1 Digital Repositories in Academic Research

Digital repositories have emerged as indispensable pillars of modern academic research infrastructure. By providing open, organized access to research outputs, repositories reduce duplication of effort, promote interdisciplinary collaboration, and enhance the global visibility of institutional scholarship. Lynch (2003), in a foundational conceptualization, described institutional repositories as a set of services that a university offers to the members of its community for the management and dissemination of digital materials created by the institution. Contemporary scholars have expanded this conceptualization to include not only document archiving but also research data management, digital preservation, and knowledge analytics (Bankole & Babalola, 2023; Mohammed & Sani, 2024).

In Nigerian academic contexts, digital repository adoption has been examined in relation to academic staff awareness, policy frameworks, and technological infrastructure. Studies consistently identify awareness deficits and inadequate internet connectivity as primary barriers to adoption (Enakrire & Onyenania, 2024; Nwosu & Ugwu, 2023).

2.2 Adoption of Institutional Repositories

The adoption of institutional repositories by academic communities is a complex, multifactorial process. Key determinants identified in the literature include system usability, perceived benefits, institutional policy, training availability, and peer influence (Okello-Obura & Kigongo-Bukenya, 2023). Research in sub-Saharan Africa highlights the additional dimensions of infrastructure reliability, power supply, and digital literacy as critical contextual moderators of adoption decisions (Mutula, 2023; Adeyinka & Oyediran, 2024).

2.3 NERD and National Research Databases

NERD represents Nigeria's most ambitious effort to establish a unified national educational knowledge infrastructure. Launched under the Federal Ministry of Education's digital transformation agenda, NERD aggregates research outputs from accredited Nigerian tertiary institutions, providing open access to theses, dissertations, journal articles, conference papers, and research data. Its architecture aligns with global standards for interoperability, metadata management, and open-access protocols (NERD Policy, 2025). Despite this mandate, scholarly attention to NERD's adoption and utility at the grassroots institutional level remains low, emphasizing the relevance of the present study.

A substantial body of recent empirical work informs this study's conceptual and contextual positioning. Bankole and Babalola (2023) investigated digital repository utilization among academic staff of Nigerian federal universities and found that while awareness was moderate (52.3%), active regular use was low (18.7%), attributing this disparity to inadequate training and system downtime. Mohammed and Sani (2024), in a study of repository adoption in Northwest Nigeria, found that perceived usefulness was the strongest predictor of academic staff adoption intentions, a finding consistent with TAM predictions.

Enakrire and Onyenania (2024) examined open-access repository use among academic staff in selected South-South Nigerian universities, reporting that institutional policy support and library-led training significantly moderated the TAM-adoption relationship. Nwosu and Ugwu (2023) found that poor internet infrastructure and low digital literacy were the primary barriers to institutional repository use in Southeast Nigerian universities, with younger academic staff demonstrating significantly higher adoption rates than senior colleagues.

At the continental level, Mutula (2023) conducted a systematic review of digital repository adoption across East and West African universities, identifying institutional commitment, technical capacity, and national policy frameworks as the three most critical enablers of sustained adoption. Ocholla and Odera (2024) applied TAM to the analysis of national research database usage in Kenya, finding that perceived ease of use exerted a stronger influence on adoption than perceived usefulness, contrary to findings from more developed contexts.

Okello-Obura and Kigongo-Bukenya (2023), in a comparative study of Uganda and Ghana, demonstrated that peer influence and administrative mandates significantly amplify the behavioral intention component of TAM in repository adoption contexts. Adeyinka and Oyediran (2024) extended TAM with self-efficacy variables in a study of South-West Nigerian academics, finding that digital self-efficacy mediated the PEOU-adoption relationship. Saliu and Abubakar (2024), in a study closely aligned with the current inquiry, investigated repository awareness in Kano State universities, geographically closed to Jigawa and reported that only 31% of academic staff were aware of NERD's existence.

International comparative literature provides additional context. Alzahrani and Gould (2023) applied TAM in Saudi Arabian universities, demonstrating that institutional incentives significantly boosted repository adoption beyond what TAM's core variables alone could explain. Kumah and Osei-Bonsu (2023) reported that library orientation programs tripled repository usage rates among Ghanaian academic staff within one academic session. Finally, Dike and Okonkwo (2025) found that disciplinary differences significantly moderated NERD adoption patterns, with social science academic staff demonstrating higher adoption than STEM academic staff due to differences in publication culture and database preference.

Notwithstanding the foregoing body of literature, a critical empirical gap persists regarding the specific adoption dynamics of NERD in the universities in Jigawa State. Extant studies have focused predominantly on South-South, South-West, and Southeast Nigeria, with the Northwest geopolitical zone remaining significantly underrepresented in the empirical literature. The distinctive socio-economic, infrastructure, and institutional characteristics of Jigawa State universities including lower average research productivity, limited library resource budgets, and greater dependence on mobile internet necessitate a dedicated empirical inquiry. The present study addresses this gap directly.

2.4 Theoretical Framework: Technology Acceptance Model (TAM)

This study is anchored in the Technology Acceptance Model (TAM), originally developed by Davis (1989) and subsequently elaborated by Davis, Bagozzi, and Warshaw (1989) as an adaptation of Ajzen and Fishbein's Theory of Reasoned Action. TAM proposes that an individual's behavioral intention to use a technology system is primarily determined by two core cognitive perceptions: Perceived Usefulness (PU) and Perceived Ease of Use (PEOU).

Perceived Usefulness refers to the degree to which a user believes that employing a particular system will enhance their work performance or research productivity. In the context of NERD, this encompasses beliefs about the platform's capacity to provide relevant research materials, save research time, and facilitate access to indigenous Nigerian scholarship. Perceived Ease of Use captures the extent to which the user believes using the system will be free of mental and physical effort, encompassing interface navigability, search functionality, and accessibility across devices and connectivity conditions.

TAM further posits that PEOU directly influences PU, as a system perceived as easy to use is more likely to be evaluated as useful. Together, PU and PEOU shape the user's Attitude toward Use, which in turn predicts Behavioral Intention to Use, ultimately leading to Actual System Use. Several extensions of TAM have incorporated additional variables including social norms, self-efficacy, and facilitating conditions, to better capture adoption dynamics in

complex organizational contexts (Venkatesh & Bala, 2008; Adeyinka & Oyediran, 2024). The present study operationalizes TAM within the NERD adoption context, incorporating institutional support as an external variable moderating the TAM pathways.

3. Methodology

3.1 Research Design

This study adopts a descriptive survey research design, which is appropriate for systematically gathering information about the characteristics, attitudes, behaviors, and perceptions of a defined population at a particular point in time (Creswell & Creswell, 2023). The descriptive survey design is well suited to the current inquiry because the study seeks to describe and explain the adoption patterns, awareness levels, and usage behaviors of academic staff regarding NERD, rather than manipulate variables experimentally.

3.2 Population of the Study

The target population comprises all academic staff of four universities in Jigawa State: Sule Lamido University, Kafin Hausa (SLU); Federal University Dutse (FUD); Jigawa State University of Medical and Allied Science, Majia (JSUMAS) and Federal University of Technology, Babura (FUTB). Based on data from institutional registrars and the 2023/2024 academic staff registers, the total population is 1,247 academic staff: SLU (427), FUD (518), JSUMAS (113) and FUTB (189).

3.3 Sample Size and Sampling Technique

Using Krejcie and Morgan's (1970) sample size determination table, a minimum sample of 297 respondents was indicated for a population of 1,247. The study increased this to 380 to account for potential non-response, yielding a final usable sample of 312 questionnaires (response rate: 82.1%). Proportionate stratified random sampling was employed, allocating respondents across institutions and faculties in proportion to their share of the total population, ensuring adequate representation of all academic departments and ranks.

3.4 Instruments for Data Collection

The primary data collection instrument was a structured questionnaire titled the 'NERD Adoption and Use Questionnaire,' developed by the researchers based on validated TAM scales from Davis (1989), Venkatesh and Bala (2008), and adapted items from Bankole and Babalola (2023). The questionnaire comprises six sections: (A) demographic information; (B) awareness of NERD; (C) adoption level; (D) frequency of use; (E) factors influencing adoption (TAM variables: the PU, the PEOU, Attitude, Institutional Support); and (F) challenges of utilization. Sections B–F used a 5-point Likert scale (1 = Strongly Disagree to 5 = Strongly Agree).

3.5 Validity and Reliability

Content and face validity were established through expert review by an information science scholar and instructional technologist, whose feedback was incorporated into the final instrument. Construct validity was assessed through exploratory factor analysis, confirming the five-factor structure hypothesized by TAM. Reliability was determined through a pilot study involving 40 academic staff from Kano State University of Science and Technology. Cronbach's alpha coefficients ranged from 0.81 to 0.91 across subscales, exceeding the 0.70 threshold recommended by Pallant (2020).

3.6 Data Collection Procedure

Questionnaires were administered through a mixed-mode approach: physical copies distributed through departmental contact persons and a Google Forms version disseminated via institutional email lists and WhatsApp groups. Data collection spanned Seven weeks (February-April 2025). Reminders were sent after two weeks to non-respondents. All respondents provided informed consent, and confidentiality of responses was assured.

3.7 Methods of Data Analysis

Completed questionnaires were coded and entered into IBM SPSS Statistics Version 27. Descriptive statistics including frequencies, percentages, means, and standard deviations were used to address RQ1 through RQ5. Inferential analysis using Pearson Product Moment Correlation (PPMC) was conducted to test the three research hypotheses at the 0.05 level of significance. A mean score ≥ 3.00 on the 5-point scale was adopted as the benchmark for a positive response.

4. Results

4.1 Demographic Profile of Respondents

Table 1: Demographic Characteristics of Respondents (N = 312)

Variable	Frequency	Percentage (%)
Gender: Male	258	82.7
Gender: Female	54	17.3
Academic Rank: Lecturer II/I	141	45.2
Academic Rank: Senior Lecturer	98	31.4
Academic Rank: Reader/Professor	73	23.4
Years of Experience: <5 years	87	27.9
Years of Experience: 5–15 years	163	52.2
Years of Experience: >15 years	62	19.9

4.2 Level of NERD Awareness (RQ1)

Respondents were asked whether they had previously heard of or used NERD. Only 119 (38.1%) indicated awareness of NERD's existence, while 193 (61.9%) had no prior knowledge of the platform. Among those aware, the primary sources of awareness were colleagues/peers (42.0%), library-organized workshops (28.6%), internet searches (19.3%), and formal institutional communication (10.1%).

Table 2: Level of NERD Awareness Among Academic Staff

Awareness Indicator	Yes (%)	No (%)
Aware that NERD exists	38.1	61.9
Visited the NERD website	22.6	77.4
Attended NERD-related training	11.2	88.8
Downloaded content from NERD	16.3	83.7

4.3 Level of Adoption and Frequency of Use (RQ2 & RQ3)

Table 3: Adoption Level and Frequency of NERD Use

Usage Pattern	Frequency (n)	Percentage (%)
Never used NERD	193	61.9
Used once or twice (trial only)	48	15.4
Use occasionally (<once/month)	43	13.8
Use regularly (weekly/monthly)	21	6.7
Use very frequently (daily)	7	2.2

4.4 Factors Influencing Adoption (RQ4)

Table 4: Mean Ratings of TAM Variables as Factors Influencing NERD Adoption

TAM Factor / Statement	Mean	SD	Decision
NERD would improve my research productivity	3.87	0.71	Agreed
NERD provides access to relevant Nigerian scholarship	3.74	0.83	Agreed
NERD interface is easy to navigate	2.61	1.02	Disagreed
Learning to use NERD requires minimal effort	2.49	1.11	Disagreed
My institution encourages use of NERD	2.33	0.98	Disagreed
Library staff have informed me about NERD use	1.97	0.87	Disagreed
I feel positively disposed to using NERD regularly	3.12	0.94	Agreed

4.5 Challenges Hindering NERD Utilization (RQ5)

Table 5: Challenges Hindering Effective NERD Utilization

Challenge	Mean	SD	Rank
Poor internet connectivity	4.41	0.62	1st
Lack of awareness and sensitization	4.28	0.71	2nd
No institutional training on NERD	4.17	0.79	3rd
Preference for global databases (e.g., Scopus, Web of Science)	3.98	0.88	4th
Difficult NERD interface/navigation	3.84	0.91	5th
Infrequent content updates on NERD	3.71	0.97	6th
No institutional policy mandating NERD use	3.59	1.04	7th

4.6 Hypothesis Testing Results

Table 6: Pearson Correlation Analysis of TAM Variables and NERD Adoption

Hypothesis	r	p-value	Sig. Level	Decision
H_{01}: PU → NERD Adoption	0.673	0.000	0.05	Rejected
H_{02}: PEOU → NERD Adoption	0.521	0.000	0.05	Rejected
H_{03}: Institutional Support → Frequency of Use	0.588	0.000	0.05	Rejected

All three null hypotheses were rejected at the 0.05 significance level ($p < .001$). Perceived Usefulness demonstrated the strongest positive correlation with NERD adoption ($r = 0.673$), followed by Institutional Support ($r = 0.588$) and Perceived Ease of Use ($r = 0.521$). These results are statistically significant, confirming that PU, PEOU, and institutional support are significant determinants of NERD adoption among academic staff in Jigawa State universities.

5. Discussion of Findings

5.1 Awareness and Adoption Levels

The finding that only 38.1% of academic staff in the universities in Jigawa State are aware of NERD, and that a mere 22.6% have visited the platform, represents a stark adoption deficit that aligns with the broader pattern of underutilization documented across Nigerian university contexts. This result corroborates Saliu and Abubakar (2024), who reported similarly low NERD awareness (31%).

The finding that most awareness was generated through informal peer channels (42%) rather than institutional communication underscores the failure of formal dissemination mechanisms, a pattern also noted by Enakrire and Onyenania (2024) in their South-South Nigeria study on digital repository. This has important implications for library outreach strategy: informal social networks appear to be the dominant channel through which repository awareness percolates in these contexts, suggesting that structured peer-ambassador or library-liaison programs could leverage existing social dynamics to accelerate awareness.

5.2 Factors Influencing Adoption and TAM Validation

The rejection of all three null hypotheses confirms the predictive validity of TAM within the NERD adoption context. The finding that Perceived Usefulness ($r = 0.673$) is the strongest predictor of adoption aligns consistently with TAM's central propositions (Davis, 1989) and corroborates Mohammed and Sani (2024), who similarly found PU to be the dominant TAM predictor in their Northwest Nigeria institutional repository study. Interestingly, the mean ratings on the PEOU subscale were below the threshold of 3.00 (means of 2.61 and 2.49), suggesting that while academic staff recognize the potential value of NERD, they do not find the platform sufficiently easy to use, a contradiction that creates an adoption intention-behavior gap.

This finding stands in contrast to Ocholla and Odera (2024), who found PEOU to be the stronger predictor in their Kenyan sample, suggesting that the relative influence of TAM variables may be moderated by cultural, infrastructural, and platform-specific contexts. The strong correlation between Institutional Support and Frequency of Use ($r = 0.588$) is particularly significant in light of the very low mean score for institutional support indicators ($\bar{x} = 2.33$), demonstrating that the absence of institutional scaffolding directly constrains actual use behavior. This finding echoes Okello-Obura and Kigongo-Bukenya (2023), who found administrative mandates to be critical adoption enablers.

5.3 Challenges of NERD Utilization

Poor internet connectivity emerged as the most critical challenge ($\bar{x} = 4.41$), a finding consistent with Nwosu and Ugwu (2023) and Mutula's (2023) systematic review. In Jigawa State, where internet penetration remains low and power supply is irregular, this structural barrier effectively negates the platform's potential value for a significant proportion of academic staff. The high ranking of 'preference for global databases' (4th; $\bar{x} = 3.98$) reflects a deeply instilled scholarly culture in which global citation indices serve as proxies for research quality, a cultural barrier that no amount of technical improvement alone can overcome without complementary policy interventions such as NERD-compatible research evaluation frameworks.

6. Conclusion

This study set out to investigate the adoption and use of the Nigeria Education Repository and Databank (NERD) among academic staff of universities in Jigawa State, Nigeria. The findings reveal a worrying pattern of low awareness (38.1%), limited adoption (22.6%), and infrequent utilization, driven by a confluence of technical, institutional, and cultural barriers. However, the findings also laid a foundation of latent positive disposition: academic staff who are aware of NERD generally acknowledge its potential usefulness, and perceived usefulness is the strongest predictor of adoption intention, providing a lever for targeted interventions. The Technology Acceptance Model provides a robust and empirically validated framework for understanding these dynamics, confirming the importance of perceived usefulness, perceived ease of use, and institutional support in shaping ways for NERD adoption. Addressing NERD's low adoption in Jigawa State universities is not merely a matter of technical improvement; it requires a coordinated, ecosystem-level response involving institutional leadership, library professionals, and national education policy.

7. Recommendations

Based on the findings of this study, the following recommendations are offered:

7.1 For Universities Managements

Develop and implement formal institutional policies that mandate or motivate NERD use as part of research evaluation and promotion criteria, thereby converting awareness into behavioral obligation.

Invest in dedicated institutional internet bandwidth and digital infrastructure that supports consistent, high-speed access to online repositories, including NERD.

Establish NERD coordinators in each faculty to facilitate peer-led adoption and provide frontline technical assistance.

7.2 For Library Professionals

Design and implement structured, faculty-specific NERD orientation and training programs both in-person and online, integrated into the academic calendar to address the awareness and low PEOU identified in this study.

Develop NERD usage guides, tutorial videos, and infographics tailored to disciplinary communities, recognizing the differential adoption patterns across faculties.

Use informal peer networks identified in this study as the dominant awareness channel by training peer library ambassadors at the departmental level.

7.3 For the Federal Ministry of Education

Launch a sustained national awareness campaign for NERD, incorporating partnerships with the National Universities Commission (NUC), the Tertiary Education Trust Fund (TETFund), and state ministries of education to ensure comprehensive reach.

Invest in upgrading NERD's technical architecture by improving interface usability, search functionality, mobile optimization, and content currency to address PEOU barriers identified in this and related studies.

Develop an NERD integration policy that links repository deposit and utilization to TETFund research grant applications, institutional accreditation reviews, and academic staff appraisal frameworks.

Abstract
Institutional open-access repositories play an important role in higher education, offering unrestricted access to deposited intellectual outputs that democratize knowledge and expand access to relevant information without discrimination or paywalls. Using Okoli's systematic review framework, this research analyzes studies from JSTOR, IEEE Xplore, and Google Scholar to determine publication patterns, research communication channels, and the rate of implementation of institutional open access repositories in Nigeria between 2018 and 2025. The review indicates a thematic decline in research on open access repositories, as the available studies do not reflect diversity in research communication. Although the analysis discovered a 29% increase in the adoption of open access repositories in Nigeria, considering the adoption rate between 2024 and 2025, the following factors are generally agreed to inhibit the adoption rate: inadequate power supply, poor network connectivity, lack of awareness, inadequate research grants, and insufficient advocacy for the open access initiative. To improve repository sustainability in Nigeria, the study suggests that subsequent studies should prioritize longitudinal research to track open access policies. Institutional and governmental support through relevant infrastructure and sufficient funding should be provided. Additionally, various institutions with repositories should develop clear guiding policies, repositories should be prioritized as part of NUC accreditation requirements, and more studies should be conducted to investigate institutional repository practices in Nigeria.
Keywords: Institutional repositories, open access, Nigeria, higher education, research archive, librarians

INTRODUCTION

Open access has emerged as one of the most transformative developments in scholarly communication. The term has been widely used over the last two decades by various researchers, considering its ability to provide free access to academic publications. The Budapest Open Access Initiative defined the term as the unrestricted online access to academic publications, allowing users to read, download, and distribute content without financial, legal, or technical barriers. (BOAI, 2017). As valuable digital resources, institutional open-access repositories provide free and unrestricted access to submitted manuscripts or publications, making them accessible to users without subscription or financial obligation (Baro & Eze, 2017). This relieves the burden of exorbitant journal subscriptions, enhancing access to relevant resources (Jrose, 2024). An institutional open access repository (IOAR) archives theses, dissertations, lecture notes, conference proceedings, review articles, and other forms of grey literature, making it useful to both academic and non-academic staff of the institution. The presence of IOAR can enhance institutional visibility and webometric rankings, encouraging its wider adoption across various institutions, serving as a digital archive for scholarly output. (Ajibade, 2022)

Despite the adoption of IOAR across various higher institutions around the globe, implementation in Africa is slow due to limited funding. Although Nigeria adopted a national institutional open access policy for higher education in 2017, before the second World Open Educational Resource Congress (Tlili et.al. 2022), Aghoghovwia and Ekereuche (2023) reported that as of 2023, no college of education or polytechnic in Nigeria has an IOAR, while only 20 academic libraries out of 272 approved universities in Nigeria have implemented it. Other reported challenges include insufficient knowledge of open-access publishing, inefficient internet access, inadequate technological infrastructure, and a lack of sustainable policies.

Although Institutional Open Access Repositories (IOARs) are widely accepted, they remain at an early stage of development in many developing countries. This has contributed to an ongoing debate about whether repository adoption necessarily translates into effective utilization. While there is broad consensus regarding the benefits of IOARs in higher education, scholars disagree on the extent to which repository adoption leads to efficient use. Some studies argue that the development of repositories improves access to scholarly information and increases research visibility (Ajibade, 2022), whereas utilization-focused studies report that academics and students continue to underutilize repository resources (Temim et al., 2025). This suggests that the mere availability of repositories does not necessarily guarantee active participation in scholarly communication.

This study synthesized existing research on IOAR in Nigeria between 2018 and 2025, as studies in the field remain largely fragmented and predominantly descriptive. While existing systematic reviews have examined repository utilization and the role of institutional repositories in promoting digital inclusion, none have comprehensively

synthesized the adoption, implementation, growth, institutional readiness, and policy-related factors influencing the development of institutional repositories in Nigerian higher education institutions. Therefore, the study provides a comprehensive review of the adoption and growth of IOAR in Nigeria, while highlighting the gap between repository availability and its actual use for scholarly communication.

METHODS

This section specifies the search process for the systematic review, using inclusion and exclusion criteria for the selection process. Table 1 presents the details of the reviewed literature, following Okoli's (2015) systematic review framework. The study also adopted the PRISMA 2020 reporting guidelines to document the study selection process, from the identification and screening of records to the final inclusion of eligible studies. In addition, the PRISMA flow diagram was utilized to provide a transparent representation of the study selection procedure.

Table 1: Systematic Literature Review Framework (Okoli, 2015)

SLR Steps	Activity
Step 1 Identify the purpose	The researcher sought to investigate the adoption of institutional open access repositories (IOAR) in higher education in Nigeria by reviewing the available literature published in JSTOR, IEEE Xplore, and Google Scholar between 2018 and 2025.
Step 2 Draft protocol	1. The study made use of the following research objectives: • To examine publication trends, methodology and the platforms used to publish research on institutional repositories in Nigeria between 2018 and 2025. • To evaluate the adoption, growth, and performance of institutional repositories in Nigerian higher education between 2018 and 2025. 2. The researcher used a guiding protocol to execute the objectives of the research
Step 3 Apply practical screening measures	To be included, articles have to meet the following criteria: I. must focus on open access initiatives such as institutional repositories, digital repositories, and research archives in Nigeria II. must be written in the English Language III. must be a peer-reviewed journal article, conference papers, or theses; Studies published between 2018 and 2025. IV. must be focused on higher education
Step 4 Search for literature	A comprehensive literature search was conducted across three academic databases: Google Scholar, Jstor, and IEEE Xplore. Using advanced search, Boolean operators, and the following keywords: "institutional repository" OR "open access repository" OR "digital repository" OR "research archive" AND Nigeria OR Nigerian AND "higher education" OR university OR polytechnic OR "college of education" to acquire relevant articles from the databases.
Step 5 Extract Data	The researcher extracted the necessary information that is consistent with the criteria identified in Step 3.
Step 6 Appraise quality	The researcher reviewed all articles that are consistent with the criteria identified in Step 3 to evaluate their quality. Moreover, the concept of quality is subjective. Therefore, the researcher used the conditions outlined as established quality appraisal.
Step 7 Synthesize studies	The author aggregated information from the selected articles, highlighting the findings
Step 8 Write the review	The discussion of findings and implications of the study was provided

IEEE Xplore returned 1,866 articles, Google Scholar returned 14,100 articles, and Jstor returned 842 articles. Given that Google Scholar ranks search results in the order of relevance, and this study sought to include the most applicable literature, the titles of the first 300 retrieved articles were reviewed. From these, 200 articles were selected for further screening based on the researcher's perceived relevance to the study. Also, the advanced search criteria were utilized for JSTOR and IEEE Xplore to filter unrelated material. After applying the inclusion criteria, the search results were reduced to 54 records from JSTOR and 212 records from IEEE Xplore, consisting only of peer-reviewed journal articles, theses, and conference papers, after inaccessible (non-open-access) and inconsistent materials, such as reports, book chapters, and magazines, were removed. Thereafter, the inclusion and exclusion criteria presented in Table 1 (Step 3) were applied, and duplicate records were removed. As a result, a total of 36 studies were retained for the review (see Figure 1).

A data extraction form was utilized to obtain relevant data from the selected studies in order to guarantee consistency and transparency. Important details were recorded on the form, including the author(s), year of publication, study's goals,

methodology, and the main research. Using the inclusion and exclusion criteria, the researcher carried out the data extraction procedure.

RESULT

This section discusses findings in relation to previous studies on IOAR in Nigeria. 36 studies were found applicable to the selection criteria and formed the basis for achieving the research objectives. Table 2 presents the list of selected studies on IOAR in Nigeria.

36.	Sustaining the Relevance of Institutional Repository in Academic Libraries in Nigeria: A University of Jos Perspective	Igboechesi G.P., Adigun T.A., Pobish P.S., and Angulu R.K. (2023)

Research Objective One: To examine publication trends, methodology and platforms used to publish research on institutional open access repositories in Nigeria between 2018 and 2025.

Publication Trend

To determine publication trends, articles published each year were analyzed. Findings reported that most articles were published in 2020 (8), 2019 (6), and 2018 (5). The research momentum showed a steady increase from 2018 to 2020, with each year recording one or two additional studies on institutional repositories in Nigeria. While 2020 recorded the highest number of publications, there was a decline in subsequent years: 2021 (4), 2022 (4), 2023 (4), and 2024 (2), through 2025 (4). This rise could be linked to the increase in the adoption of technology in Education during the COVID-19 period, when access to electronic resources became more crucial, and the growing awareness of open-access efforts. The decrease seen after 2020, however, suggests that the momentum of research was not maintained. This tendency indicates that even while institutional repositories have garnered scholarly interest, the discipline has not yet grown into a sophisticated and consistently growing area of study within Nigerian higher education(Igboechesi. et.al 2023; Anene, Ozor & Baro 2020). It can also be admitted that the prevalence of studies largely focusing on the challenges has reduced the novelty in research quality, limiting possible research trajectories.

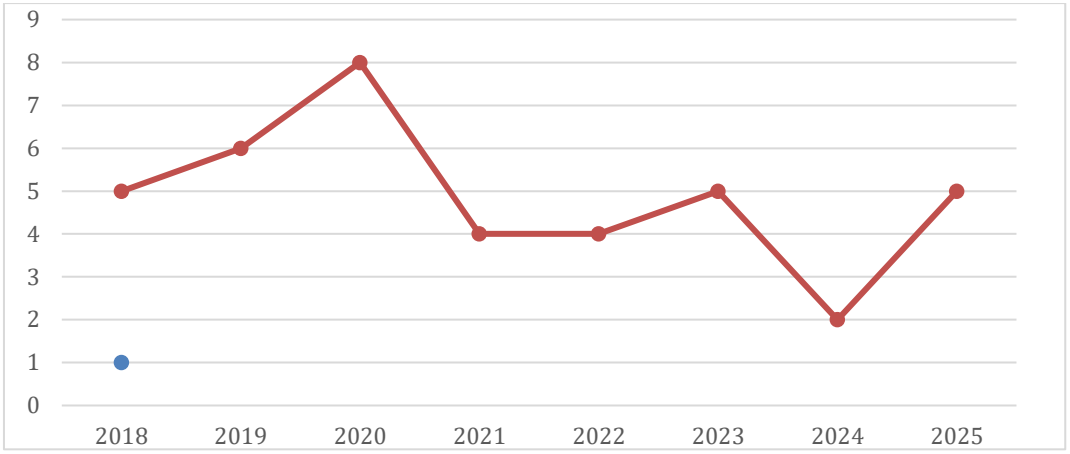

Fig 1: Publication trend of open access research in Nigeria

Publication Platforms

The articles were analyzed to determine publication outlets. The findings revealed that most publications were journal articles, comprising 94% (34) of the entire studies, while the remaining 6% (2) were conference proceedings. This implies limited diversity in research communication, as researchers in the field tend to prefer journal publications to disseminate their findings because of the credibility and visibility these platforms provide (Creswell, 2018). Meanwhile, these findings reveal the inadequate use of grey literature and other alternative channels of research communication, such as IOAR for archiving theses and dissertations, and conference proceedings. These platforms could serve as inclusive avenues for early-career researchers, yet they remain underutilized. The results also showed that most researchers prefer publishing in foreign journals, as reflected in the higher prevalence of foreign publications compared to local journals. About 81% (29) of the studies were published in foreign outlets, while only 19% (7) appeared in local publications. It is also noteworthy that Library Philosophy and Practice recorded the highest number of publications on IOAR in Nigeria. This result is consistent with other research showing that African academics prefer international journals for their global visibility, credibility, and broader distribution of research findings (Ambaka, 2023; Ezechukwu et al., 2024). Table 3 presents the list of journals in which these studies were published.

Table 3: Types of Publication

Publication Type	Outlet Name	No of Article	Outlet Status

Research methodology

The research methods used in the 36 studies were categorized as quantitative, qualitative, and mixed methods. Table 4 presents this in detail, showing the frequency of each method. Evidently, the quantitative method is the most commonly used, accounting for 67% (24) of the studies, followed by qualitative methods at 19% (7) and mixed methods at 14% (5). This demonstrated the significance of the quantitative approach in IOAR research, as it provides statistical support for research findings. When measuring factors influencing IOAR research in Nigeria, such as user engagement, learning outcomes, and technology adoption rates, the quantitative approach is commonly used (Traxler, 2018). The substantial gap indicates the need for an additional qualitative study to offer deeper insights beyond the general descriptions of IOAR use in Nigeria, even though the quantitative approach is crucial.

Table 4: Results classified by research methods

Research Objective Two: To evaluate the adoption, growth, and performance of institutional open access repositories in Nigerian higher education institutions

Method	Number of times used	Frequency
Quantitative	24	67%
Qualitative	7	19%
Mixed Method	5	14%

The researcher thematically reviewed all 36 articles, revealing several related terms to "IOAR" such as Institutional Repositories (IR), Institutional Open Access Initiative (IOAI), and Institutional Repository Resources (IRR). Nevertheless, IOAR are generally regarded as digital platforms that provide unrestricted access to institutional scholarly outputs. Several studies investigated the adoption rate of IOAR in Nigeria. Idiedo et al. (2024) stated that only a few higher institutions have successfully adopted a repository to preserve and manage their intellectual outputs. Haven consulted the OpenDOAR database, the authors identified the following 21 institutions with IOAR in Nigeria as at 2024: Ahmadu Bello University – Zaria; Afe Babalola University; Ambrose Alli University – Ekpoma; American University of Nigeria; Covenant University, Ota; Federal University Ndufu-Alike, Ikwo; Elizade University; Ebonyi State University; Federal University of Technology, Akure; Federal University Dutsinma; Federal University Lokoja; Federal University Oye-Ekiti; Federal University of Technology, Minna; Landmark University; Nassarawa State University, Keffi; Usmanu Danfodiyo University, Sokoto; University of Ibadan; University of Jos; University of Lagos; University of Ilorin; and University of Nigeria Nsukka. Meanwhile, 86% (18) of the institutions use DSpace software, while the remaining 14% (3) make use of EPrint software (Idiedo et al., 2024). This resonated with the findings of Ukwuoma, Madumere, and Iwundu (2021), who established that there were thirty functional repositories in Nigeria as of 2021. These 30 repositories were hosted by 21 higher institutions in Nigeria, including the University of Ibadan, Covenant University, University of Nigeria Nsukka, Landmark University, etc., which have two or more open repositories on DOAR. The most recent study identified in the review was conducted by Abdu, Farouk, and Maisango (2025), who reported a steady increase in adoption in Nigeria. Their findings showed that 27 institutions had adopted institutional repositories by 2025, thereby updating the earlier reports of Idiedo et al. (2024) and Ukwuoma, Madumere, and Iwundu (2021), which identified 21 institutions. Of the six additional institutions, four are higher education institutions — Ajayi

Crowther University, Benue State University, Bingham University, and Federal University of Technology, Owerri — while the others are the Central Bank of Nigeria and the National Library of Nigeria. This represents approximately 29% growth in IOAR adoption within two years.

Regarding performance and contributions, Ukwuoma, Madumere, and Iwundu (2021) identified the major contents of IOAR in Nigeria to include journal articles, theses, dissertations, and conference proceedings produced by staff and students across different disciplines. This was confirmed by Abdu, Farouk, and Maisango (2025), who stated that articles are the most popular resources in IOAR, followed by theses/dissertations and conference/workshop papers. Samson, Dolapo, and Opeyemi (2022) further highlighted that IOAR enhance the visibility, accessibility, and dissemination of scholarly outputs, thereby increasing institutional prestige and research impact. Remarkably, it is a game-changer for early-career research, providing a more accessible and cost-effective alternative to traditional subscription-based publishing systems.

Despite various advantages, the reviewed studies identified several challenges hindering the adoption and effective performance of IOAR in Nigeria. Research has shown that the rate of repository adoption among Nigerian higher institutions remains relatively slow (Olubiyo & Olubiyo, 2023). This resonated with the studies of Idiedo et al. (2024) and Ukwuoma, Madumere, and Iwundu (2021), who consulted the OpenDOAR database at two different time frames and reported a limited number of IOAR despite Nigeria's large number of higher institutions. Also, Orsu, E. (2019) researched the utilization of open access repositories for the visibility of academic publications by lecturers. His findings revealed that instead of archiving in IOAR, most lecturers prefer to archive their scholarly outputs on Google Scholar, Academia, and ResearchGate. In addition to this, Samson, Dolapo, and Opeyemi (2022, p.1) similarly identified that "inadequate advocacy for the open access initiative, copyright issues, low preparedness of academic librarians to acquire and apply digital knowledge, non-existence of institutional repository policies, narrow technological expertise, insufficient funding, inadequate ICT infrastructure, insufficient internet bandwidth, and erratic electricity supply" are major barriers. Ultimately, Abdu, Farouk, and Maisango (2025) observed that Nigerian IOAR still lag behind those of several other countries in terms of visibility, accessibility, and performance.

LIMITATIONS AND IDENTIFIED GAPS

There are notable limitations to the study. Firstly, after an extensive search across three broad high-quality databases— Google Scholar, JSTOR, and IEEE Xplore- while there were more materials available, only 36 studies met the inclusion criteria: focusing on IOAR in Nigeria, written in English, and published between 2018 and 2025. More relevant studies are recommended due to the lack of sustained momentum in publishing studies in the field. Similarly, only a few studies examined the state of IOAR in Nigeria using qualitative methods, which could have provided deeper insights into the experiences and challenges.

There is limited diversity in research communication. Most researchers preferred peer-reviewed journals to other possible outlets. While this is acceptable given the credibility and visibility such platforms provide, the use of IOAR for archiving theses/dissertations and conference proceedings should also be encouraged to ensure inclusivity. Journal articles are often brief, sidestepping most findings that could easily have been featured in thesis/dissertation uploaded to the IOAR.

The available studies identified the following challenges as factors inhibiting the adoption and growth of IOAR in Nigeria higher education system: Inadequate power supply; Poor network connectivity; Lack of awareness; Inadequate research grants; Inadequate advocacy for the open access initiative; Low preparedness of academic librarians (who are managers of IOAR) to acquire and apply digital knowledge; Non-existence of institutional repository policies; Inadequate technological expertise; Insufficient funding; Inadequate ICT infrastructure; Insufficient internet bandwidth; Nigeria lagging behind its counterparts in repository performance. Researchers in the field can pick up interest in conducting studies that address these specific challenges.

RECOMMENDATION

1. More qualitative research should be conducted to investigate the state of IOAR in Nigeria, focusing on the in-depth experiences, and provide further recommendations that would positively affect the research landscape.
2. Relevant policies should be developed to guide the implementation and the trajectory of IOAR from the early stage of adoption, consistently providing guiding protocols for continuity and efficiency.
3. IOAR should also be prioritized in academic libraries as a critical requirement for accreditation by the Nigerian Universities Commission (NUC). This will further enhance implementation
4. Institutional management and relevant government policymakers should provide the necessary support by ensuring the availability of relevant infrastructural resources and adequate funding for effective implementation

CONCLUSION

Open access democratizes knowledge in order to achieve unbiased dissemination of information. As a valuable digital resource, an IOAR provides unrestricted online access to submitted manuscripts of academic publications, making them freely accessible on the internet. The findings identified that there is a lack of sustained momentum in publishing studies on open access repositories in Nigeria, and available studies do not embrace diversity in research communication, as

researchers prefer peer-reviewed journals over other possible ways of communicating their findings. Also, the findings identified that in the last one to two years, there has been an approximately 29% growth in the adoption of institutional open access repositories in Nigeria, considering the adoption rate between 2024 and 2025. Among many others, the following challenges are considered factors inhibiting the adoption rate of open access repositories in Nigeria: inadequate power supply, poor network connectivity, lack of awareness, inadequate research grants, and inadequate advocacy for the open access initiative. It is recommended that subsequent studies look into user participation, sustainability methods, policy execution outcomes, repository effectiveness, and comparative experiences of IOAR across various higher institutions. Such research will enhance deeper understanding of the factors influencing growth and long term impact of IOAR in Nigeria is proposed.

07033007161

Abstract

This study examined the adoption of library application software packages for library operations in Colleges of Education libraries in Katsina State, Nigeria. The study was designed to investigate the level of automation of library operations in these institutions. Four objectives were formulated, alongside four corresponding research questions. A descriptive survey research design was adopted for the study. The population consisted of 61 librarians, and a total enumeration sampling technique was employed due to the manageable size of the population. Data were collected using a structured questionnaire and analyzed using frequency counts, percentages, mean, and standard deviation. The findings revealed that KOHA and E-LIB are the most widely adopted and currently used software packages in the libraries studied. However, the analysis also indicated low utilization of these software packages, as core library functions such as cataloguing and classification, circulation management, overdue fines management, and RFID/barcode-based tracking are underutilized. The study further identified several challenges, including the high cost of software, poor network and internet access, erratic power supply, and lack of after-sales maintenance and technical support. The study concluded that college librarians should promote the adoption and effective use of library application software packages to enhance service delivery and improve operational efficiency. Based on these findings, the study recommended that college libraries adopt widely supported and flexible software such as KOHA, implement awareness programs to encourage the acceptance and use of library technologies, and ensure adequate funding by government and institutional authorities for the acquisition and maintenance of modern library software.

Keywords: library software packages, adoption, library operations, college libraries

Introduction

Rapid advances in information and communication technologies (ICTs) are moving libraries all over the world to undergo significant transformation. A library can benefit from this underlying universal force that drives inventions, ideas, and tactics by consciously working to improve the library experience for patrons and employees equally. Automated systems are increasingly supporting or replacing traditional manual library operations, such as cataloguing, classification, circulation, acquisition, and serials management. Library automation has become crucial for improving the speed, accuracy, efficiency, and accessibility of information services.

Library application software packages are essential tools for modern library management, streamlining a variety of tasks to improve efficiency and enhance user experience. These software systems typically encompass integrated library systems (ILS) or library management systems (LMS), which automate library functions such as cataloguing, circulation, acquisitions, and inventory management. One of the critical benefits of these software packages is their ability to manage vast amounts of data seamlessly, ensuring that library resources are accurately catalogued and easily accessible to patrons and staff alike (Breeding, 2021).

A primary feature of library application software is its cataloguing capability, which organizes library materials using metadata standards like MARC (Machine-Readable Cataloguing). This standardization facilitates data sharing between libraries and enhances resource discoverability through online public access catalogues (OPACs). Another vital function is circulation management, which tracks the borrowing and returning of library items. This feature not only improves the efficiency of these processes but also integrates with patron management modules to monitor user activity and manage fines and fees. Advanced systems can offer automated notifications for due dates and overdue items, fostering better communication between the library and its patrons (Johnson, 2019). This automation reduces the workload on library staff, allowing them to focus on more personalized services and community engagement.

Research shows that availability and utilization of library oriented software packages are achieved with little or no fund via open source software initiative. The advent of development of library application software packages in this dispensation has made the transition from “traditional” to technological services which give room for the provision of more efficient services in a cost effective manner, hence the adoption of the packages by libraries in their services such as acquisition, processing, storage and dissemination (Sambe, 2015). The use of library software is progressively spreading throughout Nigeria, especially in higher education institutions. Effective library systems are crucial to the teaching, learning, and research of tertiary institutions. In order to satisfy information needs, comply with national

academic standards, and stay current in an ICT-driven learning environment, these libraries in Katsina State are expected to use dependable library management software.

These software solutions differ in terms of cost, features, technical requirements, and level of support; however, their adoption across Nigerian academic institutions appears inconsistent, while some institutions still heavily rely on manual processes due to issues like insufficient funding, lack of ICT expertise, and inadequate infrastructure. Understanding the adoption level, influencing factors, and challenges is crucial for improving library operation within the college libraries in Katsina State.

Statement of the Problem

Library Application software are effective means of carrying out library functions and services and new ways of organizing information and publishing it on the internet. Library Application software enable libraries to efficiently organize and deliver information for easy dissemination to users. Proper and effective utilization of the packages may give institution libraries an edge over other information service institutions. This is because they will enable them to build and manage their institutional resources, offer efficient services as well as provide quick and open access to information resources which may support teaching, learning, and research and community services.

Despite global progress in library automation, college libraries in Katsina State continue to operate manually. Manual operations are slow, prone to errors, and often lead to difficulties in accessing and retrieving information. Although several library software packages exist, their adoption and utilization remain limited or inconsistent. Egunjobi and Awoyemi (2021) maintain that manual handling of cataloguing, circulation, acquisitions, and inventory management processes often leads to inefficiencies, errors, and delays, which can impede academic progress and research activities. College libraries in Katsina State are expected to offer timely, accurate, and user-friendly services. However, problems like poor ICT infrastructure, inadequate staff training, unstable power supplies, and a lack of management support make it difficult for library software to be adopted and used effectively. This raises questions about the quality of library services and operations and the ability of these libraries to meet academic standards. As a result, it is necessary to assess the degree of library application software packages adoption, the difficulties encountered, and potential solutions.

Objectives of the Study

The main objective of this study is to examine the adoption of library application software packages for library operations in College of Education libraries in Katsina State, Nigeria. The specific objectives are to:

1. Identify the types of library application software packages adopted for library operations in College of Education Libraries in Katsina State.
2. Evaluate the extent to which the software packages adopted are utilized for library operations in College of Education Libraries in Katsina State.
3. Identify the challenges affecting the effective use of library application software packages for library operations in College of Education Libraries in Katsina State.
4. Suggest strategies for improving the use of library application software for library operations in College of Education Libraries in Katsina State.

Research Questions

The following research questions guide the study:

1. What types of library application software packages adopted for library operations in College of Education Libraries in Katsina State?
2. To what extent are these software packages adopted are utilized for library operations in College of Education Libraries in Katsina State?
3. What challenges hinder the effective utilization of library application software packages for library operations in College of Education Libraries in Katsina State?
4. What strategies can enhance the effective utilization of library application software packages for library operations in College of Education Libraries in Katsina State?

Literature Review

Library operations in academic libraries have undergone significant transformation due to advances in information technology. According to Breeding (2025), library operations are increasingly managed through integrated cloud-based platforms that support acquisitions, cataloguing, circulation, and electronic resource management. Library operations have expanded significantly to encompass research support services, scholarly communication initiatives, and digital resource management, reflecting the changing information needs of higher education institutions. In the African context, Tella and Issa (2024) reported that ICT adoption has enhanced the efficiency of library operations through automation and improved access to information resources.

Library application software packages are veritable tools introduced by the emergence of information and communication technology (ICT) to achieve efficiency in library functions and services. Library software packages are specialized systems that automate cataloguing, circulation, acquisitions, serials management, and reporting. Egunjobi

& Awoyemi (2021) defined library application software as a sequence of instructions that tells the computer what to do, how to manipulate data and how to relate to users. It normally addresses one aspect of computing need or the other. However, Dhanavandan and Tamizhchelvan (2012) defined library application software as the application of automatic and semi-automatic data processing machines to perform functions such as acquisition, circulation, cataloguing, reference service and serial control. Thomas (2012) defined library application software as computer programs that are written individually to operate specific, tailor made procedures and systems such as library housekeeping, words processing, database management, text retrieval, expert systems.

There are generally two categories of library application software: Proprietary and Open source. Proprietary Software refers to any computer software that has restrictions on any combination of the usage, modification, copying or distributing modified versions of the software. Proprietary software may also be called closed –source software. Open-Source Software (OSS) is computer software whose source code is made publicly available and distributed under a license that grants users the right to study, modify, use, and redistribute the software to anyone for any purpose, while respecting the terms and conditions specified by the copyright holder. Open Source Software movement accelerated the development of compatible open source library software, partly to provide an alternative to the sometimes highly prohibitive cost of the Proprietary Software. Examples of Library application software are; Alice for Windows, GLASS, CDS/ISIS, Strategic Library Automation and Management (SLAM), Liberty, Tin-Lib, and X-Lib, Libsys, Virtua, E-Lib, Libra, Greenstone, Evergreen, Dspace, Fedora, KOHA, Millennium mi, Alexandria among others.

Researchers have conducted studies on the use of software packages in some universities in Nigeria. Some of the software packages used in libraries in universities in Nigeria include TINLIB, ALICE, X-LIB, GLAS, CDS/ISIS, KOHA, SLAM, Liberty 3, Docuware etc (Adogbeji, Onohwakpor and Sylvester, n.d; Okewale and Adetimirin, 2011; Udoh-Ilomechine and Idiegbeyan-ose, 2011; Obajemu, Osagie, Akinade and Ekere, 2013). These studies were however carried out in universities in Nigeria. The current study sought to fill this gap by conducting the study in college libraries in Katsina State to establish the software packages adopted in library operations.

Furthermore, Obajemu et al (2013) conducted a study on the use of library software products in Nigeria. The study covered 50 libraries in Nigeria including 22 federal, state and private universities; 11 polytechnic libraries; 3 colleges of education libraries, and 14 research institutions' libraries. The researchers reported in their findings that "some of the respondents are quite aware of the various types of software being paraded in Nigerian markets." This study did not establish the specific software packages adopted by these 50 libraries as it merely established whether or not the librarians are aware of the existence of such software packages. The present study focused on the academic institutions and sought to identify the specific software packages adopted by college libraries in Katsina State.

In a study on library automation and virtual library development in four academic Libraries in Oyo State, Gbadamosi (2011) reported that none of the four libraries investigated was fully automated. The academic libraries used for the study included those of Emmanuel Alayande College of Education, Oyo; Federal College of Education (Special), Oyo; Federal School of Surveying, Oyo; and Ajayi Crowther University, Oyo. This finding presents yet another justification for a similar study to be conducted to establish the extent of application of library software in tertiary institution libraries in Katsina State.

Kari and Baro (2015) conducted a study aimed to look at the library software in use in Nigerian university libraries, and the challenges and frustrations experienced in their automation projects. The study adopts a descriptive survey method and covers university libraries in Nigeria. A questionnaire was used to collect data from 32 university libraries in Nigeria. The study revealed that university libraries in Nigeria widely use library software such as KOHA, SLAM and VIRTUA for their library operations. Challenges such as lack of skilled manpower, lack of fund, absence of modern systems (computers) and erratic power supply were identified as the major problems university libraries in Nigeria encountered while using library software. Librarians recommended the use of KOHA, SLAM or VIRTUA library software for use by university libraries that are in search for library software to use. These studies were however expanded in scope as they involved a large number of sampled universities in Nigeria while the current study sought to fill this gap by limiting the scope to a smaller number of college libraries in Katsina State.

Methodology

This study adopts a descriptive survey research design, with a population of sixty one (61) professional and paraprofessional librarians. The population comprises 23 librarians from Federal College of Education Library Katsina (FCELK), 22 librarians from Isah Kaita College of Education Library Dutsin-Ma (IKCELD) and 16 librarians from Yusuf Bala Usman College of Education Daura (YBUCELD). Total enumeration sampling technique was used for the study due to the fact that the number of respondents is manageable. Structured questionnaire was used as instruments for data collection. Questionnaire containing forty (40) items were administered to respondents in their respective institutions and collected by the researcher with the help of two trained research assistants. Data collected through questionnaire was analyzed using frequencies, percentages, mean and standard deviation. Any percentage of above 50 was accepted and used while any one below 50 was rejected and not used. Similarly, the researcher considered the mean of 2.5 and above as accepted while any mean below 2.5 was considered as rejected.

Results and Discussion of Findings

Table 1: Response Rate by University

Institutions	Expected Respondents (N = 61)	Actual Respondents (N = 57)	Percentage of Actual Respondents (%)
FCELK	23	20	32.78
IKCELD	22	21	34.42
YBUCELD	16	16	26.22
Total	**61**	**57**	**93.42**

Table 1 reveals that 61 copies of questionnaire were distributed, out of which 57 (93.42%) copies were completed and retrieved with valid information for the analysis. A further breakdown shows that 23 copies distributed to the respondents at FCELK, 20 (32.78%) were successfully completed and retrieved, 22 copies distributed to the respondents at IKCELD, 21 (34.42%) were completed and retrieved and 16 (26.22%) from the 16 distributed at YBUCELD were retrieved. Therefore, successfully valid instrument for this study is 93.42%. This is deemed encouraging and satisfactory for the study.

Table 2: Identify the types of library application software packages (LASP) adopted in College of Education Libraries in Katsina State.
(n = 57)

S/N	Software Package	Used (n)	Used (%)	Not Used (n)	Not Used (%)
1	Alice for Windows	3	5.3	54	94.7
2	BASIS	4	7.0	53	93.0
3	BookWhere	3	5.3	54	94.7
4	DSpace	3	5.3	54	94.7
5	Greenstone	3	5.3	54	94.7
6	Koha	31	54.4	26	45.6
7	LibPlus	9	15.8	48	84.2
8	Micro CDS/ISIS	10	17.5	47	82.5
9	MINISIS	8	14.0	49	86.0
10	E-Lib	55	96.5	2	3.5
11	TINLIB	22	38.6	35	61.4
12	X-Lib	20	35.1	37	64.9

Key: U = Used and NU = Not Used

Table 2 revealed that E-LIB (96.5%) is the most widely adopted software, indicating widespread available across the libraries. Moderately adopted software is KOHA (54.4%) is the second most used, suggesting strong acceptance, likely due to its open-source nature and flexibility. TINLIB and X-LIB show moderate adoption (38.6% and 35.1%). Low adopted software are MICRO CDS/ISIS, LIB PLUS, MINISIS have low adopted software (below 20%). ALICE for Windows, BOOKWHERE, DSPACE, GREENSTONE, and BASIS are barely adopted (5–7%), indicating they are either less accessible, or not suitable for the libraries' needs.

Table 3: Mean responses of respondents on the extent to which the software packages adopted are utilized for library operations in College of Education Libraries in Katsina State.
(n = 57)

S/N	Utilization Area	HU	U	LU	NU	Mean	SD
1	Cataloging and classification of library materials	5	15	14	23	2.04	1.01
2	Circulation management (issuing, renewing, returning)	9	12	4	32	1.96	1.18
3	Patron registration and management	24	11	4	18	2.72	1.30
4	Reserving library materials	21	13	17	6	2.86	1.03
5	Inventory management and stocktaking	15	28	2	12	2.81	1.05

S/N	Utilization Area	HU	U	LU	NU	Mean	SD
6	Overdue fines and fee management	12	7	13	25	2.11	1.18
7	Interlibrary loan management	6	12	22	17	2.12	0.95
8	Reporting and statistics generation	7	16	26	8	2.39	0.87
9	Integration with online databases and resources	2	16	31	8	2.21	0.72
10	RFID or barcode-based tracking	5	4	15	23	1.49	0.94

Grand mean = 2.27.

Keys: HU = Highly Utilized; U = Utilized; LU = Low Utilization; NU = Not Utilized

The grand mean of 2.27 indicates a low to moderate level of utilization of library application software packages. The highest level of utilization was recorded in the area of reserving library materials, with a mean score of (2.86), inventory management (2.81), and patron management (2.72). Lowest utilization for RFID/barcode tracking (1.49) and circulation management (1.96)

Table 4: Mean responses of respondents on the challenges affecting the effective use of library application software packages in College of Education Libraries in Katsina State.
(n = 57)

S/N	Challenges	SA	A	D	SD	Mean	SD
1	High cost of acquisition and maintenance of LSPs	35	15	0	7	3.37	1.03
2	Change in library administration	15	27	6	9	2.84	0.97
3	Staff resistance to the use of software packages	21	16	10	10	2.84	1.12
4	Erratic power supply	32	11	4	10	3.14	1.15
5	Database conversion problems	10	34	3	10	2.77	0.90
6	Poor network server leading to lack of internet access	30	14	10	3	3.25	0.99
7	Lack of after-sales maintenance and support	13	35	3	6	2.96	0.89
8	Phobia of computer/software or internet usage among librarians	16	21	6	14	2.68	1.17
9	Lack of knowledge about library software	8	18	15	16	2.32	1.06

Grand mean = 2.91.

Key: **SA = Strongly Agree; A = Agree; D = Disagree; SD = Strongly Disagree**

The grand mean of 2.91 indicates that respondents generally agree that these factors are major challenges affecting the use of library application software. The most critical challenges include high cost of software (3.37), poor network/internet access (3.25) and erratic power supply (3.14). The only relatively weaker challenge is lack of knowledge (2.32), which falls slightly below the acceptance benchmark (2.50).

Table 5: Mean responses of respondents on the strategies for improving the adoption and utilization of library application software in College of Education Libraries in Katsina State.
(n = 57)

S/N	Strategies	SA	A	D	SD	Mean	SD
1	Adequate funding should be provided for acquisition and maintenance of LSPs	48	5	1	3	3.72	0.73
2	Newly appointed librarians should not abandon useful projects of previous administration	37	16	2	2	3.54	0.68
3	Librarians should understand and accept the importance of LSPs	45	12	0	0	3.79	0.41
4	Adequate power supply should be provided in the library	48	8	1	0	3.82	0.43
5	Proper training should be provided for database conversion using LSPs	45	8	4	0	3.72	0.58
6	Libraries should install and upgrade quality network servers for full internet access	38	14	5	0	3.58	0.65
7	Software companies should provide maintenance and support services	37	16	1	3	3.53	0.78
8	Librarians should overcome fear of using computers and software	26	20	6	5	3.18	0.97
9	Awareness of LSPs should be created among librarians	31	18	8	0	3.40	0.73

Grand mean = 3.59.

Key: **SA = Strongly Agree; A = Agree; D = Disagree; SD = Strongly Disagree**
The grand mean of 3.59 indicates a high level of agreement among respondents on the strategies for improving adoption and utilization of library software. Most strategies are strongly supported, especially for adequate power supply (3.82), awareness and acceptance of LSPs (3.79).

Discussion of Finding
According to the study's findings, respondents' revealed that E-LIB and KOHA are the most widely adopted software packages, while others such as DSPACE, GREENSTONE, and ALICE for Windows are slightly used. This suggests a concentration on a few dominant systems. This finding aligns with report of preference for widely supported and open-source systems like KOHA in developing contexts due to flexibility and lower total cost of ownership (Bello & Mansor, 2021; Yakubu & Abubakar, 2023).
The result of Utilization of Library Software Packages, indicating low to moderate utilization of library software packages in Colleges of Education Libraries. While some operations such as inventory management and reservation are moderately utilized, core functions like circulation and cataloguing are underutilized. Current studies by (Ifijeh & Yusuf, 2020; Zaid & Popoola, 2021) suggests that availability of systems does not guarantee deep use; utilization is often limited by skills gaps, workflow redesign issues, and weak integration with digital resources.
Also, the findings showed that respondents agreed on the presence of significant challenges. Major challenges include high cost, erratic power supply, poor network infrastructure, and lack of technical support. Literature confirms these constraints as persistent barriers in Nigerian and similar contexts, with infrastructure deficits and funding shortfalls directly impacting system performance and continuity (Suleiman & Sani, 2022; Yakubu & Abubakar, 2023).
Additionally, Findings from study showed a high grand mean of 3.59, indicating strong agreement on proposed strategies. Key strategies include improved funding, staff training, stable power supply, and increased awareness. This supports the works of (Bello & Mansor, 2021; Zaid & Popoola, 2021; Suleiman & Sani, 2022), who emphasized capacity building, reliable infrastructure, and sustained vendor/technical support as critical enablers for successful digital transformation in libraries.

Conclusion
This study established that E-LIB and KOHA are the most commonly adopted library application software packages in Colleges of Education libraries in Katsina State. Despite their availability, the overall utilization of these software packages remains low to moderate, particularly in core library operations such as cataloguing, circulation, and RFID/barcode tracking. The major challenges affecting effective utilization include high acquisition and maintenance costs, poor internet connectivity, erratic power supply, and inadequate technical support. Nevertheless, respondents strongly agreed that improved funding, staff training, reliable infrastructure, and increased awareness would enhance software adoption and utilization. Therefore, strengthening these enabling factors is essential for achieving efficient and fully automated library operations in the colleges studied.

Recommendations
Based on the findings, the following recommendations are made:
1. College libraries should adopt widely supported and flexible software such as KOHA to improve efficiency.
2. Awareness programs should be conducted to encourage acceptance and use of library technologies among college librarian.
3. Government and institutional authorities should ensure adequate funding for the acquisition and maintenance of modern library software. They should provide stable power supply and reliable internet connectivity.
4. Software vendors should provide continuous technical support and maintenance services. Regular training and retraining programs should be organized for librarians to enhance their technical skills.

ADVOCACY FOR FUNCTIONAL LIBRARIES IN STATE OWNED MEDIA ORGANIZATIONS IN SOUTH EAST NIGERIA

By
Chidimma V. Igwilo
Paul University Awka, Anambra State.
chidimmavictoria509@gmail.com

Abstract

Functional libraries serve as vital repositories of information that support research, knowledge creation, and professional practice across media organizations. In state-owned media organizations, functional libraries are essential for effective journalism, policy formulation, and informed public communication. Despite their importance, many media institutions in south east lack well-equipped, accessible, and professionally-managed library systems, limiting journalists, ability to access reliable information and undermining the quality of reporting. This study argues for sustained advocacy toward the establishment and strengthening of functional libraries within state-owned media houses in South East Nigeria. The methodology used for the study is survey research design, questionnaire was designed to collect data from a population of 56 library staff /librarian from five selected state owned media organizations in south east and all the copies were collected and used for the study. The data was analyzed using descriptive statistics (mean), and percentages. The findings of the study reveals high extent on how management and library staff/ librarians perceive functional libraries for effective operations. The study recommends standardization of media libraries because a standard library serves as a digital Asset Management (DAM) system or archives, for media organizations to ensure the efficient storage, retrieval, and monetization of content. The study also advocates for a functional libraries in media organizations for the reason of efficient workflow, content preservation, workflow integration and distribution also facilitates creativity and Innovation.
Keywords: Advocacy, Functional libraries, Media organization, State/Nigeria

INTRODUCTION

Advocacy for functional libraries in state-owned media organizations in South East Nigeria according to Monaci et al (2026) is a strategic and purposeful effort aimed at influencing policies, mobilizing support, and driving institutional reforms that will strengthen information services within these establishments. Advocacy is **act of pleading for or supporting a change in an existing system which will produce results that are permanent and will benefit future users of the system. Advocacy** in a media-driven society where access to credible information shapes public opinion and democratic participation, libraries in state-owned media organizations serve as a vital knowledge hubs for journalists, researchers, editors, and content producers (Igwebuike, 2022). Advocacy involves organized actions and persuasive communication strategies aimed at influencing decision-makers and stakeholders to support policies and development initiatives (American Library Association, 2023). Advocacy goes beyond mere awareness; that involves deliberate engagement with policymakers, media executives, government agencies, and professional bodies to secure financial commitment, policy backing, and institutional recognition for library (Association of College and Research Libraries, 2024) within state-owned media organizations in Abia broadcasting network, Anambra broadcasting service, Ebonyi broadcasting corporation, Enugu broadcasting Service, and Imo State Broadcasting Corporation; advocacy becomes a powerful tool to reposition libraries as indispensable components of media productivity and credibility (Ojukwu, 2022). Effective advocacy for functional libraries emphasizes the role of libraries in promoting accuracy, archival preservation, investigative journalism, and fact-checking (Galey, 2024). Advocacy efforts may include policy lobbying, strategic partnerships, public campaigns, stakeholder engagement, professional association involvement, and evidence-based presentations demonstrating the return on investment in library services. Advocacy broader developmental impact of strong library systems. By advocating for improved funding, digitization initiatives, skilled librarians, and modern information management systems, stakeholders can ensure that state-owned media organizations fulfill their mandate of public enlightenment and national development. In essence, advocacy is the driving force that transforms libraries from neglected units into dynamic centers of knowledge within Nigeria's state-owned media organizations (Udensi, 2022). It is a sustained, strategic process of influencing change, shaping perceptions, and securing commitment toward building libraries that effectively serve the information needs of media professionals and the wider society.

Functional library is not merely a room filled with books or old newspapers; it is a dynamic information center designed to support editorial decision-making, investigative journalism, and content development. Functional libraries support research-based on broadcasting, preserve national history through archives, and enhance the intellectual capacity of media personnel. Functionality implies proper organization of materials, up-to-date collections, digital integration, professional staffing, and efficient retrieval systems. It also involves the preservation of archival materials such as audio recordings, video footage, manuscripts, photographs, and policy documents that form the organizational memory of media organizations. According to Cheruiyot, (2021), functional libraries are essential for ensuring accuracy, fact-checking, and balanced reporting. They provide journalists and broadcasters with access to credible sources, historical records, government publications, and research databases necessary for producing informed and authoritative content. (Alui, 2023). Without functional libraries, media organizations risk disseminating incomplete or inaccurate information,

which can weaken public trust and undermine their public service mandate. Functional libraries support modernization and digital transformation. With the rapid growth of information technology, media libraries must adopt electronic cataloguing systems, digital archives, online databases, and automated information management tools. A truly functional library operates efficiently, offers timely access to both print and digital resources, and adapts to evolving media practices. Advocacy for functional libraries in south east's state-owned media organizations emphasizes revitalization, funding, professional development, infrastructure improvement, and policy support. By prioritizing functionality, efficiency, accessibility, relevance, and sustainability; these organizations can enhance their research capacity, strengthen content quality, preserve national heritage, and fulfill their responsibility of informing, educating, and enlightening the public.

Media organization is a structured institution responsible for information dissemination, public education, agenda setting, cultural preservation, and democratic accountability. Abia broadcasting service, Anambra broadcasting service, Ebonyi broadcasting corporation, and Imo broadcasting corporation are established to serve the public interest by providing accurate, balanced, and development-oriented information. Media organization operates through coordinated departments; news, programming, production, research, archives, and administration working together to achieve institutional goals. Its effectiveness depends largely on access to reliable information, historical records, research materials, and credible data sources. As organization entrusted with shaping public opinion and documenting national events, state-owned media organizations must maintain high standards of professionalism, accountability, and information management. Within this institutional structure, the library role is strengthening the operational capacity of the media organization. However, the focus on media organization highlights the broader institutional responsibility to create policies, allocate funding, and provide infrastructure that supports functional information units. Advocacy in this context targets the leadership and governance systems of these media establishments, encouraging them to recognize libraries as integral components of their operational framework rather than optional support units. State-owned media organizations in south east face increasing demands in the digital age rapid news cycles, competition from private media, social media influence, and the fight against misinformation. To remain credible and competitive, these organizations must invest in strong information systems, including well-managed libraries and archives. Therefore, advocacy efforts emphasize institutional reform, strategic planning, and management commitment within media organizations to ensure sustainable library development.

State/ South East/ Nigeria media sector have its role in shaping public discourse, promoting transparency, and fostering national unity (Akingbohungbe, 2025). State-owned media organizations were established to serve the public interest, inform citizens about government policies, and document the nation's historical and cultural evolution. However, the effectiveness of these institutions is closely tied to the strength of their internal knowledge systems particularly their libraries and archives. Presently in Nigerian, advocacy becomes necessary due to persistent challenges such as inadequate funding, policy inconsistency, infrastructural decay, and limited technological advancement within public institutions. Many state-owned media libraries struggle with outdated collections, poor digitization, and insufficient professional staffing. These issues reflect broader systemic challenges within Nigeria's public sector, where competing national priorities often overshadow information management and archival development. Advocating for functional libraries in South East therefore goes beyond organizational reform; it connects to national development goals. Functional libraries support investigative journalism, preserve countries historical records, and contribute to the fight against misinformation and fake news—an issue of growing concern in the countries digital age. They also enhance the capacity of media professionals to provide well-researched, balanced, and culturally relevant content to diverse audiences across the federation countries continues to pursue modernization and digital transformation, strengthening library systems within state-owned media organizations aligns with broader national aspirations for technological growth and knowledge-based development. Advocacy efforts must therefore engage policymakers, government agencies, professional associations, and civil society to recognize libraries as strategic national assets rather than mere administrative units. focusing on countries highlights the unique developmental realities, governance structures, and information challenges that shape the need for functional libraries in state-owned media organizations.

STATEMENT OF THE PROBLEM

Many state-owned organizations face persistent challenges in information management, documentation, research support, and preservation of organizational records due to weak or non-functional library systems. Libraries within these organizations are often underfunded, poorly equipped, and inadequately staffed. Lack of up-to-date materials, modern information technology, digitized databases, and organized cataloguing systems. As a result, staff members experience difficulty accessing reliable information for policy formulation, planning, research, and decision-making. The absence of functional libraries weakens institutional memory, reduces productivity, and limits the overall effectiveness of public service delivery. Without strong advocacy to influence management decisions and government policies, the neglect of library services may continue, thereby undermining information accessibility, transparency, and organizational effectiveness. Therefore, the core problem addressed in this study is the insufficient advocacy for the establishment, funding, and sustainability of functional libraries in state-owned organizations in South East Nigeria.

PURPOSE OF THE STUDY

The purpose of the study is to examine the role of advocacy in promoting the establishment, development, and sustainability of functional libraries in state-owned organizations in South East Nigeria. Specifically, the study sought to:

1. Ascertain the current state and level of functionality of libraries in state-owned organizations in South East Nigeria.
2. Identify the major challenges affecting the development and effective operation of libraries in these organizations.
3. Examine the level of awareness and perception of management toward the importance of functional libraries in state-owned organizations.

RESEARCH QUESTIONS

1. What is the current state and level of functionality of libraries in state-owned organizations in Nigeria?
2. To what extent have the challenges affects the development and effective operation of libraries in these organizations?
3. How do management and staff perceive the importance of functional libraries in state-owned Organizations?

LITERATURE REVIEW

A functional library is not limited to the presence of books but encompasses up-to-date resources, trained staff, modern technologies, digitization, organized systems, and efficient retrieval mechanisms. Therefore, the absence of functional libraries in state owned media Organizations weakens the organizational memories and reduces productivity and it affects overall effectiveness in service delivery. Stakeholder engagement tools for advocacy addressed the challenges of poor funding, inadequately staffed, poorly equipped and also lack of update materials, modern information technologies, digitalized database and that is why professional association like NLA advocates for development and establishment of functional libraries to safeguard professional interest; with serious advocacy government and management decision will stop the negligence of library services which under mind information accessibility, transparency and Organizational effectiveness (Lynch etal 2021).

RESEARCH METHODOLOGY

The survey research method was adopted for the study which sought Information from respondents on advocacy for a functional libraries in State owned media Organization in south East. The population of the study comprised of fifty six (56) Library staff/ Librarians within the state owned media Organizational libraries. The selected state owned media organizations includes Abia Broadcasting Network, Anambra Broadcasting Service, Ebonyi Broadcasting Corporation, Enugu State Broadcasting Service and Imo State News Media. A self- developed online survey using Google questionnaire form was created for data collection from respondents. Data were analyzed using mean scores, simple Percentages and frequency count.

RESULT AND DISCUSSION

Result and the analysis was presented in tables and graph charts according to the research questions that guided the study.

Result Table 1: Respondents by Organization

ORGANIZATION	FREQUENCY	PERCENTAGE
Abia Broadcasting Network	6	10.71%
Anambra Broadcasting Service Awka	10	17.85%
Enugu State Broadcasting Service	7	12.5%
Imo State News Media	25	44.64%
Ebonyi Broadcasting Corporation	8	14.28%
TOTAL	**56**	**100%**

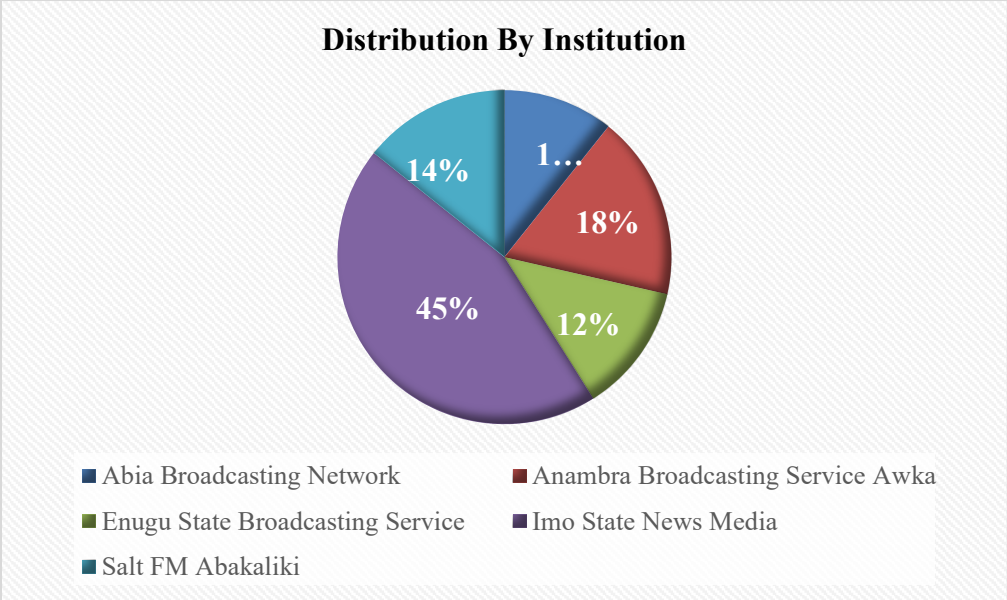

Figure 1: A pie chart showing the distribution of respondents by organizations

Table 1: Revealed that out of the 56(100%) respondents, 6(11%) were respondents from Abia Broadcasting Network, 10(18%) were respondents from Anambra Broadcasting Service, 7(12%) were respondents from Enugu State Broadcasting Service, 25(45%) were from Imo State News Media and 8(14%) were from Salt FM Abakaliki. The result revealed that Imo state media responded than every other state owned organization in south east Nigeria.

Table 2: Respondents' Percentage and Mean scores on the current state and level of functionality of libraries in state-owned organizations in South East Nigeria.

S/N	ITEMS	VHE (4)	HE (3)	VLE (2)	LE (1)	MEAN
1.	The availability of a library in your organization	35(62.5%)	10(18%)	9(16%)	2(3.5%)	3.39
2.	The quality of the library's physical infrastructure	25(45%)	15(27%)	10(18%)	6(11%)	3.05
3	The sufficiency of library resources	10(18%)	28(50%)	10(18%)	8(14.2%)	2.54
4	Current library resources	7(12.5%)	2(3.5%)	7(12.5%))	40 (71%)	1.57
5	Access to digital resources or online databases	45(80%)	11(20%)	0(0%)	0(0%)	3.80
6.	Regularly training of library staff	39(70%)	7(12.5%)	5(9%)	0(0%)	3.33
	OVERALL MEAN					**2.94**

These items was structured on a 4-point scale that ranges from Very High Extent-VHE (4 points), High Extent (3 points) Very Low Extent (2) and Low Extent (1 point). This implies that the extent in which the library is available in the organizations is in a very high extent and the people's access to digital resources or online databases in the library is at a very high extent. The quality of the library's physical infrastructure and sufficiency of library resources are slightly closed to the midpoint which implies that they are perceived at high extent.

Table 3: Challenges affecting the development and effective operation of libraries in these organizations.

S/N	ITEMS	VHE (4)	HE (3)	VLE (2)	LE (1)	MEAN
1	Poor physical infrastructure (library space, seating facilities) affect library services	30(53.5%)	3(5.3%)	10(17.8%)	13(23.2%)	2.89
2	Insufficient or outdated library collection (books, journals, databases) affect library effectiveness	40(71.4%)	5(8.9%)	6(10.7%)	5(8.9%)	3.42
3	Lack of professional and qualified library staff affect performance	39 ((70.5%)	15(26.7%)	0(0%)	2(3.56%)	3.62
4	Limited access to digital resources and online databases affect library usage	35(63%)	18(32.1%)	2(3.57%)	1 (1.78%)	3.55
5	Low awareness or utilization of library services among staff affect overall library use	40(71.4%)	10(17.8%)	10(17.8%)	6(10.7%)	4.82

6	Inadequate training or orientation for library users affect effective library use	50(89.2%)	3(5.35%)	2(3.57%)	1(1.78%)	3.82
7	Lack of advocacy or support affect efforts to strengthen library functions	39(70.5%)	10(17.8%)	5((8.9%)	2(3.56%)	3.53

Table 3: Challenges affects the development and effective operation of libraries in these organizations includes availability of a library in the organization, quality of the library infrastructure, access to digital resources or online databases are perceived, low awareness or utilization of library services among staff affect overall library use, Insufficient or outdated library collection (books, journals, databases) affect library effectiveness , Inadequate training or orientation for library users affect effective library use and Lack of advocacy or support affect efforts to strengthen library functions were perceived at a very high extent and above the midpoint while Poor physical infrastructure (library space, seating facilities) affect library services and regular training of library staff at high extent as it applies to the view of Olorunisola, 2022.

Table 4: How do management and staff perceive the importance of functional libraries in state-owned organizations.

S/N	ITEM	SA(4)	A(3)	D(2)	SD(1)	MEAN
1	To what extent do management and staff perceive Functional libraries as important for effective operations in state owned organizations	35 ((63%)	10 ((18%)	7 (13%)	4 ((7.1%)	3.35
2.	To what extent do functional libraries contribute to Accurate information access in state-owned organizations, as perceived by management and staff	40 (71.4%)	6 (11%)	5 ((9%)	5 (9%)	3.5
3.	To what extent do management and staff perceive Functional libraries as tools for promoting fact-checking and information verification	30 ((53.5%)	15 ((27%)	9 (16%)	2 (4%)	3.30
4.	To what extent do functional libraries support investigative and evidence-based decision making I in state-owned organizations	29 ((52%)	17 ((30.3%)	8 ((14.2%)	2 (4%)	3.30
5.	Is there any difference between management and staff ›erceptions regarding the importance of functional l ibraries in state-owned organizations	10 (18%)	3 (5.3%)	3 (5.3%)	40 (71.4%)	1.7
	GRAND MEAN					3.03

These items were structured on a 4- point scale that ranges from Strongly Agree, Agree, Disagree and Strongly Disagree. From the result in Table 4, item 1(35(63%)), item 2(40(71.4%), item 3(30(53.5%) and item 5(40(71.4%)) revealed above the mid-point (>50%). This implies that management and staff perceive functional libraries as Important for effective operations in state owned Organization, Functional libraries contribute to accurate information access to staff and management in state owned organization, functional libraries as tools for promoting fact-checking and management regarding the importance of functional libraries in state owned organizations were strongly agree. In summary these items in table 4 were strongly agreed and agreed. This explain the views of Igwebuike etal, 2022 that effective library services are importance to organizational decision making and efficiency.

Conclusion

The need for functional libraries in state-owned media organizations in Nigeria cannot be overstated. Libraries always serve as the intellectual backbone of any information-driven institution, providing reliable, organized, and accessible resources that enhance research quality, fact-checking, and content development. The level in which library is been made available in these organizations is highly encouraged. The factor that Influence the development and effective operation of a library includes lack of advocacy or support that will strengthen library functions, poor physical

infrastructure and lack of staff training as it been opined by Olarunisola, 2022. Libraries in media organizations should be exceptionally funded; and made provision for ultra-modern library infrastructure for library use.

Recommendation

The study recommends that libraries in media organizations especially South East were libraries serves as organizational fundamental Information management, content production, public enlightenment and a key channels for information dissemination should be treated as a strategic priority.

The libraries in media organizations should be adequately funded, well trained librarian and modern infrastructure should be considered appropriately to override the problem of outdated materials, insufficient technological integration and weak digital access (Baranzan, 2024).

The study recommends standardization of media libraries because a standard library serves as a digital Asset Management (DAM) system or archives, for media organizations to ensure the efficient storage, retrieval, and monetization of content.

The study advocates for a functional libraries in media organizations for the reason of efficient workflow, content preservation, workflow integration and distribution also facilitates creativity and Innovation.

By advocating for improved funding, digitization initiatives, skilled librarians, and modern information management systems, stakeholders can ensure that state-owned media organizations fulfill their mandate of public enlightenment and national development.

Media libraries must adopt electronic cataloguing systems, digital archives, online databases, and automated information management tools.

And
Umukoro Ighozino Oke
Delta State College of Health Sciences and Technology, Ofuoma, Ughelli, Delta State

Abstract

This study analyses the adequacy of key resources in specialised university libraries in Delta State, Nigeria, with particular emphasis on staffing, collections, facilities, and finance. Four research questions guided the investigation. A mixed-methods research approach was employed, integrating a descriptive survey design with qualitative inquiry to provide a comprehensive understanding. The study population comprised librarians working in three specialised university libraries: the Federal University of Petroleum Resources Library, Effurun; the Nigeria Maritime University Library, Okerenkoko; and the Admiralty University Library, Ibusa. A total of 52 librarians constituted the target population. Quantitative data were collected through structured questionnaire administered during physical visits to the libraries, while qualitative data were obtained through in-depth interviews with 3 divisional heads from each of the libraries studied. Quantitative data were analyzed using descriptive statistical techniques, whereas qualitative data were examined through thematic analysis. The findings from both data elicited reveal that staffing levels, library facilities, and financial resources are grossly inadequate in the libraries, while library collections were found to be moderately adequate. These results highlight critical resource gaps alongside existing strengths that require strategic intervention. Based on the findings, the study recommended deliberate efforts by relevant authorities to strengthen staffing capacity, upgrade facilities, and improve financial support for specialised university libraries to enhance effective service delivery. Also, sustained investment in regular updating of library collections is recommended to ensure continued relevance to the evolving academic and research needs of faculty and students.

Keywords: Collections, Facilities, Finance, Nigeria, Resource Adequacy, Specialised University Libraries, Staff

Introduction

Specialised university libraries are academic libraries established to support certain fields or occupations, such as medicine, law, petroleum and allied sector, engineering, agriculture, or education. Unlike general university libraries, they provide specific information resources, services, and expertise that are appropriate to the unique teaching, learning, and research needs of their specialised user groups. Their primary responsibilities typically include promoting innovative research, granting access to specialist collections, providing a convenient studying space, and enhancing information sharing within their respective fields.

The availability of essential resources plays a major role in how well specialised university libraries carry out their commitments to members of their academic community. In the present study, resources will be classified into four groups: human, information resources, facilities, and financial resources, which are all interrelated and would be considered holistically (Nwaogu et al., 2023; Simisaye et al., 2024; Nag, 2025). Human resources are the librarians, library officers, security, and other personnel performing roles in the specialised university library.

These human resources are responsible for overseeing the day-to-day operations of the specialised university library (Okiy, 2020). Okiy further affirmed that they are the core of service delivery because they acquire, organize, preserve, secure, and disseminate information to meet the teaching, learning, and research needs of users. In addition to providing reference and user education services, they also help ensure that library policies are implemented, facilities are properly maintained, and users receive timely support. The effectiveness of these personnel depends largely on their availability in sufficient numbers. In agreement with the aforementioned, Rhima and Nwachukwu (2024) noted that the more personnel a library engages to render services, the more effective and swifter the library responds to the information needs of the users with less stress and burnout since responsibilities would be shared with more hands on deck. In addition to human resources, specialised university libraries also need to have adequate information resources tied to the specific information needs of members of their university community.

These resources include books, journals, reference materials, databases, theses, reports, and other subject-specific materials that support teaching, learning, and research in the specialised field (Ashikuzzaman, 2025). The relevance, currency, and accessibility of such resources determine how well the library can satisfy users' information needs and sustain scholarly output within the institution. Another important consideration is the adequacy of these resources, as specialised university libraries should ensure they frequently update their collections to ensure they are current and balanced, meeting the information needs of their users. In addition to collections, Shoaib et al. (2022) affirmed that

specialised university libraries ought to have some essential facilities to keep their users satisfied. These facilities include comfortable reading spaces, adequate shelving, good lighting, computer systems, internet access, power supply, ventilation, and other physical and technological supports that make information access easier (Shoaib et al., 2022). When such facilities are available and properly maintained, they improve user comfort, enhance access to resources, and create an environment that supports effective study and research.

Financial resources are equally important because they make it possible for the library to acquire new materials, subscribe to databases, maintain facilities, and retain qualified staff. In agreement, Ilori and Onanuga (2025) argued that without adequate funding, even well-planned library services may not be effectively delivered. Therefore, the extent to which specialised university libraries can meet the needs of their users depends on the availability and efficient management of these resources as a whole. Human, information, facility, and financial resources determine the overall performance of specialised university libraries. Their adequacy influences service quality, user satisfaction, and the ability of the library to support teaching, learning, and research in specialised academic fields. In the light of the above, the present study is aimed at examining resources adequacy in specialised university libraries with special focus on staffing, collections, facilities, and finance.

Statement of the Problem

Specialised university libraries play a critical role in supporting discipline-specific teaching, learning, and research; however, their ability to fulfil these mandates is largely dependent on the adequacy of key resources. In many developing contexts, including Nigeria, concerns persist regarding shortages in staffing, inadequate facilities, and insufficient funding, all of which can significantly constrain effective service delivery. While some libraries may demonstrate relative strength in certain areas, such as collections, imbalances across resource components can undermine overall performance and limit their contribution to academic productivity.

In Delta State, where specialised universities are emerging to meet sector-specific educational demands, there is growing concern that library resources may not be keeping pace with institutional expectations. Inadequate staffing may lead to increased workload and reduced efficiency, poor facilities may hinder access and user satisfaction, and limited financial resources may restrict acquisition, maintenance, and innovation. These challenges, if not addressed, can compromise the quality of information services and weaken the role of libraries as knowledge hubs within specialised institutions.

Despite the importance of resource adequacy, existing studies (Wanyonyi et al., 2018; Olatunji, 2023) in Nigeria have largely examined university libraries in general terms, often without focusing on specialised institutions or adopting a holistic perspective that integrates staffing, collections, facilities, and finance. Furthermore, there is limited empirical evidence combining both quantitative and qualitative insights to provide a comprehensive understanding of resource adequacy in specialised university libraries within Delta State. This gap in context-specific and integrated analysis necessitates the present study.

While the existing literature extensively documents the challenges of resource adequacy in traditional Nigerian public universities, there remains a critical gap in understanding how these challenges manifest within the niche context of specialised institutions. This study departs from broader library assessments by focusing specifically on the unique resource configurations of specialised university libraries in Delta State. Unlike conventional institutions, specialised libraries such as those at the Federal University of Petroleum Resources, Nigeria Maritime University, and Admiralty University, operate under distinct mandates that necessitate specialised staffing expertise, technical collections, and specific facilities. By narrowing the scope to these institutions, this research aims to provide an empirical analysis of resource adequacy that is currently missing from the national discourse on library management.

Therefore, this study analyses the adequacy of key resources in selected specialised university libraries in Delta State, Nigeria, in order to identify existing gaps and inform strategic interventions for improved service delivery.

Research Objectives

The following objectives provided a guide for the study:

1. Examine the adequacy of staffing in specialised university libraries in Delta State, Nigeria.
2. Assess the adequacy of library collections in meeting users' academic and research needs.
3. Evaluate the adequacy of library facilities available for effective service delivery.
4. Determine the adequacy of financial resources supporting library operations.

Research Questions

The following questions were answered in the study:

- What is the level of staff adequacy in the specialised university libraries in Delta State, Nigeria?
- What is the level of library collections adequacy in meeting users' needs in the specialised university libraries?
- What is the level of adequacy of library facilities available for effective service delivery in the specialised university libraries?
- What is the level of financial resources adequacy for supporting library operations in the specialised university libraries?

Literature Review

The study is anchored on the Resource-Based View (RBV), a theoretical framework that explains how organisations achieve effectiveness and sustained performance through the strategic use of their internal resources. The RBV, as propounded by Barney (1991), posits that the availability, quality, and efficient utilisation of resources determine the ability of an organisation to achieve its objectives and maintain relevance. Figure 1 below shows the various variables of the resource-based view model:

Figure 1: Resource-Based View Model by Valerio (2024)

Organisational resources are broadly categorised into tangible and intangible assets, including human capital, physical infrastructure, financial capacity, and organisational knowledge. Within the context of specialised university libraries, the RBV provides a suitable lens for understanding how the adequacy of staffing, collections, facilities, and financial resources influences service delivery and overall performance. Human resources, comprising librarians and support staff, represent critical intellectual capital responsible for organising, managing, and disseminating information. Library collections constitute the core intellectual assets that support teaching, learning, and research, while facilities provide the physical and technological infrastructure necessary for effective access to information. Financial resources, on the other hand, underpin the acquisition, maintenance, and sustainability of all other resource components.

Ugwu and Chiedebere (2019) examined the militating factors affecting administration among staff of the Alex Ekwueme Library, Oko Federal Polytechnic in Anambra State. The findings indicate that inadequate library staff was a challenge affecting the effective administration in the examined federal polytechnic. In a similar study, Salunke and Hemade (2015) assessed the issue of stress faced by library and information professionals in Sangli and Kolhapur districts, Maharashtra state. The findings revealed that inadequate staff were a major challenge facing most of the libraries in the districts, resulting in stress and burnout. In addition, Moustapha and Abubakar (2023) investigated the shelving difficulties at the academic libraries in Kwara State, Nigeria. The findings revealed that inadequate shelving personnel was a major setback militating against the proper shelving activities in the academic libraries examined in Kwara State. In a study, Rhima and Nwachukwu (2024) examined the staffing needs and adequacy of staff in federal university libraries in South-south, Nigeria. The findings indicate that professional, technical, and para-professional staff are adequate in the university libraries examined in South-south, Nigeria. In contrast, Oyadeyi et al. (2020) examined the influence of occupational stressors and personal factors on library staff job performance in private universities in Oyo State, Nigeria. The findings revealed that inadequate staffing was classified as the major occupational stress affecting the library staff in the private universities in Oyo State, Nigeria.

On the adequacy of information resources, Ayaowei et al. (2024) examined the availability, accessibility, and use of information resources in the library by users who are students. It was concluded from the findings that the information resources available in the library were inadequate and not easily accessible. Owushi and Mundi (2021) assessed users' perception of currency, adequacy of library collections, and the functionality of technological equipment on the use of libraries attached to universities in South-South, Nigeria. The findings revealed that the library information resources are inadequate, and this affects the use of the information resources in the university libraries in South-South, Nigeria. Adegun et al. (2015) evaluated the effectiveness of library resources and services in Ladoke Akintola University of Technology, Ogbomosho, Oyo State, Nigeria. The population comprises 500 students from the 100-level to their final year level of the aforementioned university. The study concluded by noting that there were inadequacies that emanated from a shortfall in acquisitions, but the library resources provided were easily accessible and fairly adequate to meet the information needs of the users. From a similar perspective, Olatunji (2023) examined the adequacy of library collections and staff attitude as it relates to the provision of information services to federal polytechnic students in North Central, Nigeria. The findings indicate that the library personnel are inadequate and this negatively affects service provision in the polytechnic libraries in the North Central States of Nigeria.

Several scholars (Okunoye, 2022; Ibe & Iwhiwhu, 2025) have critically explored the adequacy of infrastructural facilities in libraries. Parbie et al. (2021) assessed users' views of library facilities using the University of Cape Coast as the case study. From the findings, the respondents agreed that the number of computers, comfortable tables, and chairs is adequate for effective user services in Sam Jonah Library, University of Cape Coast, Ghana. In contrast, Ibe and

Iwhiwhu (2025) examined the sufficiency of library infrastructural facilities for effective service delivery in state university libraries in South-South, Nigeria. The finding revealed that library buildings are largely inadequate, study spaces are inadequate, elevators and ramps are inadequate, ventilation and lighting are insufficient, among others. Similarly, Aryee and Tetteh (2024) evaluated library resources challenges, frustration, and user behaviour using an empirical survey strategy. The findings revealed that the users are largely dissatisfied with the adequacy of facilities in their library, causing frustration as they are denied access to and use of information. In agreement with the earlier study, Fagyan et al. (2023) assessed the impact of the frequency of library use on the satisfaction of students at Baguio Central University. The findings revealed that the students are highly satisfied with the adequacy of library facilities in the Baguio Central University. Nazim and Ali (2025) investigated accessibility to library services and facilities for persons with disabilities in India. The findings indicated that there were insufficient adaptive technologies in most of the libraries examined due to poor funding and financial availability. Also, the study by Okwu and Opurum (2021) examined inadequate library services as a challenge for 21st-century education from a developing nation context. The findings revealed that there is a lack of required infrastructural facilities plaguing most libraries in Nigeria, affecting educational development in Nigeria.

On the adequacy of financial resources in university libraries, Agbanu and Ezekwibe (2025) assessed funding practices in university libraries in Nigeria. The findings revealed that the libraries are facing funding shortages, which negatively affect service delivery. Mamman et al. (2019) examined funding of academic libraries in Plateau State, Nigeria. The findings revealed that the libraries had inadequate funding, which negatively affected the availability of information resources and services in the academic libraries in Plateau state. From a similar perspective, Ebiwolate (2022) assessed the present trends in funding of academic libraries in Nigeria. The finding indicates that despite the various sources of funding adopted, the libraries still suffer from inadequate financial resources to pursue their programmes and acquire a wide range of information resources to meet the information needs of members of their academic community. Also, Odili (2021) examined the funding practices of selected research libraries in South-South, Nigeria. The institutions included the Forest Research Institute of Nigeria and the National Horticultural Research Institute. The findings revealed that the libraries examined are facing poor funding, which affects their overall productivity and ability to meet their core mandate. In agreement with the earlier studies, Adeyemi (2015) evaluated the implementation of information commons in Nigerian academic libraries, with a critical look at the prospects and challenges. The findings revealed that inadequate funding was a barrier to the implementation of information commons in the libraries examined. In addition, George et al. (2025) assessed challenges affecting librarians in the discharge of quality services to patrons in South-west university libraries. The findings indicated that poor funding is a major challenge affecting the quality of discharge of services to users in the university libraries in South-West, Nigeria.

Methodology

This study adopted a mixed-methods research approach, integrating quantitative and qualitative methods to provide a comprehensive analysis of resource adequacy in specialised university libraries in Delta State, Nigeria. The study employed a descriptive survey design for the quantitative component and a qualitative inquiry for the interview aspect. The population of the study comprised 52 librarians across the three specialised university libraries in Delta State, Nigeria. These libraries include the Federal University of Petroleum Resources Library, Effurun; the Nigeria Maritime University Library, Okerenkoko; and the Admiralty University Library, Ibusa. For the quantitative aspect, the entire population of 52 librarians participated in the study through the administration of structured questionnaires, while qualitative data were obtained through in-depth interviews with 3 divisional heads, one from each library.

Ethical protocols were strictly followed, ensuring all participants provided informed consent with the right to withdraw at any time. Due to the small population size, total enumeration was used for the quantitative phase involving librarians, while convenience sampling was applied to select divisional heads for qualitative interviews. Data were collected using a structured questionnaire (covering staffing, collections, and facilities) and an interview guide (focusing on finance). The instruments underwent expert validation and a pilot study at the University of Nigeria, Nsukka, which yielded a Cronbach Alpha reliability coefficient of 0.89. Quantitative data were analyzed using descriptive statistics (frequency, mean, and percentages), while qualitative data were processed through narrative thematic analysis.

Findings

Questionnaire Response Rate

Table 1: Questionnaire Response Rate

Special University Library	Copies Distributed	Copies Returned	Percentage of Return
Federal University of Petroleum Resources Library, Effurun, Delta State	29	27	93.1%
Nigerian Maritime University Library, Okerenkoko, Delta State	9	9	100%
Admiralty University Library, Obusa, Delta State.	14	12	85.7%
Total	**52**	**48**	**92.3%**

From the table, Table 1 the Federal University of Petroleum Resources Library recorded a response rate of 93.1%, the Nigeria Maritime University Library recorded 100%, while the Admiralty University of Nigeria Library recorded 85.7%. The high response rate across the three libraries indicates a strong level of participation and enhances the credibility of the findings. The study yielded an overall response rate of 92.3%, which can be classified as high. The inference of this high response rate, particularly within a total enumeration framework, is that the findings carry a high degree of statistical power and are near-entirely representative of the target population. This minimizes non-response bias and confirms that the identified 'gross inadequacies' in staffing, facilities, and finance are an accurate reflection of the systemic challenges across these specialised libraries, rather than isolated perspectives.

Gender Distribution of the Respondents

Table 2: Gender Distribution of the Respondents

Gender Distribution	Frequency	Percentage
Male	25	52%
Female	23	48%
Total	**48**	**100%**

Table 2 revealed that 25(52%) of the respondents were male, while 23(48%) of the respondents were female. This indicates that more male respondents participated in the study than their female counterparts.

Main Findings

To answer **Research Question 1**, respondents were asked to indicate their level of agreement on statements relating to staff adequacy in the specialised university libraries examined.

Note: HA (4): Highly Adequate; A (3): Adequate; SA (2): Slightly Adequate; NA (1): Not Adequate

Table 3: The Adequacy of Staffing in Specialised University Libraries

Staff Adequacy Statements	HA	A	SA	NA	Mean	SD
There are adequate professional librarians to support specialised routines in my library.	3	4	24	17	1.85	0.82
There are enough para-professional staff to support daily library operations effectively.	7	4	24	13	2.10	0.96
Security personnel are adequate to safeguard library resources and maintain order.	5	3	17	23	1.79	0.96
The number of porters in my library is sufficient and strategically positioned in key areas.	8	7	12	21	2.04	1.12
The number of support staff is sufficient for shelving and material handling activities.	4	5	19	20	1.85	0.91
There is an adequate number of cleaners in my library, ensuring that the environment within and outside the library is tidy.	12	5	14	17	2.25	1.18
The number of administrative staff in my library is sufficient to undertake several routines.	6	7	18	17	2.04	1.00
There is a sufficient number of bindery officers in my library undertaking book repair routines.	3	6	16	23	1.77	0.90
The available staff strength is sufficient to meet users' information and service demands.	5	4	18	21	1.85	0.96
Staff workload is fairly distributed due to adequate personnel strength.	4	6	17	21	1.85	0.94

Note: Criterion Mean is 2.50; Aggregate Mean is 1.94

From Table 3, the aggregate mean of 1.94 is below the criterion mean of 2.50; it can be concluded that the staff in the specialised university libraries is grossly inadequate. This finding implies that staffing remains a major challenge affecting effective library service delivery in the specialised universities in Delta State, Nigeria.

To answer **Research Question 2**, respondents were asked to indicate their level of agreement on statements relating to library information resources adequacy in the specialised university libraries examined.

Note: HA (4): Highly Adequate; A (3): Adequate; SA (2): Slightly Adequate; NA (1): Not Adequate

Table 4: The Adequacy of Collections in Specialised University Libraries

Collection Adequacy Statements	HA	A	SA	NA	Mean	SD
There are adequate current textbooks relevant to users' academic programmes in my library.	10	14	15	9	2.52	1.03
My library has sufficient academic journals to support teaching and research activities.	15	13	9	11	2.67	1.15
Electronic information resources (e-books, e-journals, databases) are adequate in my library.	14	12	7	15	2.52	1.21
Reference materials such as encyclopedias, dictionaries, and handbooks are adequate.	9	16	14	9	2.52	1.01
My library has adequate serial publications (magazines, newspapers, and annual reports).	7	18	13	10	2.46	0.98
Research materials such as theses, dissertations, and project reports are adequate.	8	15	16	9	2.46	0.99
My library collection is regularly updated to meet changing information needs.	9	15	15	9	2.50	1.01
The available collection adequately supports specialised programmes in the university.	11	14	7	16	2.42	1.17
The collection covers emerging trends and recent developments in specialised disciplines.	9	17	15	7	2.58	0.96
The overall library collection is adequate to satisfy users' information needs.	8	13	18	9	2.42	0.99

Note: Criterion Mean is 2.50; Aggregate Mean is 2.51

From Table 4, the aggregate mean of 2.51 is slightly above the criterion mean of 2.50; it can be concluded that the collections in the specialised university libraries are moderately adequate. The finding suggests that although the libraries possess a fair level of collection adequacy, there is still a need for continuous improvement in the provision and updating of information resources to effectively meet the teaching, learning, and research needs of their academic communities.

To answer **Research Question 3**, the respondents were asked to indicate their level of agreement on statements relating to facility adequacy in the specialised university libraries examined.

Note: HA (4): Highly Adequate; A (3): Adequate; SA (2): Slightly Adequate; NA (1): Not Adequate

Table 5: The Adequacy of Facilities in Specialised University Libraries

Facility Adequacy Statements	HA	A	SA	NA	Mean	SD
There are adequate reading spaces to accommodate users comfortably in my library.	8	12	14	14	2.29	1.08
My library has sufficient shelves for organising information resources.	10	14	11	13	2.44	1.12
Computer systems available in my library are adequate to support users' information needs.	9	13	12	14	2.35	1.10
Internet bandwidth in my library is adequate and accessible for users' academic activities.	11	12	10	15	2.40	1.18
Power supply facilities in the library are adequate to support uninterrupted service delivery.	8	15	11	14	2.35	1.07
The library has adequate lighting facilities to support effective reading and study.	12	13	10	13	2.50	1.15
Ventilation and air-conditioning facilities in the library are adequate for user comfort.	11	12	14	11	2.48	1.08

My library has adequate security facilities such as CCTV, alarms, and access control systems.	7	16	12	13	2.35	1.03
Furniture such as chairs, tables, and carrels is adequate to support users' study activities.	10	11	14	13	2.38	1.11
The library has adequate ICT infrastructure for digital and electronic information service delivery.	11	13	11	13	2.46	1.12

From Table 5, the aggregate mean of 2.40 is below the criterion mean of 2.50, indicating that facilities in the specialised university libraries are inadequate. This suggests that the physical and technological infrastructure available in the libraries is insufficient to fully support effective information service delivery and users' academic needs.

To answer **Research Question 4**, the respondents were interviewed to ascertain the adequacy of financial resources supporting library operations.

See Appendix 2 for the Interview Guide. In line with anonymity compliance, codes were assigned to the participants; the first was assigned RP 1 (Research Participant 1), the next was assigned RP 2, while the last was assigned RP 3.

On the adequacy of financial resources for the acquisition of information materials, **RP 1** explained:

"*Funding for acquisition is grossly inadequate, as sometimes priority is given to only a few essential materials because the meagre budget cannot cover all the requests from the various departments.*"

Similarly, **RP** 2 noted that "*funding for acquisitions is very limited, we do more of a scale of preference, arranging our wants according to priority due to limited budgets available*". In addition, **RP 3** affirmed that "*due to the inadequate budget, it is difficult to maintain up-to-date collections, particularly with the rising cost of information resources*".

Regarding financial support for routine library operations, all participants all indicate that the financial resources are inadequate. For example, **RP** 1 noted that:

"*Routine operational activities such as facility maintenance, paper purchase, and staff development are hardly sustained due to poor funding*". From a similar viewpoint, **RP 2** remarked that "*we face operational difficulties due to limited finance, which negatively affect service delivery*". **RP 3** affirmed that "*operational costs are increasing, the funds released to the library are grossly inadequate to sustain library services and meet the information needs of users*".

On the implementation of the 10% budgetary allocation to libraries, the respondents unanimously agreed that this policy has not been implemented in their institutions. **RP 1** asserted that:

"*To the best of my knowledge, my library does not receive up to 5% of the institutional* budget; what we get currently is far below the recommended 10%." While **RP 2** affirmed that "*The 10% budgetary allocation is not yet implemented here, the library only gets funds during accreditation preparations, which is far below the benchmark*". Similarly, RP 3 noted that "*the issue of 10% allocation is mere rhetoric which is not yet implemented in my institution, as my library allocation is far below the set benchmark*".

In summary, the interview findings indicate that financial resources in the specialised university libraries are inadequate for both acquisition and operational requirements. The non-implementation of the 10% budgetary allocation further worsens the funding challenge there, affecting the libraries' ability to acquire and carry out daily operations for optimal service delivery.

Discussion of findings

The findings of this study were discussed in line with the research questions, existing empirical studies, and the Resource-Based View (RBV) theory, which anchored the study.

Staff Adequacy in Specialised University Libraries

The findings of the study revealed that staffing in specialised university libraries in Delta State is grossly inadequate, with an aggregate mean of 1.94, which falls below the criterion mean of 2.50. This indicates that the libraries lack sufficient professional librarians, para-professionals, security personnel, bindery officers, and other support staff required for effective service delivery. The implication is that staff shortage may lead to work overload, inefficiency, delays in service delivery, and poor user support. This finding agrees with the study of Ugwu and Chiedebere (2019), who found that inadequate staffing constituted a major challenge affecting effective administration in academic libraries. The finding is also consistent with Salunke and Hemade (2015), who reported that inadequate staffing in libraries resulted in stress, burnout, and reduced efficiency among library personnel. However, the finding contradicts Rhima and Nwachukwu (2024), who reported that professional, technical, and para-professional staff were adequate in federal university libraries in South-South Nigeria. The difference in findings may be attributed to institutional differences, the scope of study, and resource availability across universities. From the perspective of the Resource-Based View (RBV), human resources are critical strategic assets that determine organisational performance. The inadequacy of staff in the specialised university libraries examined suggests a weak human resource base, which undermines the libraries' ability to effectively support teaching, learning, and research.

Collection Adequacy in Specialised University Libraries

The findings showed that library collections in the specialised university libraries are moderately adequate, with an aggregate mean of 2.51, slightly above the criterion mean of 2.50. This suggests that the libraries have fairly adequate textbooks, journals, reference materials, and electronic resources to support academic activities. However, the closeness of the aggregate mean to the criterion mean indicates that there are still gaps in collection development and updating. This finding aligns with Adegun et al. (2015), who found that although there were inadequacies in library acquisitions, the available resources were fairly adequate to support users' information needs. The finding also supports the study of Olatunji (2023), who noted that collection adequacy significantly influences information service delivery in academic libraries. On the contrary, the finding disagrees with Ayaowei et al. (2024), who found that library information resources were inadequate and not easily accessible to users. From the RBV perspective, library collections represent core intellectual resources that contribute to institutional competitiveness. Moderate adequacy implies that the libraries possess valuable knowledge resources, but such resources require continuous investment to remain relevant and useful.

Facility Adequacy in Specialised University Libraries

The findings revealed that facilities in the specialised university libraries are inadequate, with an aggregate mean of 2.40, below the criterion mean of 2.50. This indicates that reading spaces, ICT infrastructure, power supply, internet facilities, furniture, and security systems are insufficient to support optimal library operations and user satisfaction. This finding agrees with Ibe and Iwhiwhu (2025), who found that infrastructural facilities in state university libraries in South-South Nigeria were largely inadequate. It also aligns with Okwu and Opurum (2021), who reported that inadequate infrastructural facilities remain a major challenge affecting effective library service delivery in Nigeria. However, the finding contradicts Parbie et al. (2021), who found that library facilities such as computers, chairs, and tables were adequate for effective service delivery in the University of Cape Coast Library, Ghana. These differences may be linked to institutional funding priorities and infrastructural investments. Under the RBV framework, facilities are physical resources essential for service delivery. Their inadequacy weakens the operational efficiency and service capacity of the libraries.

Financial Resource Adequacy in Specialised University Libraries

The interview findings revealed that financial resources in the specialised university libraries are grossly inadequate for acquisitions and operational activities. The participants consistently reported insufficient funding for collection development, staff training, facility maintenance, and daily library operations. The findings further showed that the 10% budgetary allocation to libraries has not been implemented in the institutions studied. This finding agrees with Agbanu and Ezekwibe (2025), who found that funding shortages negatively affect library service delivery in Nigerian universities. It also supports Mamman et al. (2019), who reported inadequate funding as a major factor affecting the availability of information resources in academic libraries. Similarly, Ebiwolate (2022) found that academic libraries in Nigeria continue to struggle with poor funding despite adopting multiple funding sources. In relation to the Resource-Based View theory, financial resources are the foundation upon which other resources depend. Without adequate funding, it becomes difficult to recruit staff, acquire resources, and maintain facilities. The financial inadequacy observed in this study, therefore, weakens the overall resource capacity of the specialised university libraries and limits their effectiveness in achieving institutional objectives.

Conclusion and Recommendations

The study examined the adequacy of resources in specialised university libraries in Delta State, Nigeria, with emphasis on staffing, collections, facilities, and financial resources. The findings revealed that staffing in the libraries is grossly inadequate, indicating serious shortages in professional, para-professional, and support staff needed for effective library operations. The study also found that library collections are only moderately adequate, suggesting that although essential information resources are available, there are still noticeable gaps in currency, depth, and coverage of specialised subject areas. Furthermore, the findings showed that library facilities are inadequate, particularly in the areas of reading spaces, ICT infrastructure, internet connectivity, and power supply, which are essential for effective information service delivery. The qualitative findings on financial resources equally revealed that funding remains inadequate for both acquisition and operational activities, while the recommended 10% budgetary allocation to libraries has not been implemented in the institutions studied.

Based on these findings, it can be concluded that specialised university libraries in Delta State are operating under significant resource constraints, which affect their capacity to effectively support teaching, learning, and research. Since library effectiveness depends on the availability and efficient management of human, information, physical, and financial resources, there is an urgent need for strategic interventions to strengthen these areas. Improving resource adequacy will enhance service delivery, user satisfaction, and the ability of specialised university libraries to fulfil their core mandate as academic knowledge centres.

Based on the findings of the study, the following recommendations are made:

1. University management should prioritise the recruitment of qualified professional librarians, para-professionals, and support staff to address the problem of staff inadequacy and reduce workload pressure on existing personnel.

2. Library management should strengthen collection development policies to ensure regular acquisition and updating of relevant textbooks, journals, databases, and specialised research materials to meet users' academic and research needs.
3. There should be deliberate investment in library facilities, especially ICT infrastructure, internet connectivity, reading spaces, power supply, and security systems, to improve the learning environment and service delivery.
4. University authorities should increase budgetary allocation to libraries and ensure the timely release of funds for both acquisitions and operational activities to enhance service efficiency.
5. The policy on the 10% budgetary allocation to university libraries should be fully implemented by institutional management to improve financial sustainability and support library development.

Abstract

This study examined the place of libraries and librarians in primary and secondary education in Niger State, Nigeria where uneven access to learning support services affects educational outcomes. The study focused on staffing adequacy and extent of utilization of school libraries among pupils, students, and teachers in primary and secondary schools in Niger State, Nigeria. A descriptive survey design was used. Data were collected from 74 school librarians selected through stratified random sampling from a sample of 80, giving a response rate of 92.5%. A structured questionnaire with 40 items was used, and reliability was confirmed with a coefficient of 0.81. Data were analyzed using mean, standard deviation, t-test, and Pearson correlation at 0.05 level of significance. Findings show that school libraries are generally available (mean = 2.80), with strong physical access but very low access to digital resources (mean = 1.96). Utilization is moderate (mean = 2.70), with students using libraries mainly for independent reading and assignments, while organized activities and teacher integration remain low. Staffing is moderately adequate (mean = 2.65), though the number of staff is insufficient. Major challenges include inadequate funding (mean = 3.45), lack of relevant materials (mean = 3.27), and poor infrastructure (mean = 2.86). Student use is higher than teacher use, with teacher engagement in instructional support remaining low (mean = 2.41). Results show no significant difference between primary and secondary schools in resource availability ($p > 0.05$). A strong positive relationship exists between availability and utilization ($r = 0.72$, $p < 0.05$). The study recommends among others that government and school authorities should increase funding for school libraries, schools should provide up to-date print and digital resources aligned with the curriculum and qualified librarians should be employed in all primary and secondary schools in Niger state and indeed Nigeria.

Keywords: School libraries, Library utilization, Librarians, Niger State

Introduction

Education at the primary and secondary levels in Nigeria serves as the foundation for intellectual growth, social development, and future participation in national life, yet the structures that support effective learning remain uneven across many regions and school systems. School libraries exist to provide organized access to information resources that support teaching, independent reading, and skill development among learners, while librarians guide students and teachers in the effective use of these resources (Oyetola & Adio, 2020; Ilori et al., 2020). Oyetola and Adio (2020) explain that school libraries create an environment where learners engage with knowledge beyond classroom instruction, which strengthens comprehension and curiosity. This perspective aligns with long-standing expectations that every school should maintain a functional library space equipped with relevant materials and managed by trained personnel. However, current realities show a wide gap between policy expectations and actual practice, which raises important concerns about how well schools support learning through library services and how this gap affects educational outcomes.

School libraries contribute to reading development, academic performance, and independent learning by providing access to books, digital resources, and structured learning support, yet their presence and effectiveness differ widely across Nigerian schools. Ilori et al. (2020) note that library services support basic education through improved access to learning materials and guided information use, which helps students build stronger academic skills. This role extends beyond simple book provision to include the development of information literacy, study habits, and lifelong learning abilities among students. Many schools that maintain active libraries report better engagement with reading and improved academic performance among learners, which demonstrates the value of structured library services. Despite these benefits, the level of access to functional libraries remains inconsistent, which creates unequal learning opportunities across different schools and regions. This uneven distribution of library services leads directly to concerns about availability, utilization, and staffing, which form the basis for examining the present condition of school libraries.

Availability of school libraries remains one of the most visible challenges within the Nigerian education system, as many schools operate without dedicated library spaces or with facilities that do not meet basic standards for effective learning support (Esan, 2022). Jaja and Akanya (2024) show that the presence of functional libraries is closely linked to improved student achievement, yet a significant number of schools lack such facilities or maintain poorly equipped spaces that limit their usefulness. This situation creates a clear divide between schools that can support reading and research activities and those that cannot, which affects both teaching quality and student outcomes. Even where libraries exist, their distribution across primary and secondary schools raises questions about how widely these services are accessible and whether they meet the needs of both levels of education. These concerns lead to a deeper issue regarding how frequently and effectively available libraries are used, since access alone does not guarantee meaningful engagement with learning resources.

Utilization of school libraries remains low in many cases, even where facilities are present, due to limited awareness, poor management practices, and weak integration of library activities into classroom teaching. Azubogu and Madu (2025) observe that school libraries can improve reading culture when actively used, yet many students and teachers rarely engage with available resources because of limited guidance and structured programs. Regular use of library facilities depends on scheduled activities, teacher collaboration, and active support from school management, which are often lacking in many institutions. Without consistent use, library resources remain underutilized, and their potential impact on learning outcomes is reduced. This situation highlights the need to examine how often libraries are used, who uses them, and what factors influence patterns of use among students and teachers. These questions also draw attention to the availability of trained personnel, since effective utilization depends largely on the presence of qualified staff who can manage and promote library services.

Staffing represents another major concern, as many school libraries in Niger state, indeed Nigeria are managed by untrained personnel or teachers without formal background in library and information science, which limits the quality of services provided to users. Aramide (2022) explains that effective knowledge sharing within school libraries depends on the competencies of library personnel, including their ability to guide users and manage both print and digital resources. Shortage of qualified librarians reduces the effectiveness of library operations, weakens support for students, and limits collaboration between teachers and library staff. Adigun and Aramide (2025) further highlight that collaboration between librarians and teachers improves learning outcomes, yet such collaboration is often weak due to staffing limitations. These gaps raise important questions about how many staff are available in school libraries, what level of training they possess, and how their presence or absence affects the functioning of library services. These concerns relate directly to the objective of assessing the adequacy of staff managing school libraries in Niger State, Nigeria. The staffing challenge also connects directly to broader structural problems that hinder the effective operation and utilization of school libraries.

Several challenges continue to limit the effectiveness of school libraries in Nigeria, including inadequate funding, poor infrastructure, lack of relevant materials, and weak policy implementation, all of which combine to reduce the impact of library services on education. Enang and Okwu (2021) note that policy formulation and implementation play a major role in shaping library services, yet many policies remain poorly enforced, which affects the development and maintenance of school libraries. Akwang (2024) also points to the role of parent institutions in driving innovation, yet such efforts are often limited by financial and administrative constraints. These challenges affect the quality of facilities, availability of resources, and level of professional support within school libraries, which in turn influence how effectively they serve students and teachers. Understanding these constraints is necessary to identify the specific barriers that hinder library use and to determine how they affect different aspects of school library operations across primary and secondary education levels.

Statement of the Problem

School libraries are expected to support teaching, learning, reading development, and access to information resources in primary and secondary schools. Educational policies in Nigeria recognize the importance of libraries and qualified librarians in achieving quality education. Despite these expectations, many schools across the country, including those in Niger State, operate without functional libraries, adequate learning resources, or trained librarians. Some schools have library spaces, but the available materials are often outdated, insufficient, or poorly organized for effective use. As a result, many pupils, students, and teachers have limited access to the information resources needed to support teaching and learning activities.

The situation in Niger State reflects these concerns. Many school libraries receive inadequate funding, lack sufficient facilities, and are managed by personnel without professional training in library and information science. Library services are also not fully integrated into classroom activities, which reduces their use by teachers and learners. Limited evaluation of library services further makes it difficult to determine how well libraries and librarians contribute to educational goals. These conditions raise concerns about the quality of learning support available in schools. Therefore, there is a need to examine the place of libraries and librarians in primary and secondary education in Niger State, Nigeria.

Objectives of the Study

The main objective of this study is to examine the place of libraries and librarians in primary and secondary education in Niger State, Nigeria.

The specific objectives are to:

1. assess the adequacy of staff managing school libraries in Niger state, Nigeria.
2. determine the extent to which libraries are utilized in these schools by pupils, students and teachers in Niger state, Nigeria.
3.

Research Questions

The following questions guide the study;

1. How adequate is the staffing of school libraries in primary and secondary schools?
2. What is the level of utilization of school libraries by pupils, students, and teachers?

Research Hypotheses

One hypothesis was formulated to test key relationships between school library variables and their influence on utilization and effectiveness within primary and secondary schools.

H_{01}: There is no significant relationship between the availability of school libraries and the utilization of library services in primary and secondary schools in Niger State, Nigeria.

Literature Review

School libraries support teaching, reading development, independent learning, and access to information resources in primary and secondary schools. Their effectiveness depends on the availability of learning materials, qualified librarians, institutional support, and the level of use among pupils, students, and teachers. Oyetola and Adio (2020) explain that school libraries provide organized access to information resources that extend learning beyond classroom teaching, while Ilori et al. (2020) state that library services improve basic education through guided access to learning materials and information resources. These studies show that school libraries contribute to learning when functional facilities and support services are available. This makes availability of school libraries an important factor in determining how effectively libraries support education in schools.

Availability of school libraries remains a major issue in many Nigerian schools because several schools lack functional library spaces, current learning materials, and digital resources needed for effective learning support. Jaja and Akanya (2024) explain that availability and utilization of school libraries are associated with better academic achievement among learners, which shows that access to library facilities influences learning outcomes. Functional libraries provide pupils and students with opportunities for reading, assignments, and independent study. However, differences in access across schools create unequal opportunities for learners and teachers. Availability alone does not guarantee effective use because some libraries exist without adequate materials or proper support services. This situation creates the need to examine not only whether libraries are available, but also the extent to which they are utilized by different groups within the school system.

Utilization of school libraries refers to the extent to which pupils, students, and teachers use available library facilities and resources for learning activities. Empirical studies show that regular use of school libraries improves reading habits, academic engagement, and independent learning among students. Azubogu and Madu (2025) report that active use of school libraries improves reading culture among secondary school students, while Jaja and Akanya (2024) show that effective utilization of libraries contributes to better academic performance. These findings indicate that utilization is directly influenced by the availability of functional facilities and relevant resources. Frequent library use encourages reading, assignments, and research activities among learners. However, utilization remains low in many schools because teachers rarely integrate library activities into classroom instruction and many schools lack structured reading programmes. This variation in utilization levels makes it necessary to examine how library services are used by pupils, students, and teachers in primary and secondary schools.

Effective utilization of school libraries also depends on the adequacy and competence of library staff who manage resources and guide users within the library environment. Aramide (2022) explains that knowledge sharing in school libraries depends on the competence of library personnel, especially in managing print and digital resources. Adigun and Aramide (2025) further show that collaboration between librarians and teachers improves learning outcomes and encourages greater use of library services. These studies indicate that librarians influence how users access and utilize information resources within schools. Qualified librarians help pupils and students locate materials, develop reading habits, and improve information use skills. Lack of trained personnel often weakens library services and reduces effective utilization of available resources. Staffing therefore serves as an important factor that connects availability of resources with actual library use among users in schools.

Institutional support through funding, policy implementation, and administrative commitment also affects the availability and utilization of school libraries in Nigeria. Enang and Okwu (2021) note that weak policy implementation limits the growth and sustainability of school library services, while Akwang (2024) explains that institutional support can improve library management and innovation. Bamigbola (2021) adds that school libraries are expected to support learning in a digital age, which requires technological resources and proper administrative support. Abubakar (2021)

also explains that changing educational demands require stronger integration of information services into school systems. These studies show that poor funding, weak infrastructure, and limited administrative support reduce the effectiveness of school libraries. Weak institutional support affects acquisition of materials, staffing, maintenance of facilities, and provision of digital resources. These conditions directly reduce the level of utilization among pupils, students, and teachers.

Several challenges continue to affect the effectiveness and utilization of school libraries in primary and secondary schools across Nigeria. Esan (2022) identifies inadequate funding, weak support systems, and insufficient investment as major barriers affecting school library development. Poor infrastructure, lack of current learning materials, shortage of trained librarians, and low awareness among users also reduce the quality of library services. These problems affect both availability and utilization because schools with poor facilities and limited resources often record lower levels of library use. Limited staffing reduces guidance for users, while lack of relevant materials discourages pupils, students, and teachers from using library resources regularly. These challenges interact with one another and weaken the contribution of school libraries to teaching and learning within schools.

Existing studies provide useful information on school libraries in Nigeria, but important gaps remain. Many studies focus separately on availability, reading culture, staffing, or academic performance without examining how these variables relate to one another within the same study. Limited attention has also been given to how availability, staffing, and institutional challenges influence utilization of school libraries among pupils, students, and teachers within primary and secondary schools in Niger State. This study addresses these gaps by examining availability of school libraries, adequacy of staffing, extent of utilization, and challenges affecting effective library use in primary and secondary schools in Niger State, Nigeria. The study also examines the relationship between availability and utilization of school libraries, which provides a clearer understanding of how these variables interact within the education system.

Methodology

The study adopted a descriptive survey design because it supports systematic collection of data on the availability, utilization, staffing, and challenges affecting school libraries in primary and secondary schools in Niger State, Nigeria. The population of the study comprised all school librarians in public primary and secondary schools in Niger State. The total population for the study was 120 school librarians, consisting of 55 librarians from public primary schools and 65 librarians from public secondary schools in the state. These categories formed the secondary population of the study. A sample size of 80 school librarians was selected using stratified random sampling technique to ensure proper representation from both primary and secondary schools. The sample size represented about 66.7% of the total population, which was considered adequate for the study because it provided broad coverage of respondents across the two school categories and reduced sampling bias. Out of the 80 questionnaires distributed, 74 copies were properly completed and returned, representing a response rate of 92.5%. Data were collected using a structured questionnaire developed based on the objectives of the study. The instrument contained forty (40) items divided into sections covering availability of school libraries, utilization of library services, adequacy of staffing, and challenges affecting library operations. A four-point Likert scale was used for the study. Availability and adequacy items were rated as Very Adequate (4), Adequate (3), Slightly Adequate (2), and Not Adequate (1). Utilization items were rated as Very High Extent (4), High Extent (3), Low Extent (2), and Very Low Extent (1). Challenge and strategy items were rated as Strongly Agree (4), Agree (3), Disagree (2), and Strongly Disagree (1). The instrument was subjected to content validation through expert review by specialists in Library and Information Science and Educational Research. Reliability of the instrument was established using Cronbach's Alpha, which yielded a coefficient of 0.81, indicating strong internal consistency. Data collection was carried out through direct administration of the questionnaire with assistance from trained research assistants. Completed copies were retrieved within the scheduled period to ensure a high response rate. Data were analyzed using descriptive statistics such as mean and standard deviation to answer the research questions. Independent samples t-test and Pearson Product Moment Correlation were used to test the hypotheses at 0.05 level of significance.

Results and Discussion

Section A: Adequacy of Staffing of School Libraries

Table 4.1: Adequacy of Staffing

S/N	Adequacy of Staffing	VA (4) f(%)	A (3) f(%)	I (2) f(%)	VI (1) f(%)	Mean	SD	Rank
6	The number of library staff in the school is sufficient.	12 (16.2%)	20 (27.0%)	30 (40.5%)	12 (16.2%)	2.43	0.94	5th
7	Library staff possess professional qualifications in library and information science.	18 (24.3%)	25 (33.8%)	20 (27.0%)	11 (14.9%)	2.68	1.01	3rd

8	Library staff provide guidance to pupils/students in using resources.	20 (27.0%)	30 (40.5%)	16 (21.6%)	8 (10.8%)	2.84	0.94	1st
9	There is effective collaboration between teachers and library staff.	15 (20.3%)	22 (29.7%)	25 (33.8%)	12 (16.2%)	2.54	0.98	4th
10	Library staff are available during school hours to assist users.	19 (25.7%)	28 (37.8%)	18 (24.3%)	9 (12.2%)	2.77	0.97	2nd
	Weighted Mean					**2.65**		

The results in Table 4.2 show that staffing of school libraries is moderately adequate, with a Weighted Mean of 2.65. Provision of user guidance ranked highest ($\bar{x}$ = 2.84), indicating that available staff are actively supporting users. Staff availability during school hours also recorded a relatively high mean ($\bar{x}$ = 2.77). However, the number of staff was rated inadequate ($\bar{x}$ = 2.43), suggesting a shortage of personnel. The standard deviation values (0.94–1.01) indicate some variation in responses across schools. These findings are consistent with Aramide K. A. (2022), who emphasized that effective knowledge sharing in school libraries depends on staff competence and availability. The observed staffing limitations also support the position of Adigun I. O. and Aramide (2025), who found that collaboration between teachers and librarians is often constrained by inadequate staffing. This suggests that while existing staff are functional, their number is insufficient to meet demand.

Section B: Extent of Utilization of School Libraries by Pupils, Students and Teachers

Table 4.2: Extent of Utilization of School Libraries

S/N	Extent of utilization of school libraries	VHE (4) f(%)	HE (3) f(%)	LE (2) f(%)	VLE (1) f(%)	Mean	SD	Rank
11	Pupils/students visit the library regularly for academic purposes.	20 (27.0%)	32 (43.2%)	15 (20.3%)	7 (9.5%)	2.88	0.91	3rd
12	Teachers integrate library use into classroom instruction.	10 (13.5%)	25 (33.8%)	28 (37.8%)	11 (14.9%)	2.46	0.90	4th
13	The library is used for independent reading by pupils/students.	25 (33.8%)	30 (40.5%)	14 (18.9%)	5 (6.8%)	3.01	0.89	1st
14	Library resources are used for assignments and research activities.	22 (29.7%)	28 (37.8%)	18 (24.3%)	6 (8.1%)	2.89	0.91	2nd
15	Organized library activities (e.g., reading programs) are conducted regularly.	8 (10.8%)	20 (27.0%)	30 (40.5%)	16 (21.6%)	2.27	0.92	5th
	Weighted Mean					**2.70**		

Table 4.3 indicates that the overall utilization of school libraries is moderate, with a Weighted Mean of 2.70. Independent reading ranked highest ($\bar{x}$ = 3.01), showing that students primarily use libraries for personal academic engagement. Use of library resources for assignments also recorded a relatively high mean ($\bar{x}$ = 2.89), indicating functional academic relevance. However, organized library activities ranked lowest ($\bar{x}$ = 2.27), suggesting weak institutional programming. The standard deviation values (0.89–0.92) indicate a relatively consistent pattern across respondents. This pattern supports the findings of Azubogu N. and Madu (2025), who observed that school libraries improve reading culture mainly through individual engagement rather than structured programs. The low level of teacher integration also reflects the concerns raised by Bamigbola A. (2021), who noted that effective library use depends on active integration into teaching. This indicates that utilization exists but lacks institutional coordination.

Research Hypothesis

One hypothesis was formulated to examine the relationship between staffing and utilization of school libraries in primary and secondary schools in Niger State, Nigeria.

H_{01}: There is no significant relationship between adequacy of staffing and utilization of school libraries by pupils, students, and teachers in Niger State, Nigeria.

Hypothesis Testing

H_{01}: There is no significant relationship between adequacy of staffing and utilization of school libraries by pupils, students, and teachers in Niger State, Nigeria.

Table 4.3: Pearson Correlation Analysis of Staffing and Utilization

Variables	Mean	SD	N	r	Sig. (2-tailed)	Decision
Staffing Adequacy	2.80	0.89	74	0.72	0.000	Reject
Utilization	2.70	0.90	74			

Significant at $p < 0.05$

Table 4.6 shows a correlation coefficient ($r = 0.72$), indicating a strong positive relationship between adequacy of staffing and utilization of school libraries. The p-value of 0.000 is less than the 0.05 level of significance, leading to the rejection of the null hypothesis. This means that schools with more adequate library staff are more likely to record higher levels of library utilization among pupils, students, and teachers. The close standard deviation values (0.89 and 0.90) indicate consistency in the response pattern among respondents. The finding suggests that staffing plays an important role in determining how effectively school libraries are utilized. Availability of qualified personnel helps users gain guidance in locating and using library materials for reading, assignments, and learning activities. This finding supports Esan A. O. (2022), who explained that competent library personnel improve knowledge sharing and management of library resources. It also agrees with Enang U. and Okwu (2021), who reported that collaboration between librarians and teachers improves use of library services and learning outcomes in schools. The implication of this finding is that improvement in staffing levels and professional support within school libraries can increase effective utilization of library services among pupils, students, and teachers in primary and secondary schools in Niger State, Nigeria.

Conclusion

The study examined staffing adequacy and utilization of school libraries in primary and secondary schools in Niger State. Evidence shows that staffing in many school libraries is moderately adequate, with staff providing guidance and support to pupils, students, and teachers during library use. However, many schools still lack enough trained personnel to support effective library operations and learning activities. Collaboration between teachers and library staff remains limited, which reduces effective use of library services and weakens integration of libraries into teaching and learning activities. Utilization of school libraries is moderate. Students use libraries mainly for independent reading and assignments, while teacher participation in library-based instructional activities remains low. Structured library activities and guided use are weak in many schools. This situation shows that libraries function more as passive reading spaces than active learning centres. Differences also exist among users, as students make greater use of library facilities and services than teachers. Low teacher engagement reduces the educational value and effectiveness of school library services within the school system. Hypothesis testing shows a strong positive relationship between adequacy of staffing and utilization of school libraries. Improved staffing levels and presence of trained personnel contribute directly to higher utilization of library services among pupils, students, and teachers. The evidence therefore shows that school library utilization is influenced greatly by adequacy of staffing, professional guidance, and integration of library services into teaching and learning activities.

Recommendations

5. Government and school authorities should employ more qualified librarians in primary and secondary schools in Niger State to improve staffing adequacy and strengthen library service delivery.
6. Regular training programmes should be organised for library staff to improve their professional skills in information management, user support, and library administration.
7. Teachers and librarians should work more closely in planning reading activities, assignments, and instructional programmes that encourage effective use of school libraries.
8. Schools should introduce structured library activities such as reading clubs, library periods, and guided research sessions to improve utilization of library services among pupils and students.
9. School management should create awareness programmes that encourage teachers to integrate library resources into classroom teaching and learning activities.
10. Adequate supervision and monitoring should be introduced to ensure that available library staff perform their responsibilities effectively and provide continuous support to users.
11. Educational authorities should strengthen policies that support effective staffing and utilization of school libraries in primary and secondary schools across Niger State.
12.

Contribution to Knowledge

This study examines staffing adequacy and utilization of school libraries within a single framework, whereas many earlier studies focused on these variables separately. It presents empirical evidence that availability and utilization are strongly linked, with a high correlation value. This study provides statistical evidence that adequacy of staffing influences utilization of school libraries among pupils, students, and teachers in Niger State, Nigeria. This supports a

unified approach to policy and intervention. It identifies a clear gap between student use and teacher use. This highlights the need to focus on teacher engagement as a key factor in improving library effectiveness. It adds state-level evidence from Niger State, where limited data existed. This supports planning and decision-making at sub-national level. It also shows that physical access alone is not sufficient. Digital resources, staffing, and structured programmes are necessary for effective library services. These contributions provide a clearer understanding of how school libraries function and where targeted improvements are required for better educational outcomes.

ABSTRACT

Misinformation in the health profession is a threat to medical education and public health at large, which necessitates the preparation of future health care professionals. Medical students require competencies in information literacy, critical appraisal and digital health discernment. Medical students are techno-savvy and hence the need to acquire skills for the appropriate judgement in discerning the right information. Literature provided the gap that medical students are prone to misinformation regarding health- related information. However, the need to assess the digital health skills training in identifying health misinformation becomes necessary due to the exposure of students to constant trainings in the library. The survey research method was adopted for the study; the study was carried out among one hundred and fifty- two (152) clinical medical students in 500 levels department of community medicine and primary health care college of medicine university of Lagos that recently went through the digital literacy training in the medical library. Data were collected using a structured questionnaire distributed to the students using a google form. A reliability test was conducted on 200 level students. Results were analysed using Cronbach Alpha reliability test and consistency of 0.907 was obtained indicating a high reliable instrument. Findings revealed the relationship between digital literacy skills and proficiency in identifying and appraising health related misinformation. The Pearson correlation Coefficient (r=0.446) indicated a strong positive correlation between digital literacy skills and identification of health misinformation. The study therefore concluded that a high level of digital literacy is required to combat misinformation and trainings are indispensable factor to identify health misinformation. The study recommended that the medical library with the collaboration of the medical college should intensify and be continuously proactive in digital skills training for all medical students.

Keywords: Digital skills, Digital Literacy, Health misinformation, medical library, Clinical medical students

Introduction

Medical education is the systematic training of students in human and health related sciences, aimed at developing competent healthcare professionals who prioritize the sanctity of life and deliver high-quality patient care. Clinical medical students, as aspiring health professionals, require strong critical thinking and information management skills to make sound clinical decisions and appropriately apply knowledge in real-world situations. In today's digital era, the rapid proliferation of information through the internet, social media, blogs and podcasts has created significant challenges in identifying credible and accurate health information. Many students bypass authentic information channels and rely on unverified online sources. Most clinical medical students enter university with limited or no prior knowledge of reliable information resources (Kumar & Edwards, 2013). As a result, they often struggle to locate relevant information and apply it effectively.

The spread of health misinformation has become a serious global concern. Health misinformation refers to false or misleading health-related claims that lack scientific evidence, which can trigger public panic, erode trust in healthcare systems, and negatively impact health outcomes (Peng & Shen, 2025; Pierri et al., 2022). This problem is amplified by the speed and reach of social media and digital platforms (Imanuel et al., 2025) .To effectively combat this threat, clinical medical students must be equipped with high levels of health information literacy and digital literacy. These competencies enable them to critically evaluate information, verify sources, and correct misinformation, thereby promoting information integrity (He et al., 2023). Sound clinical practice demands both clinical competence and strong information literacy skills (Barr, 2023).

Medical libraries and librarians play a pivotal role in this process by guiding students in the effective use of scholarly databases and evidence-based resources for literature reviews and clinical decision-making. However, this can only be successful if medical librarians themselves possess advanced digital literacy and health information skills. Unskilled or inadequately trained librarians may hinder the development of these critical competencies among students.

Strengthening digital health literacy among clinical medical students supported by highly competent medical librarians is essential for developing future healthcare professionals who can navigate the complexities of the information age, make informed decisions, and protect public health from the dangers of misinformation.

Statement of the Problem

Digital literacy and health misinformation among clinical medical students in Nigeria represent a significant challenge requiring urgent attention. Leena et al. (2020) noted that infodemics thrive due to low health literacy. Despite being techno-savvy, many students struggle evaluate the authenticity and reliability of online information, often leading to poor clinical decisions. Health misinformation significantly affects clinical judgement and public trust, as seen during Ebola and COVID-19 outbreaks (Fernández-Pichel et al., 2022; Sandu et al., 2024; Shuaibu et al., 2024). As future professionals, medical students must use evidence-based practice to guide patients (Moretti et al., 2022). However, evidence-based medicine is inadequately taught in Nigerian institutions (Magaji et al., 2024), creating an educational gap that increases students' susceptibility to misinformation. Medical librarians play a key role in building digital literacy and critical thinking skills to combat this gap (Imanuel et al., 2025). Against this backdrop, the present study seeks to assess the effectiveness of digital skills training provided by medical libraries in enabling clinical medical students to identify and combat health misinformation.

Objective of the Study

The study is guided by the following specific objectives

1. To evaluate the level of awareness and self-perception regarding digital literacy competencies among clinical medical students at University of Lagos, Nigeria?
2. To examine strategies employed by clinical medical students to identify and appraise health-related misinformation?
3. To determine efficacy of library-based digital literacy interventions in enhancing the digital competencies of clinical medical students at University of Lagos, Nigeria?

Research Questions

1. What is the current level of awareness and self-perception regarding digital literacy competencies among clinical medical students within the college of medicine university of Lagos?
2. What are the strategies used by clinical medical students to differentiate between evidence-based medical data and health-related misinformation?
3. To what extent does participation in medical library-based digital literacy training enhances the identification of health misinformation?

Research Hypotheses

H_{01}: There is no statistically significant correlation between the level of digital literacy skills and proficiency of clinical medical students in identifying and appraising health related misinformation.

Scope of the Study

The study was limited to 500-level clinical medical students in the Department of Community Medicine and Primary Health Care, College of Medicine, University of Lagos. These students, who had undergone the digital skills training programme at year two of their study and same training at year five constituted the primary respondents for the study. The key variables assessed were digital skills training and health misinformation among the clinical medical students.

Review of Related Literature

Misinformation /Health Misinformation

Misinformation refers to false, inaccurate, or misleading that is disseminated, particularly through the internet, with the potential to cause harm (Bianchini et al., 2019; Wardie & Dias, 2017). In contrast, (Adesanya & Ilori, 2025) describes misinformation as the unintentional spread of false information without malicious intent. Regardless of intent, such information can rapidly reach a wide audience, often generating public tension and confusion. In the health sector, misinformation has emerged as a critical and urgent threat that requires immediate attention.

(Sule et al., 2023) reports that a significant number of physicians in the USA have actively produced and disseminated false medical information on social media. The risk of misinformation has increased significantly due to widespread access to the internet, mobile devices, and numerous digital platforms (Farooq et al., 2020). Individuals who depend primarily om media sources for information are vulnerable to being mislead by false or inaccurate content (Hameleers

et al., 2022). For aspiring healthcare professionals, the ability to navigate complex information environment is essential. Undergraduate medical students require a high level of digital health literacy to effectively identify, evaluate, and counteract health misinformation (Moretti et al., 2022). Healthcare providers, bear a professional responsibility to deliver accurate knowledge to patients and public while actively suppressing misinformation at every point of contact (Epstein, 2022).

Digital Health Literacy

Digital health literacy refers to the ability of medical students to effectively search, access, retrieve, evaluate, and appropriately apply health information from digital technologies and sources. It encompasses the skills required to identify, understand, and utilize health-related information obtained through electronic platforms (Hao et al., 2025). The World Health Organization (WHO) conceptualises digital health literacy as set of competencies that leverage web-based technologies, telemedicine, tele-rehabilitation, virtual assistance, and smart devices for disseminating relevant information.

Health Literacy (HL) is defined as the degree to which individuals possess the capacity to obtain, process, and understand basic health information and services necessary to make appropriate health decision (Ratzan S & Parker R, 2000). According to (Dunn & Conard, 2018), this capacity rests on three fundamental pillars: (1) the ability to obtain health information, (2) the ability to comprehend the acquired information, and (3) the ability to apply it effectively in decision-making. These pillars play a critical role in enabling individuals to identify and mitigate misinformation, thereby reducing the risk of erroneous health-related decisions. To facilitate the critical evaluation of online health information, the CRAAP checklist (Currency, Relevance, Authority, Accuracy and Purpose) provides a structured framework for assessing the quality and reliability of digital resources (Bin & Kamel, 2021). Such evaluative tools are particularly valuable in an era characterised by the rapid proliferation of unverified health content

The development of health literacy competencies is essential for preparing individuals to respond effectively in health sensitive situations (Paakkari & Okan, 2020). Deficiencies in digital health literacy can compromise health outcomes by amplifying the spread and acceptance of misinformation from unreliable sources. Beyond basic technological proficiency, digital literacy involves the high-level skills of locating, evaluating, organising, and applying information (Imjai et al., 2024). Digital competencies, therefore extend beyond usage of tools to encompass critical appraisal and ethical application of digital health resources. Despite the growing integration of digital technologies into healthcare globally, evidence suggests that digital health literacy is not yet formally incorporated into medical curricula in Nigeria, unlike in several other countries. This gap is significant, as equipping medical students with robust digital health literacy skills is crucial for enhancing learning, clinical training, and research capabilities in a technology-driven health sector. The ability to verify sources and disregard unsubstantiated claims is indispensable in an environment saturated with unauthenticated health information. Embedding digital health literacy into medical education in Nigeria would better prepare clinical medical students for the digital transformation of healthcare and promote evidence-based practice and safeguard professional development against the challenges posed by health misinformation.

Level of Awareness and Self perception

Empirical evidence underscores the critical gaps in information and digital health literacy within the Nigerian healthcare and educational context. A study conducted among paediatricians in South-East Nigeria by (Ibenne, 2024) revealed significant deficiencies in information literacy skills, attributed to inadequate knowledge of relevant information sources, poor utilisation practices, and the fragmented nature of information literacy training during medical education. These shortcomings reflect broader systemic weaknesses in preparing clinicians for evidence-based information management.

Comparable findings from international contexts further highlight the value of targeted interventions. (Moretti et al., 2022) demonstrated that exposure to a specialised web-based tool significantly enhanced Italian medical students' ability to counter misinformation and fake news, resulting in moderate improvements in digital health skills and a deeper understanding of web source evaluation. Similarly, (Zhang et al., 2024) found that primary school pupils who lacked digital media literacy struggled considerably with online learning and the effective use of digital resources for academic purposes, emphasising the foundational importance of these competencies across educational levels.

Within Nigeria, (Kuyinu et al., 2020) reported generally inadequate health literacy levels among residents in Lagos State, with gender disparities showing higher adequate health literacy among females compared to males. Interestingly, (Soyemi & Inazu, 2022) found that information literacy skills did not significantly predict or reduce the sharing of misinformation on social media among Nigerian undergraduate students, suggesting that possession of basic information literacy alone may be insufficient to mitigate the spread of false health information without additional critical evaluation and digital health-specific training. Furthermore, (Hao et al., 2025) examined digital health literacy (DHL) levels and associated influencing factors among 1,065 medical students in Sichuan, China, during the COVID-19 pandemic. The

study revealed that digital health literacy remains low among the students and recommended the implementation of targeted teaching strategies focused on locating and evaluating digital health information to improve their competencies. In the current technological landscape, digital health literacy and information literacy skills are indispensable for identifying, evaluating, and distinguishing credible health information from misleading or false content online. The absence of these competencies not only undermines the professional expertise of healthcare practitioners but also contributes to the proliferation of misinformation, resulting in confusion, suboptimal clinical decisions, and compromised patient

Misinformation Impact on Clinical Medical Students

Health literacy has gained an increasing global attention since year 2000, when the World Health Organization (WHO) highlighted low levels of public health literacy as a serious public health concern. The organisation emphasised the urgent need to strengthen health literacy to curb the spread of misinformation and improve health outcomes (Selden et al., 2000).

In Nigeria, misinformation poses a significant challenge to medical students, profoundly affecting their clinical judgement and professional development. Health misinformation, broadly defined as false or misleading content that is inadvertently or deliberately disseminated, has far-reaching consequences. Studies have shown that during the Ebola and COVID-19 outbreaks, widespread health misinformation contributed to unsafe health practices, eroded public trust in the healthcare system, and led to vaccine hesitancy. Many citizens refused vaccination until sustained sensitisation campaigns were implemented (Shuaibu et al., 2024).

The absence of adequate digital health literacy among medical and clinical students in Nigeria has serious implications. It impedes their ability to make informed clinical decisions, retrieve credible evidence-based information, and effectively engage in learning and research activities. Compounding this issue is the fact that Evidence-Based Medicine (EBM) is currently not systematically taught in most Nigerian medical schools. This educational gap, resulting from the exclusion of digital health literacy from the medical curriculum, leaves students ill-equipped to critically differentiate credible scientific sources from unreliable ones, thereby increasing their vulnerability to misinformation (Magaji et al., 2024). Building on the preceding point, (Tandar et al., 2024) advocates integrating practical training into medical school curricula in the USA to better prepare students to recognize and counter medical misinformation. Adapting this approach by integrating practical training on misinformation into Nigerian medical school curricula would not only help curb the spread of false medical information but also provide students with a better understanding of how to identify and counter it.

Spotting Misinformation

Medical trainees require robust competencies in identifying and countering health misinformation within the digital environment. Several established strategies exist for detecting and verifying potentially misleading information. These include evaluating the credibility of sources by prioritising information from reputable institutions and peer-reviewed journals with high impact factors. Sources lacking clear authorship, institutional affiliation, or established quality standards must be subjected to rigorous scrutiny. Evaluating the credibility of research and scholarly information, as outlined in (Mahmood & Jan, 2018) checklist, include the rigor of peer review, the strength of evidence-based evaluation, the credibility of the authors, the reputation of the publisher, and the journal's impact factor. Additional verification techniques involve cross-referencing information across multiple reliable sources, assessing the currency and frequency of updates, and utilising professional fact-checking platforms.

Academic librarians play a pivotal role in developing these competencies among medical students. They provide structured training in digital information retrieval skills, including effective searching of major biomedical databases such as PubMed and the Cochrane Library, as well as university-subscribed electronic journals and e-books. This training encompasses both basic and advanced search techniques, with particular emphasis on the strategic use of Medical Subject Headings (MeSH) to construct precise and comprehensive literature searches. (Prabowo & Manabat, 2021) asserts that librarians facilitate students' information literacy development through various educational initiatives, including seminars, workshops, interactive games, and dedicated information literacy programs.

Furthermore, librarians foster a critical evaluation approach, guiding students in the systematic appraisal of information quality, potential biases, and overall source credibility. Beyond technical skills, instruction should also encompass the ethical and legal dimensions of information use, including principles of open science and data science practices, to promote responsible and transparent engagement with digital health information.

Role of Medical Librarians to Curb Misinformation

Medical librarians play a critical role in combating misinformation through health information literacy, particularly as clinical medical students remain highly vulnerable to false or misleading information. Medical librarianship is fundamentally grounded in the promotion of credible, evidence-based health information by curating and facilitating access to reliable sources, primarily through the development of information literacy and critical appraisal skills. The

core mandate of medical libraries is to educate patrons about misinformation, disinformation, and fake news by directing them toward trustworthy, science-based resources (Becker, 2025). They are also responsible for delivering literacy training on accessing both print and electronic medical resources, as well as equipping users with the skills to distinguish credible from non-credible web-based sources. Medical libraries can enhance digital skills through pedagogical strategies involving trainings, workshops, database navigation and leveraging on AI tools and reference managers. Medical libraries further contribute by strengthening students' digital skills through structured pedagogical approaches, including targeted trainings, workshops, database navigation sessions, and the effective use of AI tools and reference management software. A key element of these digital competencies is information literacy, which encompasses the ability to locate, evaluate, and utilise information effectively (Ikonne et al., 2023).

To maximise impact, the coordination of digital literacy sessions should be made mandatory by medical faculties. Evidence shows that students who receive such training demonstrate improved ability to search for and retrieve relevant resources when addressing clinical questions, with better retention and sustained use of these resources over time (Maranda et al., 2016). Medical libraries also play an essential role in raising awareness among students about the potential vulnerabilities of AI-generated medical information, particularly the risks associated with hallucinations. In this capacity, librarians function as trusted intermediaries between information integrity and misinformation.

(Adewojo et al., 2025) emphasises that librarians adopt a multifaceted strategy to combat misinformation, combining information literacy initiatives with community engagement. Their position as reliable intermediaries grant them privileged access to reputable research, peer-reviewed journals, and authoritative databases. (Mullins & Boyd-Byrness, 2024) proposed a misinformation response model that librarians can adapt locally; it involves understanding the nature of misinformation, correcting it through evidence-based information, and providing sound judgement on the credibility of online sources. For medical librarians to achieve meaningful impact, healthcare professionals involved in training medical students must foster strong, high-quality collaboration with medical libraries. Furthermore, (Borji et al., 2024) outlined four primary roles that health librarians should play: educational, evaluative, information counselling, and research. Among these, the educational role emerged as the most prominent. In addition, a library toolkit developed in (San Diego Circuit, 2023) offers robust resources, including informative factsheets, for tackling health misinformation.

Empirical Evidences of Library-Led Interventions to Curb Misinformation

Developing comprehensive digital literacy programs that evolve in response to the changing digital landscape and the specific needs of health professionals and students was critically emphasized by (Jha, 2024). In his study on digital literacy skills for researchers, he underscored these competencies as essential in today's digital age. Another scholar, (Protogiros et al., 2025) mapped and accessed digital skills training programme for health care professionals in Western Australia, it was reported that effective digital skills training in the medical libraries enhances competencies to utilize technologies for effective care delivery.

In an evaluation of information literacy skills development among first-year medical students, (Carr et al., 2011) found that librarians play a pivotal role in teaching students how to evaluate medical literature for authenticity, validity, and reliability. This is achieved by guiding students with credible tools and evaluation strategies, including Scimago, Beall's List, and other assessment methods, to identify predatory journals and misinformation and Students are trained to critically examine authorship, publisher reputation, institutional credentials, and to prioritize peer-reviewed scientific sources. (Dehghani & Harris, 2023) suggested that curbing misinformation requires identifying predatory journals, establishing blacklists and whitelists (e.g., Beall's list), and supporting directories such as the Directory of Open Access Journals (DOAJ).

In the Nigerian context, (Lebo et al., 2025)investigated the impact of librarian-led case-based learning sessions among third-year medical students. The findings indicated that these sessions significantly improved students' clinical skills by training them to effectively utilise authoritative resources.
(Oso, 2024) also examined the influence of students' information literacy skills (ILS) on their perception of librarians. The study revealed that librarian-led information literacy training had a strong positive impact, enabling students to identify their information needs, distinguish between potential sources, and effectively retrieve relevant information. It further established that such training helps students differentiate between trustworthy and untrustworthy information sources, resulting in a positive correlation between the level of information literacy skills and the perceived image of librarians. Other effective interventions to address health misinformation include peer-to-peer debunking initiatives, seminars and educational programs that build literacy and teach practical for identifying and countering fake news (Czerniak et al., 2023).

Methodology

The study adopted a survey research design. The population comprised 152 clinical medical students from the department of community and primary health care college of medicine university of Lagos who are 500 level students.

The total enumeration sample size was used to cover the entire population of 152 students due to the manageable size. Total enumeration method is applicable when the entire population is small, the aim is towards obtaining accuracy and a level of precision (Singh & Masuku, 2014). The instrument used for data collection was the questionnaire.
Data from research questionnaire was analyzed using version 25 of The Statistical Package for Social Science (SPSS). Data collected were analyzed using descriptive statistics such as frequency distribution, percentages, mean and standard deviation for research questions. The hypothesis was tested using Pearsons Product Moment Correlation. The result was used to attest the combined influence of digital literacy skills on health misinformation among clinical medical students.

Result and Interpretations of Data:

Below are the results and interpretations of data obtained which are presented in tabular form.

Table 1: Descriptive Analysis of Respondent's Demographic Characteristics

Demographic Variables	Frequency (N)= 96	Percentage (%)
Gender		
Male	48	50.0
Female	48	50.0
Total	96	100.0
Age		
16 – 20 years	2	2.1
21 – 24 years	94	97.9
Total	96	100.0
Level of Study		
500 level	96	100.0
Total	96	100.0

Source: Researcher's Field Survey, 2026

Table 1 presents the demographic characteristics of the respondents. The study indicates an equal gender distribution of 50% each representing a balanced reflection of gender. Regarding age, 97.9% were between 21 and 24 years old, while only 2.1% fell within the 16 to 20 years category. This sample predominantly consist of older clinical students. Finally, all 100% were composed of 500 levels clinical medical students as this group were the targeted population for the study.

Table 2: Descriptive Analysis of Respondent's on Internet Skills

Rating of Internet Skills	Frequency (N)= 96	Percentage (%)
Poor	1	1.0
Average	17	17.7
Good	46	47.9
Excellent	32	33.3
Total	96	100.0

Source: Researcher's Field Survey, 2026

According to Table 2, majority demonstrated positive self-assessment of their internet skills with 47.9% rating them as good and 33.3% as excellent. This reflects a high level of digital competence among the students. Only 17.7% described their skills as average, while 1.0% rated themselves as poor.

Table 3: Descriptive Analysis of Respondent's on Purpose of Use of Internet

Purpose of Use of Internet	Frequency (N)= 96	Percentage (%)
	No	**Yes**
For assignments	1(1.0)	95 (99.0)
To read health related content	1(1.0)	95 (99.0)
For general update	1(1.0)	95(99.0)

Source: Researcher's Field Survey, 2026

Table 3 revealed that virtually all clinical medical students utilize the internet for essential academic and information purposes. With 99.0% reporting using it for assignments, reading health related materials and staying updated with general information.

Research Question One: What is the current level of awareness and self-perception regarding digital literacy competencies among clinical medical students within the college of medicine university of Lagos?

Table 4: Awareness and Self-perception regarding Digital Literacy Competencies among Clinical Medical Students

S/N	Awareness and self-perception	Not confident	Confident	Very confident	Extremely confident	$\bar{x}$	S.D.
1	How confident are you in your ability to find reliable health related information online	1 1.0%	36 37.5%	38 39.6%	21 21.9%	2.82	0.78
2	Do you feel confident on digital health literacy for medical students	3 3.1%	38 39.6%	36 37.5%	19 19.8%	2.74	0.81
Weighted Mean =2.78							

Table 4 indicates that clinical medical students at the university of Lagos exhibited a high level of awareness and positive self-perception of their digital literature competencies. Majority expressed confidence or very high confidence in their ability to find reliable health-relating information online (77.1%). In addition, 21.9% and 19.8% respectively indicated they were extremely confident in these areas, while a small proportion reported lacking confidence. The overall weighted mean score of 2.78 further confirms a generally strong confidence level among students. By implication most clinical medical students possess adequate digital literacy awareness and self-confidence, which is essential for effective engagement with digital health information.

Table 5: Level of Effectiveness of Medical Library-Based Digital Literacy Training among Clinical Medical Students

S/N	Digital skills training	Not effective	Effective	Very effective	Extremely effective	$\bar{x}$	S.D.
1	How effective is the training to identifying misinformation	7 7.3%	51 53.1%	29 30.2%	9 9.4%	2.42	0.76
2	Database search of health information	4 4.2%	40 41.7%	38 39.6%	14 14.6%	2.65	0.78
3	Critical appraisal of scientific literatures	7 7.3%	47 49.0%	32 33.3%	10 10.4%	2.47	0.78
4	Use of Biomedical databases	5 5.2%	43 44.8%	34 35.4%	14 14.6%	2.59	0.80
5	The use of medical subject heading (MeSH)	2 2.1%	43 44.8%	35 36.5%	16 16.7%	2.68	0.77
6	Citation Management tools	2 2.1%	35 36.5%	40 41.7%	19 19.8%	2.79	0.78
	Weighted Mean =2.60						

Table 5 clinical medical students perceived the medical library based digital literacy training as generally effective with a weighted mean score of 2.60, indicating a moderately high level of effectiveness. In critical areas respondents rated the training as effective in identifying misinformation (83.3%), database searching (81.3%), critical appraisal of scientific literature (82.3%) and the use of biomedical database (80.2%). Notably, higher effectiveness was reported for specialized skills such as the use of medical subject headings (MeSH) and citation management tools with a mean score of 2.68 and 2.79 respectively. By implication the medical library-based training plays a significant role in equipping clinical medical students with essential digital literacy skills.

Research Question Two: What are the strategies used by clinical medical students to differentiate between evidence-based medical data and health-related misinformation?

Table 6: Aspect of the training found most useful for identifying unreliable health information by clinical medical students

S/N	Strategies	Not useful	Useful	Very useful	Extremely useful	$\bar{x}$	S.D.
1	Cross Referencing	5 5.2%	41 42.7%	36 37.5%	14 14.6%	2.61	0.80
2	Author Reputation	10 10.4%	38 39.6%	33 34.4%	15 15.6%	2.55	0.88
3	Institutional Reputation	3	42	36	15	2.66	0.78

		3.1%	43.8%	37.5%	15.6%		
4	High Impact journals	-	35	45	16	2.80	0.71
			36.5%	46.9%	16.7%		
5	Other sources for identifying unreliable sources (Scimago and Beal's list)]	9	48	30	9	2.41	0.79
		9.4%	50.0%	31.3%	9.4%		
Weighted Mean =2.61							

The findings in Table 6 showed that clinical medical students employ multiple effective strategies to distinguish evidence-based medical information from health-related misinformation. Highly rated strategies included cross-referencing information 94.8% was rated to be extremely useful, assessing institutional reputation 96.9% and considering author reputation 89.6%. These highlights students' strong reliance on credible indicators. The use of high-impact journals recorded the highest mean score of 2.80 which emerged the most valued strategy. By implication it reflects a clear preference for trust and reputable scholarly sources. In contrast, specialized tools as Scimago and Beall's list of received lower rating with mean score of 2.41, which suggest limited familiarity or utilization among students.

Research Question Three: To what extent does participation in medical library-based digital literacy training enhances the identification of health misinformation?

Table 7: Extent of Identification of health misinformation in medical library-based digital literacy training by clinical medical students

S/N	Identifying health misinformation	Not confident	Confident	Very confident	Extremely confident	$\bar{x}$	S.D.
1	Can you distinguish Evidence-Based health information from false claims	10 10.4%	47 49.0%	25 26.0%	14 14.6%	2.45	0.87
2	I can identify articles that lack scientific evidence	23 24.0%	46 47.9%	19 19.8%	8 8.3%	2.13	0.87
3	I can identify biased sources of information	27 28.1%	42 43.8%	19 19.8%	8 8.3%	2.08	0.90
4	I can identify non-peer-reviewed scholarly communications	34 35.4%	31 32.3%	24 25.0%	7 7.3%	2.04	0.95
5	I can identify sensational headlines	11 11.5%	46 47.9%	25 26.0%	14 14.6%	2.44	0.88
6	My confident to discern misinformation through credibility of journals	15 15.6%	44 45.8%	27 28.1%	10 10.4%	2.33	0.87
Weighted Mean =2.24							

Participation in medical library-based digital literacy training moderately enhances clinical medical students' ability to identify health misinformation (weighted mean= 2.24). While the majority reported high confidence in distinguishing evidence-based information from false claims (89.6%) and identifying sensational headlines (88.5%). For the more complex skills such as recognizing non-peer reviewed publications (64.6%). Moderate confidence was reported in identifying articles lacking scientific evidence and assessing journal credibility revealing gaps in deeper critical appraising competencies. Further improvement is needed in advanced evaluative skills.

Testing Hypothesis

Hypothesis One: There is no statistically significant correlation between the level of digital literacy skills and proficiency of clinical medical students in identifying and appraising health related misinformation.

Table 8: Pearson Product Moment Correlation (PPMC) showing the relationship between level of digital literacy skills and proficiency of clinical medical students in identifying and appraising health related misinformation

Variables	Mean	Std. Dev.	N	R	p-value	Remarks
Digital literacy skills	15.5938	4.06934	96	.446*	<.001	Sig.
Identifying and appraising health related misinformation	13.4688	4.48847				

* Correlation is significant at the 0.05 level (2-tailed).

The Pearson product moment correlation analysis revealed a statistically significant positive relationship between clinical medical student's level of digital skills and their proficiency in identifying and appraising health related misinformation (r=.446, n=96, p (.001) <.05). This indicates that higher digital literacy skills are associated with better ability to identify and appraise misinformation. Consequently, the null hypothesis is rejected.

Discussion of Findings

Research Question One revealed a high level of awareness and a positive self-perception of digital literacy competencies among the respondents. This finding is supported by (Soyemi & Inazu, 2022), who asserted that literacy skills are not a strong predictor of the tendency to reduce or share misinformation on social media among undergraduate students. This contrasts with studies from China and South-East Nigeria, which reported low levels of digital health literacy (Hao et al., 2025; Ibenne, 2024). Furthermore, the library-based digital literacy training was found to be effective and moderately high. (Maranda et al., 2016) reported that students who received such training demonstrated improved ability to recognize misinformation. Similarly, clinical medical students at the University of Lagos have benefited from extensive digital literacy training provided by librarians through their educational, informational, and evaluative roles (Borji et al., 2024).

Research Question Two revealed the strategies employed by clinical medical students to identify and appraise health-related misinformation. The findings showed that medical students demonstrated a strong reliance on credible indicators (Mahmood & Jan, 2018; Prabowo & Manabat, 2021), although they were not familiar with specialized tools for this purpose. This aligns with (Dehghani & Harris, 2023), who recommended more intensive training to improve students' knowledge and use of specialized tools.

Findings from Research Question Three revealed the efficacy of library-based interventions in enhancing digital competencies, indicating a moderately enhanced ability among the students. These results are supported by (Lebo et al., 2025; Oso, 2024), who reported a positive and significant impact of such training on students' clinical skills through the effective utilization of authoritative resources.

Furthermore, the findings from the hypothesis tested in Table 8 led to the rejection of the null hypothesis. This indicates a statistically significant relationship between clinical medical students' level of digital literacy skills and their proficiency in identifying and appraising health-related misinformation. The results of the study therefore confirm that digital literacy skills and the ability to identify and appraise health-related misinformation are key influencing factors.

Conclusion

Digital literacy is essential in everyday life, particularly for students aspiring to become future health professionals. To effectively combat health-related misinformation, clinical students require a high level of digital literacy skills. This study revealed that clinical medical students demonstrated a high level of awareness and a positive self-perception of their digital literacy competencies. The findings underscore that digital skills training is an indispensable factor influencing their ability to identify health misinformation.

Recommendations

In line with the findings, the study therefore, recommends that

1. Digital literacy skills training should be prioritized by medical colleges in Nigeria and trainings on misinformation related to health be included in to curriculum.
2. Medical and health librarians should continuously intensify digital skills training for all medical students.
3. Trainings on specialized tools for identifying misinformation such as Scimago and Beall's list should be prioritized for all medical students.

ABSTRACT

The study centered on assessing the level Librarians preparedness for the adoption of Artificial Intelligence for information services provision in university libraries in Nasarawa state. Survey design was adopted for the study, the instrument used for data collection was structured closed ended questionnaire, and the population of the study consists 33 librarians in four (4) university libraries. 33 copies of the questionnaire were distributed and 30 were filled and returned representing 91% response rate. The data collected was analyzed using descriptive statistics expressed in frequency and mean scores. Four objectives guided the study. The findings of the study revealed that Librarians are prepared to adopt AI tools such as ChatGPT, Chatbots visual assistance, Canva and Andi search. The AI skills possessed by the respondents are information literacy skills, AI powered search & discovery, data privacy & copyright and team and human machine collaboration skills. The challenges to AI adoption by Librarians are integrating AI with existing library systems and services, limited ICT infrastructures, high cost of implementing AI based solutions for information delivery and poor internet services. The strategies for enhancing the adoption of AI by Librarians are regular training and capacity building workshops, provision of adequate ICT infrastructure, provision of AI enable software and tools and access to reliable internet connectivity. The study recommends step down workshop on the use of ChatGPT, Chatbots, Virtual assistant, Canva. Andisearch, microelectronic mechanical systems and the procurement of AI enable library software and tools

Keywords: Artificial Intelligence, University Libraries, Information services, Librarians, Preparedness.

INTRODUCTION

Universities Libraries have been reformed to reflect contemporary information services delivery across the globe. AI adoption is promoting and expanding the frontier of information services in contemporary university libraries, Artificial Intelligence (AI) is gaining grounds because it enables the librarians in university libraries to render efficient and effective information services to the maximum satisfaction of their users. Al-Khalid (2022) noted that AI has changed the narratives of modern technological advancements in all sectors and is popularized amongst all sectors of society. In addition, AI has the capabilities of giving upper hand and advantages to librarians the platform of providing all round the clock information services, regardless of location or number of users at a time.

Notably, AI adoption is pervasive, its adoption cut across all professions including Librarianship. AI can perform tasks usually associated with human intelligence, such as recognizing patterns, understanding language, making recommendations, or spotting anomalies. Practically AI helps all categories of information professionals to work faster and more accurately.

The concept of AI has been defined by different scholars based on their perspectives. McGraw-Hill Encyclopedia of Science and Technology (2007) defined AI as a subfield of computer science focusing on the understanding of our natural environment and innovatively creating intelligent gadgets and software that can handle intelligent operations often undertaken by humans. In addition, Merriam-Webster English Dictionary (2018) defined "AI as a part of computer science that deals with giving ability to the machines to look as if they have natural human intelligence".

AI could historically be traced back in 1955 when John Mac Carthy postulated that all aspects of learning and human intelligence in performing tasks could be programmed through machines. The adoption of AI in university libraries heralds a new chapter in the evolution of information service delivery which enhanced efficiency, accessibility, and user experiences. Expectedly, University librarians need to re-position themselves for the task of information services provision by retooling and reskilling to take the relative advantage of artificial intelligence's potentials by refining the quality of library services in the information explosive age. Tella (2020) and Memela (2023) stated that AI seems to be the new hope for university libraries to provide more advanced automated services to their users as it is one of the technologies that has arisen and will play a major role in the 5th Industrial Revolution.

Information service refers to the systematic collection, organization, processing, and dissemination of information to meet the specific needs of users. Information service aimed to provide relevant, accurate, and timely information that supports decision-making, problem-solving, research, and learning. The role of AI in information services provision in universities cannot be over emphasized. University libraries are playing an important role in facilitating research by

scholars, students, and teachers at all levels of education, (Auten, 2020) University Libraries provide different information resources including print and digital collections, to patrons. Universities Libraries play a pivotal role in higher education in supporting research and academic activities to excel in the learning activities.
According to Ugwu (2019) Librarian is a person in-charge of school library, they can provide services to people, organization and always holds a supervisory position, overseeing other library employees such as library technicians and assistants. An academic librarian plays an important role in tertiary institutions like universities, polytechnics, colleges of education and vocational schools by guiding students, teachers and faculty. AI is one of the most recent ICT tools available for adoption by Librarians in University Libraries. What remains unclear is their level of preparedness to adopt AI for 21st century information services delivery. This is a significant problem that needs to be empirically investigated.

Statement of the Problem
University libraries play a critical role in supporting teaching, learning, and research through effective information service delivery. In the 21st century, the rapid advancement of Artificial Intelligence (AI) technologies such as machine learning, automated cataloguing, recommendation systems, and digital reference services has transformed library and information services globally. These technologies enhance efficiency, improve user experience, and enable libraries to meet the evolving information needs of users in an increasingly digital environment.
Despite this global advancement many librarians in university libraries appear to be reluctant in adopting AI for library and information services. Issues such as limited ICT infrastructure, inadequate funding, lack of skilled personnel, low awareness of AI applications, and resistance to technological change may hinder effective AI adoption. As a result, library services may remain largely traditional, leading to slow service delivery, which leads to limited access to digital resources, and reduces user satisfaction.

Also, some librarians appear to be battling with many challenges that hampered AI adoption. These include poor ICT skills, AI phobia and poor knowledge of AI. This is why this study seeks to proffer solutions to the problem of poor or slow Adoption of AI among librarians with a focus on university libraries in Nasarawa state. The universities are Federal University of Lafia, Nasarawa State University Keffi, Bingham University Karu and Phoenix University Agwada. The problem of the study posed as a question is, what is the level of AI adoption preparedness among librarians for 21st century information services in university libraries in Nassarawa State.
Objectives of the Study
General Objective
The general objective of this study is to assess the level of AI adoption preparedness among librarians for 21st century information services in university libraries in Nasarawa State.
Specific Objectives

The specific objectives of the study are to:
1. Find out the extent to which librarians are prepared to adopt AI for 21st century information service provision in University libraries in Nasarawa state
2. Identify the AI skills required for 21st century information provision in University Libraries in Nasarawa state.
3. Identify the challenges to AI adoption by librarians for 21st century information service provision in university libraries in Nasarawa State.
4. Find out the strategies that could be used to enhance AI adoption by librarians for 21st century information service provision in university libraries in Nasarawa state.

REVIEW OF LITERATURE
The review of the literature was done in a manner that aligned with the objectives that guided the study in addition to some conceptual definitions. The concept of AI is a complex, dynamic phenomenon, which gives rise to different meaning depending on what it is used for. AI could be defined as a branch of science that stimulates intelligent behavior On the computer to solve complex problems better than humans. Field (2021) defines AI as the simulations. of human intelligence in computers that are trained to think and act like humans. Artificial Intelligence as described by Merriam Webster (2019) is a branch of computer science that works with providing machines the ability to appear natural human intelligence.

Using computers and eventual acceptance of AI could have a positive impact on library services, which are presently being studied. It is also noted that AI can enhance circulation services by making books, journals, multimedia and other resources more accessible to users and reduce wait time. Other areas in which AI is important include automated fine management, where the circulation personnel take care of the paperwork. The personnel scans records, library cards, and user IDs to verify that the requested items are available.
Artificial Intelligence (AI) has the potential to forecast material demand and aid in inventory control, guaranteeing the availability of popular items. By analyzing borrowers' borrowing patterns and past selections, AI recommendation

systems can further revolutionize library services by recommending appropriate books, improving user experience, and creating new research opportunities (Chen & Lee, 2020). Artificial intelligence (AI) algorithms can be used to determine overdue materials, compute fines, and even grant fine waivers in certain situations. Asemi and Asemi (2018) enumerated several ways that AI technologies can be applied to enhance library services. These include circulation services, book shelving, the cataloguing of library materials, and more. According to Adetayo (2023), artificial intelligence (AI) like ChatGPT, are becoming useful resources for academic libraries.

Artificial Intelligence (AI)-powered systems can also provide 24/7 assistance for library users. They can provide around-the-clock reference services, allowing users to get help even when the library is closed. This reduces the workload on librarians and offers 24/7 support, making libraries even more accessible (Harris & Turner, 2021). Barsha and Munshi (2023) averred that AI utilization in university libraries has the potential of revolutionizing library service delivery and management by improving information retrieval, streamlining knowledge organization and management, personalizing user services, and enhancing resource management, among others. Similarly, Udoh *et al.* (2024) opined that AI technologies have the potential to transform university libraries into smart and intelligent institutions for better service delivery. Shahzad *et al*. (2024) noted that AI plays a revolutionary role in the delivery of innovative library services to patrons. In a related development, Abba (2024) posited that AI technologies are used to render different library services, such as serving as a knowledgebase for cataloguing information of library materials, and a self-check-out machine for books.

Librarians' preparedness to adopt Artificial Intelligence

The preparedness of librarians to adopt Artificial Intelligence (AI) in university libraries is increasingly recognized as a critical determinant of effective 21st-century information service delivery. Preparedness encompasses multiple dimensions, including awareness, technical competence, perception, institutional support, and infrastructural readiness. Research have shown that the adoption of AI in libraries and information centers are based on the awareness and perceptions of the LIS professionals in different societies. Moustapha and Yusuf (2023) noted that libraries in Nigeria are struggling to adopt AI because of paucity of fund and technological defects, while the fear of job loss, reliability on and authenticity of content and fear of privacy and confidentiality are the problems associated with the librarians' perceptions. Subaveerapandiyan, Sunanthini and Amees (2023) claimed that LIS professionals in Zambia were aware of the skills required to adopt AI technologies. This spurred their eagerness and preparedness to take the lead role in adopting AI in libraries.

Readiness is the state of being adequately equipped with the necessary conditions and resources to facilitate the seamless utilization of AI technology in university libraries (Ali & Khan, 2024). Ajani *et al*. (2022) discovered that librarians have mixed feelings about the readiness of academic libraries to integrate AI systems into library operations and services. Sambo and Oyovwe-Tinuoye (2023) stated that training programs should be prioritized by library management to equip librarians with the skills that will enhance effective AI utilization for service delivery. Undoubtedly, the implementation of AI in libraries would provide value-added services to the users Chohan *et al*., (2023). Ma *et al*. (2020) explained that AI is beneficial to libraries as semantic library services may be offered to users. On their part, Owolabi *et al*. (2021) submitted that AI technology brings revolutionary changes in librarians' attitudes and working styles. While some studies observed that training workshops were essential for librarians for the successful implementation of AI in university libraries.

Therefore, librarians' readiness towards AI utilization in university libraries would drive innovation, which is the hallmark of the 21stcentury library workspace. The technological explosion has had a great impact on university libraries, leading to a massive shift in library services toward the use of these technologies (Emiri, 2019). Accordingly, factors influencing AI adoption include organizational technological practices, financial resources, university size, and data management and protection concerns (Jan *et al*., 2024). Also, Yakubu *et al*. (2023) reported that attitude was a major factor determining intention to use AI by librarians. Radhakrishnan and Chattopadhyay (2020) averred that factors influencing librarians' readiness towards AI adoption for service delivery were trust, cost, social influence, motivation, performance expectancy, utilitarian benefits, safety, and prior experience with AI tools. Undoubtedly, AI has the potential to revolutionize how university libraries operate, making them more efficient and effective in serving their users. Based on views expressed by scholars, AI utilization in university libraries would have valuable and far-reaching implications on the 21st century information service provision.

Challenges to AI adoption in University Libraries

Without doubt, barriers to AI adoption in libraries are multifaceted, and encompassing Librarians' limited understanding of AI, difficulties in integrating AI with existing library systems and services, and the significant financial commitments associated with AI products. Myriad of Studies conducted globally revealed that while awareness of AI's potential is growing, actual implementation remains limited. Most institutions are still in exploratory phases, with few practical applications such as chatbots, machine learning-based recommendation systems, and automated cataloging services in

place mainly in South Africa, Nigeria, and Kenya. Financial constraints, inadequate infrastructure, digital literacy gaps, cultural resistance, and the absence of clear policies and ethical frameworks were identified as critical barriers.

Furthermore, Udoh *et al*. (2024) found that lack of training opportunities on AI-related issues, poor power supply, poor Internet services, lack of AI tools and associated facilities, poor attitude to change, and poor funding of university libraries were identified as barriers to the full potential of AI utilization in university libraries. Similarly, Abba (2024) discovered that lack of funds to acquire AI tools, training of librarians, and lack of full knowledge of AI were the most mentioned challenges associated with the adoption of AI in libraries. Equally, Barsha and Munshi (2023) identified a lack of infrastructure and resources, shortage of skilled personnel, absence of data privacy regulations, digital divide, and the high cost of implementing AI-based solutions as barriers to AI utilization for service delivery in university libraries. According to Zondi *et al*. (2024), inadequate infrastructure, lack of adequate financial resources, expertise, and constant power outage were major barriers to the implementation of AI in libraries. Studies conducted by Emiri, (2023); Gartner Talent Neuron (2020) as well as Northumbria University (2024) reported that the number one challenges or major barrier to the adoption of artificial intelligence is skills shortage.

METHODOLOGY

Quantitative research method was used while survey design was adopted for the study. The population of the study comprises Thirty-three (33) librarians in the four (4) University libraries in Nasarawa state. A breakdown of the response from the 4 University libraries studied is presented in a tabular form as follows:

SN	Name Of Institution	Population
1.	Federal University of Lafia	10
2.	Nasarawa State University Keffi	12
3.	Bingjam University Karu	09
4.	Phoenix Agwada	02

The entire 33 librarians constituted the sample size for the study. The decision to use the entire population is guided by the position of Benard (2012) who stated that if the population of the Study is less than 200. The entire population should be used for the study. However, out of the 33 Copies of the questionnaire distributed, 30 were filled and returned. They were analyzed and tabulated for easy interpretation and inferences.

TABLE 1 Extent to which librarians are prepared to adopt AI in the University libraries studied.

S/N	**Item statement**	**VHE**	**HE**	**LE**	**NA**	**MEAN**
1.	Prepared to adopt MEM for multitasking.	12	08	07	03	2.7
2.	Prepared to adopt AndiSearch to help me navigate the vast amount of information needed to answer complex patron questions.	06	11	10	03	2.8
3.	Prepared to adopt perplexity to help stay up to date with the latest research trends.	06	09	05	10	2.3
4.	Prepared Scispace Copilot to help break down complex academic papers.	09	13	06	02	2.6
5	Prepared to adopt canva AI to help design eye-catching visuals for marketing library events, programs, and services.	10	06	10	04	2.9
6.	Prepared to adopt ChatGPT, Chatbots and visual assistants.	12	06	08	04	2.9
7.	Prepared to adopt Machine learning to help me learn from data	10	05	10	05	2.6

To determine the extent to which Librarians are prepared to adopt Artificial intelligence (AI) in the University libraries studied. Respondents were provided with a list of possible areas in which Librarians were ready to adopt. The responses in Table 1 indicated that Librarians were prepared to adopt Canva, ChatGPT, Chatbot, and visual assistants having a mean score of 2.9 each. This is followed by their preparedness to adopt Andi search with a mean score of 2.8. The responses also indicated that the respondents were prepared to adopt MEM with a mean score of 2.7. On the other hand, the respondents were least prepared to adopt perplexity with a mean score of 2.3.

TABLE 2 AI skills possessed by Librarians in the University Libraries studied

S/N	Item Statement	P	NP
1	AI-Powered search and discovery	26	04
2	Digital collection management	15	15
3	Ability to use prompt to get information	20	10
4	Basic machine-learning knowledge	10	20

5	AI ethics, bias and responsible use	18	12
6	Data privacy and copyright	25	05
7	Content curation and recommendation	13	17
8	Data analysis and visualization	12	18
9	Accessibility and inclusivity	19	11
10	Information literacy and AI awareness	28	02
11	Ability to work as a team and human-machine collaboration skills	25	05

KEY: P: POSSESSED NP: NOT POSSESSED

The study tried to find out the types of AI skills possessed by Librarians in the Universities libraries studied. Respondents were provided with a list of skills needed for AI adaption. Responses in Table 2 indicated that 28 of the respondents possessed AI skills in information literacy and AI awareness. This is followed by AI powered search and discovery skills, having frequency score of 26, In addition, 25 of the respondents possessed AI skills in data privacy and copyright, and ability to work as a team and human machine collaboration. Conversely, the responses further showed that 20 of the respondents indicated that they do not possess AI skills in basic machine knowledge while 18 of the respondents indicated that they do not possess AI skills in data analysis and visualization.

TABLE 3 Challenges to AI adoption by Librarians in the University Libraries studied.

S/N	Item Statement	Tick
1	Integrating AI with existing library systems and services	28
2	Limited ICT infrastructures	27
3	Poor attitude to change	24
4	Low awareness AI application	04
5	Inadequate training opportunities on AI related issues	21
6	High cost of implementing AI based solutions for information delivery	26
7	Poor internet services	25

The study equally sought to identify challenges to AI adoption by Librarians in the University Libraries studied, the respondents were provided with the list of some challenges. They were requested to tick multiple challenges to AI adoption. Table 3 shows their responses. Responses in Table 3 revealed that integrating AI with existing Library system and services are the dominant challenges faced by Librarians with a frequency score of 28. This is closely followed by limited ICT infrastructures with frequency score of 27 and high cost of implementing AI based solution for information delivery with frequency score of 26. The least challenge to AI adoption by Librarians was low awareness of AI application, having a frequency score of 4.

TABLE 4 Strategies of enhancing AI adoption by Librarians in the University Libraries Studied

S/N	Item Statement	Tick
1	AI awareness and sensitization programs	07
2	AI regular and capacity building workshops	28
3	Inclusion of AI courses in library and information curricula	25
4	Continuous professional development (CPD) on AI tools	18
5	Hands-on practical exposure to AI application	23
6	Provision of adequate ICT infrastructures	28
7	Access to reliable internet connectivity	26
8	Availability of AI enabled library software and tool	27
9	Evaluation and continuous improvement of AI systems	20
10	Management and institutional support for AI initiatives	16
11	Adequate funding and budget allocation for AI project	23
12	Clear AI implementation policies and guidelines	15
13	Change in librarian's attitude and readiness towards AI adoption	22
14	Collaboration with IT professionals and data scientists	15
15	Partnership with Universities, tech firms and professional bodies	20

The research also sought to find out the strategies that could be used to enhance AI adoption by Librarians in the University libraries studied. The response in table 4 showed that 28 of the respondents advocated for the provision of adequate ICT infrastructures and AI regular training and capacity building workshop, having frequency scores of 28 respectively. This is closely followed by 27 respondents who advocated the availability of AI-enabled library software and tools. Similarly, 26 of the respondents advocated for access to reliable internet connectivity with frequency score of 26and inclusion of AI courses in library and information science curriculum with a frequency score of 25. Conversely

AI awareness and sensitization program was the least strategy advocated to enhance AI adoption by Librarians in the University Libraries studied having a frequency of 7.

CONCLUSION

Based on the views expressed by scholars as contained in the available literatures on the subject matter and from the findings of this study. AI has become the new normal in information service delivery in the 21st century. Therefore, AI are useful tools for efficient and effective information service provision. The study has established that librarians are prepared to adopt AI in university libraries. The findings further established that they have the requisite skills for AI adoption. The challenges to AI adoption have been identified and the strategies for enhancing the adoption of AI in university libraries by librarians were equally established.

RECOMMENDATIONS

Based on the findings of this study, the following recommendations were made:

1.There should be train the trainer workshop on the use of conversational AI, ChatGPT, Chatbots, canva AI, andisearch and MEM.

2. Librarians should make frantic and deliberate efforts to acquire AI skills in basic Machine Learning, knowledge, data analysis, visualization, and content curation.

3. Library management and researchers in universities should make a deliberate effort to integrate AI with existing library systems and services in addition to the provision of state-of-the-art ICT infrastructures.

4. AI-enabled library software and tools should be procured to enhance 21st-century information service provision in the university libraries.

ASSESSING THE STATE OF SCHOOL LIBRARIES IN GOVERNMENT SECONDARY SCHOOLS IN JIGAWA STATE, NIGERIA

Dr Adamu Sa'ad
Department of Library and Information Science,
Faculty of Education,
Federal University Dutse, Nigeria

ABSTRACT

This study assesses the state of school libraries in government secondary schools in Jigawa State, Nigeria. Specifically, the study sought to: (1) assess the adequacy of library infrastructure, information resources, and information and communication technology (ICT) facilities in government secondary school libraries in Jigawa State; (2) examine the availability and professional competence of library personnel, as well as the range and quality of library services provided in these schools; and (3) evaluate the patterns of library utilization by students and teachers and identify the major challenges affecting the effective functioning of school libraries in Jigawa State. A descriptive survey research design was employed for the study. The population comprised 3,829 school administrators, teacher-librarians, and students, from which a representative sample was selected using a combination of stratified and simple random sampling techniques. Data were collected through structured questionnaires. A total of 374 valid responses were returned and analyzed using descriptive statistics, including frequencies, percentages, and mean scores. The findings indicate that most government secondary school libraries in Jigawa State are inadequately equipped, characterized by insufficient and outdated information resources, limited seating capacity, and poor integration of information and communication technologies. The study also reveals a shortage of professionally trained librarians, which adversely affects the range and quality of library services and contributes to low levels of library utilization among students. Key challenges identified include inadequate funding, weak policy implementation, and limited administrative support for library development. The study concludes that the current condition of school libraries in Jigawa State falls below recommended national and international standards. It therefore recommends increased government funding, the deployment of qualified library professionals, and the development of sustainable policies aimed at revitalizing school libraries and strengthening their role in supporting secondary education in the state.

Keywords: School Library Development, Educational Infrastructure, Information Resources, Library Services, Nigeria

INTRODUCTION

School libraries are widely recognized as essential components of the educational system, serving as resource centers that support teaching, learning, and the intellectual development of students. They provide access to diverse information resources, foster reading culture, and equip learners with critical information literacy skills necessary for academic success and lifelong learning (Tripathi et al., 2026). In secondary education, particularly, school libraries play a crucial role in complementing classroom instruction and promoting independent study habits among students. However, the effectiveness of school libraries largely depends on the availability of adequate infrastructure, up-to-date information resources, qualified personnel, and functional services (Gwakwe & Goldman; Omar et al., 2024).

In Nigeria, despite policy recognition of the importance of school libraries, many public secondary schools continue to experience challenges related to inadequate library facilities and poor resource provision. These challenges are often more pronounced in government-owned schools, where issues such as insufficient funding, lack of trained librarians, and weak policy implementation hinder the development and effective utilization of library services (Olorunyomi, 2026; Onasanya, 2024). Consequently, students and teachers may have limited access to relevant learning materials, which can negatively impact teaching quality and students' academic performance.

Jigawa State, like many other states in Nigeria, has made efforts to improve its educational system; however, concerns persist regarding the condition of school libraries in government secondary schools. Anecdotal evidence suggests that many of these libraries are either poorly equipped or underutilized, raising questions about their capacity to support educational objectives effectively. It is against this backdrop that this study assesses the state of school libraries in government secondary schools in Jigawa State, with a focus on infrastructure, information resources, staffing, services, and usage patterns.

By providing empirical evidence on the current condition of school libraries, the study aims to inform policymakers, educational administrators, and stakeholders on areas requiring urgent intervention to enhance library development and improve educational outcomes.

STATEMENT OF THE PROBLEM

Despite the widely acknowledged importance of school libraries in supporting effective teaching and learning, there is growing concern about their deteriorating condition in public secondary schools across Nigeria. School libraries are expected to provide adequate information resources, conducive learning environments, and professional services that

enhance students' academic performance and information literacy skills (Peter, 2025). However, in many government secondary schools, these expectations are not being met, thereby limiting the role libraries can play in the educational process.

In Jigawa State, the situation appears particularly troubling, as anecdotal evidence and preliminary observations suggest that many school libraries are either non-functional or grossly under-resourced. Issues such as inadequate infrastructure, outdated and insufficient learning materials, lack of information and communication technology (ICT) facilities, and poor maintenance practices are commonly reported (OBUAH, 2026; Olorunyomi, 2026; Sadiat et al., 2024). In addition, the absence or shortage of professionally trained librarians further undermines the quality of library services, resulting in low utilization by both students and teachers (Adamu, 2018; Merga & Mat Roni, 2026; Musa et al., 2025). These challenges raise serious concerns about the ability of school libraries to effectively support curriculum delivery and promote independent learning.

Furthermore, although government policies and educational frameworks emphasize the importance of school libraries, there is limited empirical data assessing their actual condition, particularly in Jigawa State. This lack of reliable data makes it difficult for policymakers and educational stakeholders to design informed interventions and allocate resources effectively. Therefore, the problem this study seeks to address is the insufficient understanding of the current state of school libraries in government secondary schools in Jigawa State, with a view to identifying existing gaps and challenges that hinder their optimal performance and development.

OBJECTIVES OF THE STUDY

This study aims to:

1. Assess the adequacy of library infrastructure, information resources, and information and communication technology (ICT) facilities in government secondary school libraries in Jigawa State.
2. Examine the availability and professional competence of library personnel, as well as the range and quality of library services provided in these schools.
3. Evaluate the patterns of library utilization by students and teachers, and identify the major challenges affecting the effective functioning of school libraries in Jigawa State.

LITERATURE REVIEW

Conceptual Review:

Concept of School Libraries

School libraries are integral components of the educational system, serving as organized collections of information resources designed to support teaching, learning, and personal development among students (Kurttila-Matero, 2011). They provide access to print and non-print materials, including textbooks, reference materials, audio-visual resources, and digital content. According to international standards, school libraries function as learning hubs that promote reading culture, independent inquiry, and information literacy skills (Tripathi et al., 2026). In secondary schools, they are expected to complement classroom instruction and foster lifelong learning habits among students.

Components of Effective School Libraries

Effective school libraries are characterized by several key components, including adequate infrastructure, relevant and up-to-date information resources, qualified personnel, and functional services (Kurttila-Matero, 2011; Mojapelo, 2018). Library infrastructure encompasses physical facilities such as reading spaces, furniture, lighting, and ventilation. Information resources include textbooks, reference materials, and digital resources aligned with the school curriculum (Tekir & Akar, 2019). Staffing is also critical, as trained librarians are responsible for organizing resources and delivering services (Ondieki, 2023). Additionally, library services such as user education, reference services, and reading promotion activities are essential for enhancing library utilization (Muzvondiwa & Marutha, 2022).

Utilization of School Libraries

The utilization of school libraries refers to the extent to which students and teachers make use of library resources and services. High levels of utilization are associated with improved academic performance, better reading habits, and enhanced research skills. However, utilization is often influenced by factors such as resource availability, accessibility, user awareness, and the presence of professional library staff (Dada, 2025; Merga & Mat Roni, 2026). In many developing countries including Nigeria, low utilization has been linked to inadequate facilities and poor service delivery (Hlatshwako & Tsabedze, 2024).

Theoretical Framework:

Library Service Quality Theory

Library Service Quality Theory emphasizes that the effectiveness of library services depends on users' perceptions of service quality, including accessibility, responsiveness, and adequacy of resources (Shi & Levy, 2005). In school libraries, the quality of infrastructure, resources, and staff competence directly influences user satisfaction and utilization.

Systems Theory
Systems Theory views the school library as a subsystem within the broader educational system. It highlights the interdependence between library resources, personnel, policies, and users (Puala, 2025; Whitchurch & Constantine, 1993). A deficiency in any component—such as inadequate funding or lack of trained staff—can negatively affect the overall performance of the library system.

Resource-Based Theory
Resource-Based Theory focuses on the importance of available resources in achieving organizational effectiveness (Assensoh-Kodua, 2019). Applied to school libraries, the theory suggests that the availability of adequate infrastructure, learning materials, and skilled personnel determines the library's ability to support teaching and learning effectively.

Empirical Review:
Global Perspective on School Libraries
Globally, studies have demonstrated that well-equipped school libraries contribute significantly to students' academic achievement and literacy development. Research in developed countries shows that access to diverse and current library resources enhances students' reading skills and supports curriculum delivery (Merga & Mat Roni, 2026). Furthermore, the presence of qualified librarians has been linked to improved student performance and higher levels of library use (Merga & Mat Roni, 2026). However, even in advanced systems, challenges such as digital integration and funding constraints persist.

African and Nigerian Perspective
In Africa, school libraries face numerous challenges, including inadequate funding, poor infrastructure, and limited access to current information resources (Jack, 2025). Studies conducted in Nigeria reveal that many government secondary school libraries are either poorly equipped or non-functional. Common issues include outdated materials, lack of ICT facilities, and shortage of trained librarians (Bello & Musa, 2025). Empirical evidence also indicates low levels of library utilization among students and teachers, largely due to these deficiencies (Hlatshwako & Tsabedze, 2024). While some schools have made efforts to improve library services, progress remains uneven across regions.
Despite the growing body of literature, there is limited empirical research specifically focused on the state of school libraries in Northern Nigeria, particularly in Jigawa State. Many existing studies adopt a generalized national perspective without addressing regional disparities. This gap highlights the need for context-specific investigations to provide a clearer understanding of the challenges and opportunities for improving school libraries in the region.
Conceptual Framework of the Study
The conceptual framework for this study is based on the relationship between school library components, moderating factors, and educational outcomes. The core components of school libraries—such as infrastructure, information resources, staffing, and services—serve as the independent variables. User-related factors (such as awareness and attitudes) and institutional factors (such as funding, policy support, and administrative commitment) act as moderating variables. The dependent variable is the level of library utilization and its impact on teaching and learning outcomes.

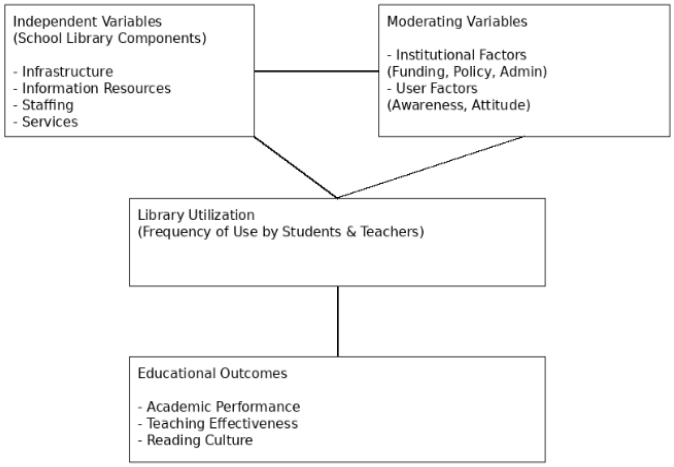

Figure 1: Conceptual framework of the study
The framework for as indicated in Figure 1 above assumes that when school libraries are adequately equipped and supported, and when users are aware and motivated, effective utilization will occur. This, in turn, leads to improved academic performance, enhanced reading culture, and better teaching effectiveness.

RESEARCH METHODOLOGY
This study adopted a descriptive survey research design to assess the state of school libraries in government secondary schools in Jigawa State, Nigeria. The descriptive survey design was considered appropriate because it allows for the systematic collection of data from a large population and enables an accurate description of existing conditions,

practices, and challenges related to library infrastructure, resources, staffing, services, and utilization patterns (Ullah & Ameen, 2018).

The population of the study comprised 3,829 respondents, including school administrators, teacher-librarians, and students drawn from selected government secondary schools across Jigawa State. These categories of respondents were considered suitable because they are directly involved in the management, use, and operation of school libraries.

Using the Krejcie and Morgan (1970) Sample Size Determination Table, a sample size of 383 respondents was selected from the study population of 3,829. The Krejcie and Morgan table was considered appropriate because it provides scientifically established sample sizes for finite populations and is widely used in social science research to ensure representativeness and reliability of findings (Mohanasundaram & Harsha, 2024). To ensure adequate representation, a combination of stratified and simple random sampling techniques was employed. Stratified sampling was used to categorize respondents into administrators, teacher-librarians, and students, while simple random sampling was used to select participants within each group.

Data were collected using a structured questionnaire designed to obtain information on the condition of library infrastructure, availability of information resources, staffing, library services, and patterns of utilization. The instrument was subjected to expert validation to ensure content and face validity, while reliability was established through a pilot study and the application of appropriate reliability measures.

The questionnaires were administered through direct distribution to respondents in selected schools. Out of 383 questionnaires distributed, 374 valid responses were retrieved and used for analysis. Data collected were analyzed using descriptive statistics, including frequencies, percentages, and mean scores.

Ethical considerations such as informed consent, confidentiality, anonymity, and voluntary participation were strictly observed throughout the study to ensure the integrity of the research process.

DATA PRESENTATION, ANALYSIS, AND DISCUSSION

State of Library Infrastructure in Government Secondary Schools in Jigawa State

Data collected from respondents reveal that the state of library infrastructure in most government secondary schools in Jigawa State is inadequate. While some schools reported having designated library spaces, many lack essential facilities such as adequate seating capacity, proper ventilation, and conducive reading environments.

Table 1: State of Library Infrastructure

Infrastructure Components	Adequate (%)	Inadequate (%)
Library building/space	41.7	58.3
Seating capacity	35.2	64.8
Furniture and fittings	38.9	61.1
Lighting and ventilation	44.5	55.5

The findings as shown in Table 1 indicate that a significant proportion of school libraries operate under poor physical conditions, which may discourage effective usage by students and teachers.

Availability of Information Resources in School Libraries

The availability of information resources was found to be generally low, with many respondents indicating that available materials are outdated and insufficient to meet users' needs.

Table 2: Availability of Information Resources

Information Resources	Available (%)	Not Available (%)
Textbooks (current editions)	46.3	53.7
Reference materials	39.5	60.5
Periodicals/newspapers	34.8	65.2
Digital/ICT resources	28.6	71.4

The results as shown in Table 2 above suggest that most school libraries lack relevant and up-to-date materials, particularly digital resources, limiting their ability to support modern teaching and learning practices.

Staffing and Library Services

Findings show a shortage of professionally trained librarians, with many schools relying on teacher-librarians without formal library training. Consequently, the range and quality of library services are limited.

Table 3: Staffing and Library Services

Variables	Adequate (%)	Inadequate (%)
Qualified librarians	31.2	68.8
Teacher-librarians	52.6	47.4
Circulation services	48.9	51.1
User education services	36.4	63.6

The findings as shown in Table 3 indicates that staffing challenges significantly affect the effectiveness of library service delivery in the schools.

Patterns of Library Utilization

The study revealed generally low levels of library utilization among students and teachers. Students primarily use the library occasionally for reading and assignments, while teachers make minimal use of library resources for instructional purposes.

Table 4: Patterns of Library Utilization

Level of Use	Students (%)	Teachers (%)
High	29.5	21.3
Moderate	34.7	30.6
Low	35.8	48.1

The findings in Table 4 indicate that libraries are underutilized, particularly by teachers, which limits their integration into teaching and learning processes.

Challenges Affecting School Libraries

Several challenges were identified as hindering the effective functioning of school libraries in Jigawa State.

Table 5: Challenges Affecting School Libraries

Challenges	Agree (%)	Disagree (%)
Inadequate funding	76.4	23.6
Lack of qualified librarians	72.8	27.2
Poor policy implementation	69.5	30.5
Inadequate ICT facilities	74.1	25.9
Limited administrative support	67.9	32.1

These challenges as indicated in Table 5 above significantly constrain the development and utilization of school libraries.

DISCUSSION OF FINDINGS IN RELATION TO LITERATURE AND THEORY

The findings of this study are consistent with existing literature on school libraries in Nigeria and other developing contexts, which report inadequate infrastructure, insufficient information resources, and a shortage of trained library personnel. The observed deficiencies in library facilities and materials support previous studies that highlight poor funding and weak policy implementation as major barriers to effective library development.

The low level of library utilization observed among students and teachers aligns with studies indicating that inadequate resources and lack of professional staffing reduce user engagement. From a theoretical perspective, the findings support **Library Service Quality Theory**, which emphasizes that poor service quality and limited resources negatively affect user satisfaction and usage. Similarly, **Systems Theory** is reflected in the interdependence of library components, where deficiencies in infrastructure, staffing, and resources collectively undermine overall performance.

Furthermore, the results align with **Resource-Based Theory**, which underscores the importance of adequate resources in achieving organizational effectiveness. The lack of critical resources in school libraries in Jigawa State explains their limited capacity to support teaching and learning effectively.

Overall, the study confirms that while school libraries are vital to educational development, their current state in Jigawa State significantly limits their potential impact. Addressing the identified challenges is essential for improving library utilization and enhancing educational outcomes.

SUMMARY, CONCLUSION, AND RECOMMENDATIONS

Summary of Major Findings

This study assessed the state of school libraries in government secondary schools in Jigawa State, Nigeria, with particular attention to library infrastructure, information resources, staffing, services, and patterns of utilization. The findings revealed that most school libraries are inadequately equipped, with poor infrastructure, limited seating capacity, and generally unconducive reading environments. In addition, the study established that information resources are insufficient, outdated, and largely unable to support the current curriculum effectively.

The study also found a significant shortage of professionally trained librarians, with many schools relying on unqualified personnel, which negatively affects the quality and range of library services. Consequently, library utilization by both students and teachers remains low. Furthermore, key challenges identified include inadequate funding, weak policy implementation, lack of administrative support, and poor provision of ICT facilities, all of which hinder effective library development and use.

Conclusion

The study concludes that the condition of school libraries in government secondary schools in Jigawa State is generally poor and falls below acceptable national and international standards. Although school libraries are recognized as essential educational support systems, their current state limits their ability to effectively contribute to teaching and learning processes.

The inadequacies in infrastructure, information resources, staffing, and services have resulted in low utilization levels among students and teachers. If these challenges are not addressed, school libraries will continue to play a minimal role in enhancing educational outcomes in the state. Therefore, urgent and coordinated interventions are required to reposition school libraries as functional learning hubs that can support secondary education effectively.

Recommendations

Based on the findings of this study and in line with the study objectives, the following recommendations are made:

1. Library Infrastructure, Information Resources, and ICT Facilities

The Government of Jigawa State, through the Ministry of Education and relevant educational agencies, should provide adequate funding for the construction, renovation, and equipping of school library facilities. Existing libraries should be upgraded to meet national and international standards by providing adequate seating capacity, conducive reading environments, current curriculum-based information resources, and modern ICT facilities such as computers, internet connectivity, and digital learning resources.

2. Library Personnel and Library Services

Qualified and professionally trained librarians should be employed in all government secondary school libraries to enhance the quality of library services. In addition, regular professional development programmes, workshops, and training should be organized for teacher-librarians and other library personnel to strengthen their competencies in library management, information service delivery, and ICT application. School libraries should also diversify and improve their services to better support teaching, learning, and research activities.

3. Library Utilization and Challenges Affecting School Libraries

School administrators and educational authorities should develop strategies to promote effective library utilization among students and teachers through library orientation programmes, reading promotion campaigns, information literacy instruction, and the integration of library activities into the school curriculum. Furthermore, educational authorities should strengthen the implementation of school library policies, establish monitoring and evaluation mechanisms, and provide sustained administrative support to address challenges related to inadequate funding, weak policy implementation, and poor management practices.

4. Strengthening School Library Development

A comprehensive school library development policy should be developed and implemented to provide clear guidelines for funding, staffing, infrastructure development, resource acquisition, ICT integration, and service delivery. Such a policy should include periodic assessment and accountability measures to ensure the continuous improvement and sustainability of school libraries in Jigawa State.

Suggestions for Further Studies

Future research could adopt a comparative approach by examining school library development across different states or geopolitical zones in Nigeria. Additionally, qualitative studies exploring user experiences and perceptions of school library services could provide deeper insights into utilization challenges and improvement strategies.

Assessment of Professional Development Programmes and Librarians' Innovative Service Delivery Outcomes in Public University Libraries in Rivers State

Eruchi Brown Akpelu *CLN*
Department of Library & Information Science, Ignatius Ajuru University of Education
eruchi.akpelu@iaue.edu.ng

Abstract

The study examined professional development programmes (PDPs) and librarians' innovative service delivery outcomes in public university libraries in Rivers State. It was guided by specific objectives which sought to identify the PDPs available to Librarians, level of participation, the effects and challenges. A descriptive design was adopted for the study. The population comprised 38 professional librarians. A structured questionnaire was used as the primary instrument for data collection. Data collected were analysed using descriptive statistics. The findings revealed that PDPs available included workshops, seminars, conferences, in-service training, amongst others. The study found a moderate level of participation with strong engagement in self-directed learning, professional conferences, workshops and seminars. The study also revealed that PDPs have positive effects as they enhance Librarians' ability to design user-centered services, utilize emerging technologies (AI tools, IoTs, SNSs), and deliver virtual services. The challenges however faced included inadequate funding, heavy workload, poor institutional support, amongst others. It concluded that although PDPs are crucial for improving innovative service delivery, their full benefits can only be realized if the barriers are addressed. The study however recommended improved funding, structured professional development policies, and provision of enabling digital facilities to help strengthen librarians' capacities for innovative service delivery outcomes.
Keywords: University libraries, Librarians, Professional development Programmes (PDPs), Innovative services delivery, Effects.

Introduction

Innovative service delivery in university libraries has become a central expectation in the digital era, as libraries are increasingly required to adopt user-centered, technology-driven, and responsive service models to remain relevant. Academic libraries are evolving from traditional information repositories into dynamic knowledge hubs that utilize digital tools, virtual services, and creative engagement strategies to meet changing user needs (Oyedokun, 2025). This shift has intensified the demand for librarians to continuously update their competencies, particularly in information and communication technologies (ICT), digital resource management, and innovative service provision. Studies have shown that the ability of librarians to deliver innovative services is strongly linked to their exposure to professional development programmes, which equip them with the necessary skills to adapt to technological advancements and emerging service models. However, the transition toward innovative service delivery remains uneven in African academic libraries due to varying levels of skills acquisition and institutional supports (Nakaziba & Ngulube, 2025; Oyedokun, 2025).

Professional development is a systematic process that brings about change in practitioners' attitudes and practices through continuous learning experiences, and its effectiveness is measured by improvements in professional practice (Solomon, et al., 2023). Professional development programmes available to librarians in university libraries are diverse and have expanded significantly in response to technological changes in the information environment. These programmes include workshops, seminars, conferences, in-service training, mentoring, and increasingly, e-learning platforms that allow flexible and continuous learning. Evidence indicates that e-learning has become a prominent component of continuing professional development, enabling librarians to acquire digital competencies and adapt to emerging trends in library services (Shahzad et al., 2023). Similarly, academic libraries are adopting structured development initiatives where staff development is prioritized for improved service outcomes. These programmes are designed to enhance both technical and soft skills, including communication, information literacy instruction, and digital service delivery, which are essential for innovative library practices in contemporary university environments (Dube et al., 2024).

The level of participation of librarians in professional development activities varies across institutions and is influenced by several organizational and individual factors. While many librarians recognize the importance of continuous learning, participation is often shaped by access to funding, institutional support, workload, and availability of training opportunities. Research shows that librarians who actively engage in development activities demonstrate improved competencies and adaptability in service delivery (Shahzad et al., 2023). However, participation is sometimes limited due to constraints such as insufficient sponsorship, time limitations, and lack of structured professional development policies within institutions. In many developing contexts, participation remains moderate rather than optimal, suggesting that systemic barriers rather than lack of interest often hinder librarians' engagement in professional development activities (Dube et al., 2024).

The rationale for this study is therefore anchored on the need to empirically assess professional development programmes and librarians' innovative service delivery outcomes, particularly within the context of public university

libraries in Rivers State. While existing studies have established the importance of professional development and its link to service innovation, there is limited context-specific evidence focusing on Rivers State. Given the increasing demand for innovative library services in Nigerian universities and the challenges facing librarians' professional growth, this study however seeks to fill this gap by providing localized evidence that can inform policy, improve professional development practices, and enhance innovative service delivery outcomes in university libraries.

Aims and Objectives

The study sought to assess professional development programmes and librarians' innovative service delivery outcomes in public university libraries in Rivers State. The specific objectives were to:

1. identify the professional development programmes available to librarians in public university libraries.
2. examine the level of participation of librarians in professional development programmes in public university libraries.
3. determine the effect of professional skills development on librarians' innovative service delivery outcomes in public university libraries.
4. identify the challenges affecting librarians' innovative professional development in public university libraries.

Review of Relevant Literature

Professional Development Programmes in University Libraries

Professional development programmes have been widely conceptualized as structured learning activities designed to enhance the knowledge, skills, and competencies of professionals to improve job performance and service delivery. Solomon, et al. (2023) views professional development as a systematic process that brings about change in practitioners' attitudes and practices through continuous learning experiences, emphasizing that its effectiveness is measured by improvements in professional practice. Similarly, Nīmante et al. (2025) conceptualize professional development as all natural learning experiences and those conscious and planned activities intended to benefit individuals, groups, or schools, which contribute to the quality of education and service delivery. In the library context, these programmes are seen as essential tools for equipping librarians with updated competencies required in a rapidly changing information environment. In another perspective, Ioannou (2024) defines professional development programmes as ongoing formal and informal learning opportunities that enable professionals to remain current with new knowledge, technologies, and practices in their field. This highlights the dynamic and continuous nature of professional learning in modern institutions. Likewise, Ukaegbu and Okwu (2022) describe professional development programmes for librarians as organized training activities such as workshops, seminars, conferences, and ICT-based training designed to improve librarians' efficiency in information service delivery. These views collectively suggest that professional development programmes are not one-time events but continuous, structured, and adaptive processes aimed at improving professional competence, particularly in enhancing innovative service delivery in academic libraries.

A survey by Edet and Alex-Nmecha (2023) found that librarians engage in programmes such as webinars, Zoom workshops, YouTube training, and online learning platforms, with digital skills like online searching being the most commonly acquired. Similarly, Margam and Pandey (2025) reported that virtual workshops and webinars became prominent professional development avenues, especially for librarians in digital era. A study by Rehman et al. (2025) examined channels of continuous professional development (CPD) among librarians in academic libraries in India using a survey method and found that common programmes include workshops, seminars, conferences, online courses, and mentoring initiatives, all aimed at bridging the gap between theory and practice in librarianship. Islam et al. (2025), using a mixed-method approach among 97 university librarians in Bangladesh, reported that continuing education programmes such as short courses, training sessions, and professional certifications are widely available and contribute to librarians' professional growth. In another empirical investigation, Oladokun and Mooko (2023) explored academic libraries in Botswana and found that structured CPD programmes, including formal education and institutional training, are essential for equipping librarians with relevant competencies for modern library services. These studies collectively demonstrate that professional development programmes in university libraries are diverse and increasingly oriented toward digital and technological competencies.

Librarians' Participation in Professional Development Programmes

The level of librarians' participation in professional development programmes refers to the extent to which librarians engage in structured and informal learning activities aimed at improving their professional competencies. Participation is often conceptualized as the frequency, intensity, and consistency with which librarians attend workshops, seminars, conferences, online training, and other capacity-building initiatives. According to Rehman et al. (2025), participation in professional development among librarians is largely influenced by accessibility, institutional support, and individual motivation, which collectively determine how actively librarians engage in such programmes. In a similar view, Diseiye et al. (2024) emphasize that active participation in professional development is essential for librarians to remain relevant in the digital information environment, as it enhances their ability to adapt to emerging technologies and changing user needs. This suggests that participation is not merely attendance but meaningful engagement that translates into improved professional practice.

Furthermore, Shahzad et al. (2023) argues that librarians' participation in professional development programmes is often moderate in developing countries due to challenges such as workload, inadequate funding, and limited access to training opportunities. They stress that where participation is high, librarians tend to demonstrate improved efficiency and innovation in service delivery. In the same vein, Moonasar (2024) note that participation levels are significantly shaped by institutional policies and the availability of continuous training programmes within academic libraries. They further explain that librarians who frequently participate in professional development activities are more likely to adopt modern practices such as digital librarianship and virtual service delivery. Collectively, these views indicate that the level of participation in professional development programmes is a critical determinant of librarians' professional growth and their ability to deliver innovative library services effectively.

Islam et al. (2025) found that while many librarians in Bangladesh participate in continuing education programmes, participation levels differ based on access to resources and institutional support. Rehman et al. (2025) reported that librarians actively engage in CPD activities such as workshops and online learning; however, participation is often constrained by workload and limited funding opportunities. Similarly, Oladokun and Mooko (2023) observed that although librarians recognize the importance of professional development, actual participation is moderate due to organizational and structural limitations within university libraries. These findings suggest that participation in professional development is not uniform and is significantly influenced by institutional support systems and available resources.

Effect of Professional Development Programmes on Librarians' Innovative Services

Professional development programmes have a significant effect on librarians' innovative service delivery outcomes in public university libraries by equipping them with updated knowledge, practical skills, and competencies required to function effectively in a technology-driven information environment. Through activities such as workshops, seminars, conferences, in-service training, and online learning, librarians acquire enhanced ICT skills, improved problem-solving abilities, and greater awareness of emerging trends in librarianship. Furthermore, professional development programmes foster innovation in library services by enabling librarians to adopt and implement modern service delivery tools such as virtual reference services, digital repositories, online user education, and electronic information management systems. As librarians gain exposure to new ideas and technologies, they become more creative and adaptable in designing services that improve user experience and accessibility.

This aligns with the findings of Rehman et al. (2025), who report that librarians who participate in professional development are more likely to adopt innovative service delivery approaches in academic libraries. In the same vein, Shlenova (2025) and Ukaegbu and Okwu (2022) assert that continuous professional training enhances librarians' capacity to integrate ICT and innovative practices into library operations. Consequently, professional development programmes play a crucial role in transforming public university libraries into dynamic, technology-driven, and user-centered service environments. Shahzad et al. (2023), through a systematic review of 30 studies, found that e-learning-based professional development enhances librarians' ability to implement user-centered and technology-driven services in university libraries. Furthermore, Shahzad and Khan (2026), using a mixed-method explanatory design involving 341 librarians in Pakistan, revealed that online learning has a significant positive effect on librarians' professional development and contributes to the delivery of innovative and sustainable library services. In addition, Dube et al. (2024) conducted a systematic review and found that the acquisition of ICT competencies through professional development programmes enables librarians to effectively use digital tools, thereby enhancing innovative service delivery in academic libraries. These studies provide strong empirical support for the role of professional development in fostering innovation in library service delivery.

Challenges Affecting Librarians' Professional Development and Innovation

Librarians' engagement in professional development programmes in public university libraries is often constrained by several institutional, financial, and infrastructural challenges. A Study by Rehman et al. (2025) revealed that librarians face challenges such as insufficient institutional support, limited access to training opportunities, and motivational constraints that hinder effective participation in professional development. According to their study, without strong institutional commitment and adequate technological support, librarians' capacity to engage in continuous learning and adopt innovative practices remains limited. Collectively, these challenges impede the effective development of librarians' competencies and slow down the adoption of innovative service delivery in public university libraries. Shahzad et al. (2023) identified key barriers to CPD participation, including technical difficulties, heavy workload, and reliance on traditional training models. Librarians are frequently overwhelmed with daily routine tasks, leaving little time for participation in professional development activities. Similiarly, Edet and Alex-Nmecha (2023) found that lack of funding is a major barrier limiting librarians' professional development programmes. Inadequate funding limits the ability of libraries and institutions to sponsor librarians for workshops, conferences, and training programmes. Additionally, Islam et al. (2024) found that challenges such as lack of awareness, and time constraints significantly affect librarians' engagement in continuing education programmes. These findings indicate that while professional development is essential for innovative service delivery, multiple systemic and organizational barriers continue to limit its effectiveness in university libraries.

Methodology

This study adopted a descriptive survey research design to assess professional development programmes and librarians' innovative service delivery outcomes in public university libraries in Rivers State. The population included thirty eight (38) professional librarians working in public university libraries including Rivers State University Library, Dame Patience Goodluck Jonathan Automated Library and Donald Ekong Library. A total enumeration sampling technique was employed to study the entire population. This technique was considered appropriate for the study because the population size is relatively small and manageable. Data were collected using a structured questionnaire titled *Professional Development Programmes and Innovative Service Delivery Outcomes Questionnaire (PDPISDOQ)*, which was designed based on the study objectives and structured on a four-point Likert scale ranging from Strongly Agree to Strongly Disagree. The instrument was validated through face and content validation by experts in Library and Information Science and measurement and evaluation, while its reliability was established using Cronbach's Alpha, yielding a coefficient of 0.89. Data collection was carried out through direct administration of the questionnaire to respondents' whatsapps and emails, ensuring a high response rate. The data collected were analyzed using descriptive statistics such as frequency counts and means to answer the research questions, with a decision rule of 2.50 as the benchmark for acceptance.

Data Presentation and Analysis

Online questionnaire was distributed via private WhatsApp messages and email. A total of 30 responses were received and deemed valid for analysis.

RQ1: What professional development programmes are available to librarians in public university libraries?

Table 1: Professional development programmes (N = 30)

SN	ITEM	SA	A	D	SD	$\bar{x}$	Decision
1	Workshops are regularly organized for librarians in my library.	9	15	3	3	3.00	Agree
2	I have access to seminars and conferences for professional growth.	8	14	5	3	2.90	Agree
3	My library provides in-service training programmes.	6	14	6	4	2.73	Agree
4	Online training (webinars, e-learning) is available to me.	7	16	5	2	2.93	Agree
5	Mentoring programmes exist for librarians in my institution.	6	15	6	3	2.80	Agree
	Weighted $\bar{x}$					**2.87**	

Table 1 shows that librarians generally agree that various professional development programmes are available in their university libraries, with a weighted mean of 2.87, which is above the 2.50 benchmark. Specifically, workshops ($\bar{x}$ = 3.00) and access to online training such as webinars and e-learning ($\bar{x}$ = 2.93) recorded the highest mean scores, indicating that these programmes are more readily available and frequently organized. Access to seminars and conferences ($\bar{x}$ = 2.90) and mentoring programmes ($\bar{x}$ = 2.80) also received positive responses, suggesting moderate availability. However, in-service training programmes recorded the lowest mean ($\bar{x}$ = 2.73), though still within the agreement range, implying that such programmes may be less consistently provided compared to others. The findings however indicate that while a variety of professional development opportunities exist for librarians, their availability varies slightly across different types, with greater emphasis on workshops and online training platforms.

RQ2: What is the level of participation of librarians in professional development programmes in public university libraries?

Table 2: Level of participation in professional programmes (N = 30)

SN	ITEM	SA	A	D	SD	$\bar{x}$	Decision
6	I frequently attend workshops and seminars.	7	13	6	4	2.77	Agree
7	I actively participate in online professional development courses.	5	12	7	6	2.53	Agree
8	I attend professional conferences regularly.	6	13	6	5	2.67	Agree
9	I engage in self-directed learning to improve my skills.	7	13	6	4	2.77	Agree
10	I participate in mentoring or peer learning activities.	5	12	7	6	2.53	Agree
	Weighted $\bar{x}$					**2.65**	

The results of Table 2 indicate a **moderate level of participation** of librarians in professional development programmes, with a weighted mean of 2.65, which is slightly above the 2.50 benchmark. Participation is relatively higher in workshops, seminars, and self-directed learning ($\bar{x}$ = 2.77), suggesting that librarians are more engaged in accessible and flexible forms of learning. However, participation in online professional development courses ($\bar{x}$ = 2.53) and mentoring or peer learning activities ($\bar{x}$ = 2.53) is comparatively lower, indicating limited engagement in these areas. Attendance at professional conferences ($\bar{x}$ = 2.67) also reflects moderate involvement. The findings suggest that while librarians do participate in professional development activities, their level of engagement is not very high and may be influenced by factors, thereby resulting in only a moderate level of participation.

RQ3: What is the effect of professional development programmes on librarians' innovative service delivery outcomes in university libraries?

Table 3: Effect of professional development programmes on Librarian innovative service delivery outcomes (N = 30)

SN	ITEM	SA	A	D	SD	$\bar{x}$	Decision
11.	Professional development enhances my ability to design user-centered services.	10	16	2	2	3.13	Agree
12.	Professional development improves my competence in using emerging technologies (AI tools, IoTs, Social networking sites).	9	17	3	1	3.13	Agree
13.	Professional development programmes equips me with the ability to implement novel library services.	10	15	3	2	3.10	Agree
14.	Professional development improves my ability to deliver impactful virtual services.	9	16	4	1	3.10	Agree
15.	Continuous professional development programmes increases my adaptability to users' information needs.	11	17	1	1	3.27	Agree
	Weighted $\bar{x}$					**3.15**	

Table 3 reveals that professional development programmes have a strong positive effect on librarians' service delivery outcomes, with a weighted mean of 3.15, which is well above the 2.50 benchmark. The highest mean score was recorded for increased adaptability to users' information needs ($\bar{x}$ = 3.27), indicating that continuous professional development significantly enhances librarians' responsiveness to changing user demands. This is followed by improved ability to design user-centered services ($\bar{x}$ = 3.13) and enhanced competence in using emerging technologies such as AI tools, IoTs, and social networking sites ($\bar{x}$ = 3.13), suggesting that training effectively builds both user-focused and technical capabilities. Additionally, respondents agreed that professional development equips them to implement novel library services ($\bar{x}$ = 3.10) and improves their ability to deliver impactful virtual services ($\bar{x}$ = 3.10). The findings demonstrate that professional development programmes play a critical role in strengthening librarians' skills, adaptability, and capacity to deliver modern, technology-driven, and user-oriented library services.

RQ4: What challenges affect librarians' innovative professional development in public university libraries?

Table 4: Challenges affecting librarians' innovative professional development (N = 30)

SN	ITEM	SA	A	D	SD	$\bar{x}$	Decision
16.	Lack of funding limits my participation in professional development programmes.	12	16	1	1	3.30	Agree
17.	Heavy workload prevents me from attending professional development programmes.	11	17	1	1	3.27	Agree
18.	My institution does not adequately support professional development programmes.	10	18	1	1	3.23	Agree
19.	Poor internet connectivity affects my participation in online professional development programmes.	11	16	2	1	3.23	Agree
20.	Lack of awareness limits my involvement in professional development programmes.	10	17	2	1	3.20	Agree
	Weighted $\bar{x}$					**3.25**	

Table 4 shows that respondents generally agree that several challenges hinder their participation in professional development programmes, with a weighted mean of 3.25, which is above the 2.50 criterion mean. Specifically, lack of funding ($\bar{x}$ = 3.30) and heavy workload ($\bar{x}$ = 3.27) were identified as the most significant constraints, indicating that financial limitations and job demands strongly affect librarians' ability to engage in training activities. Institutional support ($\bar{x}$ = 3.23) and poor internet connectivity ($\bar{x}$ = 3.23) also recorded high mean scores, suggesting that organizational and infrastructural factors further limit access to professional development opportunities, especially online-based training. Lack of awareness ($\bar{x}$ = 3.20), although slightly lower than the other items, still falls within the

agreement range, implying that some librarians are not fully informed about available development programmes. The findings reveal that professional development participation among librarians is significantly constrained by financial, institutional, workload, technological, and informational barriers, which collectively hinder continuous skill acquisition and professional growth in public university libraries.

Discussion of Findings

In RQ1, the findings revealed that several professional development programmes are available to librarians in university libraries in Rivers State, including workshops, seminars, conferences, in-service training, online training, and mentoring programmes, with a weighted mean of 2.87. This indicates that librarians generally agree that such opportunities exist, although the availability is more pronounced in workshops and online training compared to structured mentoring and in-service training. This findings aligns with the view that academic libraries are increasingly adopting blended and digital professional development approaches to support staff capacity building (Rehman et al. (2025); Edet & Alex-Nmecha, 2023). The implication is that while training structures exist, their depth and consistency may vary across institutions.

In RQ2, the study found that librarians demonstrate a moderate level of participation in professional development activities, with a weighted mean of 2.65. Respondents showed strong engagement in self-directed learning, workshops, and seminars, while participation in online courses, conferences, and mentoring activities was comparatively moderate. This suggests that librarians are actively involved in skill development but tend to prefer less formal and more accessible learning methods. This supports Oladokun and Mooko (2023), who observed that participation in CPD activities is often moderate and influenced by accessibility, time, and institutional support.

In RQ3, findings showed that professional development programmes have a strong positive effect on librarians' innovative service delivery outcomes, with a weighted mean of 3.15. Librarians reported improved ability to design user-centered services, use emerging technologies, deliver virtual services, and implement novel library services. This confirms that professional development enhances librarians' competencies and innovation capacity. This is consistent with Rehman et al. (2025), Dube et al. (2024) and Shlenova (2025) reaffirming that continuous training strengthens digital transformation and innovative service delivery in academic libraries. The implication is that well-structured professional development directly contributes to service modernization in university libraries.

In RQ4, the study revealed that librarians face significant challenges in accessing professional development programmes, with a weighted mean of 3.25. Key constraints include lack of funding, heavy workload, inadequate institutional support, poor internet connectivity, and lack of awareness. These findings indicate that despite the availability of training opportunities, structural and institutional barriers significantly limit participation. This aligns with Shahzad et al. (2023) and Edet and Alex-Nmecha (2023) who reported that financial constraints, infrastructural deficits, and workload pressures are major obstacles to continuous professional development in academic libraries. This suggests that without addressing these barriers, the effectiveness of professional development initiatives will remain limited. Across all research questions, the study demonstrates that while professional development programmes are available and positively enhance innovative service delivery, actual participation and effectiveness are constrained by institutional, financial, and infrastructural challenges.

Conclusion

The study established that professional development programmes such as workshops, seminars, conferences, in-service training, online learning, and mentoring are available to librarians in public university libraries in Rivers State, and librarians generally show a high level of participation in these activities, particularly through workshops and self-directed learning. The findings further revealed that professional development programmes have a significant effect on librarians' innovative service delivery outcomes, as they enhance skills in user-centered service design, the use of emerging technologies, and the delivery of virtual and modern library services. The effectiveness of these programmes is constrained by several challenges, including inadequate funding, heavy workload, poor institutional support, limited internet connectivity, and lack of awareness. However, it is concluded that while professional development is essential for improving innovation in library service delivery, its full effect can only be achieved if the identified barriers are effectively addressed in university libraries.

Recommendations

Based on the findings of the study, the following recommendations are made to enhance professional development and improve librarians' innovative service delivery outcomes in public university libraries in Rivers State:

1. Adequate funding/support for professional development programmes should be provided to ensure regular and sustained participation of librarians in workshops, seminars, conferences, and online training.
2. Establishment of structured and continuous professional development policies that make participation compulsory and well-coordinated, rather than optional or irregular.
3. Reduce workload on librarians by employing adequate staff, to allow time for participation in training and development activities.

4. Institutions should improve ICT infrastructure, including stable internet connectivity and access to digital learning platforms, to support effective participation in online professional development programmes.
5. The Library management should improve internal communication mechanism to ensure that all librarians are well informed about available training opportunities.
6. Library stakeholders should collaborate with universities to organize affordable training programmes to enhance accessibility for all librarians.

Abstract

This study assessed the current state of public libraries in Niger State, Nigeria, focusing on facilities, collections, and information and communication technology (ICT) infrastructure. The objectives that guided this study sought to find out the frequency of library visits by users of public libraries in Niger State, Nigeria; to identify the purposes of visit by users of public libraries in Niger State, Nigeria; to find out the performance of professional roles in public libraries in Niger State, Nigeria etc. A descriptive survey was conducted using 42 librarians and 324 registered users across five library branches using questionnaires and an observation checklist. The findings of this study revealed among others that there was severe infrastructural decay: 66–74% of buildings were in poor condition, and basic amenities such as toilets (71.4% non-existent), lighting (61.9%), and clean water (78.6%) were absent. Over 85% of librarians rated textbook, fiction, and reference collections as inadequate, with more than 70% of materials published before 2000. No functional computers or internet access for public use were found in any branch (0% availability). The study concludes that public libraries in Niger State are in a state of chronic neglect, severely limiting their ability to serve the community.
Keywords: Digital exclusion, infrastructure decay, Niger State, outdated collections, public libraries

Introduction

Public libraries in Nigeria have declined significantly due to inadequate funding and weak policy implementation (Chimah, 2023). Niger State, the largest state by landmass with a predominantly rural population, has experienced chronic budgetary neglect, with library allocations consistently below 0.5% of the education budget (Niger State Budget Office, 2023). Prior studies have documented dilapidated buildings, outdated collections, and absence of ICT in North Central Nigeria (Usman & Mohammed, 2022; Sani & Bello, 2025; Ahmadu, 2024). Public libraries continue to occupy a strategic position in modern society as institutions that facilitate access to information, education, and lifelong learning opportunities. They serve as community centres where individuals can acquire knowledge, improve literacy skills, access educational materials, and engage in personal development activities. Public libraries also promote social inclusion by providing information resources to all members of society regardless of their economic status, educational background, or geographical location.

In an era characterized by rapid technological advancement and information growth, public libraries remain important channels for bridging information gaps and supporting digital literacy among citizens. In Nigeria, the relevance of public libraries is particularly significant because they complement formal education and provide alternative avenues for learning, especially for students, researchers, job seekers, and members of underserved communities. They contribute to the promotion of reading culture, support educational attainment, and provide access to information necessary for informed decision-making and socio-economic development. For many citizens who cannot afford personal educational resources, public libraries represent an important source of knowledge and learning opportunities. The importance of public libraries is even more pronounced in Niger State due to its vast geographical coverage and predominantly rural population. Many communities within the state have limited access to educational and information resources, making public libraries potentially valuable centres for learning, information dissemination, and community development. Effective public library services can support literacy development, access to digital information, agricultural awareness, youth empowerment, and educational advancement. Consequently, understanding the current condition of public

libraries in Niger State is essential for evaluating their capacity to fulfil these roles and for identifying areas requiring improvement to enhance service delivery and community impact. However, a holistic assessment of the status of public libraries in Niger State, Nigeria, remains lacking.

Statement of the Problem

Public libraries in Niger State are expected to function as information centres to all. Public libraries are globally recognised as critical institutions for promoting literacy, bridging the digital divide, and supporting lifelong learning (IFLA, 2022). While several studies have documented the challenges facing public libraries in various Nigerian states, the situation in Niger State remains particularly underexplored and alarming.

Niger State, one of the largest states in Nigeria by landmass, has a predominantly rural population with low literacy rates and limited access to information services (National Bureau of Statistics, 2021). The Niger State Library Board has suffered from chronic budgetary neglect, with annual allocations consistently below 0.5% of the state's education budget (Niger State Budget Office, 2023). This funding crisis has led to severe dilapidation of physical infrastructure, grossly outdated collections, and a near-total absence of information and communication technology (ICT) facilities (Usman & Mohammed, 2022; Ahmadu, 2024; Sani & Bello, 2025). Consequently, usage rates have plummeted, and the professional roles of librarians have been reduced to largely clerical functions (Eze & Tanko, 2024; Yahaya, 2025). While national-level studies have painted a grim picture of public libraries in Nigeria, there is a critical lack of recent, empirical research focusing specifically on Niger State. This study, therefore, fills that gap.

Research Questions

This study answered the following research questions:

1. What is the frequency of library visits by users of public libraries in Niger State, Nigeria?
2. What are the purposes of visit by users of public libraries in Niger State, Nigeria?
3. What is the performance of professional roles in public libraries in Niger State, Nigeria?
4. What challenges are encountered in the use of public libraries in Niger State, Nigeria?
5. What is the users' satisfaction with the public libraries in Niger State, Nigeria?

Objectives of the Study

The following objectives guided this study:

1. To find out the frequency of library visits by users of public libraries in Niger State, Nigeria
2. To identify the purposes of visit by users of public libraries in Niger State, Nigeria.
3. To find out the performance of professional roles in public libraries in Niger State, Nigeria.
4. To investigate the challenges encountered in the use of public libraries in Niger State, Nigeria.
5. To find out the users' satisfaction with the public libraries in Niger State, Nigeria.

Literature Review

This section presents the review of related literature. It is presented as follows:

Evolution of Public Libraries in Nigeria

The development of public libraries in Nigeria is intertwined with colonial history and post-independence aspirations. The earliest public library, the Tom Jones Library, was established between 1910 and 1920, followed by the Lagos Library in 1932 (Zaid, 2024). However, these were subscription-based and accessible only to the colonial elite. The modern public library system was laid after World War II through British colonial policies, leading to regional library boards and mobile library services (Ogbonna, 2023).

Despite this promising start, public libraries in Nigeria have experienced stagnation and decline due to political and socioeconomic factors (Chimah, 2023). After Nigeria's transition to a federal structure, funding and management fell to state governments, resulting in chronic underfunding, dilapidated infrastructure, outdated collections, and a near-absence of ICT (Nwokocha et al., 2025). Many public libraries have become "relics of a bygone era" (Unomah, 2025).

Global and African Perspectives

Globally, public libraries have evolved into dynamic community hubs supporting lifelong learning, digital inclusion, and economic empowerment (IFLA, 2022; Bertot et al., 2020). In developed countries, public libraries function as digital literacy centres, makerspaces, and job-seeking assistance hubs (Johnson & López, 2023). In Sub-Saharan Africa, however, public libraries struggle to fulfil even basic roles due to resource limitations (Alemna & Antwi, 2022; Msuya & Oluwole, 2024).

Previous Studies in North-Central Nigeria

Aina and Ogungbeni (2020) assessed public library services across six North-Central states and found that only the FCT (Abuja) had a functional system, while others exhibited chronic under funding and dilapidated buildings. Usman and Mohammed (2022) focused on infrastructure decay in Niger, Kwara, and Kogi states, reporting that 78% of library buildings required major repairs and 82% lacked internet access. Sani and Bello (2025) investigated ICT infrastructure

and found that public libraries in Niger State had no functional computers or broadband internet. Ahmadu (2024) examined collection development and found that the last major book purchase in Niger State occurred in 2014. Eze and Tanko (2024) reported that librarians in Niger State exhibited the lowest morale in the region, with 71% intending to leave within two years. Yahaya (2025) documented a 46% decline in professional librarians between 2010 and 2024.

Methodology

Descriptive survey research was adopted in this study. The population of this study comprises of 42 professional librarians and 3,850 registered users. Five library branches in Minna, Bida, Suleja, Kontagora and Lapai, were used. All the 42 librarians and a sample size of 324 users using Yamane formula, 5% margin, was used. Questionnaire was used as the Instrument. Descriptive statistics (frequencies, percentages and mean), were used.

Data Presentation, Analysis and Discussion

This section presents the data analysed and discussed. It is presented as follows:

Table 1: Frequency of Library Visits

S/N	Frequency	F	%
1.	1–2 times per month	156	48.1
2.	3–4 times per month	98	30.2
3.	5–6 times per month	36	11.1
4.	More than 6 times per month	34	10.5

Table 1 is on the low frequency of library visits, with nearly half of users attending only 1–2 times per month, signals a declining engagement with library services. This trend aligns with the Niger State Library Board (2024), which documented a 60% decline in visitor numbers since 2015. Such limited engagement indicates that libraries are underutilized, functioning more as optional community spaces than as central information hubs, which diminishes their potential in fostering literacy and lifelong learning (Obi & Ibrahim, 2023; Yahaya, 2025).

Table 2: Purposes of Visit

S/N	Purposes	F	%
1.	Read newspapers	187	57.7
2.	Charge mobile phones	145	44.8
3.	Borrow books	112	34.6
4.	Study/read quietly	98	30.2
5.	Use computers/internet	4	1.2
6.	Attend library programme	2	0.6

Table 2 presents the analysis of the purpose of library visits, which shows that most users prioritize reading newspapers (57.7%) and charging mobile phones (44.8%) over borrowing books or using ICT facilities. Only 1.2% of users reported using computers or the internet, reflecting the near absence of ICT resources. This pattern corroborates findings by Obi and Ibrahim (2023), who observed that Nigerian public libraries often serve as informal shelters rather than educational centers. The data indicate that infrastructural deficiencies and limited program offerings restrict the library's ability to facilitate academic and research activities.

Table 3: Performance of Professional Roles

S/N	Roles	Mean	Regularly (%)	Never (%)
1.	Charge/discharge books	3.86	90.5	0
2.	Shelving books	3.71	85.7	2.4
3.	Register new users	3.62	73.8	4.8
4.	Answer directional questions	3.48	66.7	7.1
5.	Reference services	2.33	14.3	26.2
6.	User education	1.74	4.8	47.6
7.	Community outreach	1.45	2.4	66.7
8.	Digital literacy training	1.10	0	90.5

From Table 3, the performance of librarians is heavily skewed toward clerical duties, such as charging/discharging books and shelving. Critical professional services such as reference, user education, community outreach, and digital literacy training, are rarely or never performed, which echoes Eze and Tanko's (2024) study that identified low morale and underutilization of professional skills among librarians in Niger State. This reduction in professional roles likely contributes to low library engagement and underlines the importance of empowering librarians with resources and training to perform these core duties.

Table 4: Challenges Identified by Respondents

S/N	Challenges	Librarians (%)	Users (%)
1.	Inadequate funding	95.2	–
2.	Poor infrastructure	88.1	76.5
3.	Lack of ICT/internet	100	85.5
4.	Outdated books	90.5	70.4
5.	Irregular electricity	100	82.1
6.	No toilet/water facilities	78.6	88.6
7.	Poor reading culture	71.4	62.0
8.	Lack of staff motivation	83.3	–
9.	Low community awareness	–	62.0

Table 4 indicates that both librarians and users report severe challenges that impede library performance, including inadequate funding, poor infrastructure, lack of ICT, irregular electricity, and outdated collections. Chronic underfunding (<0.5% of the education budget) is identified as the root cause of these issues (Chimah, 2023; Yahaya, 2025). Users' qualitative feedback underscores how these challenges shape their behavior: libraries are primarily used for incidental activities such as newspaper reading and phone charging, rather than educational purposes. This evidence aligns with Bertot, Sarin, and Percell (2020), who argue that infrastructural and resource deficits severely limit public libraries' role in community development.

Table 5: User Satisfaction

S/N	Service aspect	Mean	% Very dissatisfied
1.	Toilet/water facilities	1.12	88.6
2.	Computers/internet	1.15	85.5
3.	Availability of current books	1.43	61.7
4.	Lighting/ventilation	1.51	58.0
5.	Staff attitude	2.00	42.3
6.	Reading space	2.10	38.0

Table 5 indicates that the user satisfaction is extremely low across all measured service aspects, including toilet and water facilities, ICT availability, lighting, and reading space. Dissatisfaction with these services directly correlates with infrequent visits and limited engagement in library activities (Msuya & Oluwole, 2024). This pattern supports the observations of Usman and Mohammed (2022), who noted that infrastructure decay and lack of ICT resources negatively affect library utilization in North Central Nigeria. Addressing these deficits through improved funding, ICT provision, and enhanced staff roles, is critical to revitalizing public libraries as functional centers for learning and social development.

Conclusion

It is concluded that the Niger State public library usage is very low (48% visit 1-2 times/month), and users primarily engage in peripheral activities (newspaper reading, phone charging) rather than core library functions. Public service librarians are performing almost exclusively clerical tasks; professional roles (reference, user education, outreach, digital literacy) are rarely or never performed. The major challenges are chronic underfunding, dilapidated infrastructure, complete digital exclusion, outdated collections, lack of basic amenities, and low community awareness. User satisfaction is extremely low across all service dimensions. Without urgent intervention, the public library system in Niger State faces collapse.

Recommendations

Based on the findings, the following recommendations are proposed:

i. Increase library funding to at least 2% of the state's education budget and create a legislative mandate for a fixed percentage (e.g., 1% of internally generated revenue) to ensure predictable funding.

ii. Launch an urgent book acquisition and weeding program. Remove all materials published before 2005 and allocate at least ₦50 million for current books, newspapers, and journal subscriptions. Partner with Book Aid International.

5. Establish e-library hubs in Minna, Bida, and Suleja with at least 20 computers each, broadband internet, backup power, and a trained ICT librarian per hub.

6. Re-train all 42 librarians in modern reference services, user education, community outreach, and digital literacy. Revise job descriptions and link performance evaluation to these professional activities.

7. Advocate for sustained funding and monitor budget releases. Assist with book donations, ICT equipment, and training programmes.

Abstract

This study examined augmented librarianship and the repositioning of artificial intelligence as a collaborative tool in 21st century information services. The study has 4 objectives. A descriptive survey design was used on a sample of 120 librarians in Lagos, Imo and Oyo states selected randomly from a population of over 1000 academic librarians in Nigeria. Questionnaire was used to collect data which address the research objectives. Data collected was analyzed using descriptive statistics such as frequencies, percentages, and mean scores. The findings showed that librarians had a high level of awareness of artificial intelligence, viewed it positively as a collaborative tool, and demonstrated readiness to adopt AI driven technologies. The study also found that adoption is influenced by training, ICT infrastructure, management support, cost, technical skills, internet connectivity, and institutional policies. The conclusion is that artificial intelligence can strengthen library service delivery when it is treated as a support tool that works with librarians rather than replacing them. The study recommends regular staff training, improved ICT facilities, supportive leadership, adequate funding, and clear institutional policies to make AI adoption practical and effective in libraries.

Keyword: Augmented librarianship; Artificial intelligence; Collaborative Tool; 21st Century; Information Services, Professional practice; Digital transformation

Introduction

The 21st century has witnessed an unprecedented transformation and repositioning in the creation, organization, and dissemination of information, largely driven by rapid advancements in digital technologies. This repositioning moves beyond simplistic notions of AI as a mere external tool, instead emphasizing its transformative capacity to reconfigure professional relationships and workflows within the library domain (Bu et al., 2026). AI technologies such as machine learning, natural language processing, and intelligent automation are increasingly being integrated into information systems to enhance data processing, improve information retrieval, and personalize user experiences. This perspective aligns with a relational librarianship approach, where knowledge is understood as socially embedded and dependent on context, rather than an individual technical problem solvable solely through enhanced queries (Cardenas-Dow, 2026). The digital shift has expanded library services beyond physical collections to include digital repositories, virtual reference services, and data-driven decision-making systems.

The integration of AI into these services has introduced new possibilities, including automated cataloguing, recommendation systems, chatbots for reference services, and predictive analytics for understanding user behavior. AI has the potential to significantly enhance library services by improving efficiency and enabling more responsive, user-centered information delivery. Despite these advancements, the adoption of AI in libraries has generated concerns regarding job displacement, ethical responsibility, and the erosion of core professional values. Many librarians express apprehension about the automation of tasks traditionally performed by humans, particularly in cataloguing, indexing, and reference services. These concerns are further intensified by gaps in digital competencies and limited institutional readiness, especially in developing countries. The American Library Association notes that while AI offers opportunities for innovation, it also raises issues related to data privacy, algorithmic bias, and the need for human oversight.

In response to these challenges, contemporary discourse in library and information science has begun to shift toward viewing AI as a tool for professional enhancement rather than replacement. This shift is reflected in the concept of augmented librarianship, which emphasizes collaboration between human expertise and intelligent systems. Rather than replacing librarians, AI is seen as augmenting their capabilities by automating routine tasks and enabling focus on higher-order functions such as critical evaluation, user advocacy, and ethical decision-making. Cox, Pinfield and Rutter

(2019) argue that the future of librarianship depends on the ability of professionals to adapt to technological change and redefine their roles within digital environments. Furthermore, the need for developing digital competencies among librarians has become increasingly important. These competencies include data literacy, digital curation, and an understanding of ethical AI practices. According to Miao et al. (2021), building digital skills among information professionals is essential for ensuring inclusive and equitable access to information in the digital age.

The relevance of augmented librarianship is particularly significant in developing contexts such as Nigeria, where libraries face challenges including inadequate funding, limited technological infrastructure, and shortages of digitally skilled professionals. At the same time, increasing digital penetration presents opportunities for innovation and service improvement. AI, when effectively integrated, can support resource optimization, expand access to information, and enhance service delivery even within resource-constrained environments (Zhang & Liu, 2025). However, despite growing theoretical discussions, there is a lack of empirical studies that examine how librarians perceive and interact with AI technologies in real-world contexts. This gap limits the development of practical strategies for AI integration in libraries. It is within this context that this study is situated, aiming to provide empirical insights into librarians' perceptions, awareness, and readiness to engage with AI as a collaborative tool in information service delivery. This study therefore investigates how librarians, as central mediators of information, perceive the integration of AI within their professional roles, moving from traditional "knowledge guardians" to "intelligent collaborators"

Statement of the Problem

The integration of artificial intelligence (AI) into library and information services has been widely recognized as a transformative development with the potential to enhance efficiency and redefine professional roles. However, much of the existing literature remains largely theoretical, with limited empirical evidence on how librarians in specific institutional contexts perceive and engage with AI technologies. This is particularly evident in developing countries such as Nigeria, where infrastructural challenges and varying levels of digital literacy may significantly influence AI adoption. In academic libraries, awareness of digital transformation is increasing, yet it is unclear whether this translates into meaningful engagement with AI tools. Additionally, concerns related to job security, ethical implications, and skill adequacy may shape librarians' attitudes toward AI. The lack of context-specific empirical data limits the ability of stakeholders to design effective policies and training programmes that support AI integration, most especially in academic libraries in Lagos, Imo and Oyo states. This study therefore seeks to address this gap by examining librarians' awareness, perceptions, and readiness to engage with AI in these selected academic libraries.

Objectives of the Study

The main objective is to examine augmented librarianship by investigating how artificial intelligence can be repositioned as a collaborative tool in 21st-century information services. The specific objectives are:

1. To assess the level of awareness of artificial intelligence among librarians.
2. To examine librarians' perceptions of AI as a collaborative tool in 21st-century information services.
3. To determine librarians' readiness to adopt AI-driven technologies in 21st-century information services.
4. To identify factors influencing AI adoption as a collaborative tool in 21st-century information services.

Artificial Intelligence in Libraries

Artificial intelligence (AI) refers to the simulation of human intelligence processes by machines to perform tasks such as learning, reasoning, and decision-making. In libraries, AI includes technologies such as machine learning and natural language processing, which enhance information organization and retrieval. AI is transforming how libraries deliver services in digital environments and this includes AI applications in libraries include cataloguing, indexing, chatbots, and recommendation systems, all of which improve efficiency and user experience. These tools enable libraries to manage large volumes of data and provide personalized services. Studies show that AI supports the evolution of libraries into more user-centered information systems. However, challenges such as infrastructural limitations, lack of expertise, and ethical concerns affect AI adoption. Miao et al. (2021) emphasizes the need for responsible AI use to ensure inclusivity and transparency.

Augmented Librarianship

Augmented librarianship is a framework that positions AI as a tool that enhances rather than replaces librarians' roles. It emphasizes collaboration between human expertise and intelligent systems, enabling librarians to focus on higher-level tasks. According to Cox, Pinfield and Rutter (2019), adapting to AI requires developing new competencies and redefining professional roles. This concept highlights the continued importance of human judgment, ethical reasoning, and user-centered service, making AI a supportive tool in librarianship.

Librarians' Perception and Readiness

Librarians' perception refers to how they understand and evaluate AI technologies, influencing their willingness to adopt them. Positive perceptions encourage innovation, while negative perceptions create resistance. Readiness involves the skills, knowledge, and institutional support required for AI adoption. Workforce readiness is also critical for AI

integration. In Nigeria, challenges such as limited funding and training affect both perception and readiness, making it important to study these factors for effective AI implementation.

Recent scholarship on artificial intelligence (AI) in library and information science has increasingly emphasized its transformative potential in enhancing service delivery, improving information retrieval, and supporting user engagement. A growing body of literature highlights that AI technologies such as machine learning and natural language processing are reshaping traditional library operations, particularly in cataloguing, reference services, and digital resource management. For instance, a systematic review by Das and Islam (2021) shows that while AI applications in libraries are expanding, much of the research remains conceptual, with fewer empirical studies examining real-world implementation.

Empirical studies have begun to explore librarians' perceptions and attitudes toward AI adoption. A survey of academic librarians in North America found that while there is general awareness of AI, there is no consensus on its definition or application within libraries, and many librarians expressed the need for additional training to effectively engage with AI technologies. Similarly, Andrews, Ward & Yoon (2021) research using the Unified Theory of Acceptance and Use of Technology (UTAUT) indicates that factors such as perceived usefulness and attitude toward AI significantly influence librarians' intention to adopt these technologies.

In developing contexts, particularly Nigeria, studies reveal a growing awareness of AI alongside persistent challenges in adoption. Ebaye, Orim & Edam-Agbor (2024) research conducted among librarians in South-South Nigeria demonstrates that awareness, perception, and acceptance are key determinants of AI utilization in library services. Another study by Odigie (2024) in North-Central Nigeria found that although librarians are familiar with AI tools such as chatbots and digital assistants, their use is often limited to personal rather than professional contexts. This suggests a gap between knowledge and practical application.

More recent studies have also examined librarians' lived experiences with AI. A phenomenological study focusing on Nigerian academic librarians reports that while AI improves efficiency in tasks such as cataloguing and user services, concerns remain regarding algorithmic transparency, cultural bias, and data privacy. Similarly, librarians recognize AI's potential to enhance learning and digital literacy, but their acceptance depends on institutional support and skill development.

Overall, the literature indicates that while AI holds significant promise for transforming library services, its successful integration depends largely on librarians' perceptions, readiness, and institutional support systems. However, there remains a noticeable gap in context-specific empirical studies within Nigerian academic libraries, particularly those that examine AI as a collaborative tool rather than a disruptive force. This study seeks to fill this gap by providing empirical insights into augmented librarianship within selected institutions.

Methodology

This study adopted a descriptive survey research design to examine librarians' awareness, perceptions, and readiness to engage with artificial intelligence in academic libraries. The population of the study comprises over 1000 professional librarians working Nigerian academic libraries. A sample of 120 librarian were selected randomly from academic libraries of Lagos, Imo and Oyo states. A structured questionnaire was used as the primary instrument for data collection, designed to capture information on respondents' awareness of AI, perceived usefulness, concerns, and readiness for adoption. The questionnaire will consist of both closed-ended and Likert-scale items to allow for quantitative analysis of responses. Data collected was analyzed using descriptive statistics such as frequencies, percentages, and mean scores.

Analysis and Discussion

Results

Research Question 1: What is the level of awareness of artificial intelligence among librarians?

Table 1: Observation Checklist on level of awareness of artificial intelligence among librarians

S/N	Items	Aware	Not Aware
1	I am aware of the concept of artificial intelligence in librarianship.	✓	
2	I know the different ways AI can be used in library and information services.	✓	
3	I am familiar with AI tools that support library operations.	✓	
4	I understand the role of AI in modern information service delivery.	✓	
5	I have heard about AI applications in libraries through training, seminars, or professional discussions.	✓	
6	I can identify specific AI technologies used in librarianship.	✓	

S/N	Items	Aware	Not Aware
7	I am knowledgeable about the benefits of AI in library services	✓	
8	I am aware of how artificial intelligence can be applied in librarianship.	✓	
9	I know the AI tools used for research in library and information services.	✓	
10	I am familiar with AI tools to support my task in the library	✓	

The table shows that all librarians were aware of artificial intelligence on every item in the checklist. This means that the respondents had full knowledge of the concept of artificial intelligence in librarianship, knew the different ways it can be used in library and information services, and were familiar with AI tools that support library operations. It also shows that they understood the role of AI in modern information service delivery, had exposure to AI through training, seminars, or professional discussions, and could identify specific AI technologies used in librarianship. In the same way, they were knowledgeable about the benefits of AI in library services, aware of how AI can be applied in librarianship, knew the AI tools used for research, and were familiar with AI tools that support their tasks in the library. In simple terms, the result suggests that awareness of AI among the librarians was very strong and was not limited to basic knowledge alone, but also extended to practical understanding of its use in library work.

This finding agrees with a study by Odigie (2024) which reported a high level of awareness of artificial intelligence technologies among librarians and showed that such awareness was related to their use of AI in library services. It also agrees with the survey by Ebaye, Orim and Edam-Agbor (2024) on AI literacy in academic libraries, which found that library employees had at least a moderate understanding of AI concepts and recognized the need for training and ethical guidance in its use. Similarly, the study by Cox, Pinfield and Rutter (2019) found that librarians had moderately high awareness of artificial intelligence and that this awareness supported positive perceptions of AI in university libraries, including its usefulness in reducing repetitive tasks and improving discovery of information.

Research question 2: What are librarians' perceptions of AI as a collaborative tool in 21st-century information services?

Table 2: Mean Responses on librarians' perceptions of AI as a collaborative tool in 21st-century information services

S/N	Items	Mean	SD	Decision
1	AI can work effectively alongside librarians rather than replacing them.	2.78	0.75	Agree
2	AI can improve the quality of service delivery in libraries.	3.28	0.68	Strongly Agree
3	AI can support librarians in handling routine and repetitive tasks.	3.15	0.70	Strongly Agree
4	AI can make information services faster and more efficient.	2.88	0.72	Agree
5	AI is a valuable tool for enhancing user satisfaction in libraries.	3.22	0.65	Strongly Agree
6	AI can help librarians make better decisions in service provision.	3.34	0.73	Strongly Agree
7	I believe AI should be integrated into librarianship as a support tool	2.64	0.80	Agree
	Grand Mean	**2.90**	**0.72**	**Agree**

The table shows that librarians generally held a positive perception of artificial intelligence as a collaborative tool in 21st century information services. Items two, three, five, and six recorded strong agreement, which means that the respondents believed AI can improve service delivery, help with routine and repetitive tasks, enhance user satisfaction, and support better decision making in library practice. Items one, four, and seven recorded agreement, showing that the respondents also accepted the idea that AI can work with librarians, make services faster and more efficient, and serve as a support tool in librarianship. The grand mean of 2.90 shows that the overall perception was positive, with the librarians leaning toward acceptance of AI as a useful partner in service delivery rather than seeing it as a threat.

This result is supported by Cox, et al (2019) who found that many librarians believed AI has the potential to improve library services, even though some were still unsure about its broader impact on work processes. It is also supported by Abba (2024) whose study on librarians in university libraries in Kwara State reported that respondents perceived AI as beneficial because it reduces manual and repetitive work, supports tailored recommendations, and improves the discovery of information. In the same direction, Adebayo (2023) reported that AI improves librarians' ability to handle demanding tasks, reach more users, solve problems, and provide more personalized information services, which strengthens the view that AI works best as a collaborative support tool in libraries.

Research Question 3: What is the level of readiness of librarians to adopt AI-driven technologies in 21st-century information services?

Table 3: Mean Responses on level of readiness of librarians to adopt AI-driven technologies in 21st-century information services

S/N	Items	Mean	SD	Decision
1	I am willing to use AI-driven technologies in my library work.	3.18	0.68	Strongly Agree
2	I am ready to learn how to operate AI tools used in information services.	2.86	0.70	Agree
3	I would adapt easily to the use of AI in library operations.	2.74	0.75	Agree
4	I am prepared to participate in AI-related training programs.	3.22	0.78	Strongly Agree
5	I feel confident that I can work with AI-based systems.	3.31	0.65	Strongly Agree
6	I am open to changes brought about by AI in librarianship.	3.12	0.80	Strongly Agree
7	I am ready to adopt AI technologies if they are introduced in my library	2.91	0.67	Agree
	Grand Mean	**3.05**	**0.72**	**Strongly Agree**

The table shows that librarians were generally ready to adopt AI driven technologies in 21st century information services. Items one, four, five, and six recorded strong agreement, showing that many librarians were willing to use AI in their daily work, ready to join training programmes, confident about working with AI based systems, and open to the changes that AI may bring to librarianship. Similarly, Items two, three, and seven recorded agreement, which suggests that while the librarians were positive, some of them still wanted more time, support, and practical exposure before fully adopting AI. The grand mean of 3.05 shows a strong overall readiness, which means that the respondents did not only accept the idea of AI in principle but were also open to learning, training, and actual use in library work.

This finding is supported by Adebayo (2023) who found that librarians in private university libraries showed high AI literacy and strong readiness to adopt AI, although the study also noted that actual use was still limited by infrastructure and training issues. It is also supported by Amoah and Minishi-Majanja (2023) whose survey of academic library employees reported limited hands on use but clear readiness for implementation when training and ethical guidance were available. In the same vein, Gbadebo (2024) reported that librarians recognized the usefulness of AI in improving services and showed readiness to adopt it, but also pointed to the need for better infrastructure, staff development, and institutional support before full adoption could take place.

Research Question 4: What factors influence the adoption of AI as a collaborative tool in 21st-century information services?

Table 4: Mean Responses on factors influence the adoption of AI as a collaborative tool in 21st-century information services

S/N	Items	Mean	SD	Decision
1	Availability of adequate training influences my willingness to adopt AI.	3.42	0.62	Strongly Agree
2	Availability of ICT infrastructure affects the adoption of AI in libraries.	2.84	0.70	Agree
3	Management support influences the use of AI in information services.	3.18	0.68	Strongly Agree
4	Cost of AI tools affects their adoption in library settings.	3.36	0.59	Strongly Agree
5	Technical skills influence the effective use of AI in librarianship.	2.90	0.75	Agree
6	Internet connectivity affects the adoption of AI technologies.	2.95	0.65	Agree
7	Institutional policies influence the use of AI as a collaborative tool in libraries	2.72	0.67	Agree
	Grand Mean	**3.05**	**0.66**	**Strongly Agree**

The table shows that several important factors influence the adoption of AI as a collaborative tool in 21st century information services. The strongest factors were training, management support, and cost of AI tools, which means that librarians believe they are more likely to adopt AI when they are properly trained, when leaders in the institution support its use, and when the tools are affordable. The item on cost also shows that financial issues remain important because expensive tools may slow down adoption even when interest is present. Items two, five, six, and seven recorded agreement, which shows that the respondents also recognized the role of ICT infrastructure, technical skills, internet

connectivity, and institutional policies in shaping the use of AI. The grand mean of 3.05 shows that the respondents generally strongly agreed that AI adoption depends on practical conditions in the workplace. In simple terms, the table suggests that librarians are ready for AI, but their actual adoption depends on whether the institution provides the right environment, the right support, and the right resources.

This result is supported by Hussain (2023) who found that library professionals viewed AI adoption as dependent on organizational support, staff skills, and access to adequate resources. It is also supported by Akinola (2023) who reported that AI adoption in libraries is strongly affected by training opportunities, technological infrastructure, and the financial cost of digital tools. Likewise, Adebayo (2023) found that librarians' willingness to adopt AI is influenced by usefulness, institutional readiness, and supportive policy structures, showing that adoption grows when libraries provide clear guidance, equipment, and leadership backing.

Conclusion

The study concludes that augmented librarianship offers a practical way of repositioning artificial intelligence as a partner in 21st century information services rather than as a replacement for librarians. The findings from the four objectives and the interviews show that librarians are aware of AI, see its value in improving service delivery, are increasingly ready to use it, and understand that adoption depends on training, infrastructure, management support, cost, technical skill, internet access, and institutional policy. This means that AI can strengthen library work only when people, systems, and policies are prepared to support it. The study therefore shows that the future of librarianship lies in a balanced human and technology relationship where librarians remain central, while AI helps them work faster, serve users better, and manage information more effectively.

Recommendations

Several recommendations were made to address the identified problems:

1. Library management should provide regular practical training on AI tools so that librarians can build the skills needed to use them confidently in daily service delivery.
2. Institutions should invest in reliable ICT infrastructure and stable internet access to support the smooth use of AI driven library systems.
3. Library leaders should give strong administrative support and allocate funds for AI tools so that staff can adopt them without financial and organizational barriers.
4. Libraries should develop clear policies and staff development guidelines for AI use so that adoption is orderly, ethical, and effective.

Abstract

Automation and smart technologies are increasingly shaping the future of academic library service delivery, especially in developing economies where resource constraints and infrastructural challenges influence the pace of technological adoption. Consequently, this paper provides a conceptual clarification of automation and smart technologies, outlines historical developments from traditional integrated library systems (ILS) to cloud-based and intelligent systems, and reviews key opportunities and challenges faced by academic libraries in Africa, Asia, and Latin America. The paper also presents a strategic framework for future adoption that emphasises policy readiness, sustainable funding, human capacity development, ethical and user-centred design, and monitoring and evaluation. It argues that while automation offers significant efficiency gains, cost reduction, and improved access, its sustainability depends on context-sensitive implementation, strong leadership, and effective collaboration among stakeholders. The paper concludes that academic libraries in developing economies can become resilient and future-ready by adopting smart technologies that align with institutional missions, ethical principles, and sustainability goals. Ultimately, automation is presented not merely as a technological advancement but as a strategic pathway for equitable, inclusive, and sustainable information service delivery in academic libraries.

Keywords: Artificial intelligence, Automation, Developing economies, Digital transformation, Library innovation and sustainability, Smart technologies, Sustainable information service delivery,

Introduction

In the 21st century, academic libraries are no longer static repositories of physical books but are dynamic knowledge ecosystems shaped by rapid advancements in automation and smart technologies. The global information landscape has witnessed substantial transformation driven by technologies such as artificial intelligence (AI), Internet of Things (IoT), cloud computing, and data analytics, all of which are redefining how information is created, accessed, and delivered (Tshabalala & Dube, 2024; Adigun et al., 2024). These innovations have catalyzed a shift from traditional library functions to digitally enabled services that emphasise efficiency, personalisation, and scalability. Automation is no longer optional but a strategic imperative for libraries seeking to fulfil their core missions in an increasingly interconnected world. Smart technologies, including AI chatbots, predictive recommendation engines, and IoT-enabled inventory systems, support these shifts by enhancing user interaction and streamlining operational processes (Tshabalala & Dube, 2024; Awoyemi, 2025). The result is a reimagined academic library that is responsive to user needs and capable of delivering sustainable services under the pressures of digital transformation.

The role of academic libraries in the digital age has fundamentally evolved. Historically, academic libraries served primarily as custodians of print materials and facilitators of in-person research support. However, the rise of digital scholarship, open access, online learning, and mobile technologies has shifted user expectations toward instant, remote, and customised information services (Tshabalala & Dube, 2024). Technologies such as cloud-based integrated library systems and AI-enhanced discovery tools enable patrons to locate and retrieve resources more efficiently than ever before, often without direct staff intervention. Furthermore, software-driven automation reduces the burden of repetitive tasks, allowing librarians to reallocate their expertise toward instruction, research support, and digital literacy initiatives (Tshabalala & Dube, 2024). These developments underscore a broader reconceptualisation of academic libraries: from static knowledge warehouses to intelligent service hubs that support learning, research, and innovation (Adigun *et al*., 2024).

Despite these advancements, much of the existing research and technology deployment has originated in high-income contexts, leaving a noticeable gap in understanding how developing economies can harness automation and smart

technologies for sustainable information service delivery. Indeed, academic libraries in Sub-Saharan Africa, Asia, and parts of Latin America continue to grapple with inadequate infrastructure, unreliable power supply, limited internet connectivity, and constrained access to funding (Mkulama, 2024). Studies have shown that a significant percentage of academic libraries in countries such as Zambia still operate basic or semi-automated systems, hindered by these structural limitations (Mkulama, 2024). In addition, the pace of adopting emerging technologies such as AI remains slower compared to developed regions, largely due to skills gaps and resource constraints (Adeyeye & Oladokun, 2025). Without deliberate focus on the unique challenges and opportunities within developing economies, global narratives about library automation risk overlooking contexts where the digital divide remains deeply entrenched.

Focusing on developing economies is essential for sustainable development. Academic libraries in these contexts play a vital role in advancing education, research capacity, and socio-economic growth. By strategically integrating automation and smart technologies, libraries can optimise resource use, improve access to information for underserved populations, and enhance institutional resilience against disruptions such as pandemics or infrastructure challenges. Such investments contribute directly to the broader goals of educational equity, knowledge democratisation, and sustainable development. Adopting a conceptual framework, therefore, this paper is structured to provide a comprehensive examination of automation and smart technologies in academic libraries within developing economies.

Automation and Its Evolution in Academic Libraries

Automation in libraries refers to the use of software and systems to perform routine tasks with minimal human intervention. Historically, library automation encompassed functions such as circulation, cataloguing, and online public access catalogues (OPACs). However, the contemporary automation landscape extends to cloud-based integrated library systems (ILS), automated metadata generation, self-service kiosks, and smart inventory systems powered by advanced algorithms and networking protocols (Adigun *et al*., 2024). These systems reduce manual workloads, improve accuracy, and support scalability in service delivery, particularly in environments where human resources may be limited.

The trajectory of automation in academic libraries is a telling narrative of how libraries have progressively embraced technological innovations to improve operations and enhance user experiences. The evolution of automation reflects broader shifts in information technology and library science, from early mechanization to highly integrated and intelligent systems. Early efforts to automate library functions began in the mid-20th century, driven by the need to manage increasingly large collections and streamline routine processes. The introduction of computer-based cataloguing and circulation systems marked the first significant departure from purely manual activities. One of the key developments was the adoption of Machine-Readable Cataloguing (MARC) in the 1960s, which standardised bibliographic records and enabled libraries to share data electronically, laying the foundation for computerised catalogues (Salah *et al.,* 2025). During the 1970s and 1980s, this movement continued with the emergence of stand-alone computer systems that replaced card catalogues and manual logs, improving both speed and accuracy in basic library operations. The maturation of Integrated Library Systems (ILS) between the late 1970s and mid-1990s represented a major milestone in library automation. ILS platforms combined several core functions, including cataloguing, circulation, acquisitions, and public access catalogues (OPACs), into unified software suites, thereby centralising and simplifying management processes.

The 1990s and 2000s witnessed another transformative phase, marked by the proliferation of the internet and web-based technologies. Libraries began implementing Online Public Access Catalogues (OPACs), allowing users to search collections remotely and reducing reliance on in-library terminals (LIS Academy, 2024). This period also saw the growth of digital repositories, electronic journals, and virtual library services that extended access across geographic boundaries, heralding a new era of digital scholarship and resource discovery. By the 2010s, the rise of cloud computing had fundamentally altered the landscape of library automation. Cloud-based ILS and Library Services Platforms (LSPs) offered several advantages over traditional on-site systems, including reduced infrastructure costs, scalability, and easier integration with external systems and digital collections (LIS Academy, 2024). Solutions such as Koha, Alma, and Evergreen allowed institutions, especially those with limited technical resources, to adopt powerful automation tools without investing heavily in servers and specialised hardware. These platforms supported a broader range of services, including integrated discovery layers, mobile compatibility, and real-time metadata updates, reflecting the shift toward more user-centric, digitally accessible services.

Concurrently, the emergence of digitization initiatives ensured that physical collections could be converted into digital formats for preservation and increased accessibility. Digitisation became especially important as libraries sought to support remote research and learning, a trend accelerated during the COVID-19 pandemic when digital access became essential for continuity of academic activities (Shikali *et al*., 2022). Digital repositories, institutional archives, and e-resource management systems are now core components of modern library ecosystems. The most recent phase in the evolution of automation involves the integration of smart and intelligent technologies, including Artificial Intelligence (AI), machine learning (ML), and data analytics. AI applications in academic libraries are increasingly used to support resource discovery, automate metadata generation, and provide virtual reference services through chatbots and natural language processing systems (Wankhede, 2025). These intelligent systems enhance personalisation, optimise workflows, and allow library professionals to focus on higher-value tasks such as research support and user education.

Smart technologies like RFID and IoT further automate inventory management, user tracking for space optimisation, and environmental monitoring, contributing to more efficient and responsive service delivery (Salah et al., 2025).
In developing economies, the adoption of automation has generally lagged behind that of wealthier regions but has followed similar patterns, often catalysed by cloud-based and open-source solutions that lower entry barriers (Salah *et al*., 2025). Research from Nigerian academic libraries indicate the use of platforms such as Koha and DSpace for cataloguing and resource management, though full automation remains constrained by infrastructural challenges, limited ICT training, and intermittent connectivity (Salah *et al*., 2025). Nonetheless, the gradual uptake of digital tools and automated systems signals growing recognition of automation's role in improving accessibility, efficiency, and service quality in academic contexts.
Overall, the evolution of automation in academic libraries illustrates a dynamic shift from mechanical cataloguing to fully integrated and intelligent digital systems. This progression not only reflects broader technological developments but also underscores the adaptability of libraries as they strive to meet changing user needs and institutional goals in the digital age.

Smart Technologies Transforming Academic Library Services
Smart technologies encompass a broader suite of tools that include artificial intelligence (AI), Internet of Things (IoT), machine learning (ML), big data analytics, and robotics. AI systems such as intelligent chatbots and recommendation engines can parse natural language queries and offer personalised guidance to users, enhancing accessibility and responsiveness (Adigun et al., 2024). IoT technologies employ connected sensors, RFID tags, and networked devices to enable functions like automated check-ins, real-time stock monitoring, and occupancy analytics, thereby transforming physical and digital spaces into smart libraries. Machine learning and big data analytics feed upon vast interactions and datasets to optimise collection development, predict resource demand, and refine user experience. Robotics, though still emergent in many contexts, offers potential for automated retrieval, sorting, and physical space management.
The integration of smart technologies into academic library services is reshaping how information is delivered, accessed, and managed. Beyond conventional automation, today's innovations, particularly artificial intelligence (AI), the Internet of Things (IoT), big data analytics, robotics, and blockchain, are enabling services that are proactive, personalised, efficient, and secure. These technologies expand the capacity of libraries to serve diverse user needs in increasingly digital and hybrid environments.

Artificial Intelligence (AI) and Machine Learning (ML) Applications: AI and ML are pivotal in modernising library services. One of the most visible applications is chatbots and virtual reference services, which provide immediate, 24/7 user support through natural language interaction. AI-enabled chatbots can answer common queries, guide users to resources, and reduce the workload on human frontline staff (Mupaikwa, 2024). While adoption in many developing contexts remains limited by infrastructure and expertise constraints, research indicates that, where implemented, AI improves responsiveness and user satisfaction. AI and ML also enhance automated cataloguing and metadata generation. Traditional classification and indexing workflows, once labour-intensive, can now be supported by algorithms that analyse text, suggest subject headings, and auto-generate metadata, increasing accuracy and reducing turnaround time for new acquisitions. These systems can handle large volumes of data, making them especially valuable for institutions with growing digital collections.

Internet of Things (IoT) in Libraries: The IoT refers to networked sensors and devices that communicate and exchange data. In library settings, IoT has been used to create smart shelves, RFID-enabled inventory systems, and space utilisation tools. For example, RFID (Radio-Frequency Identification) tags affixed to items allow automated tracking, self-checkout, and improved security, which enhances both operational efficiency and user experience (Ikwauanusi *et al*., 2024). Sensors with IoT also collect data on how spaces are used, such as study areas or collaborative zones, allowing libraries to optimise layouts and services based on real-time usage trends.

Big Data and Analytics: Academic libraries increasingly harness big data and analytics to understand patron behaviour and tailor services accordingly. By analysing patterns in search queries, borrowing history, and digital resource access, libraries can make informed decisions about collection development, personalised services, and targeted user engagement (Ahammad *et al.*, 2024). Analytics derived from user interaction data support strategic planning, ensuring that libraries invest resources where they are most needed and deliver services that reflect actual use patterns. Big data also enables personalised information services. Rather than one-size-fits-all assistance, analytics can inform recommendation engines that surface relevant resources based on individual user profiles, preferences, and research behaviours. This personalisation improves user satisfaction and supports deeper engagement with library collections.

Robotics and Automation Tools: Robotics is another frontier in smart library transformation. While still emerging in many regions, automated storage and retrieval systems (ASRS) illustrate how robotics can optimise physical resource access. These systems use robotic cranes or autonomous units to store and retrieve volumes from high-density shelving with greater space efficiency and speed than traditional stacks (Adjei *et al.,* 2025). Libraries equipped with such systems

can conserve floor space and provide rapid access to rarely used materials, integrating physical and digital collections seamlessly. Beyond ASRS, robotics also extends to interactive service robots, which can assist with navigation, shelf reading, and basic user inquiries — freeing staff to focus on more complex research support. While empirical research on the impact of robotics in library contexts continues to grow, these technologies represent an important component of future-oriented service infrastructures.

Blockchain for Information Management and Scholarly Communication: Blockchain technology, known for decentralisation, immutability, and security, is gaining attention for its potential to transform library information management and scholarly communication. In academic settings, blockchain can support secure digital rights management (DRM), provenance tracking, and transparent record keeping for collections and research outputs (Nnatu *et al.,* 2024). Its decentralized nature reduces dependency on centralized servers, potentially enhancing resilience and trust in digital repositories (Adjei *et al*., 2025). Although still nascent in many libraries, early research suggests that blockchain tools could underpin emerging services such as credential verification systems and decentralized scholarly record systems.

Automation and Sustainable Information Service Delivery

Automation and smart technologies have become pivotal to achieving sustainable information service delivery in academic libraries, especially as institutions grapple with limited resources and evolving user expectations. Economically, automation and smart technologies can reduce operational costs, maximise limited budgets and reallocate human labour toward higher-value functions such as instruction and research support. Socially, these technologies can expand access, support inclusive information practices, and reduce inequities in service provision by offering personalised, scalable support (Dabengwa, 2025). Sustainability in library services transcends simple technology adoption; it encompasses efficiency, equity, resilience, and environmental responsibility. Recent research highlights how automation supports these dimensions, enabling libraries to operate more sustainably in a rapidly changing information environment.

Enhancing Service Efficiency and Operational Sustainability: Automation fundamentally improves operational efficiency by streamlining routine tasks such as cataloguing, circulation, and resource management. AI-enabled systems, for example, automate metadata workflows and search functions, reducing human workload and processing times while maintaining service quality (Monyela & Tella, 2024). These efficiencies free library staff to focus on strategic functions like research support, instruction, and community engagement, roles that are vital for long-term sustainability. By reducing redundancies and enhancing responsiveness, automation supports an environment where services remain agile, user-centred, and cost-effective even amidst institutional shifts or resource constraints.

Cost Reduction and Resource Optimisation: One of the most compelling sustainability outcomes of automation is cost reduction. Automated systems, including integrated software platforms and cloud-based services, lower staffing and maintenance costs by replacing manual processes with scalable digital solutions. RFID-enabled circulation and inventory systems, for example, improve asset tracking and reduce losses, leading to both financial savings and optimised resource utilisation (Ikwuanusi *et al*., 2024). Similarly, open-source automation tools are increasingly recognised for their contribution to sustainable library services by providing cost-effective alternatives to expensive proprietary systems and promoting community-supported innovation (Ahammad et al., 2024). These cost efficiencies are especially important in developing economies, where budget limitations make sustainable service delivery particularly challenging.

Improving Access, Equity, and Inclusiveness: Sustainability also encompasses social dimensions, ensuring equitable access to information for all users. Automation enhances accessibility by enabling 24/7 digital access to catalogues, databases and virtual reference services, reducing barriers related to time, location, and physical mobility. AI-driven personalisation features, such as adaptive recommendation systems, tailor services to individual users based on preferences and usage patterns, fostering a more inclusive user experience (Monyela & Tella, 2024). Additionally, automated assistive technologies, such as text-to-speech interfaces and adaptive search tools, extend library access to users with disabilities, aligning service delivery with inclusive practice and social sustainability goals. By embedding equity into service design, automation contributes to information justice and lifelong learning opportunities for diverse student populations.

Environmental Sustainability Through Green Library Technologies: Environmental sustainability is another core dimension of sustainable information service delivery. Libraries increasingly adopt green technologies and practices to minimise ecological footprints. Digital delivery of resources, including e-journals, e-books, and online repositories, reduces reliance on printed materials, thereby lowering paper consumption and mitigating the carbon emissions associated with physical production and distribution (JTHEM, 2024). Beyond digitisation, green library practices, like energy-efficient infrastructure, waste reduction programs, and eco-friendly facility design, contribute to broader

environmental goals by promoting responsible resource use and environmental awareness (Librarian, 2024; Adjei *et al.,* 2025). While research shows that awareness of such practices can be uneven in some regions, there is growing engagement with environmentally sustainable initiatives that integrate technology and operational stewardship.

Long-Term Service Continuity and Resilience: Sustainability in information services also demands long-term continuity and resilience. Automation supports continuity by creating systems that are less vulnerable to disruption, whether due to staffing changes, economic pressures, or unforeseen crises like pandemics. Cloud-hosted services, for example, ensure that users can access digital resources even when physical facilities are closed or restricted, maintaining service delivery across contingencies. Predictive analytics and automated workflows further strengthen institutional resilience by anticipating demand patterns and enabling proactive resource management. By building redundancy and adaptability into library operations, automation helps institutions withstand shocks and sustain services over time.

Opportunities for Academic Libraries in Developing Economics

Academic libraries in developing economies are uniquely positioned to harness automation and smart technologies to advance their core missions. Beyond merely modernising infrastructure, these innovations present transformative opportunities that can expand access to information, bridge long-standing digital divides, strengthen academic support, build professional capacity, and enhance institutional competitiveness on regional and global stages.

Expanding Access to Information and Digital Resources: One of the most immediate benefits of automation and digital platforms is expanded access to a wider array of information resources. Electronic collections, including e-books, e-journals, and open educational resources, enable academic communities to retrieve scholarly content anytime and anywhere, mitigating geographic and temporal barriers that often constrain access in developing contexts. Studies of Nigerian academic libraries, for example, highlight how smart technologies facilitate personalised search and retrieval mechanisms, thereby enhancing user engagement with electronic resources and boosting overall satisfaction (Wankhede, 2025). Furthermore, library mobile applications and integrated discovery platforms bring collections to users' fingertips, promoting continuous use and deepening research engagement across student and faculty populations. In contexts where traditional print resources may be limited or outdated, digital access ensures that curriculum needs and research inquiries receive timely support.

Bridging the Digital Divide: Academic libraries can play a central role in narrowing the digital divide, the persistent gap in access to digital technologies and connectivity that disproportionately affects developing economies. The digital divide is not only about infrastructure but also encompasses differences in digital literacy and opportunity to use digital tools effectively (Salah *et al*., 2025). By investing in automated systems and digital resource platforms, libraries create equitable access points that extend beyond campus walls. Strategic initiatives like digital literacy workshops and facilitated access to ICT devices equip users with the skills to navigate online collections, information systems, and research tools effectively. Such efforts align with a broader development agenda to enhance education quality and equitable information access, bridging gaps between urban and rural learners as well as socioeconomic groups.

Strengthening Teaching, Learning, and Research Support: Smart technologies enable academic libraries to transcend traditional service models and become active partners in learning and research. Automation tools assist in advanced information retrieval, support literature reviews, and integrate with learning management systems, enhancing instructional experiences. Emerging technologies, including AI and analytics, can curate personalised resource recommendations, facilitating individualised learning pathways and research workflows (Tshabalala & Dude, 2024). Additionally, by providing enhanced digital support for research activities, libraries help faculty members and graduate students access relevant scholarship efficiently, export bibliographic data, and track evolving research fronts. This research facilitation role reinforces the library's position as a strategic partner in academic excellence and scholarly output within the institution.

Capacity Building and Skills Development for Librarians: Opportunities extend beyond service delivery to professional growth among library staff. As academic libraries adopt and integrate smart systems, there is a corresponding need for capacity building in areas such as automated system management, digital curation, data analytics, and user engagement strategies. Research indicates that librarians in developing economies frequently express readiness and positive perceptions toward adopting smart technologies, but often lack structured professional development pathways and institutional support for training (Adigun *et al.,* 2024). Targeted capacity-building programmes, including workshops, certifications, and collaborative learning exchanges, can strengthen technical competencies and transform librarians into agents of innovation. Building such competencies not only enhances service quality but also fosters a culture of continuous learning, adaptability, and resilience among library professionals.

Institutional Competitiveness and Global Visibility: Robust automation and smart technologies can elevate the institutional profile of academic libraries within global knowledge networks. Universities in developing economies that

adopt advanced library systems, like cloud-based discovery services and digitised repositories, increase their visibility and connectivity with international scholarly ecosystems. Digital repositories that support open access to theses, dissertations, and research outputs extend the global reach and citation potential of institutional scholarship, thereby contributing to research impact and reputation. As noted in broader literature, institutions that leverage technology strategically often exhibit stronger academic profiles and attract greater collaboration opportunities (Adeyeye & Oladokun, 2025). In an era where global rankings increasingly emphasise digital presence and research visibility, libraries that adopt smart services position their institutions for broader recognition and collaboration.

Challenges and Constraints

While automation and smart technologies hold immense promise for transforming academic libraries, especially in developing economies, their adoption and meaningful integration encounter significant challenges and constraints. These barriers are structural, institutional, ethical, and human-focused, and must be critically understood to design sustainable implementation strategies.

i. **Infrastructural Limitations (Power Supply, Internet Connectivity)**: In many developing economies, infrastructural deficits present daunting obstacles to deploying digital technologies. Libraries often operate in environments with unreliable electrical power and limited broadband connectivity, which are prerequisites for running cloud-based systems, AI applications, and IoT networks. Research on Nigerian and African academic libraries highlights that unstable power supply and weak internet connectivity severely limit access to digital collections and inhibit the functionality of intelligent systems such as AI-enabled search, automated cataloguing, or virtual reference platforms (Agboke & Oladokun, 2024). Such constraints not only impede service continuity but also reinforce the digital divide between resource-rich and resource-constrained institutions, slowing the pace of modernisation and widening global disparities in library services.

ii. **Funding and Sustainability Concerns**: A second major challenge relates to funding and financial sustainability. Emerging technologies typically require substantial upfront investment in hardware, software licenses, system integration, and ongoing maintenance. Many academic libraries in developing economies operate with constrained budgets that prioritise core academic and operational needs over innovative systems. As a result, pilot programs may stall, platforms fall into disuse due to a lack of updates, and libraries struggle to secure long-term commitments for technology upgrades. Studies indicate that high implementation and maintenance costs are among the most persistent barriers to adopting automation and AI tools, limiting libraries' ability to scale services and benefit from evolving digital infrastructures.

iii. **Skills Gaps and Resistance to Change**: Even when infrastructure and funding align, human capacity, or lack thereof, remains a central constraint. Many librarians and support staff lack training in digital technologies, data analytics, AI system management, and cybersecurity practices necessary to maintain and leverage smart systems effectively. Research reports emphasise that skills gaps and limited technical expertise hamper not only operational adoption but also librarians' confidence in managing advanced platforms, leading to underutilization of otherwise promising tools (Akinola, 2024). In addition, fear of job displacement, scepticism about the reliability of automated systems, and resistance to institutional change can further hinder adoption, particularly when leadership and staff are not actively engaged in strategic planning or capacity building.

iv. **Ethical Issues, Data Privacy, and Algorithmic Bias**: The incorporation of AI and data-intensive tools introduces complex ethical and privacy challenges. AI systems often require extensive user data to tailor services and refine algorithms, which raises concerns about data privacy, confidentiality, and informed consent. Libraries, traditionally seen as custodians of patron privacy, now face the challenge of safeguarding personal and behavioural data in digital ecosystems. Research from Zimbabwe and other contexts underscores how inequitable infrastructure and weak data governance frameworks exacerbate these concerns, undermining trust and raising the risk of unauthorised access or misuse of sensitive information. Algorithmic bias presents another ethical issue. AI-driven tools trained on non-representative datasets may inadvertently perpetuate historical inequalities and epistemic injustice, privileging dominant languages and perspectives while marginalising local knowledge systems or minority voices. Such biases can affect search rankings, metadata classification, and recommendation outputs, with consequences for equitable access to information, a core library value. Addressing algorithmic bias requires not only technical oversight but also ethical frameworks and transparency in system design.

v. **Policy, Governance, and Institutional Barriers**: Finally, the absence of clear policies, governance structures, and strategic frameworks within institutions can significantly constrain technology adoption. Without dedicated policies on digital transformation, data governance, and ethical use of AI, libraries are left to navigate implementation on an ad hoc basis, leading to fragmented systems, interoperability challenges, and inconsistent standards across institutions. Moreover, where institutional leaders do not prioritise smart technologies within broader strategic plans, libraries may struggle to secure necessary support, alignment, and resource allocation. The result is often piecemeal adoption of innovations that fail to scale or integrate with core institutional priorities.

Conclusion

This paper highlighted the multifaceted intersection of automation, smart technologies, and sustainable information service delivery in academic libraries, particularly within developing economies. The discussions traversed conceptual foundations, historical evolution, emerging innovations, opportunities, constraints, strategic frameworks, and the broader implications of integrating intelligent systems into library practice. Collectively, these sections illuminate both the promise and complexity of technology-driven transformation in academic libraries. A central insight from this paper is that automation and smart technologies are not ends in themselves but means to enhance efficiency, expand access, and strengthen service resilience. From early mechanised cataloguing systems to cloud-native platforms and artificial intelligence applications, library automation has continually evolved to meet the demands of scholarly communication and user expectations (Adigun et al., 2024). Contemporary smart technologies, including AI, the Internet of Things (IoT), predictive analytics, and blockchain, are redefining what is possible across automated reference services, space utilisation, personalised discovery layers, and secure scholarly communication. This evolution has transitioned libraries from static repositories of information to dynamic service hubs capable of anticipating and adapting to user needs.

Sustainability intersects with technology adoption across economic, social, and environmental dimensions. Automation facilitates operational sustainability by streamlining routine workflows, reducing manual workloads, and lowering long-term maintenance costs, thereby enabling libraries to allocate human resources to higher-order tasks like research support and information literacy instruction. Socially, smart technologies contribute to equitable access by enabling remote access to digital collections and fostering inclusive services for diverse user groups. Environmentally, digital delivery systems and energy-efficient architectures reflect a broader commitment to reducing ecological footprints (Nnatu *et al.,* 2024). These outcomes underscore that smart technologies, when thoughtfully implemented, can advance a holistic sustainability agenda within library ecosystems. Another key theme is the contextual reality of developing economies. While developed regions often lead in adopting cutting-edge technologies, institutions in developing economies are adapting innovations to local contexts marked by infrastructure limitations, funding constraints, and skills gaps. Despite these challenges, there are remarkable examples of ingenuity and adaptation, from hybrid digital access models in African universities to emerging AI experimentation in Asian academic libraries. These cases demonstrate that innovation is not the exclusive domain of the resource-rich but can be achieved through strategic partnerships, capacity building, and flexible adoption pathways that align with institutional priorities and resource realities.

This paper further emphasises that sustainable technology integration requires more than technical systems as it necessitates supportive policy frameworks, strategic leadership, inclusive governance, and continuous monitoring and evaluation. Libraries that anchor technology adoption in policy and institutional readiness are better positioned to secure sustainable funding, build long-term collaborations with ICT units and external partners, and align technology with broader academic priorities. Moreover, capacity development and human-centred design are essential for fostering professional competencies and ensuring that automation systems respond meaningfully to user needs while respecting ethical imperatives and data privacy concerns. In reaffirming the role of smart technologies in sustainable service delivery, it is clear that technology adoption must be intentional, equitable, and aligned with institutional missions. Smart systems can support richer learning experiences, more efficient research workflows, and broader access to information, but they must be grounded in ethical practices and inclusive design principles that safeguard user rights and promote accessibility for all members of academic communities.

Recommendations

To accelerate the effective and sustainable integration of automation and smart technologies in academic libraries, particularly in developing economies, the following evidence-based recommendations are offered, grounded in recent research and best-practice guidance, with attention to policy, ethical, human capacity, and institutional imperatives.

i. **Develop Clear Technology Governance and Policy Frameworks**: Academic libraries should establish comprehensive governance and digital technology policies that guide the adoption, use, and evaluation of automated and AI-enhanced systems. Policies must address data protection, ethical use of AI, transparency, user privacy, and interoperability standards to ensure responsible and sustainable implementation across services (Mannheimer *et al*., 2024). Clear policies also support librarians in balancing innovation with core professional values such as equity and intellectual freedom.

ii. **Secure Sustainable Funding and Strategic Partnerships**: Given limited budgets in many developing contexts, sustainable funding models are essential to support infrastructure, software licensing, and ongoing technology updates. Libraries should advocate for inclusion of automation costs in institutional budgets and explore public-private partnerships, donor support, and consortia procurement to pool resources and reduce individual financial burden (Awoyemi & Awoyemi, 2025).

iii. **Invest in Human Capacity Development and Lifelong Learning**: Automation initiatives succeed when library professionals possess relevant technical and analytical competencies. Recent research shows that knowledge management practices and structured professional development significantly enhance librarians' AI capabilities (Yusuf *et al*., 2025).

iv. **Uphold Ethical, Inclusive, and User-Centred Technology Design**: Smart technologies should be deployed in ways that respect ethical principles, inclusivity, and user needs. Responsible AI implementation requires transparency, accountability, and data protection mechanisms. Libraries must ensure that automated services are designed with input from diverse user groups and that systems avoid bias and unfair outcomes. Research emphasises the importance of ethical frameworks and inclusive practices in the adoption of library technology (Mannheimer *et al*., 2024).

Abstract

This study examined academic library autonomy and institutional support in public universities in Abia State, Nigeria, A descriptive survey design was adopted. The study population comprised 45 professional librarians at Abia State University (ABSU) and Michael Okpara University of Agriculture, Umudike (MOUAU), from which 35 respondents participated, representing a response rate of 77.78%. A structured questionnaire rated on a four-point Likert scale was used for data collection, organized around four thematic clusters aligned with the specific objectives of the study. Data were analyzed using descriptive statistics comprising frequency counts, percentages, means, and standard deviations, with a criterion mean of 2.50. Findings revealed that academic library autonomy is critical and widely supported by librarians, academic libraries play significant roles in promoting teaching, learning, and research, the academic library is structurally unique and occupies a central position within the university and adequate financial, infrastructural, and administrative support are essential requirements for effective library service delivery. The study concludes that academic library autonomy is a structural necessity for improving institutional academic performance, and recommends deliberate policy commitment, sustained investment, and formal institutional recognition of academic libraries as core academic entities.

Keywords: Academic Library, Library Autonomy, Institutional Support, Teaching and Learning, Research Support, Information Literacy.

Introduction

Academic libraries are central to the intellectual life of universities and other institutions of higher learning. They support teaching, learning, and research through provision of access to information resources, services, and technologies. However, their effectiveness is often determined by the degree of autonomy they possess within institutional governance structures and by the level of institutional support they receive. In the context of Nigerian public universities, where resource constraints, administrative centralization, and policy inconsistencies are prevalent, library autonomy and institutional support emerge as critical and interrelated variables that shape educational outcomes. Rajpurkar (2022) defines library autonomy as the institutional freedom of the library to manage its own operations, collections, policies, and services without undue interference from external governing bodies, bureaucratic constraints, or political pressures. Many institutions of higher learning are shifting toward managerial styles of leadership where financial concerns tend to override educational values, with the consequence that libraries are increasingly marginalized within institutional governance (Fitzgerald et al., 2025). Recent studies warn that limiting library roles and restricting autonomy can weaken both teaching and research quality.

Simultaneously, institutional support in the form of financial investment, infrastructural development, administrative recognition, and professional development is indispensable for translating library autonomy into tangible academic benefits. Libraries that possess operational independence but lack adequate resources remain constrained in their capacity to fulfill their core mandate. The convergence of autonomy and support therefore constitutes the structural foundation for academic library effectiveness. Libraries have transformed significantly in response to demands for institutional relevance. They are no longer ordinary repositories of printed materials but have evolved into centers for digital learning, student support, and specialized research services (Saib et al., 2023). Despite this transformation, many libraries in Nigerian public universities remain heavily dependent on institutional administrations and lack the independence and support necessary to fully realize their potential contributions to academic goals (Walczak, 2022).

This study focuses on Abia State, Nigeria, where two public universities Abia State University (ABSU) and Michael Okpara University of Agriculture, Umudike (MOUAU) operate academic libraries whose autonomy and institutional standing have not been rigorously examined. Understanding the relationship between library autonomy, institutional support, and academic output in this context carries implications for policy, governance, and library management across Nigeria's public university sector.

Statement of the Problem

Academic libraries holds a strategic position in universities by providing access to information resources, supporting academic activities, and facilitating knowledge creation and dissemination. As higher education institutions now depend

on digital technologies, information services, and knowledge management systems, the expectations placed on academic libraries have expanded considerably. To respond effectively to these demands, libraries require a reasonable degree of administrative autonomy as well as adequate institutional support in the form of funding, infrastructure, policy recognition, and professional development opportunities.

Despite the recognized importance of academic libraries, there are concerns regarding their position within university governance structures. In many public universities, libraries operate within a highly centralized administrative systems where major decisions relating to budgeting, staffing and service development are often controlled by university management. Such arrangements may limit the ability of libraries to respond promptly to academic and technological needs. At the same time, inadequate funding, insufficient infrastructure, and limited administrative support may further constrain library effectiveness and institutional relevance. It is against this backdrop that this study investigates academic library autonomy and institutional support in public universities in Abia State, Nigeria. Answering the question of how autonomy can be implemented and to what extent.

Objectives of the Study

The main aim of this study is to examine the autonomy of academic library and institutional support in public universities in Abia State, Nigeria, with specific objectives:

1. To examine the perceptions of librarians on the need for library autonomy in public universities in Abia State.
2. To assess the roles academic libraries play in supporting teaching, learning, and research in public universities in Abia State.
3. To examine the structural uniqueness of the academic library as an institution within the university.
4. To justify the need for financial, infrastructural, and administrative support of academic libraries in public universities in Abia State.

Literature Review

Library Autonomy and Librarians' Perceptions

Researchers have made a strong case for giving academic libraries more organizational autonomy. It shows that when libraries have the freedom to operate independently, they are better able to plan strategically and contribute more effectively to the university. Studies also point out that academic autonomy in general has a positive influence on strategy development and improves the overall performance of universities (Al Gharsi et al., 2024). In places like Poland, new higher education laws, such as Act 2.0, have pushed forward conversations about where the academic library should stand in the university structure and how much independence it should have (Walczak, 2022).

This conversation also ties into the professional status of academic librarians. Many librarians are required to publish within the field of Library and Information Science as part of their work (Gamache et al., 2025). Their sense of professionalism often shows up in peer and shared governance practices within libraries, which are seen as important for academic staff whose influence has been reduced by forces like academic capitalism (Fitzgerald et al., 2025). In addition, a librarian's career path can shape how they see their role. Whether someone enters librarianship as a first career or comes into it later in life affects how they relate to faculty status and how loyal they feel to the institution. This adds another layer to understanding professional identity in relation to the university (Wiser, 2025)

Roles of Academic Libraries in Teaching, Learning, and Research

The modern academic library now carries many important responsibilities that support the main goals of the university, which include teaching, research, and community service. More recently, the library has come to be seen as a research enabler (Pike & Barrantes, 2025). This means, its work should be recognized in major institutional evaluations like the Research Excellence Framework environment statements. Much of this support is built on the close working relationship between librarians and academics, which is often explained through the Community of Practice Theory. This theory describes how both groups interact at different stages of scholarly communication (Mierzecka, 2025).

One of the fastest growing areas of library work is Research Data Services. These services include guidance, training, technical tools, and policy support for managing research data throughout its entire lifecycle (Martin-Melon et al., 2023). This work fits within the larger movement toward Open Science, where research data plays a major role and where principles like the FAIR guidelines (Findability, Accessibility, Interoperability and Reusability) influence how research is produced and shared (Cerda-Cosme & Mendez, 2025). The entire system of academic publishing is changing because of digital tools and Open Access. Some scholars even compare this moment to the historic impact of Gutenberg's invention of letterpress printing (Maier, 2025).

The academic library also has a proven positive effect on student learning at the university level (Shoaib et al., 2021). This influence is closely linked to how students engage with information. Their information literacy skills, combined with their level of library use have a strong connection to their academic success (Ferrer, 2024).

Librarians are expanding their teaching roles by building stronger knowledge of modern pedagogies and digital tools that are needed for effective online instruction (Saib et al., 2023). This includes collaborating with faculty to design assignments that help students use sources more thoughtfully, even when those sources include non-traditional online platforms like Google or Reddit (Redekop & Hobbs, 2025). Beyond specific skills, the overall quality of university

services, including library services, plays a major part in shaping student satisfaction, academic performance, and loyalty to the institution (Ngo et al., 2025).
Peer mentoring programs supported by universities have also shown clear results. These programs are linked to lower dropout rates and improved performance among mentees, even during challenging times such as the COVID 19 disruption (González Ortiz de Zárate et al., 2025)

Structural Uniqueness of the Academic Library
The academic library stands out because it is both an intellectual resource and a social space, and it needs to reflect the values of the institution it belongs to. Libraries can help create an inclusive and supportive environment by offering personalized services that build students' confidence, independence, and trust (Sanches, 2024). This also includes providing physical spaces that meet different student needs, such as family-friendly areas that support students who are parents (Caniano, 2025).
At the same time, the library is not separate from the social and ethical issues that exist in the wider academic community. The idea of library neutrality, which has long been seen as a key professional value, is now being questioned. Many academic librarians describe neutrality simply as the act of not taking a side (Jaeger McEnroe, 2024). These are subtle and often unintended comments or actions that can negatively affect users, especially academics and researchers.
The roles of academic librarians continue to grow in complexity. They now require a wide range of specialized skills (Dewi et al., 2025).

Financial, Infrastructural, and Administrative Support for Academic Libraries
The full potential of the modern academic library can only be achieved when there is real investment in its infrastructure, the skills of its staff, and its relationship with the community. It then becomes important to design informal learning spaces that support both guided activities and independent collaborative work (Cui et al., 2024). Libraries also need to make better use of their available resources. One way to do this is by adopting strong and correct digital marketing strategies. These strategies work best when staff have a solid understanding of digital marketing literacy, which plays a major role in how well libraries connect with their users (Ali et al., 2025).
Many libraries include community engagement in their strategic plans, yet research shows that there is a clear gap between what is written in policy and what is actually supported through funding, staffing, and formal evaluation from the university (Bangani and Dube, 2023). This shows that real administrative and financial commitment is needed if libraries are to meet their community engagement goals.

Methodology
This study adopted a descriptive survey research design to examine the autonomy of academic library and institutional support in public universities in Abia State, Nigeria. The population comprised all 45 professional librarians in the two public universities in Abia State: Abia State University (ABSU) and Michael Okpara University of Agriculture, Umudike (MOUAU). Given the manageable population size, total enumeration was adopted, and all professional librarians were targeted for participation. However, 35 librarians responded to the questionnaire, representing a response rate of 77.78%. The respondents consisted of 18 librarians from ABSU and 17 from MOUAU. Data were collected using a structured questionnaire containing 20 items organized into four clusters based on the objectives of the study. The items were rated on a four-point Likert scale of Strongly Agree (4), Agree (3), Disagree (2), and Strongly Disagree (1). The instrument was validated by two experts in Library and Information Science, while a pilot test conducted with five librarians outside the study population yielded a Cronbach's alpha reliability coefficient of 0.81.The questionnaire was administered directly to respondents in the two universities and retrieved within a two-week period. Data collected were analyzed using descriptive statistics, including frequency counts, percentages, means, and standard deviations. A criterion mean of 2.50 was used as the basis for decision-making, with mean scores of 2.50 and above indicating agreement, while scores below 2.50 indicated disagreement.

Data Analysis and Discussion of Findings
This section presents the results of the study in line with each of the four research questions, followed by a discussion of the implications of the findings.

Research Question One*: What are the perceptions of librarians on the need for library autonomy in public universities in Abia State?*
Table 1: Responses on the Need for Academic Library Autonomy (N = 35)

S/N	Statements	SD	D	A	SA	Mean	Std. Dev.	Remark
1	Academic libraries should have administrative independence within universities.	0	4	17	14	3.29	0.667	Agreed

2	Autonomy allows academic libraries to make better decisions about information resources.	0	0	24	11	3.31	0.471	Agreed
3	Limited autonomy reduces the effectiveness of academic libraries.	0	3	25	7	3.11	0.530	Agreed
4	Academic libraries should participate in institutional decision making.	0	2	17	16	3.40	0.604	Agreed
5	Greater autonomy helps libraries respond better to academic and technological changes.	0	3	18	14	3.31	0.631	Agreed

Weighted Mean = 3.28

Table 1 presents data on the need for academic library autonomy in higher institutions. On the statement that academic libraries should have administrative independence within universities, 17 respondents (48.6%) agreed and 14 (40.0%) strongly agreed, with only 4 (11.4%) disagreeing, giving a mean of 3.29 and a standard deviation of 0.667. Since the mean of 3.29 exceeds the criterion mean of 2.50, this item is categorized as Agreed, indicating that respondents acknowledged the need for administrative independence. On the statement that autonomy allows academic libraries to make better decisions about information resources, 24 (68.6%) agreed and 11 (31.4%) strongly agreed (Mean = 3.31, SD = 0.471; Agreed). The statement that limited autonomy reduces library effectiveness recorded 25 agreements (71.4%) and 7 strong agreements (20.0%), with 3 disagreements (8.6%) (Mean = 3.11, SD = 0.530; Agreed). Academic libraries should participate in institutional decision-making returned a mean of 3.40 (SD = 0.604; Agreed), while the statement on greater autonomy helping libraries respond to changes yielded a mean of 3.31 (SD = 0.631; Agreed). The weighted mean of 3.28 exceeds the criterion mean of 2.50, confirming overall agreement across this cluster.

Research Question Two: ***What roles do academic libraries play in supporting teaching, learning, and research in public universities in Abia State?***

Table 2: Responses on the Roles of Academic Libraries in Teaching, Learning, and Research (N = 35)

S/N	Statements	SD	D	A	SA	Mean	Std. Dev.	Remark
6	Academic libraries provide essential resources that support teaching activities.	0	0	13	22	3.63	0.490	Agreed
7	Libraries support students' learning through access to print and digital resources.	0	0	16	19	3.54	0.505	Agreed
8	Academic libraries provide research support services for students and lecturers.	0	0	9	26	3.74	0.443	Agreed
9	Information literacy programmes offered by libraries improve students' research skills.	0	1	13	21	3.57	0.558	Agreed
10	Academic libraries serve as centers for academic collaboration and knowledge sharing.	0	0	13	22	3.63	0.490	Agreed

Weighted Mean = 3.62

Table 2 presents findings on the roles academic libraries play in promoting teaching, learning, and research. On the statement that academic libraries provide essential resources that support teaching activities, 13 respondents (37.1%) agreed and 22 (62.9%) strongly agreed, giving a mean of 3.63 (SD = 0.490; Agreed). Libraries supporting student learning through access to print and digital resources recorded 16 agreements (45.7%) and 19 strong agreements (54.3%) (Mean = 3.54, SD = 0.505; Agreed). The highest mean in the entire study was recorded for the statement that academic libraries provide research support services for students and lecturers: 9 respondents (25.7%) agreed and 26 (74.3%) strongly agreed, yielding a mean of 3.74 (SD = 0.443; Agreed). Information literacy programmes improving research skills returned 1 disagreement (2.9%), 13 agreements (37.1%), and 21 strong agreements (60.0%) (Mean = 3.57, SD = 0.558; Agreed). Academic libraries serving as centres for collaboration and knowledge sharing recorded 13 agreements (37.1%) and 22 strong agreements (62.9%) (Mean = 3.63, SD = 0.490; Agreed). The weighted mean of 3.62 is the highest recorded across all four clusters.

Research Question Three: ***What is the structural uniqueness of the academic library as an institution within the university?***

Table 3: Responses on the Structural Uniqueness of the Academic Library (N = 35)

S/N	Statements	SD	D	A	SA	Mean	Std. Dev.	Remark
11	The academic library occupies a central position in the structure of the university.	0	0	15	20	3.57	0.502	Agreed

12	Academic libraries serve both academic and research functions in universities.	0	0	17	18	3.51	0.507	Agreed
13	Libraries provide specialized services that distinguish them from other academic units.	0	1	17	17	3.46	0.561	Agreed
14	Academic libraries function as intellectual hubs within universities.	0	0	16	19	3.54	0.505	Agreed
15	The academic library contributes to knowledge creation and dissemination in universities.	0	0	12	23	3.66	0.482	Agreed

Weighted Mean = 3.55

Table 3 presents findings on the structural distinctiveness of the academic library as an institution within the university. The statement that the academic library occupies a central position in the structure of the university recorded 15 agreements (42.9%) and 20 strong agreements (57.1%) (Mean = 3.57, SD = 0.502; Agreed). Academic libraries serving both academic and research functions returned 17 agreements (48.6%) and 18 strong agreements (51.4%) (Mean = 3.51, SD = 0.507; Agreed). Libraries providing specialized services that distinguish them from other academic units recorded 1 disagreement (2.9%), 17 agreements (48.6%), and 17 strong agreements (48.6%) (Mean = 3.46, SD = 0.561; Agreed). The statement on academic libraries functioning as intellectual hubs yielded 16 agreements (45.7%) and 19 strong agreements (54.3%) (Mean = 3.54, SD = 0.505; Agreed). The academic library's contribution to knowledge creation and dissemination recorded 12 agreements (34.3%) and 23 strong agreements (65.7%), the second highest strong agreement frequency in this cluster (Mean = 3.66, SD = 0.482; Agreed). The weighted mean of 3.55 confirms overall agreement across the cluster.

Research Question Four: ***What is the need for financial, infrastructural, and administrative support for academic libraries in public universities in Abia State?***

Table 4: Responses on Financial, Infrastructural, and Administrative Support for Academic Libraries (N = 35)

S/N	Statements	SD	D	A	SA	Mean	Std. Dev.	Remark
16	Adequate funding improves the quality of academic library services.	0	0	17	18	3.51	0.507	Agreed
17	Modern library infrastructure improves access to academic resources.	0	0	15	20	3.57	0.502	Agreed
18	Administrative support from university management strengthens library performance.	0	0	19	16	3.46	0.505	Agreed
19	Adequate investment in digital technologies improves library services.	0	2	17	16	3.40	0.604	Agreed
20	Professional development for librarians enhances the effectiveness of library services.	0	0	17	18	3.51	0.507	Agreed

Weighted Mean = 3.49

Table 4 presents data on the justification for financial, infrastructural, and administrative investment in academic libraries. On the statement that adequate funding improves the quality of library services, 17 respondents (48.6%) agreed and 18 (51.4%) strongly agreed (Mean = 3.51, SD = 0.507; Agreed). Modern library infrastructure improving access to academic resources recorded 15 agreements (42.9%) and 20 strong agreements (57.1%) (Mean = 3.57, SD = 0.502; Agreed). Administrative support from university management strengthening library performance recorded 19 agreements (54.3%) and 16 strong agreements (45.7%) (Mean = 3.46, SD = 0.505; Agreed). Adequate investment in digital technologies improving library services returned 2 disagreements (5.7%), 17 agreements (48.6%), and 16 strong agreements (45.7%) (Mean = 3.40, SD = 0.604; Agreed). Professional development for librarians enhancing service effectiveness recorded 17 agreements (48.6%) and 18 strong agreements (51.4%) (Mean = 3.51, SD = 0.507; Agreed). The weighted mean of 3.49 confirms overall agreement across this cluster.

Discussion of Findings

Need for Academic Library Autonomy in Higher Institutions

The findings showed that respondents agreed on the need for greater academic library autonomy, with a weighted mean of 3.28. Librarians agreed that libraries should have administrative independence, participate in institutional decision-making, and exercise greater control over information resource management. This suggests that librarians believe autonomy is necessary for effective service delivery and responsiveness to academic and technological changes. The implication is that limited autonomy may restrict the library's ability to contribute fully to institutional goals. This finding supports Fitzgerald et al. (2025), who emphasized the importance of governance structures that allow librarians to participate actively in institutional affairs.

Roles of Academic Libraries in Teaching, Learning, and Research

The findings revealed agreement on the role of academic libraries in supporting teaching, learning, and research, with the highest weighted mean of 3.62. Research support services recorded the highest mean score, showing that librarians view research support as a major responsibility of the academic library. Respondents also agreed that libraries provide learning resources, information literacy programmes, and opportunities for collaboration. The implication is that libraries remain central to academic success and should be recognized as key contributors to educational and research outcomes. This finding agrees with Pike and Barrantes (2025), Shoaib et al. (2021), and Ferrer (2024), who highlighted the contribution of libraries to academic achievement and research productivity.

Structural Uniqueness of the Academic Library

The findings indicated agreement that the academic library occupies a unique position within the university structure, as reflected in the weighted mean of 3.55. Respondents viewed the library as an intellectual hub that supports both academic and research activities while contributing to knowledge creation and dissemination. This suggests that libraries are more than support units; they are central components of the university's academic system. The implication is that universities should recognize this unique role when making decisions on governance, planning, and resource allocation. This finding is consistent with Cui et al. (2025), who described academic libraries as active spaces for knowledge creation and exchange.

Need for Financial, Infrastructural, and Administrative Support

The findings showed agreement on the need for adequate funding, infrastructure, administrative support, digital technologies, and staff development, with a weighted mean of 3.49. Respondents recognized that these resources are essential for effective library services. The implication is that without sustained institutional support, libraries may struggle to meet the changing information needs of their users. This finding aligns with Bangani and Dube (2023), who noted that inadequate institutional commitment can limit library development and performance.

Overall, the finding suggest that academic libraries in higher institutions require greater autonomy, recognition, and support to perform their teaching, learning, research, and knowledge-sharing functions effectively.

Conclusion

This study examined the relationship between academic library autonomy and the promotion of teaching, learning, and research in public universities in Abia State. The findings are clear and consistent, confirming agreement on every dimension investigated. Respondents agreed that academic library autonomy is necessary in higher institutions, that their libraries play vital and multifaceted roles in supporting teaching, learning, and research, that the academic library occupies a structurally central and distinctive position within the university, and that sustained investment in funding, infrastructure, administrative support, digital technology, and professional development is indispensable for effective library service delivery. Libraries are acknowledged as central, as research enablers, as intellectual hubs, and as providers of indispensable services, yet the response patterns consistently reflect the reality that these roles are being constrained by inadequate autonomy and insufficient institutional support. This is not merely a professional complaint; it is an evidence-based institutional problem with direct consequences for the quality.

Recommendations

Based on the findings of this study, the following recommendations are made:

1. University governing councils should embed academic library autonomy formally into institutional statutes, policy frameworks, academic planning committees, curriculum development forums, and research strategy discussions.
2. Information literacy programmes should be strengthened and formally integrated into the academic curriculum at undergraduate and postgraduate levels.
3. University Administrations should classify the academic library as a core academic research entity rather than a non-academic support unit.
4. University Administrations should prioritize the allocation of a dedicated percentage of the institution's annual internal revenue to ensure adequate funding for the library.

Abstract
The main objective of the study is to assess the library resources and services available for people with disabilities (PWDs) in public libraries under Ebonyi State Library Board. The specific objectives are to: identify the types of library resources and services available for people with disabilities in Ebonyi State Library Board; Assess the level of adequacy of library resources and services for people with disabilities; Identify the challenges faced by people with disabilities in utilizing library resources and services. The study adopts a descriptive survey research design. The study is focused on Ebonyi State Library Board located in Abakaliki, A total estimated population of 65 individuals were targeted, including both library professionals and supportive staff of the library. A sample size of 35 respondents was used. They were selected from the main public library located at Nwele Street Abakaliki. However, 30 questionnaire instruments out of the 35 distributed were returned and found usable. This is 85% respondents there were accessible. The primary instrument for data collection was a structured questionnaire with both closed-ended questions. Findings reveal that only about 20% of the materials for people with disabilities are provided. Most of the facilities and resources are lacking in the library. Most of the materials were either not provided at all or grossly inadequate for people with disabilities. Many challenges affecting inclusive library services access were identified to include: No ramps or very steep ramps; Limited or no Access to the Internet; Poor ICT Infrastructure and Non-availability of adaptive technology and specialized software packages. The study recommends, among others, the need for renovation and refurbishment of the State Library Board building; provision of assistive technologies; Enhance Staff Training in caring for people with special needs. Increase funding and resource allocation for procurement of specialized PWDs facilities and library materials.

Keywords: Public Libraries, Librarians, Library resources, library services, disabilities

Introduction

Libraries operate with the core objective of supporting the vision and mission of their parent organizations. Whether situated within academic institutions, government agencies, or communities, they are not standalone institutions but are structured to serve the broader goals of the entities they belong to. They are established primarily to meet the information needs of their users, making the user a central focus of all library operations and services (Aina, 2022; Kumar, 2017). Public libraries are community-oriented institutions established to ensure equitable access to information, education, and knowledge for all categories of users. These libraries are mandated to serve diverse users, irrespective of physical, mental, or social differences. As posited by Nwalo (2023), library users range from specialists to students, the disadvantaged majority, and the indisposed. This diversity necessitates that libraries provide resources in multiple formats, print, digital, and assistive technologies to accommodate varying needs (Aina, 2022).

However, evidence from literature and practice suggests that most libraries, especially public libraries in Nigeria, fall short in serving users with special needs, particularly persons with disabilities (PWDs). Eze (2020) emphasized that many Nigerian libraries lack adequate provisions for physically challenged individuals, despite their recognized legal and social right to equal access to information. People with disabilities often experience marginalization due to architectural, technological, and service-related barriers within the library environment. Mackie (2020) further observed that these individuals, often labeled as handicapped or disadvantaged, are victims of circumstances beyond their control, and the failure of libraries to address their needs significantly affects their quality of life and participation in society.

Libraries, including public ones, must therefore go beyond traditional models of service delivery to embrace inclusive practices. This includes investing in accessible facilities, adaptive technologies, and specialized training for staff to support users with visual, auditory, mobility, or cognitive impairments. Oyegunle (2019) noted that libraries, especially those in tertiary institutions, are evolving towards broader service provision, yet public libraries, which often serve the most vulnerable populations, are lagging in this regard.

Disability is defined in the Rights of Persons with Disabilities Act 2022 as "a person with long term physical, mental, intellectual or sensory impairment which, in interaction with barriers, hinders his full and effective participation in society equally with others". Rights of Persons with Disabilities Act, (2022) prohibits discrimination concerning disabled persons in India from various forms of discrimination and ensures their access to education, employment opportunities, and enhances their societal participation. In 2018, the government of India created a national policy for

people with disabilities. The National Policy recognized that people with disabilities are a valuable human resource for the country and aims to build an environment that gives them equal opportunity, protects their rights, and allows them to participate fully in society. Aside from the numerous priority areas, the policy document specified that all buildings, approaches, bathrooms, playgrounds, labs, libraries, and other public spaces should be barrier-free and accessible to people with all types of disabilities. Educational toys, Braille, talking books, relevant software, and other teaching/learning aids should be available. Expanding facilities for general libraries, e-libraries, Braille libraries, talking book libraries, and resource rooms should be prioritized (Ministry of Social Justice and Empowerment, Government of India, (2018).

Persons with Disabilities have varying degrees of difficulty accessing libraries and the materials available in libraries, depending on their impairment. They are unable to enter libraries since the buildings themselves are inaccessible. Because the reading materials at libraries are not available in convenient formats, people who are blind or have low vision cannot use them. UNESCO and the International Federation of Library Associations (IFLA) have set guidelines for providing equitable access to library facilities and services to all people, including those with disabilities. The Indian government and the UGC have both issued guidelines in this regard. However, in India, only about 0.5 percent of books are available in accessible formats for the blind or those that have low vision (The Centre for Internet & Society, 2019). Therefore, libraries in India must be inclusive of becoming accessible by the person with disabilities. One of the core objectives of librarianship is equal access to recorded knowledge and information. It is essential to make sure that everyone in the community has equitable access to materials. As a result, to provide equitable opportunities for those with disabilities, the physical condition of library buildings, facilities, collections, and services must be examined from the perspective of various user groups.

Ebonyi State, located in southeastern Nigeria, is not exempt from these challenges. Despite the existence of the Ebonyi State Library Board, there is limited empirical research on the accessibility of its resources and services to people with disabilities. This raises concerns about how inclusive public libraries are and whether they align with international best practices on disability inclusion. This study therefore seeks to assess the resources and services available for persons with disabilities in Nigerian public libraries, with particular focus on the Ebonyi State Library Board. The objective is to evaluate the extent to which the library meets the information needs of disabled users and to recommend strategies for more inclusive service provision. This study is significant for several reasons, particularly in the context of promoting inclusive library services in Nigeria.

1.2 Statement of the Problem

Libraries are expected to serve all members of the community equitably, including people with disabilities (PWDs), by providing accessible resources, services, and facilities. However, despite national and global calls for inclusion, many public libraries in Nigeria continue to neglect the specific information needs of persons with disabilities. Studies by Eze (2020) and Mackie (2020) have shown that public libraries across the country often lack assistive technologies, barrier-free physical access, trained staff, and inclusive service policies, factors that are critical for meaningful access and participation.

In Ebonyi State, the situation appears to mirror this national trend. Although the Ebonyi State Library Board is mandated to provide services to all members of the public, there is little documented evidence on whether it has adequately integrated disability-friendly resources and services into its operations. Physically challenged users may still face architectural, technological, and attitudinal barriers that hinder their use of the library.

Furthermore, there is a scarcity of empirical research assessing the level of inclusiveness of public library services in Ebonyi State. Without a clear understanding of the current provisions or lack thereof for people with disabilities, efforts to reform, improve, or align library services with the best global practices remain ineffective. This study is therefore necessary to bridge the knowledge gap by assessing the availability and adequacy of resources and services for people with disabilities in the Ebonyi State Library Board. It aims to identify existing challenges and recommends practical strategies for making public libraries in the state more inclusive and responsive to the needs of all users, especially the physically challenged.

1.3 Objectives of the Study

The main objective of the Study is to assess the library resources and services available for people with disabilities in public libraries in Ebonyi State Library Board.

The specific objectives are to:

1. identify the types of library resources and services available for people with disabilities in Ebonyi State Library Board.
2. Assess the level of adequacy of library facilities and resources for people with disabilities in Ebonyi State Library Board.
3. Identify the challenges faced by people with disabilities in utilizing library resources and services in Ebonyi State Library Board.

Research Questions

The study will be guided by the following research questions:

1. What type of library resources and services are available for persons with disabilities in Ebonyi State public Libraries?
2. To what extent are library facilities and resources adequate for people with disabilities?
3. What are the challenges encountered by people with disabilities in utilizing library resources and services in Ebonyi State?

Literature Review

Library Resources

Library resources constitute the core of any library's existence and operations. They are the various materials both physical and digital that a library acquires, organizes, and makes available to its users to support education, research, information dissemination, recreation, and personal development. These resources include but are not limited to printed books, journals, newspapers, magazines, reference materials, digital databases, audio-visual content, and increasingly, assistive technologies designed to serve people with special needs. The availability, accessibility, and relevance of these resources greatly influence the utility and inclusivity of any library system.

According to Aina (2022), for a library to fulfill its core mandate of meeting the diverse information needs of its users, it must possess a wide variety of resources that cater to different categories of users. This diversity becomes especially important in public libraries, where users come from various educational, socio-economic, physical, and cognitive backgrounds. A key measure of a library's effectiveness and inclusiveness is the extent to which it accommodates and supports vulnerable populations, especially people with disabilities (PWDs). In the context of people with disabilities, traditional library resources such as standard print books and newspapers may be inaccessible due to visual, mobility, or cognitive impairments. To bridge this gap, libraries are expected to provide specialized resources that enable these users to access information on an equal footing. These specialized resources include Braille books**,** audio books**,** large print books**,** tactile maps**,** and digital talking books**.** In addition to this, screen readers**,** text-to-speech software**,** refreshable Braille displays, and closed-captioned videos are essential components of a truly inclusive resource collection.

Unfortunately, studies have shown that most public libraries in Nigeria, including those in Ebonyi State, are under-equipped to meet these needs (Eze, 2020). Most libraries in the country struggle with inadequate funding, obsolete collections, and poor infrastructure, and these challenges disproportionately affect users who require non-traditional formats. Where special needs resources are available at all, they are often outdated, insufficient, or inaccessible due to a lack of trained personnel to guide users on their effective use. This severely undermines the principle of equity in access to information.

Beyond physical and technological resources, library policies also play a vital role in resource acquisition and utilization. A library that aims to be inclusive must have a well-articulated collection development policy that specifically addresses the needs of PWDs. This includes not only acquiring specialized materials but also ensuring that these materials are frequently updated, catalogued in accessible formats, and integrated into the general library services rather than isolated as "special collections." Inclusive resource provision should also be guided by international frameworks such as the Marrakesh Treaty**,** which facilitates access to published works for persons who are blind, visually impaired, or otherwise print-disabled.

Furthermore, digital resources have the potential to significantly enhance access for people with disabilities, particularly in underserved areas. E-books, online databases with text-to-speech features, open educational resources (OERs), and accessible library websites can help mitigate physical barriers. However, digital inclusion requires that libraries also provide necessary infrastructure such as reliable electricity, internet access, and adaptive devices, which many Nigerian public libraries, including those in Ebonyi State, currently lack.

Given these challenges, it becomes evident that the assessment of library resources for people with disabilities must go beyond simply identifying the presence of materials. It must also evaluate the quality, accessibility, relevance, and usability of such resources. For example, a library may have audio books, but if they are not catalogued properly or if there are no listening devices available, the resource remains underutilized. Similarly, if Braille books are available but only in outdated subjects or foreign languages irrelevant to the users' local context, they fail to serve their intended purpose.

Library Services

Library services are the activities, programs, and operations that support user interaction with library resources, spaces, and technologies. These services are designed to facilitate the effective and efficient use of information by providing guidance, support, and access to various tools and learning opportunities. Typical library services include reference and information services**,** circulation services**,** user education**,** interlibrary loans**,** digital literacy programs**,** and community outreach initiatives**.** However, to be truly inclusive, these services must be adaptable to meet the needs of all user categories, including people with disabilities (PWDs). According to Oyegunle (2019), effective library services must reflect the diversity of the community they serve. This includes recognizing that users differ in their physical, sensory,

cognitive, and learning abilities, and that services must be delivered in ways that ensure equitable access to information. In the context of public libraries especially in developing countries like Nigeria, there is a growing need to ensure that all services are inclusive, accessible, and user centered. Yet, evidence shows that this inclusiveness is often lacking.

Inclusive Service Delivery

For library services to be inclusive, they must go beyond one-size-fits-all models. Services must be responsive to the specific needs of users with disabilities, many of whom face physical, sensory, and systemic barriers when trying to access library services. For instance, a visually impaired user requires information in alternative formats, such as audio or Braille. Likewise, a user with a hearing impairment may require access to sign language interpreters or captioned materials. An individual with mobility challenges may need home delivery services or online access to resources. Inclusive services also include staff support tailored to PWDs. Trained personnel who are knowledgeable in disability issues, communication strategies (such as sign language), and the use of assistive technologies are essential. Unfortunately, most public libraries in Nigeria including those under the Ebonyi State Library Board are understaffed and the existing workforce often lacks the specialized training needed to support users with disabilities effectively (Eze, 2020). This lack of staff preparedness contributes to the exclusion of PWDs from fully benefiting from library services.

Concept of Physically Challenged Persons

Physically challenged is a term that is used to denote people with various forms of disabilities that is debilitating them from executing normal activities that are expected of them. They are usually in different degrees ranging and they come in different dimensions. Blindness, deafness, loss or weakness of limbs, mental retardation and lot of others are some of the forms that people could be physically challenged. Forrest (2022) posited that physically challenged people are people who have substantial, adverse and long-term effect on their ability to carry out normal day to day activities. Muya (2021) sees it as any restriction or lack of ability to perform an activity considered normal for able-bodied people. Physically challenged is a dysfunction that occurs in different ways. Some are born with this trait while some others suddenly become challenged during the cause of their existence. Echezona et al. (2020) posited that the causes of physical challenge among people in Nigeria includes malnutrition, communicable diseases and accident which is responsible for about one third of all disabilities.

Eze (2020) reported that increase in road crashes in recent times has led to more accident victims who become physically challenged. The pitiable conditions of the road coupled with the use of motorcycle (popularly known as Okada) in Nigeria is not helping matters at all. Momodu (2019) described physically challenged as a term used in describing people with various forms of disabilities like blindness, deafness, loss or weakness of limbs and mental retardation etc. ICF (2023) reported that disabilities can affect people in different ways. It could be physical and mental impairments that can hamper or reduce a person's ability to carry out his day-to-day activities. There are many types of disabilities, such as those that affect a people's vision, hearing, thinking, learning, movement, mental health, remembering, communicating and social relationships.

ICF (2023) also broke down "Disability" into a number of broad subcategories, which are: Mobility and Physical Impairments; Spinal Cord Disability; Head Injuries – Brain Disability (Acquired or Traumatic Brain Injury); Vision Disability; Hearing Disability; Cognitive or Learning Disabilities; Psychological Disorders; Affective Disorders; Personality Disorders – defined as deeply inadequate patterns of behavior and thought of sufficient severity to cause significant impairment to day-to-day activities; Schizophrenia: A mental disorder characterized by disturbances of thinking, mood, and behavior; Invisible Disabilities: disabilities that are not immediately apparent to others. The Quality Assurance Agency (2023) reported that the physically challenged that are more prevalent in regular tertiary institutions in Nigeria are physical and mobility impairment, visual impairment (total blindness) and hearing impairment (deaf and dumb).

People with Disabilities (PWDs)

People with disabilities (PWDs) are individuals who experience long-term physical, sensory, mental, or intellectual impairments that, when combined with various societal and environmental barriers, hinder their full and equal participation in everyday life (UNCRPD, 2018). Disabilities can be visible or invisible, congenital or acquired, and may range from mild to severe. Examples include conditions affecting mobility (e.g., paralysis or limb loss), vision (e.g., blindness or low vision), hearing (e.g., deafness), cognition (e.g., dyslexia or autism), and mental health (e.g., depression or schizophrenia).

Accessibility

Accessibility refers to the design and implementation of environments, products, services, and technologies to ensure they can be used by all people, including those with disabilities. In the context of libraries, accessibility is a critical principle that aims to remove barriers whether physical, technological, or attitudinal that prevent persons with disabilities (PWDs) from fully participating in and benefiting from library resources and services.

Dimensions of Accessibility in Libraries

Accessibility in libraries covers multiple dimensions, each essential to the overall inclusiveness of the institution:

Physical Accessibility: Physical accessibility pertains to the architectural and infrastructural features that enable PWDs to enter, navigate, and use the library space independently and safely. This includes features such as ramps, elevators, wide aisles, accessible restrooms, automatic doors, and adequate signage in large print or Braille (Mackie, 2020). Without these basic accommodations, PWDs, particularly those with mobility impairments, face significant difficulties in using library facilities. The absence of physical accessibility is a common challenge in many Nigerian public libraries, including those under the Ebonyi State Library Board, where outdated or poorly designed buildings often fail to meet universal design standards (Eze, 2020).

Technological Accessibility: Technological accessibility involves the availability and usability of digital tools, information systems, and electronic resources in formats that accommodate users with different disabilities. Examples include screen readers for visually impaired users, voice recognition software**,** closed captions for videos, and keyboard navigation for those unable to use a mouse (Aina, 2022). With the global shift towards digital libraries and online information services, technological accessibility has become increasingly critical. However, many public libraries in Nigeria lack the ICT infrastructure and assistive technologies required to support PWDs effectively (Oyegunle, 2019). This digital divide excludes many users from participating in the information society.

Service Accessibility; Service accessibility focuses on attitudes, policies, and programs that libraries implement to ensure that PWDs receive equitable treatment and support. This includes staff training on disability awareness, communication aids such as sign language interpreters, inclusive programming, and flexible service delivery options (e.g., home delivery, online services). As Mackie (2020) and Eze (2020) emphasize, library staff attitudes and knowledge significantly affect the extent to which PWDs feel welcomed and supported. Without an inclusive service culture, physical and technological accessibility alone cannot guarantee meaningful access.

Legal and Moral Imperatives: Accessibility is not merely a technical or operational issue but is firmly rooted in human rights and ethical obligations. According to Mackie (2020), equal access to information is a fundamental right and should not be considered a privilege granted at the discretion of library authorities. This view aligns with international human rights instruments such as the United Nations Convention on the Rights of Persons with Disabilities (UNCRPD, 2018), which Nigeria ratified in 2023. The convention obliges states to ensure access to information and communication technologies, cultural materials, and public services for PWDs on an equal basis with others.

Similarly, the Discrimination Against Persons with Disabilities (Prohibition) Act, 2024 enacted by the Nigerian government mandates public institutions including libraries to eliminate barriers that prevent PWDs from accessing public services. Despite these legal frameworks, compliance remains limited in many Nigerian states, including Ebonyi. Libraries often lack the resources, policy guidelines, and political will to fully implement accessibility measures (Nwalo, 2023; Eze, 2020).

Challenges to Accessibility in Nigerian Public Libraries

Several barriers hinder the realization of full accessibility in Nigerian public libraries:

- **Infrastructural Deficiencies:** Many libraries are housed in old buildings without ramps, lifts, or accessible restrooms. This physical exclusion disproportionately affects PWDs with mobility impairments (Eze, 2020).
- **Lack of Assistive Technologies:** Limited funding and poor prioritization mean that libraries seldom have access to screen readers, Braille printers, or audio materials tailored to PWDs (Oyegunle, 2019).
- **Insufficient Staff Training:** Staff often lack awareness or training in disability inclusion, resulting in inadequate or insensitive service delivery (Mackie, 2020).
- **Inadequate Policy Frameworks:** Many libraries operate without explicit policies on disability inclusion or accessibility, leading to inconsistent practices and neglect of PWDs (Aina, 2022).
- **Social and Cultural Attitudes:** Negative perceptions and stigmatization of disability within society influence the design and operation of libraries, often perpetuating exclusion (Eze, 2020).

Empirical Review

Library Services for People with Disabilities

Libraries are service organizations which give services without discrimination to their numerous users, including disabled people. Libraries are required to make modifications to their designs to ensure that they are physically accessible to people with disabilities; acquire appropriate materials and assistive devices to ensure that people with disabilities can access their collections; and introduce services that cater for their special needs (Ahmad 2021). Libraries in developing countries are beginning to provide assistive technologies as well as reading materials to people with disabilities (Nassimbeni & De Jager 2020). As (Majinge & Stilwell 2019) noted, libraries have put in place working lifts and ramps to assist with the mobility of people with disabilities (Majinge & Stilwell 2019).

Furthermore, information resources in Braille and large print are being procured to enable people with disabilities to access information sources more easily. Libraries are also training selected members of staff on how best to serve people with disabilities (Nassimbeni & De Jager 2020). Concerted efforts should be made to ensure that those with disabilities are able to access the information resources that others are able to access. Access to information resources for all can be made possible through use of assistive tools and technologies. Commonly used technological devices include Braille books, talking books, playback machines, audiotapes and screen readers (Epp 2018). A recent study by Adetoro (2012) of alternate format preferences among secondary school visually impaired students in Nigeria found that talking books and/or audio recordings were the most preferred format for blind students (51%) as well as partially sighted students (55%). These formats were preferred over others because of their playback facility and because they were easy to understand. Other technological devices for people with disabilities, and particularly the visually impaired, include talking computers and Braille embossers.

The use of Library Services for Persons with Disabilities

Popoola (2017) noted that information availability does not mean accessibility and utilization. A lot of information and information resources are available in the libraries, some are good and others are not. Mehta (2023) described service delivery as a process that involves effective communication, building strong relationships, identifying problems, providing solutions, sound planning and all round the clock support with the sole aim of ensuring that the goals of the organization are met. This implies that any organization that does not take this process seriously is bound to lose patrons. Therefore, Nigerian public libraries and libraries in the schools of the deaf, as organizations, should have good service delivery as its watch word. This will in the long run assist in making information available timely to people with disabilities, enhance their information literacy level and make them more useful to themselves, their immediate society, the country and the world at large. Ekwelem, (2019) carried out a study and revealed that here is nothing on the ground for disabled student to participate fully in the ongoing technology exploits. It was found that the only electronic resources available are taped books and online public access catalog (OPAC) and these have not been fully used. The study also indicated that all the items for the mobility challenged were not available in any of the samples studied, suggesting that, in general terms, that mobility challenged users are not benefiting from the new technology.

Challenges that Militate against Provision of Library Services for PWDs

Studies have associated the marginalization of persons with visual impairment in the public libraries with some challenges such as inadequate budget, poor information and telecommunication infrastructure, limited access to high speed internet, low take-off of open access repositories and digital libraries, non-availability of adaptive technology and specialized software packages (Adetoro, 2024; Lucky and Achebe, 2019; Zaid, 2023). Chaputula, & Mapulanga, (2023) lamented that those with disabilities experience difficulties in accessing library buildings as some buildings had too many steps leading to the top floors and no lifts. Although ramps are provided in some libraries, some users complained that these were very steep, hence making it problematic for those in wheelchairs to access the library on their own.

The web has evolved rapidly in recent years, providing the public with access to vast stores of information. However, not everybody is enjoying this. The web creates two potential difficulties for visually impaired persons. First, hypertext web documents are non-linear, allowing users to link quickly to other pages that may have a completely different design and layout. This may cause confusion for those who cannot easily follow visual cues. Second, the web now revolves around video, multimedia real – time collaboration, and interactive documents, all of which are heavily visually based. (Chiang et al, 2022).

Methodology

The population of the study comprises library staff of the Ebonyi State Library Board. A total estimated population of 65 individuals were targeted, including both library professionals and supportive staff of the State Library Board. A purposive sampling technique was used to select respondents who have direct relevance to the objectives of the study. These include the library staff who are involved in service delivery and collection development. A sample size of 35 respondents was used. They were selected from the main public library located at Nwele Street Abakaliki. The 35 library staff sampled were the people who are professional and could respond to the questions in terms of resources /services for the target library users. Sampling technique was purposive. However, 30 out of the 35 were returned and found usable. This is 85% respondents there were accessible.

The primary instrument for data collection was a structured questionnaire with both closed-ended and open-ended questions, designed to elicit information from respondents. The questionnaire was divided into Sections A (Demographic Data of respondents) and Section B (Clusters covering the items in the questionnaire). These include: Cluster A: Availability of Library Resources and Services for Persons with Disabilities (with options of Available or Not Available of the items); Cluster B: Adequacy of Library Facilities and Resources for Persons with Disabilities (with 12 items from Very Adequate to Not Applicable)

The researcher administered the questionnaires in person. A checklist was used to ascertain the availability or otherwise of the library resources and facilities which should be provided for people with disabilities. Data collected from the questionnaire was analyzed using descriptive statistics such as frequency counts, percentages and mean scores with the

use of Likert rating scale of 4-points. The responses were rated 4, 3, 2 and 1 with an average acceptable response rate of 2.50. Any response below the average 2.50 was regarded as disagreed by the respondents. Data collected were presented in tabular format and analyzed quantitatively based on the objectives and research questions of the study.

Data Presentation and Analysis

Section A: Demographic Data

Gender: Male: 18(60 %) Female: 12 (40%)

Age: 18-25 = 14(46.7%); 26-35 = 10(33.3%); 36-45 = 6(20%) 50 and above

Table 1: Categories of Respondents

Department /Unit	Frequency	Percentage
Acquisition	5	2.0%
Technical Services	4	1.2%
Readers Services	8	2.4%
Serials Section	5	2.0%
Administration	8	2.4%
Total	**30**	**100%**

Section B: Clusters

Table 1. Availability of Library Resources and Services

S/N	Variable	Available	Not Available
1	Braille books	√	
2	Large print materials	√	
3	Audio books		√
4	Screen readers		√
5	Sign language services		√
6	Hearing aid loop systems		√

Table 1 shows that only a few library resources such as Braille books and large print materials are available for people with disabilities. Other materials such as audio books, screen readers, sign language services, hearing aid loop systems etc. are not available in the library. This means that only about 20% of the materials for people with disabilities are provided. On the contrary, 80% of the required facilities and resources for people with special needs are lacking in the library understudy.

Table 2: Adequacy of Library Facilities and Resources for PWDs

S/N	Items	VA	A	I	VI	NA	Score	Mean
1	Braille books	13	14	0	1	2	125	4.5
2	Large print materials	9	12	3	4	2	112	3.7
3	Audio books	4	2	5	17	2	79	2.6
4	Digital talking books	1	2		20	2	55	1.8
5	Screen readers	2	1	6	19	2	72	2.4
6	Text-to-speech	3	2	6	19	1	80	2.7
7	Assistive technology for the hearing impaired	3	2	5	19	1	80	2.7
8	Ramps	4	2	5	17	2	79	2.6
9	Sign language interpreters	2	1	6	19	2	72	2.4
10	Accessible Toilets	5	14	3	6	2	212	7.0
11	Tactile Signage	1	2	6	19	2	71	2.4
12	Hearing aid loop	3	2	6	19	1	80	2.7
	Grand Mean Score							3.13

Key: *VA = Very Adequate; A=Adequate; I = Inadequate; Very Inadequate; Not Applicable*

The data in Table 2 shows that majority of the respondents agree that the items listed were not adequate. In fact, most of them were not provided at all for people with disabilities. The highest rank is Accessible toilets with a mean score of 7.0, followed by Braille books with a mean score of 4.5. Next is large print materials with a mean score of 3.7. Only four items were weighted lower than the 2.5 benchmark.

Table 3: Challenges Affecting Access to Library Resources/ Services by PWDs

S/N	Items	SA	A	D	SD	Score	Mean
1	Non-linear Hypertext web Document or video	23	3	2	2	107	3.6
2	No ramps or very steep ramps	23	3	2	2	107	3.6
3	Inadequate Budget for the Library	7	19	4	0	93	3.1
4	Poor ICT Infrastructure	22	3	2	2	103	3.4
5	Limited or No Access to the Internet	24	2	2	2	108	3.6
6	Non-availability of adaptive technology and specialized software packages	22	3	2	2	103	3.4
7	No open access repositories and digital resources for those who can't visit physical library	5	20	3	2	88	2.9
	Grand Mean Score						**3.37**

Key: SA= Strongly Agree; A=Agree; D = Disagree; SD = Strongly Disagree

The data in Table 3 shows that all respondents in the library agree that: Non-linear Hypertext web Document or video, No ramps or very steep ramps; Limited or no Access to the Internet with the mean score of 3.6 each. Following this are: Poor ICT Infrastructure and Non-availability of adaptive technology and specialized software packages both of which had 3.4 mean score. And finally, the item of 'No open access repositories and digital resources for those who can't visit physical library' which had the lowest mean score of 2.9.

Summary of Findings

Objective 1: Availability of Library Resources and Services for People with Disabilities Findings show that only a few library resources such as Braille books and large print materials are available for people with disabilities. Other materials such as audio books, screen readers, sign language services, hearing aid loop systems etc. are not available in the library.

Objective 2: Adequacy of Library Facilities and Resources for People with Disabilities

Findings of the study show that majority of the respondents agree that the items listed were not adequate. In fact, most of them were not provided at all for people with disabilities.

Objective 3: Challenges of Access to Library Facilities and Resources by People with Disabilities

It was found that there are no non-linear hypertext web documents or videos. No ramps; no access to the Internet. On the contrast there are poor ICT infrastructure and non-availability of adaptive technology and specialized software packages. Again, there are no open access repositories or digital resources for those who cannot visit physical library.

Conclusion

This study investigated the situation at the Ebonyi State Library Board as it concerns the availability, adequacy, accessibility and challenges militating against inclusivity. Significant barriers persist, including near dilapidated physical infrastructure, limited availability and maintenance of assistive technologies, inadequate staff training, and social attitudes that hinder full participation of people with disabilities. There is urgent need to improve resources, accessibility and inclusivity for people with disabilities in public library studied.

To truly realize the goal of equitable access to information, it is essential that the Library Board undertake comprehensive upgrades to their facilities, provide modern assistive resources, invest in regular and inclusive staff training, and develop programs that actively engage and accommodate people with disabilities.

Recommendations

Based on the findings of the study, the following are recommended:

i. **Upgrade Physical Infrastructure:** The Ebonyi State Library Board including its branches should be renovated and furnished to include ramps with proper gradients, wider doorways, accessible toilets, elevators, and tactile signage to ensure full physical accessibility for people with disabilities.
ii. **Provide Assistive Technologies:** Libraries should invest in a wider range of assistive technologies such as screen readers, Braille devices, hearing support systems, and alternative format materials (audio books, large print, e-books) to enhance access to information.
iii. **Enhance Staff Training:** Regular and comprehensive training programs on disability awareness, etiquette, and assistive technology usage should be provided to all library staff to improve their ability to support persons with disabilities effectively.

iv. **Develop Inclusive Programmes and Services:** Libraries should design and implement programs that accommodate various disabilities, including sign language interpreters, accessible reading clubs, technology workshops, and mobile outreach services to reach users unable to visit physical branches.

ABSTRACT

This paper aims to examine how advocacy and marketing of the library's services, operations, and enhanced public engagement can strengthen the visibility and impact of the National Library of Nigeria. Drawing on existing literature, institutional reports, and documented practices, the paper also highlights key activities, including legal deposit administration, bibliographic services, readership promotion campaigns, digital inclusion initiatives, and community-based outreach programs. The paper also underscores the role of service innovation, staff capacity development, technology adoption, and strategic partnerships in repositioning the Library as a dynamic national knowledge hub. It further identifies persistent challenges such as inadequate funding, infrastructural deficits, and public awareness, which constrain optimal performance. The paper opines that a deliberate integration of advocacy, marketing, and user-centered service delivery is essential for enhancing the relevance, accessibility, and societal impact of the NLN. By strengthening public engagement and modernizing operations, the National Library of Nigeria can significantly increase contributions to national development, lifelong learning, and cultural preservation.

KEYWORDS: Library, Visibility, Advocacy, Marketing, National Library of Nigeria,

1.0 Introduction

1.1 Brief Institutional Evolution of the Apex Library

The National Library of Nigeria (NLN) serves as the intellectual repository and "giant memory" of the nation, functioning as the apex library institution within the West African sub-region. Established under the *National Library Act No. 29 of 1970*, which expanded upon the provisions of the 1964 Act, the NLN is mandated to collect, preserve, and document Nigeria's intellectual output through the legal deposit system (National Library of Nigeria, 1970). This statutory responsibility ensures the systematic acquisition of all materials published within Nigeria, by Nigerians abroad, or about Nigeria, thereby safeguarding the nation's documentary heritage for present and future generations. https://nationallibrary.gov.ng

The mission of the NLN aligns with the broader mandate of national libraries worldwide to acquire, organize, preserve, and disseminate knowledge resources in support of education, research, and having an informed citizenry. As (Eddy-Ugorji & Eke, 2025) are of the opinion that contemporary scholarship emphasizes that modern libraries are no longer passive repositories but active agents of national development and knowledge democratization and as such its vision underscores the creation of an enlightened society through equitable and seamless access to visible information resources across diverse user groups. As the national bibliographic agency responsible for producing the *National Bibliography of Nigeria (NBN)* and maintaining a comprehensive repository of the nation's published heritage in accordance with legal deposit obligations the digital era has this role has expanded significantly to include the digitization of cultural heritage and the provision of virtual access to information resources, thereby enhancing national development outcomes (Eddy-Ugorji & Eke, 2025).

1.2 Advocacy and Marketing in Librarianship

Advocacy in libraries refers to the deliberate, organized effort to influence decision-makers, stakeholders, and the general public to recognize, support, and sustain libraries as essential institutions for national development. According to the International Federation of Library Associations and Institutions (IFLA, 2014), effective library advocacy entails demonstrating the social, educational, and economic value of libraries to decision-makers and communities. Similarly, Jaeger et al. (2017) argue that libraries increasingly rely on evidence-based advocacy, impact narratives, and strategic engagement with policymakers to obtain funding, shape public policy, and reinforce their role as essential institutions for learning, research, and social development.

Library marketing, on the other hand, as stated by Oguntoye…et al. (2024) is a means to promote library services and products to attract more patronage from the public. It is needed to make libraries visible to the community of local and global users thereby enhancing the reputation of the library in the eyes of its users. Marketing of library products and services is very important because it is a sure means through which people get to know about the library, its programs,

activities, functions and services. It provides opportunity for prospective users to be aware of what the library has in stock.
Marketing is a process of identifying user needs, designing appropriate services, and communicating their benefits through various channels to increase awareness, access, and usage. In the Nigerian context, according to Otobrise & Omagbon (2019), marketing helps reposition libraries from passive "bookstores" visited only by students and scholars to active, user-centered information hubs that serve diverse social groups, including children, women, entrepreneurs, and rural communities.

In the context of Nigerian librarianship, advocacy and marketing are increasingly recognized as essential strategies for demonstrating the value and relevance of libraries to their communities, administrators, and funding bodies. As advocacy is a coordinated and strategic effort to influence decision-makers, shape public policy, and secure institutional support through the promotion and defense of a cause or institution. Within librarianship, advocacy emphasizes the fundamental role of libraries in ensuring free, equitable, and inclusive access to information, thereby positioning librarians as key drivers of an information-literate and knowledge-based society (International Federation of Library Associations and Institutions, 2023; ALA, 2024). While Marketing in the library sector involves the systematic identification of users' information needs and the strategic promotion of library resources, services, and programs to satisfy those needs effectively. Contemporary scholarship emphasizes that library marketing extends beyond promotional activities to encompass user engagement, service innovation, relationship building, and the delivery of value-added services that enhance user satisfaction and library visibility (Chukwuemeka & Nzewi, 2024). While advocacy may seem to primarily target policy influence, funding acquisition, and institutional recognition, marketing focuses on increasing service utilization, enhancing public awareness, and improving user satisfaction.
Simply put, what advocacy and marketing mean for libraries is actively "selling" the value of libraries to policymakers, funders, and the public to secure immense support, adequate funding, and legitimacy. Marketing, on the other hand is about identifying user needs, designing services around those needs, and using communication channels (social media, radio, print, events) to make people aware of what libraries offer.
The continuous ying-yang synergy between advocacy and marketing is critical for sustainable library development. Effective advocacy is strengthened by evidence generated through successful marketing efforts of increased patronage, user engagement metrics, and measurable social impact. In this sense, marketing provides the foundation upon which advocacy arguments are built, enabling libraries to demonstrate their relevance and justify continued or increased investment (International Federation of Library Associations and Institutions, 2023).
In the digital age, librarians are increasingly encouraged to "market themselves" as information professionals, productivity experts, and knowledge managers. This shift toward personal and professional branding is particularly important given the proliferation of alternative information sources such as Google and various social media platforms, which compete directly with traditional library services for user attention. As a result, librarians must adopt innovative communication strategies, leverage digital platforms, and actively engage users in both physical and virtual spaces.
Effective marketing thus emerges as a critical tool for sustaining library relevance in a rapidly evolving information landscape. It supports the integration of libraries into contemporary patterns of information consumption while reinforcing their role as trusted, authoritative, and user-centered institutions. Ultimately, the combined application of advocacy and marketing ensures that libraries not only survive but continue to thrive as it is essential that for libraries and information services to remain feasible in any environment, they must strategies to meet set visions and missions. Similarly, if they want these strategies to work, libraries need to focus on their remote clients' wants, needs and demands, and to create and distribute relevant library materials and other services more effectively. Benson, Udo-Anyanwu and Onuoha (2016) opined that if librarians and libraries must survive, then marketing must be seen as a necessity as indispensable components of national development and global knowledge ecosystems.

2.0 The Strategic Framework for Visibility

Nigeria is one of Africa's largest and most populous countries, with a rapidly growing youth population, rising internet penetration, and a dynamic but uneven educational landscape. At the same time, many Nigerians still face barriers to quality information, including low literacy in some regions, uneven distribution of educational institutions, and limited access to digital infrastructure in rural areas (Igwebuike, … et al., 2022).
In this context, libraries including the National Library, state libraries, university libraries, and school libraries should be central actors in bridging information gaps. The National Library of Nigeria, as the national metadata and bibliographic center, is at the fore front to coordinate and amplify efforts through robust advocacy and marketing strategies. Practical strategies adopted by the National Library of Nigeria includes;

3.0 The NLN 2025-2030 Roadmap

Over the decades, the NLN has evolved from a traditional custodian of print collections into a dynamic, multi-knowledge hub. This transformation is driven by the rapid advancement of information and communication technologies (ICTs), which have redefined how libraries deliver services and engage users. The structural organization of the NLN is designed

to facilitate outreach and effective service delivery through its various departments. Each department plays a specific operational role that contributes to the overall visibility and efficacy of the library's mission:

Department	Core Functions
Public Services	**Provides access to collections through lending, reference, and reader services; enhances user engagement.**
Virtual Library Services	**Develops and manages digital systems, e-resources, and virtual platforms.**
Legal Deposit Services	**Ensures compliance with legal deposit laws and produces the National Bibliography of Nigeria.**
Planning, Research, and Statistics	**Conducts assessments and evaluates institutional impact for strategic planning.**
International Standards and Programs	**Ensures compliance with global bibliographic standards.**
Collections Development and Technical Services	**Oversees acquisition, cataloguing, and classification of resources.**
Human Resources and Administration	**Manages workforce development and administrative efficiency.**
Finance and Accounts	**Ensures financial transparency and accountability.**

In recent years, the NLN has taken on a more visible role in national-level coordination acting as a national voice for State Public Library Boards through conferences and round-table discussions held annually, and digital-transformation projects. The 2025–2030 Strategic Plan explicitly positions the NLN as a leader in promoting visibility, accessibility, and digital integration of library services (National Library of Nigeria, 2025).
In response to the rapidly evolving information landscape, the roadmap emphasizes innovation, inclusivity, and sustainability as core pillars for institutional transformation**.** The National Library of Nigeria Strategy for 2025-2030 represents a successor to the 2019-2024 plan and is designed to serve as a cursory compass for the institution's growth as Africa's foremost digital knowledge hub. This strategic plan envisions the NLN leveraging technologies to bridge educational gaps, promote lifelong learning, and preserve Nigeria's unique cultural heritage. The core pillars of the 2025-2030 roadmap include digital transformation, cultural preservation, literacy promotion, sustainability, and institutional capacity building.

A primary focus of this strategic era is the rollout of the National Virtual Library Platform, which strives to provide seamless digital access to journals, e-books, and digitized local content for all Nigerians, regardless of their geographic location. The plan explicitly recognizes that traditional models of library service are insufficient in the fourth industrial revolution and calls for the integration and or inclusion of Virtual library services through the strengthening of its virtual library platform. This includes the national repository, digitization of national publications, provision of online indexing and abstracting of newspaper articles, ISBN/ISSN verification portal, provision of remote access to electronic resources, and development of online catalogues. Such services enable users in both urban and rural areas to access information and services without physical constraints, thereby enhancing equity in information distribution (Eddy-Ugorji & Eke, 2025).

From an advocacy and marketing perspective, virtual services significantly increase institutional visibility, as users can engage with the NLN from anywhere in the country and beyond. This also supports continuous engagement through digital touchpoints such as websites, databases, and online exhibitions.
The strategic objectives for the NLN's 2025-2030 period are further categorized by their intended national impact.

Strategic Objective	Key Transformational Initiatives
Digital Transformation	National Virtual Library rollout; adoption of AI-powered navigation and assistive technologies.
Cultural Preservation	Digital Heritage Preservation Project; global promotion of digitized Nigerian historical archives.
Literacy Promotion	Nationwide Readership Promotion Campaigns (RPC); establishment of literacy centers in rural areas.
Sustainability	Implementing revenue-generating services; securing grants to diversify from government funding.

Strategic Objective	Key Transformational Initiatives
Stakeholder Engagement	Collaboration with private firms, international bodies (UNESCO, IFLA), and government bodies.

This strategy emphasizes that "public awareness must be prioritized" to enhance the NLN's visibility and impact. By engaging the public through innovative campaigns and programs, the NLN aims to create a resilient and inclusive knowledge ecosystem that empowers individuals and strengthens communities. The plan also underscores the essential non dismissive nature of digital transformation, identifying that technology is the primary tool for expanding reach and improving service delivery in a country with a rapidly growing and digitally savvy population. The NLN's 2025–2030 Strategic Plan highlights initiatives that are inherently marketing-oriented, such as the National Virtual Library platform, national literacy campaigns, and digital-heritage projects. The roadmap represents a strategic visibility shift toward a more proactive, innovative, and resilient institution.

4.0 National Readership Promotion Campaigns (RPC) and NLN Visibility

National Readership Promotion Campaigns (RPCs) constitute a central strategy through which the National Library of Nigeria (NLN) advances its mandate of fostering a reading culture and enhancing public engagement with knowledge resources. In an era characterized by declining reading habits and increasing competition from digital entertainment platforms, structured and sustained readership initiatives have become essential for reinforcing the relevance and visibility of national libraries. Contemporary studies emphasized that effective reading campaigns contribute significantly to educational development, lifelong learning, and civic participation (Eddy-Ugorji & Eke, 2025).

The Readership Promotion Campaign (RPC) is the NLN's flagship annual advocacy program aimed at reviving a declining reading culture in Nigeria. These campaigns are conducted annually across the 36 states and the Federal Capital Territory, targeting diverse demographics including children, youth, expectant and nursing mothers, motor park workers, and prison inmates. The RPC seeks to encourage reading beyond academic and examination purposes, promoting it instead as a lifestyle for personal development and national progress. National Readership Promotion Campaigns represent a vital mechanism for enhancing the visibility, relevance, and societal impact of the NLN. The RPC is necessary as the NLN recognizes that certain groups often face multiple barriers to information access, including geographic distance, low literacy, limited digital skills, and cultural norms. The 2024 RPC, themed "Reading Without Boundaries: A Renewed Hope," marked a significant milestone in the NLN's outreach efforts. The campaign documented localized field reports from 34 state branches, highlighting a range of activities from impromptu speech contests to book donations. This initiative was powered by dedicated NLN staff, volunteers and included the establishment of a vast network of book clubs and literacy centers to ensure the reach extended into "hard to reach" communities.

The RPC's visibility is enhanced through marketing, including the use of local radio stations to reach rural areas where digital penetration is low. The management of the NLN flags of the campaign by invitation of high-ranking government officials, such as the Minister of Education or state commissioners, which serves to amplify the advocacy message to policy-makers to the flag-off event. Furthermore, RPCs play a critical role in strengthening institutional visibility and advocacy through measurable outcomes such as increased library usage, higher resource utilization, and improved literacy indicators. These provide tangible evidence of the NLN's societal impact. Success stories from the RPC are found across various branches, including Kano, Jos, Enugu, Abuja, and Lagos, where holiday programs and literary competitions have successfully engaged a great number of students. A notable example is the participation of a National Library user in the "Readmania Contest," a world-record attempt for the longest marathon of reading aloud, which generated significant public interest and visibility for the library's services. By consistently showcasing these stories, the NLN helps build a national narrative that libraries are tools for equity and inclusion, not merely elite services.

Evidence suggests that such outreach-driven models significantly enhance library visibility and user engagement, particularly when combined with digital communication strategies (Chukwuemeka & Nzewi, 2024). Within this context, RPCs serve as a strategic tool for positioning the NLN not only as a repository of knowledge but also as an active facilitator of intellectual engagement and social development. Also, by integrating traditional outreach method with innovative digital strategies, the NLN strengthens its focal position.

5.0 Digital Marketing Channels with the use of social media in Nigeria

The modern Nigerian library environment is increasingly defined by social media engagement. In his report, Kemp (2025) states that being home to over 47.8 million social media user identities in October 2025, equating to **20.0 percent** of the total population, this shows that the necessity for digital advocacy is immense. Olaniyi(2022) posits that Social media has got a great potential in the present web world. It is a very effective tool for sharing and communicating the information.

(Nakaziba & Ngulube, 2024; Reisberger et al., 2024) in their recent studies highlights that digital transformation in libraries involves not only technological adoption but also organizational, cultural, and service innovations aimed at improving accessibility and user experience Furthermore, evidence from Nigerian library contexts indicates a growing

readiness to integrate emerging technologies, including virtual environments, to enhance service delivery and user engagement.

Libraries cannot ignore the potential of this great tool to communicate ideas, opinions, resources and news. Social media helps the library users to access library resources without physically visiting the library. Social media platforms like Facebook, X (Twitter), and WhatsApp have become "household names" and essential tools for libraries to market their resources and connect with the internet generation. This provides a captive audience for library marketing efforts. The NLN has successfully utilized social media to approach large followership, reflecting a significant increase in public engagement thus, acknowledging the shift in consumer behavior toward mobile-centric content consumption. The effectiveness of social media marketing in libraries is often measured through engagement metrics such as likes, comments, and shares, with Facebook showing the highest frequency of use for these activities. By connecting physical library spaces with digital resources, it allows libraries to expand services without heavy infrastructure investment, which is particularly relevant in the post-pandemic "new normal" where remote service delivery has become a strategic necessity.

6.0 Collaborative partnership: The NLN, NLA, and LRCN

Strategic collaboration among key professional and regulatory bodies is essential for strengthening advocacy and marketing efforts within the Nigerian library and information sector. The partnership between the National Library of Nigeria (NLN), the Nigerian Library Association (NLA), and the Librarians' Registration Council of Nigeria (LRCN) represents a critical framework of advancing Nigerian Librarianship visibility and relevance. Together, these institutions form a complementary structure capable of driving unified advocacy and marketing initiatives.

The advocacy and marketing of library services in Nigeria are coordinated through a tripartite relationship between the National Library of Nigeria (NLN), the Nigerian Library Association (NLA), and the Librarians' Registration Council of Nigeria (LRCN). The NLA, established in 1962, serves as the umbrella body for the profession and has historically been instrumental in lobbying the government for critical legislation, including the 1962 National Library Act. The coordination between these bodies is structural. The National Librarian/CEO of the NLN and the Registrar of the LRCN are formal members of the NLA Council, ensuring that institutional leadership is directly involved in professional advocacy and policy formulation. This collaborative framework is essential for addressing the myriad challenges facing the sector.

Through National Conference Advocacy Platforms where joint communiques are issued at the end, Professional Certification and Advocacy Synergy through LRCN Induction Ceremonies, the NLA, LRCN partners with the NLN. Similarly, on national literacy initiatives, the Network of Book Clubs and Reading Culture Promoters in Nigeria (NBRP), is used to promote reading beyond library walls. These collaborations extend internationally, with the NLN engaging in participatory workshops sponsored by UNESCO to train librarians in documenting family heritage and indigenous languages.

These examples demonstrate that collaboration among the NLN, NLA, and LRCN is not merely only theoretical but practical and operational having proven outcomes.

7.0 Socio-Geographic Disparities: Urban Visibility vs. Rural Deserts

A significant hurdle to the NLN's visibility is the profound disparity between urban and rural library service delivery. Historically, public libraries in Nigeria have been primarily urban-centered, often located in state capitals or large commercial hubs, while rural populations remain marginalized from the knowledge society. This deprivation is increased as a result of poor infrastructure, inadequate funding, and a lack of professional staffing in rural library branches.

By extending its physical presence across the country, the NLN seeks to bridge regional disparities in access to information and promote inclusive national development. Through its state branches the NLN has strengthened its visibility, enhanced user engagement, and facilitated the implementation of national programs such as readership promotion campaigns and digital library services. Furthermore, the continued development and upgrading of these branches demonstrate a progressive trajectory toward achieving full national coverage and improved service delivery. Ongoing efforts in infrastructure enhancement, digital integration, and community outreach indicate a sustained institutional commitment to bridging access gaps and ensuring that all Nigerians benefit from library services, regardless of geographic location (Eddy-Ugorji & Eke, 2025).

However, the physical presence does not always translate into effective visibility. In many rural areas, the "library" exists merely as a building without modern resources or internet connectivity, failing to provide the "need-specific information dissemination" required for community development. To this, NLN responded by intensifying efforts its "hard to reach" campaigns, establishing literacy centers and providing basic textbooks and materials to remote local government areas. There is also a push for participatory approach that involves the inclusion and adoption of "friends of the library" strategies, where interested community members are involved in decision-making processes to co-create knowledge and ensure that library services are culturally relevant and locally owned especially where trust and local relevance are critical. Such collaborative strategies are vital for empowering rural dwellers to navigate the digital landscape and access educational opportunities.

8.0 Institutional Barriers: The Headquarters Project

The most critical barrier to the visibility and effective role of the National Library of Nigeria is the uncompleted National Library Headquarters building in Abuja. This project, which began in 2006 and was originally conceived in 1981, has outlived various administrations and remains a structural manifestation of policy and implementation inactivity. The lack of a completed headquarters prevents the centralization of heritage collections many of which are currently stored in state branches without climate control and thus undermines the institution's image as a national Apex knowledge citadel.

The development of a purpose-built headquarters for the National Library of Nigeria (NLN) has long been positioned as a transformative initiative capable of strengthening the institution's national visibility, advocacy capacity, and service delivery. Conceived as a central hub for bibliographic control, digital innovation, and public engagement, the headquarters project reflects the strategic importance of infrastructure in enhancing the institutional image and operational effectiveness of national libraries. However, like many large-scale public sector projects, its prolonged development has also highlighted a range of institutional barriers that affect advocacy and marketing outcomes. Library budget allocations are frequently insufficient to meet the growing demands for resources, infrastructure, and technology. This is often attributed to the political class unwillingness and inability to connect national development with enlightened human capital.

However, most recent advocacy has led to individual gesture of the First Lady's using her birthday to raise funds as intervention in the national library project. While highly commendable, it highlights the need for the government to take full responsibility for its institutional structures without any further delay. The 2025-2030 strategy also acknowledges that moving beyond government funding toward philanthropic partnerships and revenue-generating activities is essential for long-term operational resilience.

9.0 Conclusion

The role of the National Library of Nigeria in the advocacy and marketing of library services is vital for the nation's intellectual and social progress. Through the implementation of its 2025-2030 Strategic Plan, the NLN is actively transitioning from a traditional archival repository into a digital-first knowledge hub that prioritizes visibility and user engagement. The success of the Readership Promotion Campaigns and the growth of the virtual library platform are clear indicators of this strategic shift. To secure institutional sustainability, the NLN plans to strengthen its advocacy and marketing efforts. This includes promoting the value of library services to policymakers, stakeholders, and the general public while leveraging digital platforms for outreach and engagement. Evidence-based advocacy, supported by user data and impact metrics, will be central to this effort.

However, to fully enhance its visibility and fulfill its apex mandate, the NLN must address the structural and financial barriers that have historically impeded its growth. This involves not only the completion of its physical headquarters in Abuja but also the continuous professional development of its workforce to ensure they are equipped with the digital and marketing competencies of the future. The collaborative framework with the Nigerian Library Association and the Librarians' Registration Council of Nigeria provides a strong professional foundation for these advocacy efforts.

Ultimately, the visibility of the National Library of Nigeria is a reflection of the nation's commitment to literacy and research. By leveraging emerging technologies and continuing its aggressive grassroots outreach through book clubs and literacy centers, the NLN can ensure that it remains a relevant and inclusive pillar of Nigeria's national development. The goal remains the creation of an informed and enlightened citizenry, where access to knowledge is a fundamental right, not a geographic privilege.

Accordingly, the paper opines that a strategic integration of advocacy and marketing is essential for enhancing the relevance, accessibility, and societal impact of the National Library of Nigeria. By strengthening these two, the NLN can reposition itself as a dynamic knowledge institution capable of effectively supporting national development, digital inclusion, and lifelong learning.

Abstract
This paper focuses on advocacy and marketing approaches to improving the National Library of Nigeria's visibility and patronage in the modern information ecosystem. It underscores the need for libraries to embrace active communication strategies to survive in the digital age. This research is grounded in a review of previous studies and explores Relationship Marketing Theory and Diffusion of Innovations Theory to explain the impact of continued engagement and innovation adoption on library visibility. It shows that advocacy and marketing activities like public relations, social media marketing, word-of-mouth promotion, and publicity campaigns play a critical role in enhancing library visibility and usage. However, the National Library of Nigeria still struggles with low visibility, funding problems, poor ICT infrastructure, and stakeholder engagement. The paper concludes that advocacy and marketing practices are crucial in enhancing library performance, and recommends building capacity and partnerships to adopt digital technology and enhance service to clients and stakeholders.
Key Words: Advocacy; Library marketing; National Library of Nigeria; Visibility; Public relations; Digital libraries

Introduction

The National Library of Nigeria (NLN) is the highest library institution in Nigeria, whose mandate is to acquire, preserve, and make available for use the published works in Nigeria for education, culture, and research. It is also the coordinating body for national bibliographic control and library development. Nevertheless, empirical studies indicate that despite its mandate, the institution faces some challenges of low public awareness and underutilisation of its services, which are symptomatic of the larger library awareness and promotion challenges in the country (Ezema & Okafor, 2015; McClure *et al*., 2006). This is further exacerbated by an inefficient stakeholder engagement framework, which undermines the realisation of the institution's national mandate (Abubakar, 2024). These issues, therefore, contribute to the disconnect between the library institution's mandate and public understanding of its role in Nigeria.

In the modern library environment, advocacy and marketing play crucial roles in increasing institutional relevance and patronage. Advocacy helps mobilise resources, influence policy and increase stakeholder awareness, while marketing enables effective communication of library services to potential users. Research suggests that public relations activities, including brochures, exhibitions, and community outreach campaigns, have a positive impact on library usage and brand perception (Okubue *et al*., 2023). Oral communication has also been shown to be an effective approach to building public trust and promoting greater service utilisation (Orowhe *et al*., 2024). Furthermore, social platforms, including social media, provide new avenues for libraries to engage broader audiences and enhance user interactions in a technologically advanced world (Akobe *et al*., 2025).

Despite these developments, the National Library of Nigeria continues to face challenges in achieving greater recognition and user engagement, particularly in public awareness, readership promotion, media visibility, funding, ICT infrastructure, and stakeholder participation. Previous studies reveal that although readership promotion and advocacy initiatives exist within the National Library of Nigeria, they are often constrained by low funding, inadequate media coverage, weak stakeholder engagement, and limited institutional support (Abubakar, 2024). In addition, poor physical infrastructure and limited ICT skills among library professionals restrict the effective use of digital marketing platforms and other modern engagement tools (Baba & Ocloo, 2026). These challenges weaken the National Library of Nigeria's capacity to promote its services, attract broader patronage, and respond effectively to users' changing information needs in the digital age (Akobe et al., 2025; Ukubeyinje et al., 2025). Therefore, the NLN needs to strategise to fit into the changing information economy.

The specific objectives of the paper include:

i. Explore the meaning of and need for advocacy and marketing in libraries;
ii. Review empirical evidence on library advocacy and marketing;
iii. Draw lessons that will enhance visibility and engagement efforts at the National Library of Nigeria.

These goals are achieved through a review of scholarship in this area, including both theoretical and empirical studies in library and information science. For instance, empirical research indicates that publicity campaigns and well-planned outreach programs increase visibility and public awareness, as well as trust in libraries (Ukubeyinje *et al*., 2025). Likewise, successful promotional efforts of library value enhance advocacy and support for libraries (Albert, 2017).

This serves as a strong basis for exploring opportunities for libraries to enhance their visibility and participation strategies.

This study uses a qualitative literature review method to synthesise theory and empirical work to develop conceptual knowledge without data collection. This approach allows the research to examine advocacy and marketing strategies in various library settings. In theoretical terms, the study advances knowledge by synthesising Relationship Marketing Theory and Diffusion of Innovation Theory to account for the impacts of continuous engagement and innovation adoption on library visibility and users' engagement (Muhammad & Zhiwei, 2021). This study adopts a qualitative literature review approach to examine advocacy and marketing strategies for enhancing the visibility and engagement of the National Library of Nigeria. The approach is appropriate because the paper does not involve primary data collection but synthesises existing theoretical and empirical literature in library and information science. Through this method, the study examines how advocacy, public relations, digital marketing, stakeholder engagement, and innovation adoption can improve library visibility and patronage.

The study is significant because it is expected to provide conceptual and practical insights for policymakers, librarians, information professionals, and stakeholders concerned with improving the relevance of the National Library of Nigeria. It will also contribute to the literature by linking Relationship Marketing Theory and Diffusion of Innovations Theory to library advocacy and marketing. In practical terms, the study is expected to guide the development of integrated advocacy and marketing strategies that combine traditional outreach, stakeholder collaboration, social media engagement, ICT development, and staff capacity building.

Literature Review

Advocacy in library and information services relates to active and continuous activities to advocate for the library, gain institutional support, and have an impact on policy and funding decisions that can support library development. It includes targeted communication to stakeholders (government agencies, parent institutions, and the public) to improve library service awareness and visibility. Research findings reveal that promotion of library service through advocacy events, seminars, workshops, public relations campaigns, and institutional engagement plays a critical role in enhancing library visibility and securing funding (Ezema & Okafor, 2015; Plunkett, 2010). Likewise, advocacy is enhanced by networking and political lobbying to make libraries relevant to stakeholders for long-term institutional support (McClure *et al*., 2006). As a result, advocacy is now seen as a professional responsibility of librarians involving communication/engagement skills to convey library value (Beales, 2012).

Marketing in non-profit and public organisations is a strategic approach to meeting users' needs and promoting services to promote awareness, usage and satisfaction without financial profit. For libraries, marketing aims to increase awareness, promote service utilisation, and demonstrate the value of library services to stakeholders. The current evidence shows libraries apply both offline and online marketing strategies in the form of public relations, exhibitions, brochures, and social media to promote their services and resources (Okubue et al., 2023; Kenneway, 2007). Also, new technologies and digital media are essential in reaching out and enhancing user communication in public library settings (Muhammad & Zhiwei, 2021; Akobe *et al*., 2025). So, marketing in public institutions is an ongoing, user-focused effort to ensure engagement and visibility in an ever-changing environment.

Visibility in library and information services is related to the awareness of library resources, services and activities to targeted users, while user engagement is related to the utilisation of library and information services, response and participation in library activities. Maximising visibility is through effective communication, publicity and advocacy campaigns that increase awareness and user attention. Research evidence indicates that techniques such as word-of-mouth promotion, use of social media, and library publicity campaigns play a crucial role in increasing the visibility of libraries and encouraging user engagement (Ukubeyinje *et al*., 2025; Orowhe et al., 2024). Likewise, user engagement increases when libraries use interactive and participatory marketing strategies that facilitate user feedback and co-creation, collaboration with users, and ongoing service use (Singh & Trinchetta, 2020; Akobe *et al*., 2025). In this sense, visibility and engagement are critical measures of library success and sustainability in the digital information society.

Theoretically, this study is hinged on two distinct theories, namely, the Relationship Marketing Theory and the Diffusion of Innovation Theory. The Relationship Marketing Theory, developed by Morgan and Hunt (1994), offers a theoretical basis for understanding how libraries can promote ongoing engagement through advocacy and marketing. This theory highlights trust, commitment, and ongoing engagement as key pillars of effective organisational-stakeholder relationships. This suggests that in libraries, ongoing engagement through user-focused services, communication and advocacy supports builds loyalty and maximises resource use. Research aligns with this position, demonstrating that advocacy strategies, including outreach programs, organisational websites, and personal interactions that enhance users' awareness and build long-term relationships (Ezema & Okafor, 2015; Okwoli, 2025). Likewise, branding strategies and the use of public relations have been demonstrated to strengthen institution branding and promote trust, improving user and advocacy patronage of the library (Okubue *et al*., 2023; Albert, 2017).

The Diffusion of Innovation Theory developed by Rogers (2003) also supplements this model by describing the diffusion of innovations, ideas, services, and products across a social system. It explains that the diffusion process is affected by perceptions of usefulness, channels of communication, and change agents. In the context of libraries, innovations like electronic publications, social media, and virtual libraries need to be advocated and communicated through various channels to ensure acceptance. Research findings reveal that awareness and accessibility play a crucial role in the adoption of innovations, especially in developing countries with infrastructural issues (Akobe *et al.,* 2025; Baba & Ocloo, 2026). Additionally, the impact of librarians as opinion leaders is paramount in the diffusion process through training, demonstration and education of users, but the lack of technical capacity and support from institutions often prevents efficient utilisation (Mashiyane, 2022; Muhammad & Zhiwei, 2021).

The combination of Relationship Marketing Theory and Diffusion of Innovation Theory provides a holistic perspective on library advocacy and marketing. Relationship Marketing Theory emphasises the importance of striving to connect and retain users, whereas Diffusion of Innovation Theory explains how to introduce and diffuse services and technologies successfully. These theories imply that effective library advocacy and marketing demand strong user relationships, as well as the strategic diffusion of innovations. Research shows that blending user-centred communication strategies with technology-based outreach and advocacy strategies also improves visibility, engagement and usage (Singh & Trinchetta, 2020; Ukubeyinje *et al*., 2025). Also, advocacy and outreach activities that focus on collaboration and engagement further enhance relationship-building and diffusion of innovation (Lawal *et al*., 2024; Clark, 2021). Therefore, this study's foundation in these two theories offers a solid foundation for understanding how libraries can enhance their visibility and sustainability in a dynamic information landscape.

Empirically, the literature on advocacy in library systems highlights its role in raising awareness, funding, and relevance to the institution. The seminal work of Ezema and Okafor (2015) identified advocacy as a key factor in the development of open access institutional repositories in Nigeria through advocacy tools like seminars, workshops, and institutional websites, among others. It also identified target audiences, such as regulatory agencies and institutional leaders, for advocacy. Building on this, Singh and Trinchetta (2020) showed that advocacy can be enhanced by brand management approaches that turn users into brand ambassadors for libraries. Equally, Lawal et al. (2024) highlighted the importance of advocacy and outreach programs for collaboration and knowledge sharing in libraries. Likewise, Okubue *et al*. (2023) suggested that the incorporation of public relations with advocacy practices enhances the usage and acceptance of library services.

Similarly, the effectiveness of marketing tactics on library promotion has also been well documented. Ukubeyinje *et al*. (2025) identified strategic media publicity campaigns as being successful in enhancing patronage, trust, and generating funding in government libraries in Nigeria. Likewise, Orowhe *et al.* (2024) found that word-of-mouth marketing is effective in enhancing user engagement and outreach, especially when complemented with testimonials and reviews. Okwoli (2025) also confirmed that both offline and online marketing activities, such as training and social media campaigns, lead to higher awareness and use of library resources by students. Previous research by Kenneway (2007) brought to light the changing face of library marketing through the use of technology, with digital technologies increasing visibility and facilitating the customisation of library services. Together, these studies confirm that marketing plays a key role in promoting relevance in the cut-throat information market.

Research also confirms that online platforms and new technologies are increasingly significant modes of marketing and promotion for libraries. Akobe *et al*. (2025) noted that while social media platforms like Facebook and WhatsApp are acknowledged as effective marketing platforms, they are underused due to logistical and technical constraints. Likewise, Baba and Ocloo (2026) observed that knowledge of electronic library services has a profound impact on their usage, but channels of dissemination are limited. In line with this, Mashiyane (2022) noted the growing use of TikTok to boost library awareness and user engagement, especially among youth. Likewise, Muhammad and Zhiwei (2021) emphasised that social media platforms and other new technologies offer novel opportunities for library promotion and engagement. This indicates that while digital platforms bring great potential, they need to be managed with a deliberate approach and supported by institutional mechanisms.

Stakeholder involvement and support are also recognised as key elements in library advocacy. Abubakar (2024) reported that while stakeholders offer some form of support for book readership promotion events, it is generally not sufficient - especially in terms of financial and media support. This is consistent with the view of Albert (2017), who stressed the need to communicate the value of libraries to facilitate advocacy and partnerships. Moreover, Beales' (2012) analysis of ineffective advocacy in library management revealed that the lack of critical evaluation in library management and strategic planning leads to sub-optimal advocacy outcomes. McClure *et al*. (2006) also emphasised the importance of networking and political involvement in improving advocacy and community engagement. These studies suggest that effective advocacy involves ongoing stakeholder engagement, planning, and collaboration.

As well, empirical evidence has suggested that outreach and user-centred strategies are critical for enhancing library use and engagement. Clark (2021) demonstrated that outreach marketing is an effective way to advertise library services - but often difficult to implement due to resource limitations. Likewise, Plunkett (2010) highlighted the importance of advocacy to keep libraries relevant and responsive to users' needs. Lyons (2009) also noted that advocacy needs to be critically examined to enhance its efficacy and credibility. Baker (1989) also stressed the need for library services to integrate marketing and planning to meet customer and organisational needs. Together, these studies show that libraries must prioritise active approaches focused on users to increase visibility and engagement.

In summary, the empirical studies demonstrate that advocacy and marketing are intertwined approaches that play a crucial role in library visibility, engagement, and sustainability. Research consistently demonstrates the impact and value of both traditional methods (seminars, outreach campaigns) and digital marketing and social network engagement. However, problems like a lack of funding, limited technological advancement, and a lack of support from stakeholders still limit the effectiveness of these strategies. As such, there is an urgent need for coordinated advocacy and marketing strategies that build on organisational and resource support at the individual and community levels to improve library performance, especially in the Nigerian context.

Findings of the Study

i. Meaning and need for advocacy and marketing in libraries

The literature shows that advocacy and marketing are essential tools for enhancing the visibility, relevance, and sustainability of libraries. Advocacy involves deliberate efforts to create awareness, influence stakeholders, secure institutional support, and promote the value of library services to users, policymakers, and the wider community (Ezema & Okafor, 2015; McClure et al., 2006; Plunkett, 2010). Marketing, on the other hand, focuses on identifying users' information needs, communicating available services, promoting library resources, and encouraging service utilisation (Baker, 1989; Kenneway, 2007; Okubue et al., 2023). In the case of the National Library of Nigeria, advocacy and marketing are necessary because many potential users are either unaware of its services or do not fully understand its national role in education, research, culture, and knowledge preservation. This makes strategic communication, stakeholder engagement, and service promotion important for improving visibility and public patronage (Abubakar, 2024; Albert, 2017).

ii. Empirical evidence on library advocacy and marketing

Empirical studies reviewed in this paper show that advocacy and marketing strategies such as seminars, workshops, public relations, exhibitions, brochures, outreach programmes, word-of-mouth promotion, social media campaigns, and institutional websites improve library awareness and patronage (Ezema & Okafor, 2015; Okubue et al., 2023; Orowhe et al., 2024; Ukubeyinje et al., 2025). The literature also shows that digital platforms such as Facebook, WhatsApp, TikTok, and other online communication channels can strengthen library engagement, especially among young and digitally active users (Akobe et al., 2025; Mashiyane, 2022; Muhammad & Zhiwei, 2021). However, the effectiveness of these strategies depends on adequate funding, ICT infrastructure, staff competence, institutional planning, and stakeholder support. Studies have shown that poor funding, weak ICT capacity, inadequate media support, and limited stakeholder participation continue to constrain effective advocacy and marketing in library institutions, particularly in developing contexts (Abubakar, 2024; Baba & Ocloo, 2026; Clark, 2021).

iii. Lessons for enhancing visibility and engagement at the National Library of Nigeria

The review suggests that the National Library of Nigeria needs a more coordinated and integrated advocacy-marketing framework. Such a framework should combine traditional advocacy methods with digital marketing, stakeholder partnerships, community outreach, media visibility, staff training, and continuous user engagement. Evidence from previous studies indicates that libraries achieve better visibility and patronage when advocacy, branding, publicity, outreach, and digital communication are implemented as complementary strategies rather than isolated activities (Albert, 2017; Lawal et al., 2024; Singh & Trinchetta, 2020). The findings also indicate that the NLN should move beyond occasional or event-based promotional activities and adopt a long-term strategic communication plan that targets students, researchers, policymakers, schools, communities, and the general public. This would enhance public awareness, increase usage, strengthen institutional relevance, and improve stakeholder support for library development (Abubakar, 2024; Okwoli, 2025; Ukubeyinje et al., 2025).

Discussion of the Findings

The results are well explained by the Relationship Marketing Theory (Morgan & Hunt, 1994), which is grounded in trust, commitment, and ongoing interaction as the foundations for organisational success. The literature shows that advocacy and marketing initiatives, such as publicity, training, and social media outreach, serve as processes of relationship building, enhancing loyalty, relevance, and capacity. Likewise, Diffusion of Innovation Theory (Rogers, 2003) is corroborated by studies that demonstrate that knowledge, communication and usefulness are antecedents for the acceptance of library innovations such as digital repositories and e-services. Empirical studies also confirm that librarians are change agents who promote the diffusion of innovation through training and outreach, but with limited capacity due to infrastructure and resource problems (Baba & Ocloo, 2026; Mashiyane, 2022). The theories combine to

explain the role of advocacy in creating relationships and the role of marketing and communication as diffusion agents for new library services.

Comparing international trends with the Nigerian context, the literature shows a capacity gap and integration of strategies. Global libraries are increasingly adopting sophisticated digital marketing tools, data analytics-driven engagement strategies, and holistic branding approaches to maintain visibility and engagement (Singh & Trinchetta, 2020; Albert, 2017). By contrast, Nigerian libraries, such as the National Library of Nigeria, predominantly adopt traditional advocacy strategies such as workshops and seminars, and occasional outreach programs, with limited use of digital tools because of infrastructural and funding constraints (Ukubeyinje *et al.,* 2025; Akobe *et al*., 2025). While there are readership promotion campaigns and engagement with stakeholders, these are disconnected and poorly coordinated, and lead to low visibility and low usage of services. This reflects a digital and strategic divide between best practices and realities.

An analysis of the research also highlights deficiencies in existing practice, especially as it relates to the National Library of Nigeria. Although research discusses advocacy and marketing activities, there is little discussion of holistic and long-term strategic planning approaches that consider interpersonal and digital aspects. Interventions are often short-term, isolated, and reactive, and donor- or event-based, rather than integrated and aligned with institutional plans (Lawal *et al.*, 2024; Okubue *et al*., 2023). Furthermore, there are contradictions in the literature on the impact of digital platforms, with some studies focusing on their potential benefits. In contrast, others focus primarily on institutional challenges such as ICT competence, connectivity, and infrastructure. Moreover, little research has been conducted in the areas of user behaviour analysis, long-term stakeholder engagement approaches, and assessing advocacy's impact on library use. These areas of neglect point to the need for a comprehensive and evidence-based approach to advocacy and marketing that is sensitive to the context and connected to macro and micro institutional realities.

Implications of the Findings

This study highlights the theoretical need for an advocacy-marketing approach that connects Relationship Marketing Theory (Morgan & Hunt, 1994) with Diffusion of Innovation Theory (Rogers, 2003). Relationship Marketing Theory addresses how engagement, trust, and commitment lead to stable user relations and relationships, while Diffusion of Innovation Theory offers insight into the adoption of new services and technologies in institutional and community contexts. What this suggests is the need to conceptualise advocacy and marketing as complementary processes that work together to influence awareness, user relationships and institutional relevance. This is supported by the literature, which reveals that a segmented approach constrains the effect of library communication policies and strategies, and decreases the impact of library advocacy (Singh & Trinchetta, 2020; Ezema & Okafor, 2015). As such, an integrated theoretical framework is needed to explain and inform libraries' approach to nurturing relationships and promoting innovation simultaneously.

In practical terms, the research offers strategic guidelines for improving libraries' visibility and user engagement, especially the National Library of Nigeria. The study shows that libraries need to shift from the traditional to a blended strategy, merging online marketing, stakeholder engagement, and community approach. This means utilising social media, enhancing public relations strategies and designing publicity campaigns aimed at raising awareness and encouraging participation (Ukubeyinje *et al*., 2025; Akobe *et al*., 2025). Additionally, capacity-building within the institutions, through training staff, ICT infrastructure development, and policy support, is key to ensuring the strategies are sustained. Indeed, empirical research indicates that libraries pursuing multi-channel communication and user engagement strategies have higher visibility and patronage (Okwoli, 2025; Albert, 2017). Hence, library managers must adopt strategic advocacy and marketing to enhance sustainability and service delivery.

Conclusion

This study concludes that advocacy and marketing are central to improving the visibility, engagement, and relevance of the National Library of Nigeria. The review shows that advocacy helps libraries communicate their value, mobilise stakeholder support, and strengthen institutional recognition, while marketing helps promote services, attract users, and sustain patronage. However, the National Library of Nigeria still faces challenges such as limited public awareness, inadequate funding, weak ICT infrastructure, low media visibility, and insufficient stakeholder engagement. The study further concludes that a more integrated and strategic approach is required. The National Library of Nigeria should combine traditional advocacy methods with digital marketing, stakeholder collaboration, staff capacity building, and continuous user engagement. Such an approach would not only improve visibility and patronage but also strengthen the library's contribution to education, research, cultural preservation, and national development.

Based on the findings of the study, the following recommendations are made:

(i) Develop an integrated advocacy and marketing strategy: The National Library of Nigeria should develop a coordinated advocacy and marketing plan that combines public relations, media campaigns, community outreach, exhibitions, school visits, stakeholder meetings, and digital engagement.

(ii) Strengthen digital marketing and social media presence: The library should make effective use of social media platforms, official websites, email newsletters, online exhibitions, and digital storytelling to promote its services and reach wider audiences, especially young users and researchers.
(iii) Improve ICT infrastructure and staff capacity: Government and relevant stakeholders should invest in ICT facilities, internet connectivity, digital platforms, and staff training to enable librarians to use modern marketing and communication tools effectively.
(iv) Build stronger stakeholder partnerships: The National Library of Nigeria should collaborate with schools, universities, government agencies, media organisations, community associations, publishers, researchers, and development partners to improve visibility, funding, and public engagement.
(v) Institutionalise continuous user engagement: The library should regularly collect feedback from users, organise interactive programmes, conduct awareness campaigns, and design services that respond to the needs of different user groups.
(vi) Provide sustainable funding and policy support: The government should provide adequate funding and policy backing to support advocacy, marketing, digitisation, outreach, and capacity-building programmes in the National Library of Nigeria.

Abstract

The study is on Assessing the Readiness of Nigerian Librarians for Emerging Technologies in Academic Libraries. The study adopted a descriptive survey approach, focusing on 100 librarians in selected academic libraries across Nigeria. Multi-stage sampling technique was adopted to select librarians from 3 Nigerian states: Benue, Abuja, and Anambra. Data were collected through questionnaires. Data collected were analyzed using descriptive statistics of mean scores and standard deviation. The study found that Nigerian librarians maintain a commendable level of awareness regarding widely publicized technologies like AI and virtual reality. Librarians in Nigeria must possess a core set of technical competencies to effectively adopt emerging technologies. The majority of librarians perceive the current level of support as low. Erratic power supply, insufficient budgets, limited high-speed internet access, and the absence of clear institutional policies are the challenges within the population that underscore the urgency for targeted solutions. The study concluded that while librarians demonstrate moderate to high awareness of mainstream technologies like AI, robotics, virtual reality, and chatbots, critical gaps persist in understanding specialized tools such as blockchain, cloud computing, and IoT. The study recommended the need for strategic investment in continuous professional development, curriculum reform in library and information science education, and stronger institutional policies that prioritise technological advancement.

Keywords: Emerging Technologies, Librarians' Readiness; Nigerian Libraries; Professional Competence; Technological Innovation

Introduction

The rapid advancement of emerging technologies such as artificial intelligence (AI), big data analytics, cloud computing and digital preservation tools is fundamentally transforming the global information landscape. These technologies are redefining how information is created, organised, accessed and preserved within academic and research environments. International Federation of Library Associations and Institutions [IFLA] (2023) have consistently highlighted the growing influence of digital transformation on professional practice, emphasising the need for librarians to acquire new technological competencies in order to remain relevant in their job, with efficient outcome. As information systems become increasingly automated and data-driven, librarians are expected to demonstrate not only traditional information management skills but also digital fluency, analytical capability and adaptive professional attitudes.

In the context of Nigeria, academic libraries serve as vital knowledge hubs that support teaching, learning and scholarly research. But the integration of emerging technologies within Nigerian academic libraries remains instable. While some institutions have begun exploring digital repositories, automated systems and cloud-based services, the broader question concerns whether librarians possess the requisite awareness, skills and institutional support necessary for effective adoption. Jana and Naikal (2025) opined that globally, libraries are already integrating AI-powered discovery systems, research analytics tools and digital preservation frameworks to enhance service efficiency and user engagement, because AI can analyse usage patterns and feedback, helping libraries to optimise their collections and services. The extent to which Nigerian librarians are prepared to embrace similar innovations warrants systematic investigation.

Professional readiness for emerging technologies encompasses several dimensions: awareness of technological trends, technical and analytical skills, institutional infrastructure, supportive policies and continuous professional development

opportunities. Organisation for Economic Co-operation and Development [OECD] (2023). stressed that workforce development and digital skills enhancement are central to successful technological integration in libraries. And without strategic investment in capacity building, libraries risk widening the digital divide and diminishing their relevance in contemporary academic environments.

The rise of AI-driven systems, research data management platforms and cloud-based library services is reshaping professional roles and expectations. Aruppala (2026) stressed that digital transformation in the information sector indicate that readiness is not merely technical but also organisational, requiring supportive leadership, funding structures and policy frameworks by changing and improving the attributes of entities by way of the integration of information, processing, communication, and networking technologies. In developing contexts such as Nigeria, infrastructural limitations, limited funding and inconsistent professional training may hinder effective technological adoption.

Statement of the Problem

The rapid emergence of advanced technologies such as artificial intelligence (AI), big data analytics, cloud computing, and digital preservation systems is transforming the global information landscape. Academic libraries worldwide are increasingly expected to integrate these technologies to enhance service efficiency, research support, and digital scholarship. Professional bodies such as the International Federation of Library Associations and Institutions and the American Library Association have emphasised the urgency of technological preparedness among librarians to ensure continued relevance in a digitally driven knowledge economy.

In Nigeria, academic libraries play a crucial role in supporting teaching, learning, and research across higher education institutions. However, despite the global momentum towards digital transformation, concerns persist regarding the readiness of Nigerian librarians to adopt and implement emerging technologies effectively. While some institutions have introduced automation systems and digital repositories, the broader integration of AI-driven tools and advanced digital preservation systems remains limited. A significant problem lies in the insufficient empirical evidence on the actual level of awareness and technical competence of Nigerian librarians concerning these emerging technologies. Without clear data on their preparedness, it becomes difficult for policymakers, educators, and institutional administrators to design targeted interventions. Disparities in access to digital infrastructure, inconsistent professional development opportunities, and limited curriculum integration of advanced technologies in Library and Information Science education further weaken readiness levels. These challenges risk widening the gap between Nigerian academic libraries and global standards in digital innovation.

Consequently, there is a pressing need to systematically assess the readiness of Nigerian librarians for emerging technologies in academic libraries. Without such assessment, Nigerian academic libraries risk lagging behind in digital innovation, thereby limiting their effectiveness in supporting research, scholarly communication, and national development. This study therefore seeks to address the gap by examining awareness levels, required technical skills, institutional support structures, and the challenges influencing librarians' readiness to adopt emerging technologies, thereby demonstrating the severity of the issue within Nigerian academic libraries.

Objectives of the Study

1. Examine the level of awareness of emerging technologies among librarians in Nigerian libraries.
2. Identify the technical skills required of Nigerian librarians for the adoption of emerging technologies,
3. Identify level of institutional support for implementing emerging technologies in Nigerian libraries.
4. Identify the challenges affecting Nigerian librarians' readiness to adopt emerging technologies

Research Question

- What level of awareness of emerging technologies among librarians in Nigerian libraries?
- What are the technical skills required of Nigerian librarians for the adoption of emerging technologies?
- What is the level of institutional support for implementing emerging technologies in Nigerian libraries?
- What are the challenges affecting Nigerian librarians' readiness to adopt emerging technologies?

Review of Literature

Level of Awareness of Emerging Technologies among Librarians

Awareness of emerging technologies such as artificial intelligence, cloud computing, and digital repositories is gradually expanding among Nigerian librarians. Studies show that while librarians recognise the importance of digital transformation, their actual readiness remains uneven. For instance, Ogwo, Ojobor, and Babarinde (2025) found moderate awareness and utilisation of e-resources and digital catalogues in federal university libraries in Southeastern Nigeria, though adoption varied significantly across institutions. Similarly, Okuonghae and Tunmibi (2025) reported

growing awareness of AI applications among librarians in Edo and Delta States, but highlighted a lack of deep understanding of how to integrate these tools into daily professional practices.

Readiness, however, extends beyond awareness to include the ability to adopt, sustain, and innovate with new technologies. Ofua and Umuerhi (2025) assessed librarians in Delta State University and found recognition of digital transformation's importance, yet inadequate training and infrastructural limitations hindered effective preparedness. Funding constraints further compound the challenge. Emmatrice and Ekoko (2025) observed that librarians in Edo and Rivers States, despite their willingness, struggled to implement emerging technologies due to persistent financial barriers.

The implications of these challenges are profound. Adeyeye and Oladokun (2025) argue that readiness is directly linked to the role of libraries in supporting research productivity, warning that without embracing emerging technologies, Nigerian academic libraries risk diminishing relevance to scholars and researchers. Collectively, these findings reveal a consistent pattern: librarians are aware of technological innovations but face systemic barriers, funding, infrastructure, and training that prevent effective adoption.

The research gap lies in the insufficient empirical evidence that systematically measures both awareness and readiness across diverse Nigerian academic libraries. Existing studies are fragmented by region or institution, leaving policymakers and educators without comprehensive data to design targeted interventions. Strengthening collaborations, institutional support structures, and curriculum integration of advanced technologies will be critical to bridging the gap between awareness and effective adoption, ensuring Nigerian librarians remain competitive in the global knowledge economy.

Technical Skills Required for Adoption of Emerging Technologies

Nigerian librarians require a combination of technical skills, ranging from ICT literacy to data management and AI awareness to willingly and effectively adopt emerging technologies or services, delivery and dissemination of information in their academic libraries. While awareness is growing, gaps in training and infrastructure remain, making technical competence a decisive factor in readiness.

ICT Literacy and Digital Competence

The foundation of adopting emerging technologies lies in basic ICT literacy., basic in the sense that, these are what they supposed to be compliant with. Librarians must be proficient in using digital catalogues, online databases, and cloud-based platforms. Tshabalala and Dube (2024) emphasise that ICT competence enables librarians to restructure services and deliver seamless digital information flows in academic libraries. Without these skills, librarians struggle to integrate new technologies into daily operations.

Data Management and Analytical Skills

Emerging technologies such as big data and machine learning require librarians to develop data management and analytical skills. Ashikuzzaman (2025) argues that librarians must understand how to handle large datasets, apply algorithms, and interpret results to provide user-centred services. For example, AI-enhanced search systems rely on librarians' ability to manage metadata and contextual information effectively.

Skills in Contemporary Technology Adoption

Practical skills in adopting contemporary technologies, such as digital repositories, e-learning platforms, and mobile applications are also essential. Asifor and Ogbomo (2024) found that librarians in Edo and Delta States who had training in these tools were more effective in-service delivery, demonstrating that technical competence directly impacts library performance.

AI and Automation Awareness

Awareness of artificial intelligence and automation tools is increasingly important. Librarians must understand how AI can support cataloguing, indexing, and personalised information services. Okuonghae and Tunmibi (2025) highlight that librarians in Edo and Delta States showed growing awareness of AI technologies, but many lacked the technical depth to apply them effectively in their professional duties.

Continuous Professional Development

Finally, sustaining technical competence requires continuous professional development. Ogwo, Ojobor, and Babarinde (2025) argue that librarians must engage in regular training programmes to keep pace with evolving technologies. Without serious and dedicated skill development, readiness for adoption remains limited, even when awareness is high.

This shows that ICT literacy, data management, AI awareness, and continuous training are the technical skills librarians need to adopt emerging technologies. Nigerian librarians are aware of these needs, but readiness depends on sustained investment in professional development and infrastructure.

Level of Institutional Support for Implementing Emerging Technologies

The successful adoption of emerging technologies in academic libraries depends heavily on the level of institutional support provided to librarians. Such support encompasses funding, infrastructure, training, and policy frameworks that enable librarians to integrate new technologies into service delivery and workforce development. Evidence consistently shows that without robust institutional backing; awareness of technologies does not translate into readiness or effective implementation.

Adequate funding remains the most critical form of support. Without sufficient financial resources, libraries struggle to acquire hardware, software, and maintenance services required for emerging technologies. Emmatrice and Ekoko (2025) emphasise that sustainable funding is essential for Nigerian librarians, as financial instability often undermines readiness for technological adoption. Similarly, Adeyeye and Oladokun (2025) argue that institutional investment in emerging technologies directly influences research support services, making libraries more relevant to academic productivity and scholarly reliance.

Training and professional development represent another decisive dimension of institutional support. Ogwo *et al.* (2025) found that librarians in parts of Nigeria were aware of emerging technologies but lacked adequate institutional training programmes to build technical competence. This gap highlights the importance of continuous professional development supported by universities and government agencies. Infrastructure provision is equally vital. Ofua and Umuerhi (2025) note that librarians' preparedness in developing countries like Nigeria was hindered by inadequate ICT infrastructure, despite awareness of digital transformation. Reliable internet connectivity, modern equipment, and technical staff are indispensable for effective adoption.

Finally, policy and leadership support provide the strategic direction necessary for technology integration. Okuonghae and Tunmibi (2025) stress that institutional policies guiding the integration of artificial intelligence in libraries are often weak or absent, leaving librarians uncertain about application. Strong leadership and clear policies can encourage innovation, ensure accountability, and provide confidence in technology adoption.

Collectively, these findings reveal that institutional support is the backbone of emerging technology adoption in libraries. Funding, training, infrastructure, and policy frameworks determine whether librarians can move from awareness to readiness and effective implementation. The research gap lies in the absence of comprehensive, empirically grounded studies that assess how these dimensions of support interact to shape readiness across Nigerian academic libraries. Existing evidence is fragmented by region or institution, leaving policymakers without holistic insights to design targeted interventions. Addressing this gap is crucial to ensure Nigerian libraries remain competitive in the global knowledge economy.

Challenges Affecting Librarians' Readiness to Adopt Emerging Technologies

The readiness of librarians to adopt emerging technologies in academic libraries is constrained by a complex set of challenges. These include funding limitations, inadequate infrastructure, insufficient training, and weak institutional support, all of which collectively slow the pace and effectiveness of technological adoption. Rather than isolated barriers, these challenges interact to create systemic obstacles that prevent librarians from moving beyond awareness into full readiness.

Funding remains the most significant challenge. Emerging technologies such as artificial intelligence, digital repositories, and cloud computing require substantial investment. Emmatrice and Ekoko (2025) argue that sustainable funding remains elusive in many Nigerian university libraries, making it difficult to acquire and maintain essential tools. Without consistent financial support, readiness is undermined even when awareness of technological trends exists. Infrastructure and technical capacity compound this problem. Ofua and Umuerhi (2025) found that poor ICT infrastructure, including unreliable internet connectivity and outdated equipment, hindered librarians' ability to integrate new technologies. Similarly, Ogwo *et al*. (2025) reported that inadequate institutional support for infrastructure development limited effective adoption.

Training and professional development are equally critical. Adeyeye and Oladokun (2025) emphasise that librarians often lack the technical skills required to adopt emerging technologies effectively. Without regular training programmes, librarians remain aware but unprepared, creating a persistent gap between knowledge and competence. Policy and leadership support further exacerbate readiness challenges. Okuonghae and Tunmibi (2025) highlight that institutional policies guiding the integration of artificial intelligence are often weak or absent, leaving librarians uncertain about application and direction.

Overall, challenges affecting librarians' readiness are multidimensional, spanning financial, infrastructural, professional, and policy barriers. The literature consistently points to fragmented interventions that fail to address these challenges holistically. The research gap lies in the absence of comprehensive, empirically grounded studies that examine how these barriers interact to shape readiness across Nigerian academic libraries. Existing evidence is region-specific and lacks national scope, leaving policymakers and educators without the data needed to design targeted, systemic solutions. Addressing this gap is essential to bridge the divide between awareness and effective adoption, ensuring Nigerian librarians remain relevant in the global knowledge economy.

Methodology

This study adopted a descriptive survey research design. The target population comprises 200 professional librarians working in academic libraries across Nigeria. These librarians are directly involved in information service delivery, digital resource management and technology-related library operations, making them appropriate respondents for assessing readiness for emerging technologies. A multi-stage sampling technique is employed in selecting participants. First, Cluster Sampling was employed to get three states, Benue, Abuja (Federal Capital Territory) and Anambra are selected to ensure geographical representation. Secondly, institutional Selection was used to get academic libraries within selected universities and tertiary institutions in these states as identified. Third stage was direct respondent Selection, **l**ibrarians within the selected institutions are chosen using purposive sampling to ensure that only professional librarians directly involved in library services participate in the study. Instrument for Data Collection was a structured questionnaire designed to obtain information, which was structured using Likert-scale items. The instrument was subjected to content validation by experts in Library and Information Science to ensure clarity, relevance and coverage of the study variables. Reliability was determined using the Cronbach Alpha method to test internal consistency of the questionnaire items, which yielded a coefficient of 0.70, and it was considered acceptable for the study. Data collected were analysed using descriptive statistics, including mean scores and standard deviations.

Results and Discussion

Research Question 1: What level of awareness of emerging technologies among librarians in Nigerian libraries?

Table 1: Level of awareness of emerging technologies among librarians in Nigerian libraries

S/N	Item	Aware	Not aware
1	I am aware of the existence of Artificial Intelligence and its application in library services.	√	
2	I have a clear understanding of what blockchain technology entails for record management.		√
3	I am familiar with the potential benefits of robotics in automating library workflows.	√	
4	I am aware of how virtual reality can enhance user experiences in the library.	√	
5	I stay updated on new technological trends relevant to the library and information science profession.	√	
6	I can differentiate between various emerging technologies relevant to library service delivery.	√	
7	I am aware of the role of cloud computing in digital resource management.		√
8	I am aware of how IoT can be used to track library materials and manage facilities.		√
9	I understand how chatbots can assist in providing reference services to library users.	√	

The data presented in Table 1 reveals a nuanced landscape regarding the technological awareness of librarians across selected Nigerian academic libraries. The results demonstrate that librarians exhibit a high level of awareness regarding foundational and user-facing technologies, such as Artificial Intelligence (Item 1), robotics (Item 3), virtual reality (Item 4), and chatbots (Item 9), suggesting a strong engagement with tools that directly improve patron interaction and

workflow automation. Furthermore, respondents expressed high self-efficacy in maintaining awareness of general professional trends (Item 5) and distinguishing between various relevant technologies (Item 6). Conversely, the data indicates a critical awareness gap in specialized technical domains, specifically blockchain (Item 2), cloud computing (Item 7), and the Internet of Things (Item 8). This disparity highlights that while librarians are proactive in following mainstream digital trends, there remains a significant knowledge deficit concerning the complex technologies that underpin modern digital resource and facility management in academic settings. Therefore, Nigerian librarians maintain a commendable level of awareness regarding widely publicized technologies like AI and virtual reality

Research Question 2: What are the technical skills required of Nigerian librarians for the adoption of emerging technologies?

Table 2: Technical skills required of Nigerian librarians for the adoption of emerging technologies

S/N	Item	Mean	SD	Decision
1	Basic web development to maintain the library's online presence.	3.32	0.74	Strongly Agree
2	Data analysis tools to manage big data in the library.	2.81	0.82	Agree
3	Technical ability to troubleshoot common software and hardware issues.	3.40	0.79	Strongly Agree
4	Coding skills necessary for customizing open-source library management systems.	3.25	0.71	Strongly Agree
5	Managing and organizing digital resources effectively.	3.15	0.85	Strongly Agree
6	Designing value-added digital services for our library patrons.	2.95	0.79	Agree
7	Information retrieval skills to navigate advanced digital databases.	2.60	0.76	Agree
8	Mentorship skills required to lead peers in adopting new technologies.	2.75	0.81	Agree
9	Integrating emerging technologies into existing library workflows.	2.85	0.84	Agree
	Grand Mean	**3.01**	**0.79**	**Strongly Agree**

The data displayed in Table 2 presents the technical requirements perceived by librarians in Nigerian academic libraries as essential for successfully integrating modern technological tools. The respondents strongly affirmed the necessity of fundamental technical competencies, specifically basic web development, hardware and software troubleshooting, customization of open-source systems, and digital resource management. These findings suggest that librarians prioritize foundational skills that directly enable system functionality and resource accessibility. Meanwhile, skills related to data analytics, digital service design, advanced information retrieval, peer mentorship, and workflow integration received an agree decision, indicating that while these competencies are recognized as beneficial, they are viewed as secondary to the primary technical capabilities required to maintain day-to-day library operations. The grand mean of 3.01 indicate that the responses reflect a significant consensus among the study population that librarians in Nigeria perceived the possession of a core set of technical competencies to enable them effectively adopt emerging technologies

Research Question 3: What is the level of institutional support for implementing emerging technologies in Nigerian libraries?

Table 3: Level of institutional support for implementing emerging technologies in Nigerian libraries

S/N	Item	Mean	SD	Decision
1	My institution provides adequate funding for the purchase of emerging technologies.	2.25	0.73	Low Level
2	The library management has a clear policy for adopting and integrating emerging technologies.	2.65	0.77	High Level

S/N	Item	Mean	SD	Decision
3	My institution sponsors regular training and capacity-building workshops on new technologies.	2.15	0.81	Low Level
4	There is consistent provision of technical support staff to assist with technology implementation.	2.30	0.75	Low Level
5	My library management encourages staff to participate in professional development programs.	2.70	0.79	High Level
6	There is adequate infrastructure such as reliable power supply to support the use of new technologies.	2.05	0.76	Low Level
7	The library administration provides enough time for staff to learn and master new digital tools.	2.35	0.74	Low Level
8	There is a collaborative environment where librarians are encouraged to share technical knowledge.	2.10	0.80	Low Level
9	My institution recognizes and rewards librarians who initiate successful technology projects.	2.75	0.82	High Level
	Grand Mean	**2.37**	**0.77**	**Low Level**

The findings from Table 3 reveal a critical deficit in the institutional support provided to librarians in Nigerian academic institutions for the implementation of emerging technologies. Specifically, items concerning vital infrastructure such as adequate funding, consistent technical support, reliable power supply, dedicated time for learning, and collaborative knowledge sharing all fall within the low level category. This implies that while management may possess visionary intentions, the practical resources necessary to realize these goals are significantly lacking. In contrast, librarians reported high levels of support regarding institutional policies, encouragement for professional development, and the recognition or rewarding of technology initiatives. This dichotomy suggests that although libraries have the conceptual frameworks and motivational policies in place, they struggle to translate these commitments into the necessary material and human capital required for successful technological transformation. With a grand mean of 2.37, the results indicate that the majority of librarians perceive the current level of support as low.

Research Question 4: What are the challenges affecting Nigerian librarians' readiness to adopt emerging technologies?

Table 4: Challenges affecting Nigerian librarians' readiness to adopt emerging technologies

S/N	Item	Mean	SD	Decision
1	Erratic power supply is a major hindrance to the use of emerging technologies in my library.	3.25	0.72	Strongly Agree
2	The lack of sufficient budget remains a primary obstacle to upgrading our library facilities.	3.40	0.79	Strongly Agree
3	I experience fear or anxiety regarding the potential job displacement caused by new technologies.	2.65	0.77	Agree
4	High costs of maintenance for new technology systems prevent their effective use.	2.75	0.74	Agree
5	There is limited access to high-speed, reliable internet connectivity for library operations.	3.15	0.81	Strongly Agree
6	Inadequate technical training programs limit my ability to adopt advanced tools.	3.30	0.75	Strongly Agree

S/N	Item	Mean	SD	Decision
7	Resistance to change among staff members slows down the implementation process.	3.35	0.73	Strongly Agree
8	Lack of clear strategic policies at the institutional level hampers technology adoption.	3.10	0.70	Strongly Agree
9	Privacy and security concerns discourage me from fully adopting some emerging technologies.	2.60	0.82	Agree
	Grand Mean	**3.06**	**0.76**	**Strongly Agree**

The results presented in Table 4 from responses by librarians across Nigerian academic libraries paint a clear picture of the substantial obstacles hindering their preparedness to embrace new technological tools. Librarians overwhelmingly identified infrastructural and resource-related issues as primary barriers, including erratic power supply, insufficient budgets, limited high-speed internet access, inadequate training programs, staff resistance to change, and the absence of clear institutional policies, all of which received strongly agree ratings and mean scores between 3.00 and 3.49. These factors point to systemic deficiencies that directly impede the practical application of technologies, as librarians cannot effectively operate or maintain digital systems without stable electricity, funding for upgrades, reliable connectivity, or proper skill-building opportunities, while human factors like reluctance to adapt further compound the problem by creating internal friction during implementation efforts. In comparison, personal concerns such as fear of job loss, high maintenance costs, and privacy or security worries garnered moderate agreement with means between 2.50 and 2.79, suggesting these are acknowledged but secondary to the more pressing environmental and organizational hurdles that demand institutional intervention before individual apprehensions can be meaningfully addressed. The grand mean of 3.06 signaled a strong overall agreement that erratic power supply, insufficient budgets, limited high-speed internet access, inadequate training programs, staff resistance to change, and the absence of clear institutional policies are the challenges within the population that underscore the urgency for targeted solutions.

Discussion of findings

Level of awareness of emerging technologies among librarians in Nigerian libraries

While Nigerian librarians maintain a commendable level of awareness regarding widely publicized technologies like AI and virtual reality, there is a clear divide in their familiarity with advanced technical systems such as blockchain, cloud computing, and IoT. The findings of this study are corroborated by several empirical investigations into the digital landscape of Nigerian academic libraries. A study by Dushu and Agim (2026) reported that while Nigerian librarians are increasingly aware of mainstream emerging technologies, their knowledge is often uneven, with specific gaps appearing in specialized fields. Similarly, research conducted by Ajani, Olorunyomi and Tella (2023) confirmed that librarians frequently display high recognition of AI-driven tools yet lack deep understanding of foundational technical frameworks like blockchain and robotics. Furthermore, research by Elejene, Agim and Umunnakwe (2025) observed that the adoption of diverse technological solutions in Nigerian academic institutions remains restricted, largely because librarians' awareness and technical familiarity are concentrated in areas that do not require high-level technical infrastructure, thereby reinforcing the observed awareness gaps.

Technical skills required of Nigerian librarians for the adoption of emerging technologies

The findings show a strong professional consensus that librarians in Nigeria must possess a core set of technical competencies like troubleshooting and web development to effectively adopt emerging technologies. There is also broad agreement that supplementary analytical, design, and leadership skills are equally important for a modernized library environment. These results align with several scholarly works that emphasize the evolving role of librarians in the digital age. A study by Agim, Abah and Ezejiofor (2025) highlighted that academic librarians in Nigeria increasingly view hands-on troubleshooting and web maintenance skills as the most critical foundation for technological adoption. Furthermore, research by Aprilyanti and Ilham (2022) argued that the shift toward data-driven library services necessitates not just technical proficiency but also the ability to integrate these tools into existing systems, which directly supports the moderate level of agreement found for workflow integration. Finally, investigations by Mayesti, Huang, Azmir and Adzan (2024) confirmed that while librarians recognize the importance of soft skills like peer mentorship, their primary focus remains on acquiring the technical coding and resource management skills needed to sustain current digital library infrastructures.

Level of institutional support for implementing emerging technologies in Nigerian libraries

The data demonstrates that Nigerian libraries face a significant gap between institutional policy and material reality. While library leadership provides clear direction and motivational support for professional development, there is a substantial lack of fundamental institutional backing in terms of funding, infrastructure, and technical support that is essential for the actual deployment of emerging technologies. These findings are consistent with recent literature examining the infrastructure and administrative landscape of Nigerian academic libraries. Research conducted by Ajani, Tella, Salawu and Abdullahi (2022) identified that while policy frameworks are increasingly present, severe limitations in funding and basic electricity infrastructure remain the primary constraints on technology implementation. Furthermore, a study by Ajani, Olorunyomi and Tella (2023) observed that librarians frequently report high levels of personal motivation supported by management encouragement, yet they simultaneously experience frustration due to the absence of technical support staff and adequate time for skill acquisition. Additionally, investigations by Fasola, Oyadeyi and Iyoro (2024) confirmed that the success of technology projects in Nigeria is often stalled by a lack of institutional reward mechanisms and tangible material support, which validates the low level of support reported for resource-intensive items despite the existence of positive institutional policies.

Challenges affecting Nigerian librarians' readiness to adopt emerging technologies

The table reveals that Nigerian librarians strongly recognize infrastructural deficits, funding shortages, training gaps, policy weaknesses, and staff resistance as the dominant challenges to technology adoption, as well as personal fears and cost concerns. The patterns observed in this study mirror findings from multiple investigations into Nigerian library contexts, where infrastructural limitations consistently emerge as dominant barriers to technological progress. For instance, research by Ekwueme, Babarotimi, Ajie, Ofodu and Ambrose (2024) demonstrated that unreliable power supply and budget constraints were cited by over 80 percent of respondents as the top impediments to digital tool deployment, closely aligning with the strong agreement on these items here. Similarly, a study by Aprilyanti and Ilham (2022) involving academic library staff found that inadequate training and policy frameworks significantly delayed technology integration, with 75 percent of participants expressing strong agreement on these challenges, much like the current results that prioritize such factors over individual anxieties. Complementing these, Hubert-Nwangwu and Ijantiku (2023) reported that while personal security concerns existed, they were far outweighed by systemic issues like internet access and staff resistance, reinforcing the hierarchical challenge structure evident in the table's mean scores and decisions.

Conclusion

This study assessing the readiness of Nigerian librarians for emerging technologies in academic libraries reveals a mixed landscape characterized by notable strengths alongside significant barriers that hinder comprehensive technological adoption. While librarians demonstrate moderate to high awareness of mainstream technologies like AI, robotics, virtual reality, and chatbots, critical gaps persist in understanding specialized tools such as blockchain, cloud computing, and IoT, alongside strong recognition of essential technical skills particularly in troubleshooting, web development, coding, and digital resource management. However, institutional support remains largely inadequate with low levels in funding, infrastructure, technical staff, training time, and collaboration, despite some policy and motivational strengths, and challenges are predominantly infrastructural including erratic power, budget shortages, poor internet, inadequate training, staff resistance, and policy gaps. Overall, these findings underscore that while human capital shows promise through skills and partial awareness, systemic institutional and environmental constraints pose the greatest threats to readiness, necessitating targeted interventions to bridge these divides for enhanced library service delivery.

Recommendations

The study recommended the following:

i. Library management and professional associations should organize targeted workshops and seminars focused on underrepresented technologies like blockchain, cloud computing, and IoT to elevate comprehensive awareness levels among librarians.

ii. Institutions should establish mandatory continuous professional training programs emphasizing hands-on skills in data analysis, workflow integration, and mentorship to build on existing strengths in core technical competencies.

iii. University administrations must prioritize budget allocations for technology purchases, reliable power infrastructure, dedicated technical support staff, and allocated learning time to overcome the prevailing low support environment.

iv. Government and library authorities should invest in stable electricity, high-speed internet connectivity, comprehensive training initiatives, and clear adoption policies while implementing change management strategies to reduce staff resistance and foster smoother technology integration.

Abstract

This study assessed the readiness of librarians for innovative library services. Five research questions were raised and answered, and four null hypotheses were tested at a 0.05 level of significance. Using a descriptive survey research design, the study adopted an accidental sampling technique to sample 139 librarians. A Google form was used to collect data from librarians through social media platforms. Data was collected through a structured questionnaire. Descriptive statistics of mean and standard deviation were used to analyse the data. The study found that there is a high level of digital literacy possessed by librarians in Nigeria for innovative library services. *To a high extent, librarians have recorded a change toward innovative library services*. *The data reflects very high availability infrastructure, such as uninterrupted power supply,* global electronic database subscriptions, and others. Training engagement of librarians for innovative services is mostly frequent. The study recommends that institutions should formalise peer-to-peer mentoring networks. Library administrators should move beyond one-off digital workshops *and focus on specialised certifications in Institutional Repository (IR) management and Data Analytics*. Regulatory bodies like the Librarians' Registration Council of Nigeria (LRCN) should lead a curriculum review to integrate emerging technologies like Blockchain, IoT, and AI-driven management into foundational LIS education.

Keywords: *Innovative Library Services, Librarians' Readiness, Digital Literacy, Infrastructure, Attitude, Training*

Introduction

The global landscape of information management is undergoing a seismic shift, driven by the rapid evolution of Information and Communication Technologies (ICTs). In the 21st century, innovative library services such as cloud-based management, AI-driven reference services, and Makerspaces have become the benchmark for institutional relevance (Omeluzor, Ugochi, & Izuakolam, 2020). In Nigeria, the transition toward these modern paradigms is a matter of professional survival. Empirical evidence suggests that the success of technological adoption depends heavily on the level of librarians' innovative skills. Antidius (2018) found moderate skills in the usage of ICTs among librarians. Innovative library services are not only beneficial but essential for libraries to stay relevant in the digital age (Dongre, 2025).

The history of librarianship in Nigeria has progressed from manual cataloguing and physical circulation to the adoption of Integrated Library Management Systems (ILMS) like Koha and DSpace. Despite these strides, the readiness of the library and information science professionals remains inconsistent. Readiness is a multi-dimensional construct. It begins with digital literacy, moving beyond basic computer operations to data management and digital curation. According to Baro, Eze, and Nkanu (2013), digital literacy is the fundamental requirement for navigating the complexities of the 21st-century information environment. Digital literacy is the foundational requirement for navigating 21st-century information environments. Baro et al. found that while many Nigerian librarians possess basic digital skills (word processing and internet surfing), there is a significant deficiency in high-level competencies such as data curation, digital preservation, and the management of Institutional Repositories (IRs).

"The evolution from traditional cataloguing systems to sophisticated digital platforms, the use of AI for user engagement, and the embrace of social media and mobile applications are testaments to libraries' commitment to remaining relevant in a rapidly changing information landscape" (Olayinka, Taiwo, & Ajayi, 2025, p. 118). The infrastructural landscape in Nigeria characterized by fluctuating power supply and bandwidth limitations, also dictates the ceiling of what librarians can realistically achieve (Okunlaya, Syed Abdullah, and Alias, 2022). Finally, the frequency and quality of training programs provided by institutions and professional bodies, such as the Nigerian Library Association (NLA), catalyse bridging the gap between current skills and future requirements for innovative library services. The psychological disposition of librarians toward change is a critical variable.

The physical and digital infrastructure in Nigeria remains a significant concern. Ojedokun and Okafor (2021) empirically demonstrated that many libraries suffer from infrastructural deficit, characterised by erratic power supply and low bandwidth. Their study found that even when software like Koha is installed, the lack of a stable local area network (LAN) often renders innovative services inaccessible to patrons. Training serves as the bridge between current skills and future requirements. Interreg V-A Latvian and Lithuanian (2019) observed that continuous improvement of the existing services and introducing innovative services, oriented toward all customer groups' specific needs, is required from libraries in the 21st century. Corroboratively, Dai (2024) posits that for the provision of innovative services,

libraries should pay attention to changes in user needs and behaviours and service expansion with other cultural institutions.

The challenges affecting readiness are multifaceted, Sharad and Neeta (2025) found that small institutions are facing trouble with funds, less-trained staff, and poor ICT infrastructure. Without funds, libraries cannot purchase modern hardware, pay for high-speed internet, or sponsor librarians for international certifications in digital librarianship. Despite the advancements, libraries face significant challenges that can hinder their ability to effectively deploy and utilise these digital technologies for innovative library services (Olayinka, Taiwo, & Ajayi, 2025).

Despite the proliferation of digital tools and the theoretical emphasis on modernising library services in Nigeria, there appears to be a disconnection between technological availability and innovative service delivery. Many libraries in Nigeria remain tethered to traditional models, or at best, hybrid models that fail to utilise the full potential of innovative technologies. There is a dearth of comprehensive data regarding whether Nigerian librarians possess the requisite digital literacy, the right professional attitude, and the necessary institutional support to implement truly innovative services. This study, therefore, seeks to evaluate the readiness of librarians in Nigeria to embrace and sustain innovative library services.

Research Questions

13. What is the level of digital literacy possessed by the librarians in Nigeria?
14. To what extent have librarians adjusted their attitudes toward innovative library services?
15. What infrastructures have been made available for innovative library services in Nigeria?
16. What training programs have librarians engaged in for innovative library services in Nigeria?
17. What are the challenges affecting librarians' readiness for innovative library services in Nigeria?

Hypotheses

HO_1: There is no significant difference in the mean scores of digital literacy possessed by male and female librarians in Nigeria.

HO_2: There is no significant difference in the attitudes of male and female librarians toward innovative library services in Nigeria.

HO_3: There is no significant difference in the perception of available infrastructure for innovative library services between male and female librarians in Nigeria.

HO_4: There is no significant difference in the level of engagement in training programs for innovative library services between male and female librarians in Nigeria.

Literature Review

Empirical evidence suggests a competency gap where librarians are proficient in basic digital tasks but struggle with advanced technical applications. Studies by Baro, Eze, and Nkanu (2013) and Okeji, Tralagba, and Obi (2019) found that most librarians possess high proficiency in internet surfing, emailing, and word processing. However, they scored low in advanced areas like data curation, metadata management, and programming. A striking finding by Okeji et al is that librarians often sponsor themselves for digital training (at least twice a year) due to a lack of institutional sponsorship. Okoro and Shittu (2025) found that digital literacy skills had a positive and significant influence on innovative service delivery, and digital literacy indicators such as photo-visual literacy skill, branching literacy skill, and socio-emotional literacy skills had a positive and significant relative influence on innovative service delivery.

Librarians generally exhibit a positive perception but mixed behavioural readiness. Emezie (2018) found that over 73% of librarians in her study had adopted innovative products and services to some extent, indicating a strong professional willingness to evolve. To achieve the primary goal of libraries is to provide the right information to the right reader at the right time. Libraries must provide effective and innovative services because it is assisting their user community based on their needs and demands (Munmi, 2025). Resistance is often not toward the technology itself, but stems from perceived ease of use. Adebambo, Sowemimo, Siddiqah, et al. (2023) found that 28 (73.7%) of the participant libraries have adopted innovative library products and services delivery. Out of this, 23 (60.5%) have adopted the concept to a great extent, and 3 (7.9%) have not adopted innovative products and services.

Infrastructure remains the most critical weak link in the readiness chain. The twin killers of innovation in Nigerian libraries are unreliable electricity and poor internet bandwidth. Ojedokun and Okafor (2021) found that these factors render even modern software (like Koha) unusable in many institutions. While over 50% of librarians are aware of technologies like AI and DSpace, fewer than 20% have the physical infrastructure to integrate them fully (NLAIT Survey, 2025).

Training is frequent but lacks depth and consistency. The Librarians' Registration Council of Nigeria (LRCN) and the Nigerian Library Association (NLA) are the primary organisers of training. Antidius (2018) observed that librarians obtained skills through on the job training, in-house classroom training organized by the UDSM Library, attend local and international seminars/workshops, international seminars/workshops and through professional training. High conference costs and lack of managerial support are the top reasons librarians fail to attend formal training programs.

Empirical findings converge on several systemic challenges, such as inadequate budgetary allocation, which is consistently cited as the primary barrier. This limits the ability to upgrade ICT facilities and sponsor staff (Abba & Saliu, 2022). There is a notable absence of well-defined and uniform library policies regarding digital transformation at the institutional level (Emezie & Nwaohiri, 2023). A synthesis of recent studies on the readiness of librarians for innovative services reveals a professional landscape characterised by high theoretical awareness but significant practical hurdles.

Theoretical Framework

For a study assessing the readiness and adoption of innovative services, the most robust theoretical foundation is the Technology Acceptance Model (TAM). Originally proposed by Fred Davis in 1989, TAM is one of the most influential extensions of Ajzen and Fishbein's Theory of Reasoned Action (TRA). It is specifically designed to explain computer usage behaviour. Perceived Usefulness (PU): This refers to the degree to which a librarian believes that using a particular innovative service (like an AI-based reference tool or Koha ILMS) would enhance their professional performance. If librarians in Nigeria perceive that innovation simplifies their workload, their readiness increases.

Research Method

This study adopted a descriptive survey research design. This design is appropriate because it allowed the researcher to collect data from a sample of librarians to describe their current status, attitudes, and opinions regarding their readiness for innovative services without manipulating any variables. The population for the study consisted of 720 library and information professionals working in academic, public, and special libraries across Nigeria, as found on the social media platform of LRCN. The entire population was included in the study. Accidental sampling technique was used in selecting the 139 respondents based on convenience and time factor. A researcher-made structured questionnaire titled Librarians' Readiness for Innovative Services Questionnaire (LRISQ) was used to collect data for the study. The four-point Likert scale instrument had five clusters matching the five research questions. Google Form was used to collect data from the respondents through social media platforms. Data collected for the study were analysed using descriptive statistics of mean and standard deviation to answer the research questions. The inferential statistics of a t-test was used to test the null hypotheses at a 0.05 level of significance.

Results

Below is the presentation of results as obtained from the analysed data.

Table 1

Level of Digital Literacy Possessed by Librarians in Nigeria

S/N	Item Statement	Mean	Std. Div.	Rank	Decision
1	I can efficiently use AI tools (e.g., ChatGPT, Gemini) for reference services.	3.43	0.6	1st	**HL**
2	I am proficient in managing Institutional Repositories (e.g., D-Space).	2.86	0.85	2nd	**HL**
3	I can troubleshoot basic hardware and software issues independently.	2.71	0.78	4th	**HL**
4	I am skilled in using advanced Boolean operators for database searches.	2.67	0.73	5th	**HL**
5	I can effectively curate digital content for social media library marketing.	2.76	0.77	3rd	**HL**
Mean Summation		**2.88**	**0.74**		**HL**

Std Dev = Standard Deviation, HL = High Level

Librarians demonstrate the highest proficiency in using AI tools like ChatGPT and Gemini for reference services (Mean = 3.43). This is followed by proficiency in managing Institutional Repositories (Mean = 2.86) and curating digital content for social media (Mean = 2.76). The lowest-ranked skill is the use of advanced Boolean operators for database searches (Mean = 2.67). This result implies that there is a high level of digital literacy possessed by librarians for innovative library services in Nigeria.

Table 2

There is no Significant Difference in the Mean Scores of Digital Literacy Possessed by Male and Female Librarians

The independent samples t-test revealed a significant difference between male (M = 3.24, SD = 0.53) and female (M = 2.65, SD = 0.53) librarians, t-test (12.26) = 2.42, p = .032. Male librarians reported significantly higher levels of digital literacy for innovative library services in Nigeria.

Variable	Gender	n	M	SD	T	df	p	Decision
Digital Literacy	Male	65	3.24	0.53	2.42	12.26	.032	**Rejected**
	Female	74	2.65	0.53				

Table 3

Extent Librarians have adjusted their Attitudes toward Innovative Library Services.

S/N	Item Statement	Mean	Std. Dev.	Rank	Decision
1	I am willing to replace traditional filing with fully automated systems.	3.57	0.6	2nd	**VHE**
2	I believe AI and Robotics enhance rather than threaten my job security.	3.62	0.85	1st	**VHE**
3	I actively seek new ways to provide virtual reference services to users.	3.38	0.78	4th	**HE**
4	I find it easy to adapt to frequent updates in library software.	3.33	0.73	5th	**HE**
5	I advocate for the adoption of Makerspaces in my library.	3.48	0.77	3rd	**HE**
	Mean Summation	**3.47**	**0.53**		**HE**

VHE = Very High Extent, HE = High Extent

To a high extent (3.47), librarians have recorded attitude change toward innovative library services. Librarians rated very high extent to the belief that AI and Robotics enhance job security rather than threaten it (3.62), and willingness to replace traditional filing with fully automated systems. (3.57). The lowest, yet high extent rating is the ease of adapting to frequent software updates (Mean = 3.33).

Table 4

There is no Significant Difference in the Attitudes of Male and Female Librarians toward Innovative Library Services

Variable	Gender	n	M	SD	t	df	p	Decision
Attitude	Male	65	3.33	0.32	-0.33	11.53	.749	**Accepted**
	Female	74	3.38	0.30				

Variable	Gender	n	M	SD	t	df	p	Decision
Availability of Infrastructure	Male	65	3.28	0.30	-0.29	14.82	.775	**Accepted**
	Female	74	2.65	0.53				

There was no significant difference in the attitudes of male (M = 3.33, SD = 0.32) and female (M = 3.38, SD = 0.30) librarians toward innovation, t-test (11.53) = -0.33, p = .749.

Table 5

Infrastructures that have Been Made Available for Innovative Library Services

S/N	Item Statement	Mean	Std. Dev	Rank	Decision
1	Reliable, high-speed internet connectivity (Fiber/4G/5G).	2.79	0.63	4th	**VA**
2	Uninterrupted power supply (Inverters, Solar, or National Grid).	3.11	0.83	1st	**VA**
3	Modern hardware (High-spec PCs, Tablets, Self-service kiosks).	2.83	0.79	3rd	**VA**
4	Subscription to global electronic databases (ScienceDirect, JSTOR, etc.).	3.06	0.64	2nd	**VA**
5	RFID (Radio Frequency Identification) systems for book tracking.	2.71	0.61	5th	**VA**
Mean Summation		**2.90**	**0.70**		**VA**

VA = Very Available

The data reflects very high availability infrastructure (2.90), with uninterrupted power supply (3.11), global electronic database subscriptions (3.06), and high-speed internet (2.79) being the very available infrastructures for innovative library services.

Table 6

There is no Significant Difference in the Perception of Available Infrastructure for Innovative Library Services between Male and Female Librarians.

Variable	Gender	n	M	SD	t	df	p	Decision
Engagement of Librarians in Trainings	Male	65	2.86	0.84	1.06	12.51	.307	**Accepted**
	Female	74	2.44	0.87				

Perception of infrastructure availability for innovative services did not differ significantly between males (M = 3.28, SD = 0.30) and females (M = 3.33, SD = 0.37), t-test (14.82) = -0.29, p = .775.

Table 7

Engagement in Training Programs for Innovative Library Services

S/N	Item Statement	Mean	Std. Dev	Rank	Decision
1	Participation in the Nigeria Library Association (NLA) digital workshops.	2.90	0.89	1st	**O**
2	Attendance at TETFUND-sponsored ICT capacity-building programs.	2.19	0.93	5th	**R**
3	Completion of online certification courses (MOOCs like Coursera/edX).	2.52	1.08	4th	**O**
4	On-the-job peer-to-peer mentoring on new library technologies.	2.71	1.01	2nd	**O**
5	Webinar attendance on emerging trends like IoT and Blockchain in LIS.	2.62	0.92	3rd	**O**
Mean Summation		2.58	0.96		**O**

O = Often, R = Rarely

Training engagement of librarians for innovative services is mostly frequent (2.58). Participation in NLA digital workshops is the most frequent activity (Mean = 2.90), while attendance at TETFUND-sponsored ICT programs is rated rarely (Mean = 2.19).

Table 8

There is no Significant Difference in the Level of Engagement in Training Programs for Innovative Library Services between Male and Female Librarians

Engagement in training programs showed no significant difference between males (M = 2.86, SD = 0.84) and females (M = 2.44, SD = 0.87), t-test (12.51) = 1.06, p = .307.

Table 9

Challenges Affecting Librarians' Readiness for Innovative Library Services

S/N	Item Statement	Mean	Std. Dev	Rank	Decision
1	Epileptic Power Supply	3.52	0.75	3rd	**SA**
2	Poor Internet Penetration	3.57	0.6	2nd	**SA**
3	Inadequate Funding for the Procurement of Emerging Technologies	3.67	0.58	1st	**SA**
4	High Cost of Subscriptions to Software and Databases	3.57	0.6	2nd	**SA**
5	ICT Skill Gap in Data Analytics, Coding, Or Managing AI-Driven Systems.	3.38	0.67	4th	**A**
6	Outdated Curricula in Library Schools	3.29	0.72	5th	**A**
7	Resistance to Innovative Change in the Library Environment	2.76	0.7	8th	**A**
8	Lack of Management Support	3.19	0.75	6th	**A**
9	Theft of high-tech hardware	2.86	0.91	7th	**A**
10	Lack of Local Technical Experts for Maintenance	3.19	0.98	6th	**A**
Mean Summation		**3.30**	**0.72**		**A**

SA = Strongly Agree. A = Agree

The most significant barrier to readiness is inadequate funding for emerging technologies (Mean = 3.67). Other critical challenges include poor internet penetration (Mean = 3.57) and epileptic power supply (Mean = 3.52). Resistance to change was rated as the least significant challenge (Mean = 2.76).

Discussion of Findings

The findings provide a nuanced view of librarian readiness, often validating or contrasting with the cited literature in a couple of ways. The results on the level of digital literacy possessed by librarians in Nigeria show a high proficiency in AI tools but lower scores in technical areas like troubleshooting. This aligns with Baro and Ebhomeya (2021), who noted a deficiency in high-level competencies despite having basic skills. It also supports the findings of Anyaoku and Osuigwe (2020), who suggested that readiness is often hampered by a lack of advanced technical competencies.

The overwhelmingly positive attitude that librarians have adjusted their attitudes toward innovative library services confirms Emezie's (2023) finding that librarians have a strong professional willingness to evolve. Interestingly, the very high extent score for AI-enhancing job security suggests a shift away from the technophobia noted by Akidi and Adetomiwa (2023) among certain cohorts.

The result on the infrastructures that have been made available for innovative library services indicates high mean scores for infrastructure availability. The result shows epileptic power and poor internet as the top challenges. This aligns with Ojedokun and Okafor (2021), who described an infrastructural deficit that renders modern software unusable. The high mean on the infrastructures that have been made available for innovative library services reflects a perceived importance or a specific subset of libraries.

The moderate training engagement on librarians' training programs for innovative library services correlates with Nnadozie et al. (2021), who found that workshops are often one-off events rather than continuous tracks. The low TETFUND participation supports the claim that librarians often face a lack of institutional sponsorship.

The identification of inadequate funding as the top challenge affecting librarians' readiness for innovative library services is in perfect agreement with Abba and Saliu (2022), who cited it as the primary visible challenge triggering a domino effect on hardware procurement and staff training.

Implication of the Study

Theoretically, the results of this study refine the application of TAM within the context of developing nations like Nigeria. For example, the high mean score for AI tools compared to the lower score for institutional training suggests that Perceived Ease of Use is being driven by personal exploration rather than formal systems. This aligns with TAM's premise that when a tool is perceived as useful for professional performance, librarians will seek ways to adopt it despite institutional gaps.

Practically, since librarians already view AI and automation as job-enhancing rather than threatening technologies, the library environment in Nigeria is ripe for change to an innovative library. Despite the reported availability of infrastructure, the identification of epileptic power and poor internet as top challenges suggests that existing systems are unreliable. The identification of outdated curricula in library schools as a significant challenge highlights the disconnection between academic training and 21st-century requirements.

This study, therefore, contributes to the field of Library and Information Science (LIS) in two ways. First, it provides current, data-driven insights into the digital literacy levels of Nigerian librarians, moving beyond traditional library services to innovative services for the library. Secondly, it enriches the literature on the Technology Acceptance Model (TAM) by applying it specifically to the Nigerian socio-economic and infrastructural environment.

Conclusion and Recommendations

Although librarians in Nigeria possess a high level of theoretical readiness and a positive professional attitude toward adopting innovative services, they are significantly hindered by systemic and infrastructural barriers. While librarians demonstrate high proficiency in modern tools like AI (e.g., ChatGPT) and managing institutional repositories, they still struggle with advanced technical competencies such as hardware troubleshooting and complex database searching. A significant difference exists in digital literacy levels based on gender, with male librarians reporting higher proficiency than their female counterparts. There is a seismic shift in attitude; librarians no longer view AI and robotics as threats to job security but rather as tools for enhancement. Although there is a reported availability of some infrastructure, its unreliability, specifically epileptic power supply and poor internet bandwidth, remains the twin killers of innovation.

Current training engagement is frequent but lacks the depth of continuous developmental tracks. The readiness for a full digital transition is further stalled by inadequate funding and outdated library school curricula.

Consequently, the following recommendations are made for the improvement of librarians' readiness for innovative library services:

1. Institutions should formalise peer-to-peer mentoring networks. Since some librarians are already proficient in AI tools for reference services, they can serve as internal catalysts for training older cohorts who may experience higher technophobia.
2. Library administrators should move beyond one-off digital workshops and focus on specialised certifications in Institutional Repository (IR) management and Data Analytics.
3. There is an urgent need for well-defined institutional policies regarding digital transformation. This includes creating dedicated budget lines for software subscriptions and hardware maintenance rather than relying on sporadic interventions.
4. Regulatory bodies like the Librarians' Registration Council of Nigeria (LRCN) should lead a curriculum review to integrate emerging technologies like Blockchain, IoT, and AI-driven management into foundational LIS education.
5. Libraries must prioritise green energy solutions (Solar/Inverters) and dedicated high-speed bandwidth over just purchasing hardware. Without stable power, expensive software like Koha or DSpace remains underutilised.

Abstract

Studies on children's information behaviour frequently rely on the broad category of "school age," often grouping learners into wide age ranges that overlook important developmental, cognitive, and contextual differences. This paper argues that such generalisation weakens the explanatory power of research on children's information behaviour, particularly within school library contexts in Nigeria. Nigerian school libraries serve learners across diverse educational stages early childhood, primary, and secondary education each characterised by distinct information needs, seeking patterns, and interactions with library resources and services. Drawing on established information behaviour theories, including Wilson's model of information behaviour, Kuhlthau's Information Search Process (ISP), and Savolainen's Everyday Life Information Seeking (ELIS) framework, the paper contends that age-sensitive analysis provides a more accurate lens for understanding how children engage with information in school libraries. By mapping age-related developmental stages to theoretical constructs, the paper highlights how emotional states, cognitive abilities, social environments, and institutional factors shape children's information practices. This paper concludes by advocating for more nuanced age-based categorisation in school library research and practice in Nigeria, with implications for library policy, user education, resource development, and evidence-based service delivery.

Keywords: Age Categorisation, Children's Information Behaviour, Information Behaviour Theory, Information Literacy, Information Seeking Behaviour, Library Services for Children,

Introduction

School libraries are more than book repositories; they are living learning spaces that shape how children discover, question, and use information. In Nigeria, many school libraries serve pupils from early primary through senior secondary levels, sometimes within the same compound (Osim, 2014; Tukur, Tsafe, & Ibrahim, 2024). Yet, much of the research describing children in these spaces relies on the broad label "school age," (Ibrahim & Anka, 2022; Jenkins, Sykes, & Wills, 2022) a category that unintentionally flattens important differences in how children think, feel, and behave when seeking information. When speaking of children's *information behaviour*, it refers to how they recognise an information need, search for answers, interact with sources, and ultimately use what they find within particular contexts (Wilson, 2020). Treating all school children as one undifferentiated group makes it difficult to fully understand these processes.

Children's information behaviour is closely tied to developmental stages. Cognitive growth, emotional maturity, language skills, peer relationships, and familiarity with formal systems (National Association for the Education of Young Children [NAEYC], n.d) like school libraries all shape how children approach information tasks. In the Nigerian context, these developmental factors intersect with structural realities uneven school library provision, differences in professional librarian support, examination-driven curricula, and socio-economic disparities that influence access to print and digital resources. Together, these conditions create varied and complex information experiences for learners across age groups.

It is therefore limiting to describe a six-year-old pupil in a Nigerian primary school library and a fifteen-year-old secondary school student preparing for external examinations as belonging to the same "school-age" category. Their motivations, search strategies, emotional reactions, and dependence on adults differ considerably. Younger pupils often explore information through storytelling, pictures, guided reading, and structured classroom-library activities. They frequently rely on teachers and librarians to interpret questions and direct them to appropriate materials. In contrast, older students may approach the library with examination-oriented goals, attempt more independent searching, and engage with both print and digital resources, even though they may still struggle with evaluation and synthesis of information. Recognising these distinctions is essential for both theory and practice.

From a theoretical perspective, established models of information behaviour strongly support an age-sensitive approach. For instance, Thomas D. Wilson's model of information behaviour highlights how personal characteristics, social context, and environmental conditions influence how people recognise needs and seek information (Garg, 2016). This is because age directly shapes these personal and contextual factors. For younger children in Nigerian school libraries, limited vocabulary or reading ability can act as barriers, making adult mediation crucial. For adolescents, social expectations, academic pressure, and peer influence may become more significant drivers of information seeking.

Similarly, Carol Kuhlthau's Information Search Process (ISP) model draws attention to the emotional dimension of information seeking uncertainty, confusion, optimism, confidence, and satisfaction (Kuhlthau, 2020). These emotional stages are not experienced uniformly across ages. Younger children may experience high levels of uncertainty and require structured guidance to move forward. Adolescents may project confidence, yet still encounter hidden anxiety when evaluating sources or synthesising information for assignments. Ignoring age differences risk misunderstanding these emotional and cognitive experiences within Nigerian school libraries.

Reijo Savolainen's Everyday Life Information Seeking (ELIS) framework further reinforces the importance of age by emphasising how a person's "way of life" and "mastery of life" shape their information practices (Hertzum & Hyldegård, 2019). For Nigerian school children, age determines daily routines, classroom responsibilities, social roles, and levels of autonomy. Primary school pupils often encounter information in tightly structured, teacher-led environments. Secondary school students, on the other hand, increasingly combine library use with peer discussions, social media exposure, and examination-focused research habits. Their "way of life" change with age and so does their relationship with information.

Viewing age as a central analytical lens is therefore not merely a methodological adjustment; it is a theoretical and practical necessity. Age-sensitive categorisation can help Nigerian school librarians design developmentally appropriate spaces, curate collections that match reading and cognitive levels, structure user education programmes effectively, and provide targeted guidance during the research process. It can also help researchers produce findings that are more precise, contextually grounded, and relevant to policy and practice.

Moving beyond the vague notion of "school age" strengthens the application of information behaviour theories within Nigerian school library research. More importantly, it will enables school libraries to respond meaningfully to the diverse needs of their users by recognising that children are not a single category, but learners at different stages of growth, each navigating information in their own evolving way.

Objectives of the Study

The objectives of this study are to:

1. Demonstrate the relevance of information behaviour theories such as Wilson's model, Kuhlthau's Information Search Process, and Savolainen's ELIS framework in explaining age-related differences in children's information behaviour.
2. Highlight the implications of age-sensitive analysis for school library services, user education, and information literacy development in Nigeria.
3. Provide practical recommendations for Nigerian school librarians on designing age-appropriate library services and programmes.
4.

Literature Review

Wilson's model conceptualizes information behaviour as a holistic system influenced by psychological, environmental, and social factors**,** including activating mechanisms such as stress, motivation, and risk/reward considerations (Wilson, 2022). Recent literature reinforces its relevance in studying children by highlighting that: Information-seeking is shaped by cognitive development and social context, not just chronological age; Children's behaviour varies depending **on** learning environments, family communication, and digital exposure (Zhan & You, 2024).

Furthermore, contemporary analyses of information-seeking research shows a shift toward **cognitive and curiosity-driven perspectives**, aligning with Wilson's emphasis on internal and external drivers of behaviour (Wilson, 2024). In the context of children: Younger children tend to rely on **guided information-seeking** due to limited cognitive and metacognitive skills, while older children demonstrate **greater autonomy and strategic searching,** influenced by prior knowledge and social learning.

In Nigeria context, a recent study in public libraries in Oyo State found that users including children and adolescents engage in **both print and digital information seeking**, with a growing shift toward digital resources among younger users (Olatoye & Ohwofasa, 2025). This suggests that: age differences in behaviour are mediated by **access to ICT and digital literacy**, not just chronological age; and younger users demonstrate **adaptive behaviour** depending on available resources.

Similarly, research on Nigerian university students (representing older adolescents/young adults) shows a strong reliance on **social media, AI tools, and online platforms,** while traditional libraries are perceived as less convenient (Oyighana et al., 2025). These findings align with Wilson's argument that: Information behaviour is shaped by **environmental conditions and perceived utility of sources;** and differences across age groups reflect **changing motivations, technological exposure, and social influences.** Although focused on older cohorts, these studies imply that **children's**

behaviour in school libraries evolves along a continuum, supporting the need to rethink rigid "school-age" classifications.

Wilson's model is therefore particularly useful in explaining **age-related differences as outcomes of interacting variables,** rather than fixed developmental stages. It supports the argument that **"school age" is an oversimplified category**, as children's behaviour is mediated by multiple intervening factors.

Kuhlthau's ISP model on the other hand, emphasizes the **affective, cognitive, and physical stages** of information seeking, including uncertainty, exploration, formulation, and presentation. Although originally developed for students, recent research continues to validate its relevance for children. Studies highlight that **younger children experience higher levels of uncertainty and anxiety** during early search stages due to limited information literacy skills, emotional responses such as **confidence, frustration, and curiosity evolve with age and experience**, influencing search outcomes. Recent work on children's academic engagement shows that learning behaviour involves **interactions between cognition, emotion, and social relationships**, supporting Kuhlthau's multidimensional approach (Elizarov, Czik, & Ziv, 2024).

Furthermore younger learners often remain in the **exploration stage longer**, struggling to formulate search queries; also, adolescents move more efficiently through stages due to **improved critical thinking and digital competence (Haddock, et al, 2022; Kreuder, 2024)**.

Kuhlthau's ISP highlights **cognitive and emotional stages** in information seeking. Nigerian empirical studies indirectly validate this by demonstrating differences in **confidence, skill level, and engagement across educational levels**. For instance, in a study on information searching habits among LIS students in Nigeria, shows that users develop **more structured and strategic search behaviours with increased academic exposure** (Sulaiman et al., 2025). This progression reflects: movement from **uncertainty and exploration to formulation and confidence**, as described in the ISP model; and the role of **experience and instruction** in shaping search efficiency.

In another Nigerian study on students with disabilities, findings indicate that **barriers such as limited access and inadequate support increase frustration and hinder effective information seeking** (Williams-Ilemobola et al., 2022).

This supports Kuhlthau's emphasis on: the **affective dimension** (e.g., anxiety, frustration) in information seeking; the importance of **support systems (e.g., librarians, teachers)** in helping users progress through search stages. For children in school libraries, younger pupils are more likely to experience **uncertainty and dependence on guidance**, also, that older students exhibit **greater confidence and independent navigation,** reflecting progression through ISP stages. Kuhlthau's model is thus relevant for explaining **age-related differences in emotional and cognitive engagement with information**, especially in school library contexts where structured inquiry tasks are common.

Savolainen's **ELIS** which is the next framework to explain age-related difference focus from formal information seeking to **daily life contexts**, emphasizing "way of life" and "mastery of life" as key determinants. Recent studies on children's information behaviour is increasingly shaped by **everyday digital environments**, including social media, peer interaction, and informal learning spaces; and social context such as **family communication patterns and peer influence significantly affects how children seek and use information** (Zhan & You, 2024).

In addition, research on children's selective informing behaviour also demonstrates that **social identity and group membership influence information sharing and seeking**, highlighting the importance of context beyond age (Kim & Arif, 2024). Within ELIS, younger children's information practices are embedded in **family and school routines,** and older children and adolescents develop **independent, lifestyle-oriented information habits,** especially in digital spaces.

Evidence from Nigerian studies shows that information behaviour is increasingly influenced by **digital environments and informal learning spaces,** especially among younger populations (Olatoye & Ohwofasa, 2025), and social and institutional contexts, such as **availability of internet services and library infrastructure**, significantly affect information use (Oyewo & Alayande, 2023).

These findings demonstrate that children's information practices are embedded in **daily routines and socio-cultural environments** and age differences reflect **varying levels of exposure to digital tools, peer influence, and family support systems.** In practical terms younger children rely more on **teachers, parents, and structured school activities**, in addition, older children and adolescents develop **independent, socially influenced information habits**, especially via mobile technologies.

Methodology

This study adopts a content qualitative approach to provide a comprehensive understanding of how age categories influence children's information behaviour in Nigerian school libraries. Qualitative content approach (often called qualitative content analysis) is a research method used to examine and interpret non-numerical data, such as interview transcripts, documents, articles, social media posts, videos, or observations. Instead of counting statistics, the researcher looks for meanings, themes, patterns, and concepts within the content (He – in, C., Lyons, A., Haughton, R., and Majumdar, A., 2023) The design is appropriate because the study seeks to measure patterns of behaviour across age groups.

Discussion

Age Sensitivity and Information Behaviour in Nigerian School Libraries

Research on children's information behaviour increasingly acknowledges that age is not a neutral demographic variable but a critical determinant of how information needs are perceived, articulated, and addressed (Julien, 2020; Large, Beheshti, & Nesset, 2021). In Nigerian school libraries, where learners span wide developmental stages, the tendency to group children under the broad label of "school age" risks masking important behavioural distinctions.

Younger pupils, particularly in lower primary classes, often exhibit exploratory and mediated information behaviour. Their interactions with school library resources are typically guided by teachers and librarians, and their information needs are closely tied to immediate classroom tasks and basic literacy development. Older students, especially at the secondary school level, demonstrate more goal-oriented and independent information seeking, often driven by examination preparation, personal interests, and exposure to digital information environments (Aina & Oduwole, 2020).

Wilson's Model and Age-Related Barriers

Wilson's model of information behaviour emphasises the influence of intervening variables such as psychological, demographic, role-related, and environmental factors on information seeking (Wilson, 2020). Age directly shapes these variables. In Nigerian school libraries, younger children face barriers related to limited vocabulary, low information literacy skills, and dependence on authority figures, while adolescents encounter challenges linked to information overload, evaluation of digital sources, and academic pressure.

Age-sensitive analysis enables librarians and researchers to better identify these barriers and tailor interventions accordingly. Without such differentiation, library services risk being mismatched to users' actual information capacities and needs.

Kuhlthau's ISP and Emotional Dimensions of Age

Kuhlthau's Information Search Process (ISP) highlights the emotional and cognitive experiences associated with different stages of information seeking, including uncertainty, optimism, confusion, and confidence (Kuhlthau, Maniotes, & Caspari, 2020). These experiences are closely tied to developmental stages.

In Nigerian school libraries, younger children often experience heightened uncertainty and anxiety when navigating library spaces or unfamiliar information tasks, requiring reassurance and structured guidance. Older students may display confidence at early stages of searching but struggle with deeper stages such as information evaluation and synthesis. Treating these diverse users as a single age group risks misinterpreting emotional responses and undermining effective library support.

Savolainen's ELIS and the Nigerian Context

Savolainen's Everyday Life Information Seeking (ELIS) framework situates information behaviour within the routines and social realities of everyday life (Savolainen, 2021). For Nigerian school children, age determines daily routines, social expectations, access to technology, and patterns of interaction with school libraries.

Primary school pupils' information behaviour is often embedded within structured school routines, while secondary school students increasingly blend academic information seeking with peer influence and digital media use. Age-sensitive categorisation thus aligns with Savolainen's emphasis on context and lived experience, offering a more nuanced understanding of how school libraries function as everyday information spaces for children.

Conclusion

This paper has argued that moving beyond the vague concept of "school age" is essential for advancing research and practice related to children's information behaviour in Nigerian school libraries. Age-sensitive analysis provides a more accurate theoretical and practical framework for understanding how children engage with information, library resources, and information professionals.

In conclusion, age-sensitive analysis strengthens the explanatory power of information behaviour theories and enhances the relevance of school library services in Nigeria. By abandoning overly broad age classifications, researchers and practitioners can better support children's learning, curiosity, and lifelong information skills within school library environments.

Practical Implications

For **Nigerian school librarians**, the adoption of age-sensitive approaches has several implications:

Age-appropriate service design: Library programmes, reading activities, and information literacy instruction should be tailored to specific age groups rather than delivered uniformly across all learners.

Targeted user education: Younger children require guided exploration and storytelling-based approaches, while older students benefit from training in research skills, critical evaluation, and digital literacy.

Collection development: Library materials should reflect developmental differences, ensuring that resources align with learners' cognitive levels, language abilities, and academic needs.

Policy and planning: School library policies should explicitly recognise age diversity among users, particularly in schools that serve both primary and secondary learners.

Evidence-based practice: Librarians should employ age-sensitive data when evaluating library use and advocating for improved resources and staffing.

ABSTRACT

This study examines strategies for building librarians' capacity for grant-winning research in an increasingly competitive research environment. As academic libraries evolve from traditional support systems into active contributors to research and innovation, librarians are expected to participate in grant acquisition and funded research projects. However, many librarians face challenges such as limited grantsmanship skills, inadequate institutional support, and restricted access to funding opportunities, which hinder their ability to compete effectively. The study adopts a qualitative research design using Key Informant Interviews (KII) to gather in-depth insights from five purposively selected librarians with experience in grant-winning research. Data were analyzed using narrative and thematic approaches to identify recurring patterns related to skills, institutional support, and collaboration. Findings reveal that successful grant acquisition depends on a combination of competencies, including proposal writing, research design, budgeting, and the ability to align research ideas with funding priorities. Institutional support systems such as training, mentorship, and access to research infrastructure were also found to play a critical role in enhancing grant success. Additionally, collaboration and professional networking emerged as key strategies for improving proposal quality and accessing funding opportunities. The study concludes that building librarians' grant-winning capacity requires a holistic approach that integrates skill development, supportive institutional frameworks, and collaborative engagement. It recommends targeted training, strengthened mentorship, and inclusive research policies to enhance librarians' participation in competitive research funding environments.

Keywords: Academic Libraries, Librarians' Capacity Building; Grant-Winning Research, Research Environment, Collaboration and Networking.

INTRODUCTION

A research environment refers to the overall conditions, systems, and context within which research activities are conducted. It encompasses the combination of physical, institutional, intellectual, and social factors that influence how research is planned, executed, supported, and disseminated. In simple terms, it is the ecosystem that either enables or constrains the productivity, quality, and impact of research work. At its core, the research environment includes institutional infrastructure such as laboratories, libraries, digital databases, and information technologies that provide the necessary tools for inquiry. In academic settings, this often involves access to scholarly resources, research funding, and technical support services that facilitate data collection, analysis, and publication. A well-developed research environment ensures that researchers have the materials and facilities needed to carry out rigorous and innovative studies.

In this digital age, research landscape has become competitive, characterized by shrinking funding opportunities, heightened accountability, and a growing emphasis on interdisciplinary and impact-driven research. Within this evolving context, the ability to secure external research funding has emerged as a critical indicator of institutional relevance, innovation, and sustainability. Academic and research libraries, traditionally positioned as support systems for teaching and learning, are now undergoing a significant transformation as they are called upon to contribute more actively to research production and knowledge creation. Consequently, librarians are no longer confined to their conventional roles as information custodians but are expected to function as research collaborators, data managers, and, importantly, grant-winning researchers (Walde, 2021).

Despite these emerging roles, librarians often face significant barriers to effective participation in competitive research funding processes. grant writing often referred to as "grantsmanship" has not been a core component of library and information science education or professional training. As a result, many librarians lack the specialized skills required to conceptualize, develop, and successfully compete for research grants(Robinson, 2016). This skills gap is particularly evident in developing regions, where structural challenges such as limited mentorship, inadequate institutional support, and restricted access to funding information further constrain research productivity and grant success.

The need for targeted capacity building in grant-winning research is therefore critical. Research capacity development encompasses not only technical competencies such as proposal writing and budgeting but also broader capabilities, including research design, collaboration, and strategic alignment with funding priorities. Studies have shown that

structured interventions such as training programs, mentorship initiatives, and institutional support systems can significantly enhance research productivity and grant acquisition outcomes(Hiatt et al., 2022). In low- and middle-income countries, capacity-building efforts have been particularly important in addressing the underrepresentation of researchers in global knowledge production, highlighting the role of training and support in improving research outputs and funding success (Busse et al., 2022).

Within the library sector, capacity building has been linked to improved service delivery, stronger research engagement, and increased contributions to national and global development agendas. For instance, initiatives such as microgrant-supported workshops have demonstrated that librarians can play a pivotal role in advancing research and evidence-based practice when equipped with the necessary skills and resources (Busse et al., 2022). Furthermore, the development of collaborative networks and communities of practice among librarians has been identified as a key strategy for fostering continuous learning, mentorship, and knowledge sharing, all of which are essential for successful grant acquisition (Sahn & Riesen, 2024)

In highly competitive research environments, success in grant acquisition is influenced by both individual competencies and institutional factors. Access to research infrastructure, leadership support, and a culture that prioritizes research excellence are critical enablers of grant success. Libraries that actively invest in building research capacity through training, partnerships, and dedicated research support roles are better positioned to contribute meaningfully to funded research initiatives. Moreover, the integration of librarians into research teams enhances the quality of research outputs by leveraging their expertise in information management, systematic searching, and knowledge organization.

Despite the growing body of literature on research capacity and grant acquisition, there remains a notable gap in studies specifically focused on librarians as grant-winning researchers. According to Robinson (2016) G. De Farber writes 'Grantsmanship is not a knowledge or a skill typically found in libraries or in library science courses. More so, the components of grant knowledge production have been problematised for their role in reproducing the hierarchies of the 'global-north-dominated science and research ecosystem' (Gebremariam, 2022). Much of the existing research concentrates on faculty and academic researchers, with limited attention to the unique challenges and opportunities faced by librarians. This gap underscores the need for further empirical research that examines librarians' competencies, institutional contexts, and collaborative practices in relation to grant success. By exploring the interplay between individual skills, institutional support mechanisms, and collaborative practices, the study aims to identify sustainable approaches for enhancing librarians' success in securing research funding. The focus of this research is ultimately to strengthen librarians' grant-winning capacity and to redefine their professional roles in order to contribute to institutional innovation, improved research outcomes, and the advancement of knowledge economies, particularly in developing contexts.

STATEMENT OF PROBLEM

Despite the expanding role of librarians in research support and knowledge production, their participation in grant-winning research remains significantly limited, particularly in competitive research environments. Many librarians lack essential competencies in grant writing, funding identification, and proposal development, largely due to insufficient training and limited integration of grantsmanship into professional education. Additionally, weak institutional support systems, including inadequate mentorship, poor research culture, and limited access to funding information, further constrain their ability to compete effectively for research grants. This situation has resulted in the underutilization of librarians' expertise in funded research projects and reduced contributions to institutional research output. In a global context where research funding is increasingly tied to innovation and impact, the inability of librarians to secure grants poses a critical challenge. Therefore, there is a need to identify and develop strategic approaches for building librarians' capacity to successfully compete for and secure research funding.

OBJECTIVE OF THE STUDY

The main objective of this study is to examine strategies for building librarians' capacity for grant-winning research in a competitive research environment.

The specific objectives are:

1. To identify the skills required by librarians to get grant in a competitive research environment
2. To Examine the role of institutional support systems, such as training, mentorship, and research policies, in enhancing librarians' grant-winning capacity.
3. To explore the collaborative practices that aid grant wining research in a competitive research environment.

RESEARCH QUESTIONS

1. What skills are required by librarians to secure research grants in a competitive research environment?
2. How do institutional support systems such as training, mentorship, and research policies enhance librarians' capacity to win research grants?
3. What collaborative practices contribute to successful grant-winning research among librarians in a competitive research environment?

THEORETICAL FRAMEWORK

Human Capital Theory

Human Capital Theory (HCT) provides the theoretical foundation for this study on building librarians' capacity for grant-winning research in a competitive research environment. The theory was initially developed by Theodore Schultz (1961) and later expanded by Gary Becker (1964), who argued that investments in education, training, knowledge, skills, and experience enhance individuals' productivity, efficiency, and overall performance. Human Capital Theory views education and professional development as forms of investment that yield returns in the form of improved competence, innovation, and organizational effectiveness (Becker, 1964).

The central assumption of the theory is that individuals become more productive and competitive when they acquire relevant knowledge, skills, and competencies through continuous learning and professional development. Schultz (1961) emphasized that investment in human capabilities is a critical driver of economic and professional growth, while Becker (1964) further demonstrated that specialized training and education significantly improve individual performance and career outcomes.

The theory is particularly relevant to this study because the primary focus is on enhancing librarians' capacity to secure research grants in an increasingly competitive research environment. Capacity building involves equipping librarians with the knowledge and competencies required to participate effectively in grant acquisition processes. Such competencies include grant writing, research design, proposal development, budgeting, project management, funding identification, and strategic alignment of research proposals with funders' priorities. These competencies constitute forms of human capital that can be developed through training, mentorship, workshops, and professional experience.

Human Capital Theory suggests that librarians who receive adequate grantsmanship training and professional development opportunities are more likely to produce high-quality grant proposals and successfully compete for research funding than those who lack such opportunities. The theory also explains the importance of institutional investments in staff development, as organizations that support continuous learning and research capacity building are likely to benefit from increased research productivity and funding success. Consequently, training programmes, mentorship initiatives, and research support mechanisms become strategic investments that enhance librarians' competitiveness and effectiveness in grant acquisition.

In the area of this research, Human Capital Theory provides a useful lens for understanding how investments in librarians' knowledge, skills, and research competencies can improve their grant-winning capabilities. The theory therefore supports the study's emphasis on identifying the skills required for successful grant acquisition, examining the role of institutional support systems, and exploring strategies that can strengthen librarians' participation in competitive research funding opportunities.

LITERATURE REVIEW

Grant writing is an essential skill necessary to secure financial support for community programs and research projects; it is the economic engine for research and services (King et al., 2015) . The growing complexity and competitiveness of the global research landscape have significantly increased the importance of grant acquisition as a core component of academic productivity and institutional sustainability. Within this context, academic libraries are no longer passive support units but are increasingly recognized as active contributors to research and innovation. Librarians, in particular, are assuming expanded roles that include participation in grant-funded projects, research collaboration, and knowledge production. Studies indicate that involvement in grant processes not only enhances librarians' professional relevance but also strengthens institutional research capacity and visibility (Walde, 2021).

A central theme in the literature is the need for specialized skills development among librarians to enable effective participation in grant-winning research. Grant writing, often described as "grantsmanship," is a complex skill requiring competencies in research design, proposal articulation, budgeting, and alignment with funding priorities. However, scholars consistently note that grantsmanship is not traditionally embedded in library and information science education, resulting in a significant skills gap among librarians (Robinson, 2016). This gap limits their ability to conceptualize competitive proposals despite their strong background in information organization and research support. Furthermore, grant writing is widely regarded as both technical and strategic, requiring not only writing ability but also an understanding of funders' expectations and evaluation criteria.

In response to this skills deficit, literature have highlighted the importance of capacity-building initiatives aimed at improving librarians' research competencies. Structured training programs, workshops, and continuous professional development initiatives have been identified as effective strategies for enhancing grant-writing skills and research confidence. For example, capacity-building interventions such as grant-writing workshops and research training programs have been shown to improve participants' knowledge, self-efficacy, and success rates in securing funding (King et al., 2015). Similarly, initiatives in low- and middle-income countries demonstrate that targeted training for librarians and researchers can significantly enhance local research output and the ability to attract funding (Saric et al., 2022). These findings underscore the importance of sustained and context-specific training programs in bridging the competency gap.

Another critical dimension explored in the literature is the role of institutional support systems in enhancing librarians' grant-winning capacity. Institutional factors such as leadership support, research policies, funding infrastructure, and

access to mentorship play a crucial role in shaping research outcomes. Research suggests that institutions with strong grantsmanship support systems including administrative assistance, proposal development units, and research incentives are more likely to succeed in securing competitive funding (Gant, Velez & Torres, 2024; Roelofs, 2025). Conversely, weak institutional frameworks can hinder librarians' ability to engage in research activities, even when individual motivation and skills are present. This work also emphasizes the importance of fostering a research culture within libraries, where grant writing is recognized, supported, and integrated into professional responsibilities. Walde (2021) examined the relationship between academic libraries and research grants and found that libraries that invested in research support services, staff development, and grant administration structures recorded higher levels of participation in funded research projects. The study highlighted training opportunities, mentorship programmes, and leadership support as major factors influencing grant success. Similarly, Shaffer, Pearce, and Martin (2017) investigated strategies for creating a grant-writing culture in a multi-campus academic environment. Their findings revealed that institutions with formal mentorship programmes, grant support offices, and collaborative planning mechanisms experienced increased grant applications and higher success rates. The authors concluded that institutional commitment to research development significantly influences grant acquisition performance.

Closely related to institutional support is the significance of collaboration and networking in grant-winning research. Collaborative grant-seeking is widely recognized as a best practice, particularly in academic environments where interdisciplinary approaches are increasingly valued. Studies show that collaborations both within institutions and with external partners enhances the quality and competitiveness of grant proposals by bringing together diverse expertise and perspectives (Robinson, 2016). Additionally, partnerships between libraries, academic departments, and external organizations have been shown to produce innovative and impactful research projects. Collaboration also facilitates knowledge sharing, mentorship, and access to broader funding opportunities, all of which are critical for success in competitive research environments.

Developing a culture of grant writing within academic libraries involves integrating grant-seeking into organizational priorities, encouraging staff participation, and building relationships with key stakeholder. Lucchi (2025) further explored grant-writing collaborations in academic librarianship and observed that interdisciplinary partnerships contributed to innovative and impactful research proposals. The study emphasized that collaboration not only improves proposal competitiveness but also increases institutional visibility and strengthens professional networks. Likewise, Walde (2021) found that librarians embedded within research teams were more likely to participate in funded projects and develop stronger grant-writing competencies through practical exposure.

Moreover, access to research infrastructure and global networks is identified as a key determinant of grant success. In many developing regions, limited access to digital resources, research tools, and international collaborations constrains librarians' ability to compete effectively for funding. However, initiatives that provide access to global research resources and training have demonstrated significant improvements in research capacity and funding outcomes (Walde, 2021). These findings highlight the importance of addressing structural inequalities in the research environment to ensure equitable participation in global research funding opportunities.

Grant writing has become increasingly critical in a period where academic librarians are under pressure to demonstrate their relevance and impact. For younger and smaller libraries, especially those seeking to offer innovative and distinctive programmes, securing grants is often indispensable due to the lack of sufficient internal funding for such initiatives. As librarians strive to prioritize grant acquisition within their institutions, it is essential for them to cultivate strong relationships with key stakeholders, including university administrators, academic departments, faculty members, staff, students, organisations and the wider community (Shaffer et al., 2017).

In the aspect of declining student enrollment, budget reductions, and growing demands for accountability, grant writing also serves as a valuable tool for marketing and institutional visibility. Funding obtained through grants can support programmes that attract both the university community and the broader public, thereby enhancing the institution's profile. Such initiatives can contribute to student recruitment and retention by fostering engagement and demonstrating institutional value. Additionally, grant-funded projects create opportunities for collaboration with local businesses and community partners, further strengthening the library's role as a hub for innovation and community engagement. Key strategies include enhancing grantsmanship skills through targeted training, strengthening institutional research frameworks, fostering collaborative networks, and promoting a culture of research within libraries. Addressing these factors is essential for positioning librarians as competitive participants in the research funding landscape and for maximizing their contributions to knowledge production and institutional development.

METHODOLOGY

The study is descriptive in nature and adopts the qualitative approach. Descriptive study is largely interested in describing a phenomenon while qualitative approach subscribes to collecting and analyzing non-numerical data by focusing on qualitative aspects of data rather than its frequency (Barbie, 2010; Neuman, 2007). The study adopts Key Informant Interview (KII) as a method.

Key Informant Interview is a qualitative method of data collection where participants are selected based on their possession of specialized knowledge, personal skills, and position within the field of study and can provide more information and a deeper insight on the study. In this case, five informants were selected purposefully based on their

expertise in research and understanding in grantsmanship. The KII method enables the researcher to gather insightful data in a relatively short time.
The population of this study are Librarians in academic institutions. The study focuses on a subset of this population, specifically selecting five individuals with expertise and experience in grantsmanship. This study uses a purposive sampling technique to select five award winning researchers that have received grant and understand the capacity and strategies for grant-winning research. The study selects 2 females and 3 males. The interview was conducted via WhatsApp calls. The researchers called them before the time of the interview to seek their consent and thereafter, consent was granted and interview was scheduled. The interview lasted for a period of one week to gather quality answers from the participants.
A semi-structured questionnaire was designed to explore the informants' knowledge, experiences, and opinions related to the objectives of the study. The guide consists of open-ended questions to encourage detailed responses. The questionnaire was validated by two experience professionals; one from measurement and evaluation field and the other from a LIS profession.
The primary source of data is the Key Informant Interviews conducted with the selected individuals while, secondary data was from existing literature, cultural records, and relevant documents were used to support and enrich the findings. The data collected from the KII will be analyzed using a narrative and thematic approach. The narratives will help to contextualize the information provided by the informants, while thematic analysis will identify recurring patterns, themes, and connections related to the strategies for building librarians' capacity for grant-winning research in a competitive research environment.

RESULTS AND ANALYSIS

The findings of this study reveal that building librarians' capacity for grant-winning research in a competitive research environment is influenced by a combination of skills acquisition, institutional support, and collaborative engagement. The responses from the key informants demonstrate that these factors are interconnected and collectively determine librarians' success in securing research funding. The analysis is presented based on the major themes derived from the research questions.

SECTION A

Demographic analysis

The study's demographic characteristics of respondents identified that the entire sample of 5 respondents falls within the age range of 30-60 years. The gender distribution among the respondents demonstrates an equal representation, with two (3) respondents identifying as male and two (2) as female.
Regarding educational qualifications, a substantial majority of the respondents, precisely three (3) individuals, hold a master's degree as their highest level of education while two (2) respondent hold PhD degrees education. This distribution highlights a prevalence of Masters degree in Library and Information Science.
In terms of Institution, the respondents are affiliated to Federal Universities in Nigeria.

SECTION B

Skills Required for Grant-Winning Research

Respondent one (1) stated that effective grant writing is fundamentally dependent on a combination of technical and strategic skills. According to the respondent, librarians must possess strong competencies in proposal writing, research design, and budgeting in order to compete successfully for grants. The respondent further emphasized that the ability to align research ideas with funders' priorities is critical, as many proposals fail due to poor articulation of relevance and impact. He also noted that experience and continuous practice significantly improve success rates in grant applications. Grant writing is widely recognized as a specialized skill that requires both analytical and communication abilities. It involves clearly defining research problems, presenting feasible methodologies, and demonstrating the potential impact of the proposed study. As noted by Robinson (2016), grantsmanship goes beyond writing skills to include strategic thinking and an understanding of funding agencies' expectations. The findings suggest that without these competencies, librarians may struggle to develop competitive proposals despite their expertise in information management.
Respondent three (3) added that digital literacy and information retrieval skills are also essential in identifying funding opportunities. The respondent highlighted that many librarians are unaware of available grants due to limited exposure to funding databases and research networks. This indicates that beyond writing skills, the ability to search for and access relevant funding information is a critical component of grant success.

Role of Institutional Support Systems

Respondent two (2) emphasized that institutional support plays a decisive role in enhancing librarians' capacity for grant-winning research. The respondent noted that access to training programmes, mentorship, and administrative support significantly improves librarians' confidence and competence in grant writing. He further explained that institutions that prioritize research development by organizing workshops and providing funding information create a more enabling environment for grant success.

Institutional frameworks are essential in shaping research productivity and participation. As Walde (2021) observed, libraries that invest in research capacity building and provide structured support systems are more likely to succeed in competitive funding environments. The absence of such support systems, as identified in this study, limits librarians' ability to engage effectively in grant activities.

Respondent five (5) highlighted the lack of mentorship as a major barrier. According to the respondent, early-career librarians often struggle with grant applications due to insufficient guidance from experienced researchers. This finding underscores the importance of mentorship in transferring knowledge and building confidence among librarians, particularly in developing research environments.

Collaborative Practices in Grant-Winning Research

Respondent four (4) laid emphasis on the importance of collaboration in securing research grants. The respondent explained that working with faculty members, interdisciplinary teams, and external organizations enhances the quality of research proposals. Collaboration allows librarians to contribute their expertise in information management while benefiting from the subject knowledge of other researchers.

Collaboration is a key factor in successful grant acquisition, as it brings together diverse skills and perspectives. Robinson (2016) noted that collaborative grant-seeking improves proposal quality and increases funding success rates. The findings of this study support this view, as respondents consistently identified teamwork and networking as critical strategies.

Furthermore, collaboration fosters knowledge sharing and provides access to broader funding opportunities. Respondent four (4) also pointed out that partnerships with external organizations and communities can strengthen proposals by demonstrating real-world impact and relevance. This aligns with the growing emphasis on interdisciplinary and impact-driven research in competitive funding environments.

Inconclusion, the findings indicate that librarians' success in grant-winning research is not determined by a single factor but by the interaction of skills, institutional support, and collaboration. While individual competencies such as grant writing and research design are essential, they must be supported by enabling institutional structures and strong professional networks. Without these combined efforts, librarians may continue to face challenges in competing effectively for research funding in a highly competitive research environment.

FINDINGS AND DISCUSSION

The findings of this study reveal that librarians' capacity to secure research grants in a competitive research environment is shaped by a complex interplay of individual competencies, institutional structures, and collaborative practices. Critically, the study establishes that while librarians possess foundational research support skills, there is a significant gap in advanced grantsmanship competencies, which limits their participation in grant-winning research. This reinforces the argument by Robinson (2016) that grant writing is not merely a technical skill but a strategic competence that requires intentional development. The responses suggest that librarians' strengths in information organization and retrieval are not automatically transferable to proposal development, thereby necessitating targeted training in proposal writing, budgeting, and aligning research with funding priorities.

Another key finding is the central role of institutional support systems in determining grant success. The study highlights that even when librarians possess the required skills, weak institutional frameworks such as lack of mentorship, inadequate training opportunities, and limited access to funding information can significantly hinder their effectiveness. This aligns with Walde's (2021) assertion that research productivity is strongly influenced by institutional culture and support mechanisms. However, a critical observation from this study is that many institutions in developing contexts do not systematically integrate librarians into research structures, thereby reinforcing their marginalization in grant-related activities. This suggests that capacity building should not be limited to individual skill acquisition but must also involve institutional reforms that create enabling environments for research engagement.

Furthermore, the findings underscore the importance of collaboration as a strategic tool for enhancing grant competitiveness. The emphasis on interdisciplinary partnerships and networking reflects broader trends in the global research ecosystem, where collaborative projects are more likely to attract funding due to their diverse expertise and broader impact. While this supports existing literature (Robinson, 2016), the study adds a critical dimension by showing that librarians often rely on collaboration not only for intellectual contribution but also as a means of overcoming skill and institutional deficiencies. In this sense, collaboration becomes both a strength and a compensatory mechanism.

Importantly, the study reveals a structural imbalance between expectations and preparedness. Librarians are increasingly expected to contribute to research and secure funding, yet the systems required to support these expectations remain underdeveloped. This disconnect raises questions about the sustainability of current demands placed on librarians and highlights the need for policy-level interventions. Additionally, the reliance on informal learning and self-development, as implied in the findings, points to a lack of formalized professional pathways for grantsmanship within the library profession.

In conclusion, the study demonstrates that enhancing librarians' grant-winning capacity requires a holistic approach that integrates skill development, institutional support, and collaborative engagement. Without addressing these

interconnected factors, efforts to improve grant acquisition among librarians may yield limited results. The findings therefore contribute to the discourse on research capacity development by emphasizing the need for systemic, rather than fragmented, strategies in competitive research environments.

LIMITATION OF THE STUDY

This study is subject to certain limitations that should be considered when interpreting its findings. First, the study adopted a qualitative approach and relied on Key Informant Interviews (KII) involving only five purposively selected librarians with experience in grant-winning research. While the selected participants provided rich and in-depth insights, the small sample size limits the generalizability of the findings to the wider population of librarians in Nigeria and beyond.

Another limitation relates to the use of self-reported data obtained through interviews. The responses were based on the participants' personal experiences, perceptions, and recollections, which may be influenced by individual bias or selective memory. Additionally, the interviews were conducted through WhatsApp calls, which may have limited the observation of non-verbal cues that could have enriched data interpretation.

Despite these limitations, the study provides valuable insights into the skills, institutional support systems, and collaborative practices required for building librarians' capacity for grant-winning research in a competitive research environment. The findings therefore serve as a useful foundation for future studies involving larger populations and diverse library settings.

CONCLUSION

This study set out to examine how librarians can build the capacity needed to succeed in grant-winning research within an increasingly competitive research environment. The findings make it clear that this is not simply a matter of individual effort, but rather a combination of skills, support systems, and meaningful collaboration. Librarians today are no longer just custodians of information; they are gradually becoming active contributors to research and innovation. However, the transition into this expanded role has not been fully supported, leaving many librarians underprepared for the demands of competitive grant acquisition. A key insight from the study is that while librarians possess strong foundational skills in information management, many lack the specialized competencies required for successful grant writing. Skills such as proposal development, budgeting, and aligning research ideas with funding priorities are still developing within the profession. At the same time, institutional factors such as limited mentorship, inadequate training opportunities, and weak research support structures further complicate their ability to compete effectively. Another important takeaway is the role of collaboration. Librarians who engage in partnerships with faculty, researchers, and external organizations are better positioned to access funding opportunities and produce stronger proposals. These relationships not only enhance the quality of research but also provide a support system that compensates for existing gaps in skills and experience. More so, the study highlights a clear mismatch between expectations and preparedness. Librarians are increasingly expected to contribute to research and secure funding, yet the structures needed to support them are still evolving. Addressing this gap requires a more intentional and coordinated approach. Strengthening librarians' capacity for grant-winning research is not just beneficial for the profession; it is essential for advancing institutional research goals and contributing to broader knowledge development, particularly in developing contexts.

RECOMMENDATIONS

The researchers recommended that;

1. To improve librarians' capacity for grant-winning research, a more structured and supportive approach is needed. First, academic institutions should invest in regular training programmes focused on grant writing, research design, and funding strategies. These should not be one-off workshops but continuous learning opportunities that allow librarians to build confidence over time.

2. mentorship should be strengthened by pairing less experienced librarians with seasoned researchers who can guide them through the grant application process. Learning from real experiences can make a significant difference.

3. Institutions also need to create a more supportive research culture by providing access to funding databases, research tools, and administrative support. Librarians should be actively included in research teams and encouraged to collaborate across disciplines.

4. Finally, professional bodies and policymakers should recognize the evolving role of librarians and develop policies that support their research involvement. When librarians are properly equipped and supported, they can contribute meaningfully to research, innovation, and institutional growth.

Abstract

This study examined capacity building of librarians in the use of electronic research tools and the quality of library service delivery in academic libraries in Rivers State. A descriptive survey research design was adopted. The study population comprised 33 professional librarians drawn from selected academic libraries in Rivers State, out of which 24 responded, giving a response rate of 72.7%. A structured questionnaire based on a four-point Likert scale was used for data collection. Findings revealed that respondents agreed across all four research questions that academic libraries in Rivers State organise capacity building programmes for librarians, that librarians possess some level of competence in the use of electronic research tools, that the use of these tools has contributed positively to the quality of library service delivery, and that several challenges continue to hinder effective capacity building. The study concludes that capacity building remains an important factor in improving the quality of library services and recommends increased institutional support, sustained training, and improved ICT infrastructure in academic libraries in Rivers State.
Keywords: *Capacity Building, Electronic Research Tools, Library Service Delivery, Academic Libraries, Rivers State.*

Introduction

Capacity building refers to the process of developing and strengthening the skills, abilities, and knowledge of individuals and institutions so that they can perform their functions more effectively. In the context of librarianship, capacity building involves equipping librarians with the skills and knowledge needed to use modern library tools, especially electronic research tools, in ways that improve how services are delivered to users (Makhafola *et al*., 2025). Electronic research tools include online databases, digital repositories, electronic journals, and reference management software, all of which have become central to academic library practice globally and are increasingly expected to be available in Nigerian university libraries.

Studies have shown that when librarians are well-trained in the use of electronic research tools, they are better able to respond to user needs accurately and within a shorter time, which in turn improves user satisfaction and the overall quality of service delivery (Sadiku *et al*., 2021). However, several challenges continue to make it difficult for many academic libraries in Nigeria to sustain meaningful capacity-building programmes. These challenges include inadequate funding, poor infrastructure, insufficient institutional support, and the rapidly changing nature of the tools (Olutoki *et al*.,2025)

As these libraries continue to expand digitally, the question of whether their librarians are adequately equipped to use electronic research tools effectively has become an important one. This study, therefore, set out to investigate the capacity-building programmes available to librarians in academic libraries in Rivers State, the level of competence of these librarians in using electronic research tools, how their use of such tools affects the quality of library service delivery, and the challenges that stand in the way of effective capacity building.

Objectives of the Study

The main aim of this study is to examine the capacity building of librarians in the use of electronic research tools and the quality of library service delivery in academic libraries in Rivers State, with the following specific objectives:

1. To examine the capacity-building programmes available to librarians on the use of electronic research tools in academic libraries in Rivers State.
2. To assess the level of competence of librarians in the use of electronic research tools in academic libraries in Rivers State.
3. To determine the extent to which librarians' use of electronic research tools influences the quality of library service delivery in academic libraries in Rivers State.
4. To identify the challenges affecting the capacity building of librarians in the use of electronic research tools in academic libraries in Rivers State.
5.

Literature Review

Capacity building in the library profession has been identified as a very important factor in ensuring that librarians are able to respond adequately to the growing demands of information services in the digital age. According to Makhafola *et al.* (2025), academic libraries need to invest in digital literacy, digital competence, and digital fluency as part of a comprehensive framework for developing library professionals in the twenty-first century. Their scoping review showed

that these three dimensions of digital capacity are closely related but distinct, and that all three are necessary for librarians to function effectively in a modern academic environment.

The importance of professional development for librarians has also been highlighted in several studies. Gamache *et al.* (2025) described how an academic library in Canada organised a structured writing support programme to help librarians build their research and publishing capacity. While that study focused on writing rather than technology, it highlighted a broader lesson: capacity building works best when structured and consistent. This lesson applies equally to the development of electronic research tool skills among librarians in Nigerian academic libraries.

Okeji *et al*. (2020) noted that professional development training for academic librarians in Nigeria tends to be irregular and contingent on external funding rather than driven by an institutional plan. This creates gaps in the skills of librarians and makes it difficult to ensure that all staff have the same level of skill with digital tools. These gaps become particularly visible when users seek help with online databases or electronic journals, and the librarian is unable to provide adequate assistance.

Electronic research tools cover a wide range of digital resources and systems that librarians and researchers use to find, access, organise, and manage scholarly information. These tools include online bibliographic databases such as JSTOR, Web of Science, Scopus, and EBSCOhost, as well as digital repositories, electronic journal platforms, and reference management software like Mendeley, Zotero, and EndNote. Bentil (2025) noted that the management of electronic resources in academic libraries involves a complex set of attitudes, skills, and institutional processes, and that librarians who have received adequate training in these tools are more confident and more effective in their work.

The use of online databases and electronic journals has transformed how researchers access academic information. In academic libraries in developing countries, however, access to these tools is often limited by poor internet connectivity, subscription costs, and the absence of institutional licensing agreements. Sadiku *et al*. (2021) found that many Nigerian university libraries rely on open access resources because of cost, and that librarians in these libraries are often more familiar with open access platforms than with the subscribed databases their counterparts in other institutions use regularly.

Reference management software is another important category of electronic research tools that has gained attention in academic library literature. Researchers and postgraduate students use these tools to manage their citations and bibliographies, and librarians are expected to be able to guide them in this regard. However, studies have shown that awareness and use of reference management software among librarians and researchers remains limited, suggesting that training in this area deserves more attention in capacity-building programmes (Olutoki *et al*.,2025).

The quality of service delivery in academic libraries is usually assessed through various views, such as the accuracy of information provided, the speed of response to patrons' requests, user satisfaction, and the overall effectiveness of the services offered. Ngo *et al*. (2025) found that the quality of university services, including library services, has a direct and significant influence on student satisfaction, academic performance, and loyalty to the institution. This finding reinforces the importance of investing in service quality improvement in academic libraries, which in turn depends heavily on the skills and competence of library staff.

Ferrer (2024) showed that there is a relationship between the level of information literacy offered by libraries and the academic success of students. When librarians are skilled in the use of electronic research tools, they are better placed to support information literacy instruction, guide patrons in using databases, and help researchers find the materials they need efficiently. This has a direct positive effect on the quality of service that users receive. Kennedy *et al*. (2025) also pointed out that informal feedback mechanisms within academic libraries play an important role in identifying service gaps and enabling improvements.

Several studies have pointed to the challenge of delivering quality services in the face of inadequate infrastructure and underfunding. Ebiwolate (2025) noted that many academic libraries in Nigeria continue to provide services using systems and equipment that are either outdated or poorly maintained, which limits what librarians are able to offer, regardless of their training. Addressing the quality of service delivery in such libraries, therefore, requires a careful approach.

The challenges to effective capacity building in academic libraries in Nigeria are well-documented. Inadequate funding is mostly identified as one of the biggest obstacles, as training programmes require financial support for registration, travel, study materials, and access to training platforms (Makhafola et al., 2025). When funding is not available, training opportunities are missed or limited to a small number of staff, creating inequalities in competence within the same library.

Poor ICT infrastructure is another major challenge. Even when librarians attend training programmes and acquire new skills in electronic research tools, the absence of functional computers, reliable internet access, and properly licensed software in their libraries makes it very difficult to put those skills to practical use (Sadiku *et al*., 2021). This creates a frustrating situation where trained librarians cannot apply what they have learned, leading to skill erosion over time.

Insufficient support from university management has also been identified as a barrier to capacity building. When university administrators do not prioritise the professional development of library staff, libraries are often left to source their own training opportunities, which tends to be ad hoc and unsustained. Bangani and Dube (2023) showed that even where libraries have included capacity building goals in their strategic plans, the absence of formal institutional backing tends to limit the actual impact of those plans.

Methodology

This study adopted a descriptive survey research design, which was considered appropriate for describing the opinions and perceptions of academic librarians on the subject under investigation. It sought to describe the current state of capacity building and with library service delivery in Rivers State academic libraries. The population of the study comprised 33 professional librarians working at Donald Ekong Library, Rivers State University Library and Dame Patience Goodluck Jonathan Automated Library. These libraries were purposively selected, and the librarians were chosen because they are directly involved in library services and the use of electronic research tools. Out of the 33 librarians, 24 returned their questionnaires, giving a response rate of 72.7%, which was considered adequate. The instrument for data collection was a structured questionnaire divided into five sections, with items based on the four research questions. It used a four-point Likert scale. The questionnaire was face-validated by two experts in library and information science before administration. Data were analysed using descriptive statistics such as frequency, percentage, mean, and standard deviation, with a criterion mean of 2.50 as the decision point.

Data Analysis and Discussion of Findings

This section presents the results of the study in line with each of the four research questions, followed by a discussion of the implications of the findings.

Research Question One: What capacity-building programmes are available to librarians on the use of electronic research tools in academic libraries in Rivers State?

Table 1: Presents the responses of librarians on the availability of capacity-building programmes designed to enhance their knowledge and skills in the use of electronic researchtools in academic libraries in Rivers State **(N = 24)**

S/N	Statements	Mean	Std. Dev.	Remark
1	Academic libraries in Rivers State organise regular training programmes to build librarians' skills in using electronic research tools.	2.92	0.881	Agreed
2	Librarians in these academic libraries are encouraged to attend external workshops and seminars on electronic research tools.	3.00	0.834	Agreed
3	The libraries provide opportunities for librarians to undergo professional certification programmes related to digital and electronic tools.	2.71	0.955	Agreed
4	University management actively supports capacity building efforts for librarians through funding and institutional policies.	2.54	0.977	Agreed
5	There is a structured and consistent professional development plan for librarians to improve their use of electronic research tools.	2.58	0.929	Agreed
	Weighted Mean	**2.75**		**Agreed**

Table 1 presents data on the availability of capacity-building programmes for librarians in academic libraries in Rivers State. The findings show that respondents agreed that academic libraries organise regular training programmes for librarians on the use of electronic research tools (Mean = 2.92, SD = 0.881). Respondents also agreed that librarians are encouraged to attend external workshops and seminars related to electronic research tools (Mean = 3.00, SD = 0.834). The provision of opportunities for professional certification programmes was also agreed upon by respondents (Mean = 2.71, SD = 0.955). Furthermore, respondents agreed that university management supports capacity-building efforts through funding and institutional policies (Mean = 2.54, SD = 0.977). They also agreed that there is a structured and consistent professional development plan for librarians to improve their use of electronic research tools (Mean = 2.58, SD = 0.929). The weighted mean of 2.75 indicates overall agreement that capacity-building programmes are available to librarians in academic libraries in Rivers State.

Research Question Two: What is the level of competence of librarians in the use of electronic research tools in academic libraries in Rivers State?

Table 2: Table 2 shows the responses of librarians on their level of competence in the use of electronic research tools in academic libraries in Rivers State. The table focuses on librarians' abilities to search online databases, use electronic journals and digital repositories, apply reference management software, and support library users in navigating electronic research tools. **(N = 24)**

S/N	Statements	Mean	Std. Dev.	Remark
6	Librarians in these academic libraries are able to effectively search and retrieve information from online databases.	3.00	0.780	Agreed
7	Librarians demonstrate adequate skill in using electronic journals and digital repositories to support user needs.	2.92	0.881	Agreed
8	Librarians are proficient in the use of reference management software.	2.50	0.978	Agreed
9	Librarians can assist library users in navigating and using electronic research tools independently.	3.04	0.751	Agreed
10	The level of digital competence among librarians in these libraries meets the current demands of library users.	2.71	0.859	Agreed
	Weighted Mean	**2.83**		**Agreed**

Table 2 presents findings on the level of competence of librarians in the use of electronic research tools in academic libraries in Rivers State. The findings reveal that respondents agreed that librarians are able to effectively search and retrieve information from online databases (Mean = 3.00, SD = 0.780). Respondents also agreed that librarians demonstrate adequate skill in the use of electronic journals and digital repositories to support user needs (Mean = 2.92, SD = 0.881). The findings further show agreement that librarians are proficient in the use of reference management software (Mean = 2.50, SD = 0.978). Respondents equally agreed that librarians can assist users in navigating and using electronic research tools independently (Mean = 3.04, SD = 0.751). In addition, respondents agreed that the level of digital competence among librarians meets the current demands of library users (Mean = 2.71, SD = 0.859). The weighted mean of 2.83 indicates overall agreement on librarians' competence in the use of electronic research tools.

Research Question Three: To what extent does librarians' use of electronic research tools influence the quality of library service delivery in academic libraries in Rivers State?

Table 3: Table 3 presents the responses of librarians on the extent to which the use of electronic research tools influences the quality of library service delivery in academic libraries in Rivers State. The table examines issues relating to service accuracy, response time to user queries, user satisfaction, overall service effectiveness, and the contribution of capacity building to improved service delivery.**(N = 24)**

S/N	Statements	Mean	Std. Dev.	Remark
11	The availability and use of electronic research tools has improved the accuracy of information services provided to library users.	3.08	0.776	Agreed
12	Response time to user queries has improved as a result of librarians' use of electronic research tools.	2.92	0.881	Agreed
13	Library users in these academic libraries express satisfaction with the services provided through electronic research tools.	2.92	0.776	Agreed
14	The use of electronic research tools has enhanced the overall effectiveness of library services in these academic libraries.	3.08	0.654	Agreed
15	Capacity building in electronic research tools has directly contributed to an improvement in the quality of library services.	3.04	0.806	Agreed
	Weighted Mean	**3.01**		**Agreed**

Table 3 presents findings on the extent to which the use of electronic research tools influences the quality of library service delivery in academic libraries in Rivers State. The findings show that respondents agreed that the availability and use of electronic research tools has improved the accuracy of information services provided to users (Mean = 3.08, SD = 0.776). Respondents also agreed that response time to user queries has improved through the use of electronic research tools (Mean = 2.92, SD = 0.881). The findings further reveal agreement that library users express satisfaction with services provided through electronic research tools (Mean = 2.92, SD = 0.776). Respondents equally agreed that the use of electronic research tools has enhanced the overall effectiveness of library services (Mean = 3.08, SD = 0.654). In addition, respondents agreed that capacity building in electronic research tools has directly contributed to improved quality of library services (Mean = 3.04, SD = 0.806). The weighted mean of 3.01 indicates overall agreement that electronic research tools positively influence library service delivery.

Research Question Four: What are the challenges affecting the capacity building of librarians in the use of electronic research tools in academic libraries in Rivers State?

Table 4: Table 4 presents the responses of librarians on the challenges affecting capacity building in the use of electronic research tools in academic libraries in Rivers State. The table highlights issues such as inadequate funding, poor ICT infrastructure, insufficient institutional support, rapid technological changes, and low motivation among librarians. **(N = 24)**

S/N	Statements	Mean	Std. Dev.	Remark
16	Limited funding for training programmes is a major challenge to capacity building of librarians in these academic libraries.	3.38	0.647	Agreed
17	Inadequate ICT infrastructure in the libraries makes it difficult for librarians to apply skills acquired during training.	3.29	0.806	Agreed
18	Insufficient institutional support from university management affects librarians' ability to build capacity in electronic research tools.	3.25	0.676	Agreed
19	The rapid changes in electronic research tools make it difficult for librarians to keep their skills updated.	3.29	0.624	Agreed
20	Low motivation and lack of incentives reduce the commitment of librarians to engage in capacity building activities.	3.08	0.830	Agreed
	Weighted Mean	**3.26**		**Agreed**

Table 4 presents findings on the challenges affecting the capacity building of librarians in the use of electronic research tools in academic libraries in Rivers State. The findings indicate that respondents agreed that limited funding for training programmes is a major challenge to librarians' capacity building (Mean = 3.38, SD = 0.647). Respondents also agreed that inadequate ICT infrastructure makes it difficult for librarians to apply acquired skills effectively (Mean = 3.29, SD = 0.806). The findings further reveal agreement that insufficient institutional support from university management affects librarians' ability to build capacity in electronic research tools (Mean = 3.25, SD = 0.676). Respondents equally agreed that the rapid changes in electronic research tools make it difficult for librarians to keep their skills updated (Mean = 3.29, SD = 0.624). In addition, respondents agreed that low motivation and lack of incentives reduce librarians' commitment to capacity-building activities (Mean = 3.08, SD = 0.830). The weighted mean of 3.26 indicates strong overall agreement that these challenges significantly affect librarians' capacity building.

Discussion of Findings

This finding is consistent with what Okeji *et al*. (2020) identified in their study on professional development in Nigerian academic libraries, where they found that training tends to be irregular and dependent on external rather than internal funding. The finding also aligns with Bangani and Dube (2023), who showed that even in cases where libraries have articulated capacity-building goals, the gap between policy commitment and actual institutional support remains a persistent challenge. The implication of this finding for academic libraries in Rivers State is that while some progress has been made, there is a clear need for more deliberate and consistent institutional investment in training programmes for librarians.

This finding is consistent with what (Olutoki *et al*., 2025) found regarding the limited awareness and use of reference management software among librarians in Nigerian universities. Reference management software is increasingly important for supporting postgraduate researchers and academic staff, and the fact that librarians in Rivers State are less confident in this area than in other electronic tools points to a specific training gap that needs to be addressed. The finding that respondents agreed that digital competence levels meet current user demands also reflects a degree of professional self-awareness that should not be ignored.

These findings are consistent with what Ferrer (2024) established in the broader literature, that the quality of information services provided by libraries has a direct connection to how well students and researchers are served. Ngo *et al*. (2025) also showed that the quality of library services is one of the strongest predictors of student satisfaction in higher education, and the findings of this study support that argument in the specific context of Rivers State. The fact that capacity building was directly linked to service quality improvement is particularly significant because it confirms the central argument of this study: that investing in the training of librarians in electronic research tools produces measurable and positive outcomes for service delivery.

This finding is not surprising given the broader pattern of underfunding that characterises many Nigerian university libraries, but the strength of the agreement here is a clear signal that this issue needs urgent attention from university administrators and government agencies responsible for higher education. The finding on inadequate ICT infrastructure is equally important because it highlights the gap that exists between training and practice: librarians who are trained in electronic research tools cannot apply those skills effectively if the tools are not available or functional in their libraries. This aligns with the findings of Sadiku *et al*. (2021), who identified poor infrastructure as one of the most significant barriers to digital library development in Nigerian universities. The pace of change in electronic research tools was also identified as a major challenge, pointing to the need for training programmes that are not only well funded but also current and regularly updated.

Conclusion

This study examined the capacity building of librarians in the use of electronic research tools and the quality of library service delivery in academic libraries in Rivers State. A key observation that runs through the findings of this study is

the contrast between what respondents recognise as important for library development and what institutions are actually providing. Librarians acknowledge that training in electronic research tools is necessary, that it improves service quality, and that it benefits library users directly. Yet the challenges identified show that the conditions needed to support effective capacity building are not yet fully in place. This is not simply a professional concern; it has direct consequences for the quality of research support and information services available to students and academic staff in Rivers State universities.

The study affirms that improving the quality of academic library services in Rivers State cannot happen without deliberate and sustained investment in the professional development of librarians. The views of librarians are consistent and clear. University administrators, government bodies, and library associations would do well to invest in capacity-building activities of the librarians as a basis for concrete action on human capacity development within academic libraries in Rivers State.

Recommendations

Based on the findings of this study, the following recommendations are made:

1. University governing councils and management in Rivers State should incorporate capacity-building programmes for librarians into their annual institutional plans.
2. Academic libraries' management in Rivers State should develop and implement continuous professional development plans that cover all professional librarians.
3. University management should prioritise the improvement of ICT infrastructure in academic libraries.
4. Library associations should collaborate with academic institutions to organise affordable and accessible capacity-building workshops and certification programmes.

ABSTRACT

This study examined career progression and professional recognition as motivational tools for enhancing service delivery in public university libraries in North-Central Nigeria. Public university libraries play a critical role in supporting teaching, learning, and research by providing timely and relevant information services; however, service delivery in many institutions remains inadequate. The study was guided by the need to determine how motivational factors such as career progression and professional recognition influence librarians' performance in service delivery. A survey research design was adopted, with data collected from 185 academic librarians across selected public universities in North-Central Nigeria using a structured questionnaire. Descriptive and inferential statistics were used for data analysis. Findings revealed that librarians demonstrated strong performance in providing accreditation support, and information resource acquisition, but showed weaker involvement in emerging roles such as grant writing and securing patent. Career progression practices were found to be largely influenced by obtaining additional qualifications, research publications and teaching information literacy, while digital library initiatives were largely undervalued. In terms of professional recognition, librarians were mainly acknowledged for their research output and teaching roles, but experienced limited inclusion in university committees and weak public recognition. Regression analysis showed that both career progression and professional recognition significantly influence service delivery, jointly explaining 66% of its variation, with career progression having the stronger effect. The study concludes that while librarians are effective in core service delivery, their performance in emerging academic roles is constrained by limited career advancement opportunities and inadequate recognition systems. It recommends the strengthening of career progression frameworks, expansion of recognition mechanisms, and greater inclusion of librarians in institutional governance and digital initiative

Keywords: Career progression, Professional recognition, motivation, service delivery and libraries

INTRODUCTION

Public university libraries are essential in supporting teaching, learning, and research by delivering timely, relevant, and high-quality information services to diverse user groups. In Nigeria, especially in the North-central region, these libraries must address the growing information needs of an expanding academic community while adapting to rapid technological advancements. Despite these expectations, service delivery in many public university libraries in North-central Nigeria remains inadequate (Seidu, 2024). This situation requires librarians to continually enhance their competencies to maintain effective service delivery. The capacity of librarians to pursue ongoing improvement is significantly shaped by motivating factors, including opportunities for career progression and professional recognition. Career progression is defined as the structured advancement of employees through ranks, responsibilities, and professional development opportunities within an organization. Within university libraries, this includes promotions, access to training, opportunities for further education, and participation in research and scholarly activities (Faulkner, 2025). When librarians perceive transparent and equitable pathways for advancement, they are more likely to demonstrate

commitment, enhance their competencies, and provide efficient services. In contrast, limited career growth can result in frustration, decreased productivity, and reduced quality of service delivery. Previous studies indicate that career progression practices have a significant positive impact on service delivery (Omotunde and Adedayo, 2024).Professional recognition is another factor that can enhance service delivery in public university libraries. This involves acknowledging and rewarding librarians' contributions through both formal and informal mechanisms, including awards, commendations, authorship opportunities, conference participation, and professional affiliations. Recognition enhances individual morale and fosters a culture of excellence and accountability within the library system. De Silva (2023) emphasized that recognition significantly influences job satisfaction and performance among librarians in academic institutions. Thus, professional recognition serves as a powerful tool for promoting effective library services.

Despite the acknowledged importance of motivation in organizational performance, there is a paucity of empirical studies focusing specifically on career progression and professional recognition as motivational tools for improving service delivery in public university libraries in North-central Nigeria.

It is against this backdrop that this study seeks to examine career progression and professional recognition as motivational tools for enhancing service delivery in public university libraries in North-central Nigeria. The study aims to fill existing gaps in the literature by providing empirical evidence on how these factors influence librarians' performance and by offering recommendations for policy and practice to improve motivation and service delivery in the region.

Objectives of the Study

This study aims to examine the roles of career progression and professional recognition as motivational tools for enhancing service delivery in public university libraries in North-Central Nigeria. The specific objectives are as follows:

1. Determine the level of service delivery in public university libraries in North-Central Nigeria.
2. Identify the career progression practices implemented in public university libraries in North-Central Nigeria.
3. Examine the forms of professional recognition provided to librarians in public university libraries in North-Central Nigeria.
4. Assess the influence of career progression and professional recognition on service delivery in public university libraries in North-Central Nigeria.

Literature Review

Level of Service Delivery

Tukur et al. (2025) assessed librarians' use of Library 3.0 technologies for information service delivery in public university libraries in Kaduna State. They found that core library services, such as reference services and information literacy programmes, were actively provided. This study is relevant to the current research because it focuses on service delivery in academic libraries and identifies the extent to which librarians provide core library services. However, it differs from the current study because the geographical scope was limited to public university libraries in Kaduna State, whereas the present study covers public university libraries across North-Central Nigeria.

Career Progression Practices

Busayo and Olajide examined career progression among academic librarians in Nigerian universities, focusing on the perceptions of practicing librarians and library officers in Ekiti State. Their results indicate that most respondents agreed that career progression enhances librarians' professional standing in relation to service delivery and helps mitigate career stagnation. This study is relevant to the present research because it recognises that opportunities for advancement can positively influence employees' professional commitment. However, it differs from the present study in that, while the Ekiti study established that career progression is valued by librarians, it did not empirically assess how career progression practices translate into improved library services.

Onifade and Okoro investigated career progression among librarians in Nigeria and Ghana and reported the existence of continuing education policies that support career advancement in both countries. This study is relevant to the present study because it examines issues relating to career progression within the library profession and provides a comparative perspective on librarians' career development experiences in two African countries. However, it differs from the present study because it adopts a broader geographical scope by covering librarians in Nigeria and Ghana, whereas the present study focuses specifically on career progression practices among academic librarians in universities in North-Central Nigeria.

Michalak and Ellixson (2025) examined factors influencing career advancement and found that professional development, unionization, and mentorship partially influenced career progression in academic librarianship. The study is relevant to the present research because it identifies important factors that contribute to librarians' career advancement. However, it differs from the current study because it focuses on factors influencing career progression in academic librarianship, whereas the present study specifically examines the career progression practices available to librarians in universities in North-Central Nigeria.

Donkor and Asimoh (2024) carried out a study on the status and career progression of librarians working in university libraries in Ghana. The findings revealed that their career progression pathways are categorized into three areas: research support, teaching, and managerial/administrative roles. Due to these multiple roles, librarians face challenges in meeting promotion criteria, especially in conducting research, which in turn affects service delivery. The study is relevant to the present research because it highlights the relationship between career progression and librarians' ability to effectively perform their professional duties. However, it leaves a gap regarding the assessment of career progression practices within Nigerian universities.

Forms of Professional Recognition

Wiser (2024) examined inequality regimes in librarian faculty status using a comparative case study. The study revealed that most librarians feel equally undervalued by disciplinary faculty regardless of their status. This study is closely related to the present study as both focus on the issue of recognition of librarians within academic institutions. However, while the previous study examined perceptions of value and status among librarians, the present study examines the specific forms through which professional recognition is accorded to librarians.

Raszewski and Goben (2026) carried out a study to determine whether librarians were acknowledged for their contributions to systematic review work in promotion or tenure processes. The study found that their contributions were not recognized. The findings are closely related to the present study as both focus on the issue of professional recognition of librarians. However, while this study concentrated on recognition within the context of systematic review work and career advancement, the present study adopts a broader perspective by examining professional recognition in general across public universities in North-Central Nigeria.

Kazim et al. (2025) examined how employee recognition and engagement serve as performance indicators among academic staff of federal universities in North-Central Nigeria. The study revealed that employee recognition improves service delivery and job satisfaction. These findings are relevant to the present study because both emphasize the importance of recognition in enhancing workplace outcomes. While this study examined professional recognition as a performance indicator among academic staff in federal universities in North-Central Nigeria, the present study specifically investigates how professional recognition affects the quality of service delivery provided by librarians in public university libraries in North-Central Nigeria.

Research Methodology

This study employed a survey research design to examine career progression and professional recognition as tools for enhancing service delivery in public university libraries in North-Central Nigeria. The population of the study consisted of 277 academic librarians in 21 public university libraries in North-Central Nigeria. The public university libraries are shown in Table 1.

Table 1: Population of the Study

S/NO	Public University Library	Total Number of Academic Librarians
1	Fr. Moses Orshio Adasu University Library, Makurdi	26
2	Joseph Sarwuan Tarka University, Benue State	10
3	Federal University of Health Sciences Otukpo	8
4	Plateau State University	7
5	University of Jos	32
6	Kwara State University	7
7	University of Ilorin	31
8	Nassarawa State University	15
9	Federal University Lafia	13
10	Federal University of Technology, Minna	25
11	Ibrahim Badamasi University Lapai	8
12	Abdulkadir Kure University. Minna	2
13	University of Abuja	28
14	National Open University Abuja	16
15	Kogi State University	5
16	Confluence University of Science Technology	7
17	Federal University Lokoja	12
18	African Aviation and Aerospace University	3
19	National University of Science and Technology Abuja	2
20	Federal University of Education, Pankshin	12
21	Federal University of Education, Kontagora	8
	Total	**277**

A simple random sampling technique was used to select 13 public university libraries from the 21 public university libraries in the region. The selected universities had a total population of 201 librarians, who constituted the study population.

Data were collected using a closed-ended questionnaire developed by the researchers based on the study objectives and an extensive review of relevant literature. The questionnaire consisted of three sections covering the level of service delivery, career progression practices, and forms of professional recognition.

Copies of the questionnaire were administered directly to librarians in the selected public university libraries in North-Central Nigeria with the assistance of seven research assistants. Follow-up visits and reminders were made to ensure a high response rate.

Of the 201 questionnaires distributed, 185 were correctly completed and returned and were therefore included in the analysis. Data analysis was conducted using both descriptive and inferential statistical methods.

Data Analysis and Discussion

Table 2: Level of Service Delivery in Public University Libraries in North-central Nigeria

S/N	Services Delivered	Very High	High	Low	Very Low	Mean
1	Teaching research skills to users	65(35.1%)	10(5.4%)	96(51.8%)	14(7.6%)	2.68
2	Collaborate with faculty to design curriculum	9(4.8%)	13(7.0%)	160(86.4%)	3(1.6%)	2.15
3	Acquire information resources that meet the information needs of users	123(66.4%)	60(32.4%)	2(1.0%)	-	3.65
4	Guide users through complex searches, using citation management tools and subject specific databases	10154.5%)	80(43.2%)	4(2.1%)	-	3.52
5	Offer information retrieval assistance through collaborative platforms. (social media, zoom)	51(27.5%)	34(18.3%)	61(32.9%)	39(21.0%)	2.52
6	Using resource description and access machine readable catalogues to effectively organize information	151(81.6%)	30(16.2%)	4(2.1%)	-	3.80
7	Manage metadata through institutional repositories	11(5.9%)	77(41.6%)	90(41.6%)	7(3.7%)	2.50
8	Provision of liaison services to department and faculties through subject librarians	51(27.5%)	66(35.6%)	60(32%)	8(4.3%)	2.86
9	Collaborate with faculties to prepare for National University commission and professional bodies resource verification and accreditation exercise.	153(82.7%)	30(16.2%)	2(1.0%)	-	3.81
10	Engaging in grant writing and securing patent	10(5.4%)	46(24.8%)	100(54.0%)	29(15.6%)	2.20
11	Teaching information search skills to users	111(60.0%)	70(37.8%)	4(2.1%)	-	3.58
12	Conducting research	124(67.0%)	60(32.4%)	1(0.5%)	-	3.66
	Grand Total Mean =3.08					

The data on the level of service delivery in public university libraries in North-Central Nigeria revealed that librarians had a high level of service delivery in collaborating with faculty to prepare for National Universities Commission and professional bodies' resource verification and accreditation exercises (mean = 3.81), as well as in acquiring information resources that meet users' information needs (mean = 3.65). However, their level of service delivery was low in grant writing and securing patents (mean = 2.20). Overall, the level of service delivery among librarians in public university libraries is high (mean = 3.08)

.The findings on the level of service delivery in public university libraries in North-Central, Nigeria suggest that librarians' high level of service delivery in accreditation support and information resource acquisition is largely due to these activities being traditional, routine, and central to their established roles in academic libraries. They are well trained and regularly involved in these functions, which makes their performance in these areas strong. These findings are in agreement with the findings of. Tukur et *al*. (2025) who observed that core library services were provided in public university libraries in Kaduna State. In contrast, their low involvement in grant writing and patent acquisition is likely due to limited training, lack of inclusion in research teams, insufficient institutional support, and the perception of librarianship as mainly service-oriented rather than research-driven. These activities require advanced research and innovation skills that librarians may not have fully developed or been exposed to.

Table 3: Career Progression Practices in Public University libraries in North-Central Nigeria

S/N	Career Progression Practices	Strongly Agree	Agree	Disagree	Strongly Disagree	Mean
1	Research publications	155(83.7%)	30(16.4%)	-	-	3.84
2	Teaching information literacy or related courses	131(70.8%)	54 (29.1%)	-	-	3.71
3	Research or project grants enhance my career progression	138(74.5%)	40(21.6%)	7(3.7%)	-	3.71
4	Excellence in core library services(cataloguing, reference, collection development	44(23.7%)	40(21.6%)	91(49.1%)	10(5.4%)	2.64
5	Contribution to digital library initiatives	21(11.3%)	35(18.9%)	91(50.0%)	38(20.5%)	2.21
6	Obtaining additional qualification	161(87.0%)	24(12.9%)	-	-	3.87
7	Attendance of conferences, workshop and seminars	91(49.1%)	22(11.8%)	70(37.8%)	2(1.0%)	3.09
8	Mentorship	11(5.9%)	55(29.7%)	101(54.5%)	18(9.7%)	2.32
9	Involving in various voluntary	107(57.8%)	71(38.3%)	4(2.1%)	3(1.6%)	3.52
10	Attracting grants and patent	128(61.1%)	50(27.0%)	3(1.6%)	4(2.1%)	3.63
	Grand Mean=.3.25					

On career progression practices in public university libraries in North-Central Nigeria, the majority of respondents strongly agreed that obtaining additional qualification (mean=3.87), conducting research (mean = 3.84) and teaching information literacy courses (mean = 3.71) are key career progression practices. However, they disagreed that contribution to digital library initiatives (mean = 2.21) is among the career progression practices.

The results on career progression practices may be explained by the traditional structure and promotion criteria in Nigerian public university libraries, where career progression is largely tied to academic and scholarly activities such as obtaining additional qualifications, research output and teaching responsibilities .Obtaining additional qualifications may contribute to the development of a more skilled and adaptable workforce capable of responding to emerging trends in information management and digital librarianship. Furthermore, conducting research is strongly emphasized because it directly influences promotion, professional recognition, and academic status within the university system. Similarly, teaching information literacy courses is widely recognized as a core professional responsibility of academic librarians, as it aligns with their instructional role in supporting students' academic success and research skills development. These factors likely account for the high level of agreement on these two practices. These findings are in agreement with the findings of Donkor, and Asimoh (2024) who found out that career progression of librarians working in university libraries in Ghana were categorized into research support, and teaching.

In contrast, the low rating for contribution to digital library initiatives suggests that such activities are not yet fully institutionalized as formal criteria for career advancement. This may be due to limited recognition of digital librarianship in promotion guidelines, inadequate technical skills among some librarians, insufficient infrastructure, or lack of institutional emphasis on digital transformation roles. In some cases, librarians may also perceive digital initiatives as administrative or supportive tasks rather than professional achievements that contribute to promotion. The findings imply that career progression in public university libraries remains largely anchored on traditional academic outputs such as research and teaching, while emerging roles related to digital librarianship are not yet fully integrated into promotion frameworks. This may discourage librarians from actively engaging in digital innovation activities, thereby slowing down the digital transformation of library services.

Table 4: Forms of Professional Recognition Provided to Librarians in Public University Libraries in North-central Nigeria

S/N	Forms of Professional Recognition	Strongly Agree	Agree	Disagree	Strongly Disagree	Mean
1	My contributions to library services are formally acknowledged by the university	86(46.4%)	74(40.0%)	20(10.8%)	5(2.7%)	3.30
2	Librarians are publicly recognized in institutional reports newsletters or ceremonies	45(24.3%)	33(17.8%)	10154.5%)	6(3.2%)	2.63

3	Recognition of librarians is commensurate to that of faculty members in other departments	22(11.8%)	60(32.4%)	102(55.1%)	1(0.5%)	2.56
4	Librarians research publications are recognized as valuable contributions	121(65.4%)	60(32.4%)	4(2.1%)	-	3.63
5	Librarians are recognized as educators by faculty members and students	33(17.8%)	51(27.5%)	98(52.9%)	3(1.6%)	3.62
6	Librarians who secure grants and patents receive institutional recognition	64(34.5%)	85(45.9%)	29(15.6%)	7(3.7%)	3.11
7	Excellence in core library services is recognized	10(5.4%)	56(30.2%)	112(60.5%)	7(3.7%)	2.37
8	Librarians are invited to attend school board and other management meetings	36(19.4%)	49(26.4%)	88(47.5%)	12(6.4%)	2.59
9	Inclusion of librarians in university committees	13(7.0%	46(24.8%	99(53.5%)	27(14.5%)	2.24
	Total Mean= 2.78					

Data on forms of recognition revealed that librarians strongly agreed that their research publications (mean = 3.63) and their role as educators (mean = 3.62) were recognized. However, they disagreed that inclusion in university committees (mean = 2.24) served as a form of recognition.

The findings regarding forms of recognition for librarians in public university libraries suggest a mixed and generally uneven recognition system. The findings indicate that librarians receive stronger recognition for research publications and teaching roles, which align with traditional academic performance indicators. However, their exclusion from university committees suggests limited involvement in institutional governance. This disparity may be due to the dominance of publication-based evaluation systems and persistent perceptions of librarians as support staff rather than full academic partners. Consequently, while librarians are acknowledged for scholarly contributions, their reduced participation in decision-making structures may limit their professional visibility, influence, and job satisfaction. . These findings are in disagreement with the findings of Raszewski and Goben (2026), who found that librarians' contributions to scholarly communication, such as systematic reviews, in United States academic libraries are not recognized.

Table 5: Influence of Career Progression and Recognition on Service Delivery in Public University Libraries in North-central Nigeria

Variable	B (Coefficient)	Std. Error	t-value	Sig. (p-value)	Decision
Constant	0.842	0.312	2.70	0.008	—
Career Progression (X_1)	0.61	0.09	6.78	0.000	Significant
Professional Recognition (X_2)	0.38	0.08	4.75	0.001	Significant

Table 4.1: Model Summary

Statistic	Value
R	0.81
R^2	0.66
Adjusted R^2	0.64
F-statistic	52.4
Sig.	0.000

The R^2 value (0.66) indicates that 66% of the variation in service delivery is explained jointly by career progression and professional recognition. The F-test ($p = 0.000$) shows the model is statistically significant overall. Both predictors are significant ($p < 0.05$): Career progression has the strongest influence ($\beta = 0.61$). Professional recognition also has a significant positive effect ($\beta = 0.38$). The analysis reveals that both career progression practices and professional recognition significantly influence service delivery among librarians. However, career progression contributes more strongly, indicating that when librarians perceive better advancement opportunities, service delivery improves more substantially than recognition alone.

The regression results indicate a strong and meaningful relationship between career progression, recognition, and service delivery among librarians. The results show that career progression and professional recognition jointly influence service delivery, suggesting that these factors are major determinants of librarians' effectiveness. While both factors are important, career progression emerges as the more critical driver of improved service delivery. Although, the researcher found limited empirical studies that specifically examined the combined influence of career progression and professional recognition on librarians' service delivery. The finding is consistent with the findings of Donkor, and Asimoh (2024) carried out a study on status and career progression of librarians working in university libraries in Ghana and the findings revealed that career progression effect their service delivery. Furthermore, these findings are in agreement with the findings of Kazim *et al.* (2025) that employees' recognition improve service delivery and job satisfaction among academic staff in North-Central, Nigeria

Conclusion

This study examined career progression and professional recognition as motivational tools for enhancing service delivery in public university libraries in North-Central Nigeria. This study concludes that career progression and professional recognition are critical motivational factors that significantly influence service delivery in public university libraries in North-Central Nigeria. Librarians demonstrate high proficiency in traditional library functions such as accreditation support and acquisition of information resources However, their engagement in emerging academic and digital responsibilities, including research-related activities, such as grant writing and patent acquisition remains limited. The findings further reveal that career progression in the study area is predominantly driven by obtaining additional qualifications, research productivity, s, and teaching responsibilities, while core library services and digital innovations are not adequately recognized as criteria for advancement. Similarly, professional recognition is uneven, with stronger acknowledgment given to research and teaching roles, while participation in university committees and public recognition remain limited.

The regression results confirm that both career progression and professional recognition significantly enhance service delivery, with career progression emerging as the stronger predictor. This indicates that opportunities for advancement play a more decisive role in improving librarians' performance than recognition alone.

Overall, the study concludes that although public university librarians contribute effectively to core library operations, their full potential is not fully realized due to limited structured career advancement pathways, inadequate recognition systems, and insufficient integration into broader academic and institutional functions. Strengthening these areas is essential for improving service delivery and aligning library services with contemporary academic demands

Recommendations

Based on the study's findings, the following recommendations are proposed:

1. .There is a need for targeted capacity development and institutional support to enhance librarians' competencies in grant writing and patent acquisition, while sustaining their strong performance in accreditation support and resource acquisition.
2. Public university libraries in North-Central Nigeria should strengthen and formalize career progression policies to fully integrate digital library initiatives as a key criterion for promotion and professional advancement.
3. University management should include librarians in key university committees, boards, and strategic planning activities to enhance their visibility and enable more meaningful contributions to institutional development.

Abstract
This study examined the challenges facing public libraries and public service librarians in Niger State, Nigeria, and identified strategies to improve service delivery and professional effectiveness. A quantitative descriptive survey design was used, covering all 51 professional and paraprofessional staff of the Niger State Library Board through total enumeration. Data were collected using a structured questionnaire and analyzed with descriptive statistics. Findings showed that public libraries face major challenges such as inadequate funding, poor infrastructure, lack of ICT facilities, shortage of qualified staff, and limited access to current information resources. Librarians also experience poor working conditions, limited training opportunities, inadequate ICT skills, heavy workloads, and weak institutional support, all of which affect service delivery. The study identified key solutions, including increased funding, improved staff welfare, better ICT infrastructure, regular training, effective policy implementation, and greater public awareness. The study concludes that improving public libraries in Niger State requires a coordinated approach that addresses both institutional deficiencies and human capacity gaps. It recommends sustained government support, professional development initiatives, and policy reforms to improve the relevance and efficiency of public library services in the state.
Keywords: Public Libraries; Librarians; Professional Challenges; ICT Infrastructure; Niger State.

1.1 Introduction

Public libraries are vital social institutions established to provide free and equitable access to information, support lifelong learning, promote literacy, and enhance community development, particularly in developing countries where access to paid information resources is limited. Around the world, they serve as accessible spaces where people of all ages and backgrounds can seek information, build literacy skills, access technology, and participate in cultural activities. In Nigeria, public libraries hold similar promise. They support education, literacy, civic engagement, and digital inclusion by providing free access to print and electronic information resources for all category of users (Okafor, 2020). They also serve as instruments for national development by fostering informed citizenry and supporting formal and informal education (Salman *et al.,* 2017). Despite their importance, the effectiveness of public libraries in Nigeria has been significantly undermined by a range of structural, operational, and professional challenges.

Scholarly literature shows that public libraries in Nigeria have struggled with persistent issues such as inadequate funding, poor infrastructure, shortage of qualified personnel, weak ICT integration, and limited government support (Chinedu & Egolum, 2025; Okafor, 2020). These constraints have significantly reduced their ability to deliver modern library services and meet the growing information needs of users in an increasingly digital society. For instance, inadequate funding has been repeatedly identified as a major barrier that affects recruitment of professional staff, acquisition of current information resources, maintenance of facilities, and provision of modern services (Okojie & Okiy, 2020). Similarly, studies have shown that many public libraries lack sufficient ICT facilities and trained personnel capable of supporting digital information services, which are now central to contemporary librarianship (Ogbonna, 2022). Furthermore, studies have shown that weak governance structures, outdated policies, and inadequate professional staffing have contributed to inefficiencies in public library administration and service delivery (Abubakar, 2017).

In addition to institutional constraints, public service librarians in Nigeria, who are at the forefront of user engagement and information dissemination, face professional challenges such as poor conditions of service, limited opportunities for professional development, and low motivation which negatively impact their performance and the quality of services delivered to users (Okafor, 2020; Onwubiko, 2021). These challenges collectively result in poor service delivery, low user satisfaction, and declining patronage of public libraries across Nigeria. If not adequately addressed, the relevance of public libraries and the effectiveness of public service librarians in Nigeria may continue to diminish, thereby undermining their role in promoting literacy, education, and national development. Therefore, this study seeks to examine the challenges affecting public libraries and public service librarians in Niger State, with a view to identifying sustainable solutions for improving library services and enhancing the performance of librarians in the state.

1.2 Statement of the Problem

Despite the critical role of public libraries in supporting education, literacy, and community development, public library systems in Nigeria continue to face numerous challenges that hinder their effective operation and service delivery. These challenges include inadequate funding, outdated collections, poor infrastructure, insufficient ICT facilities, a shortage of professionally trained librarians, poor governance and outdated library policies (Chinedu & Egolum, 2025; Okafor, 2020; Okojie & Okiy, 2020). These challenges have persisted for decades, suggesting that existing interventions have not adequately addressed the underlying structural problems. Furthermore, public service librarians, who are central to the delivery of library services, operate under difficult working conditions characterized by low remuneration, limited professional development opportunities, and lack of motivation, which adversely affects their productivity and commitment (Salman, 2018; Okafor, 2020; Onwubiko, 2021). These challenges collectively result in poor service delivery, low user satisfaction, and declining patronage of public libraries across Nigeria.

Despite these well-documented issues, there is a lack of comprehensive research that holistically examines both institutional challenges and the professional experiences of public service librarians within the Nigerian context, especially Niger State. This gap in knowledge makes it difficult to formulate evidence-based strategies that can strengthen public libraries and enhance the professional capacity of librarians. Therefore, this study seeks to examine the challenges affecting public libraries and public service librarians in Niger State, Nigeria, with a view to identifying sustainable solutions for improving library service delivery and enhancing the performance of librarians in the country.

1.3 Research Objectives:

1. To identify the key challenges faced by public libraries in Niger State.
2. To examine the professional challenges experienced by public service librarians in Niger State.
3. To suggest strategies for addressing the challenges faced by public libraries and enhancing the professional development of librarians in Niger State.
4.

1.4 Research Questions:

1. What are the key challenges affecting the functioning of public library in Niger state?
2. What are the professional challenges faced by public service librarians in Niger State?
3. What strategies can be implemented to address the challenges faced by public libraries and enhance the professional development of librarians in Niger State?

2.0 Literature Review

2.1 Challenges Facing Public Libraries in Nigeria

Public libraries in Nigeria face multiple interconnected challenges that limit their ability to effectively serve local communities. The most prominent issues are inadequate funding, poor infrastructure, and lack of modern technology, which affect their ability to provide quality services, maintain facilities, and meet users' digital needs. Numerous studies revealed that public libraries in Nigeria lack resources to acquire new materials, upgrade technology, and maintain existing resources (Okafor, 2020; Salman *et al.*, 2018; Garba *et al.,* 2019). Similar studies revealed poor infrastructure such as dilapidated buildings, insufficient reading areas, inadequate lighting, and a lack of essential amenities, all of which make the libraries less appealing (Okafor, 2020; Momodu, 2013). Other studies revealed lack of modern digital tools such as computers and internet connectivity (Okafor, 2020; Okunoye, 2022).

In addition, there is a shortage of qualified staff, particularly those with digital skills, and limited access to up-to-date educational materials. These issues affect service delivery and the ability to meet users' needs (Baada *et al.,* 2020; Onunka *et al.,* 2023). Low public awareness and weak collaboration with educational institutions further contribute to low patronage and limit libraries' role in education and community development (Akor *et al.*, 2021; Isewele-Ishola, 2024). Other challenges include bureaucratic delays, policy gaps, and cultural and socio-economic factors (Salman *et al.*, 2018; Asif & Yang, 2021; Wheeler, 2021). Delays in funding, poor management frameworks, low reading culture, and issues like poverty and low education levels reduce library usage. Addressing these problems requires stronger government support, better policies, community outreach, improved infrastructure, and staff development.

2.2 Professional Challenges Experienced by Public Service Librarians in Nigeria

Public service librarians in Nigeria face numerous professional challenges that limit effective service delivery. These challenges include inadequate access to continuous training, poor conditions of service such as low salaries or limited promotion, heavy workloads due to understaffing, and insufficient ICT skills, which hinder their ability to adapt to modern library practices (Okonkwo *et al.*, 2025; Osiesi *et al.,* 2022; Afolabi & Olubunmi, 2022; Umeji & Anaehobi, 2022). Additionally, limited decision-making power, weak professional recognition, and difficulty keeping pace with technological advancements reduce librarians' effectiveness and morale (Rajendran & Ladan, 2020; Okafor, 2020). The absence of clear policies and strong institutional governance further restricts their capacity to plan, innovate, and advocate for improved services (Salman *et al.,* 2018). Lack of updated library policies and weak institutional governance exacerbates these professional constraints (Salman *et al.,* 2018). These challenges constrain librarians' roles as information providers and educators, highlighting the need for improved funding, training, infrastructure, and policy support.

2.3. Strategies to Improve Public Library Functioning and Librarian Development

Researchers propose several strategies to improve public library performance and librarian development in Nigeria. Key recommendations include increased and sustainable funding for infrastructure, collections, ICT, and staff training, supported by alternative sources like grants and donor agencies (Aboh, 2024; Okafor, 2020). Upgrading library facilities (such as modern library, reading spaces, and basic amenities) and strengthening ICT infrastructure (such as computers, reliable internet connectivity, electricity supply, and digital collections) are also essential for improving user experience and access to information (Lawan *et al.,* 2025; Bello & Adepegba, 2023). On the professional development front, continuous professional development through training, workshops, and updated academic curricula is emphasized to equip librarians with modern skills, particularly in digital services (Adamu *et al.,* 2021). Improved conditions of service, including better salaries and career opportunities, are also necessary to boost motivation (Posigha & Seimode, 2015). Furthermore, policy reform and stronger governance structures are needed to enhance accountability and service delivery (Abdullahi, 2015). Promoting community awareness and partnerships can also increase library relevance and usage (Amanze-Unagha & Unagha, 2023).

3.0 Methodology

The study adopted a quantitative approach using a descriptive survey design to address the research objectives. This allowed respondents to freely express their views through the questionnaire. The population comprised all 51 professional and paraprofessional staff of the Niger State Library Board, drawn from five branches (Agaie, Bida, Kontagora, Rijau, and Suleja) and the headquarters in Minna. Population data were obtained from internal records of the library board. Total enumeration (census sampling) was used since the population was small and manageable, allowing data collection from all members for comprehensive and accurate results (Okuonghae & Ogiamien, 2016). Thus, the entire population of 51 staff formed the sample. Data were collected using a structured paper-based questionnaire, chosen for its cost-effectiveness and time efficiency. The instrument was adapted from previous studies, validated by experts, and approved by the library board. A total of 48 questionnaires were distributed and returned, yielding a 94.11% response rate. Data were analyzed using SPSS version 23, with descriptive statistics such as frequency and percentage used for interpretation.

4.0 Results and Discussion of Findings

4.1. Respondents Demographic Information

Table 1: Respondent Demographic Information

Variables	Categories	Frequency	Percentage
Gender	Male	33	68.75%
	Female	15	31.25%
Age	Below 30	16	33.33%
	Above 30	32	66.67%
Professional Status	Professional	15	31.25%
	Non-Professional	33	68.75%
Working Experience	Below 10	19	39.59%
	Above 10	29	60.41%

Table 1 shows that most respondents were male (68.75%), while females made up 31.25%, indicating a gender imbalance in the public library workforce in Niger State. In terms of age, the majority were above 30 years (66.67%), suggesting a mature workforce, and many had over 10 years of experience (60.41%), reflecting input from experienced staff. However, most respondents were non-professionals (68.75%), with only 31.25% being professionally trained librarians, highlighting a gap in formal expertise. This aligns with studies showing that public libraries in developing regions often depend on non-professional staff due to limited funding and recruitment challenges (Estrullo-Suaga *et al.,* 2023).

4.2. Challenges Faced by Public Libraries in Niger State

Table 2: Challenges Faced by Public Libraries in Niger State

S/N	Items Statements	SA	A	D	SD	Mean
1	Inadequate funding for acquiring new materials and maintaining facilities	28 (58.33)	18 (37.5%)	2 (4.17%)	0 (0.0%)	4.50
2	Lack of modern technological tools like computers and internet access	26 (54.17)	19 (39.58)	3 (6.25%)	0 (0.0%)	4.42
53	Poor infrastructure (outdated buildings and inadequate reading chairs or tables)	22 (45.83%)	24 (50.0%)	2 (4.17%)	0 (0.0%)	4.38
4	Shortage of trained and qualified librarians and staff members	24 (50.0%)	20 (41.67)	4 (8.33%)	0 (0.0%)	4.33

5	Poor reading habits and preference for entertainment over education	19 (39.58)	22 (45.83%)	7 (14.58)	0 (0.0%)	4.10
6	Low public awareness and patronage of public library services	19 (39.58%)	21 (43.75%)	6 (12.5%)	0 (0.0%)	3.98
7	Limited collaboration with educational institutions	18 (37.5%)	23 (47.92%)	5 (10.42)	3 (6.25)	4.06
8	Limited access to updated learning materials like books and journals	20 (41.67%)	22 (45.83%)	4 (8.33%)	2 (4.17)	4.13
9	Poverty and low educational attainment within communities	16 (33.33%)	22 (45.83%)	5 (10.42)	5 (10.4)	3.81
10	Lack of clear policies for the development of public libraries	17 (35.42%)	23 (47.92%)	5 (10.42%)	3 (6.2%)	3.96

Key: Strongly Agree = (SA), Agree = (A), Disagree = (D), Strongly Disagree = (SD)

Table 2 shows that public libraries in Niger State face major structural and operational challenges, with strong agreement from respondents. Inadequate funding (Mean = 4.50) was the most critical issue, followed by lack of modern technology such as computers and internet (Mean = 4.42), and poor infrastructure (Mean = 4.38). Shortage of qualified staff (Mean = 4.33) and limited access to updated materials (Mean = 4.13) also ranked high, indicating that the challenges are largely due to financial, infrastructural, and human resource constraints. This aligns with earlier studies highlighting underfunding, poor facilities, and inadequate staffing as key barriers (Okafor, 2020).

Other issues such as poor reading habits (Mean = 4.10), weak collaboration with educational institutions (Mean = 4.06), low public awareness and patronage (Mean = 3.98), and lack of clear policies (Mean = 3.96) were also noted. Socio-economic factors like poverty and low education levels (Mean = 3.81) further affect library use. These results align with earlier findings that emphasize the role of community factors, policy gaps, and weak institutional linkages in limiting the relevance and utilization of public libraries (Okafor, 2020; Okojie & Okiy, 2020). Therefore, improving library services in Niger State requires a comprehensive approach that includes better funding, infrastructure, staffing, policy development, and community engagement.

4.3. Professional Challenges Faced by Public Service Librarians in Niger State

Table 3: The Professional Challenges Faced by Public Service Librarians in Niger State

S/N	Items Statements	SA	A	D	SD	Mean
1	Insufficient professional development opportunities for librarians	27 56.25%	21 43.75%	0 0.0%	0 0.0%	**3.56**
2	Poor working condition of services such as low salaries and lack of motivation	30 62.5%	18 37.5%	0 0.0%	0 0.0%	**3.62**
3	Limited authority in making decisions about the library's budget and collection	19 39.58%	20 41.7%	5 52.08	4 8.33%	**3.12**
4	Resistance to adopting new technologies in the library	29 60.42	17 35.42	2 4.17%	0 0.0%	**3.56**
5	Inadequate ICT skills among librarians	28 58.33%	17 35.42%	3 6.25%	0 0.0%	**3.52**
6	Heavy workloads due to inadequate trained staff	17 35.42%	23 47.92%	6 12.5%	2 4.17%	**3.15**
7	Lack of government support for librarians' professional development and welfare	15 31.25%	29 60.42%	4 8.33%	0 0.0%	**3.23**
8	Issues of intellectual freedom like censorship or community pressures	24 50.0%	19 39.58%	5 10.42%	0 0.0%	**3.40**

Key: Strongly Agree = (SA), Agree = (A), Disagree = (D), Strongly Disagree = (SD)

Table 3 shows that public service librarians in Niger State face several professional challenges, with strong agreement on most items. Poor working conditions, including low salaries and lack of motivation (Mean = 3.62), was the most significant issue. This was followed by limited professional development opportunities (Mean = 3.56) and resistance to new technologies (Mean = 3.56). Inadequate ICT skills (Mean = 3.52) and concerns about intellectual freedom (Mean = 3.40) were also notable, showing that both skill gaps and work environment issues affect performance. These findings align with studies linking poor pay, limited training, and weak ICT competence to low librarian effectiveness (Yaya & Kikelomo, 2015). Other issues such as lack of government support (Mean = 3.23), heavy workload from staff shortages (Mean = 3.15), and limited decision-making power (Mean = 3.12) also recorded moderate agreement, reflecting broader institutional constraints. Although less severe, they still impact service delivery. This is consistent with earlier research

showing that weak institutional support and staffing shortages limit innovation and efficiency in public libraries (Salman, 2017). Therefore, improving librarians' performance requires addressing both structural and capacity-related challenges.

4.4. Strategies to Address Challenges and Enhance Librarian Development in Niger State

Table 4: Strategies to Address Challenges Facing Public Libraries and Enhance the Professional Development of Librarians in Niger State

S/N	Item Statements	SA	A	D	SD	Mean
1	Providing adequate and sustainable funding for acquiring new library materials and maintaining existing resources	37 (77.08%)	11 (22.92%)	0 (0.00%)	0 (0.00%)	3.77
2	Improving library infrastructure, including buildings, seating, and lighting facilities	30 (62.50%)	15 (31.25%)	3 (6.25%)	0 (0.00%)	3.56
3	Enhancing digital infrastructure, such as reliable internet access and stable electricity supply	32 (66.67%)	14 (29.17%)	2 (4.17%)	0 (0.00%)	3.63
4	Organizing regular professional training programs to update librarians' skills and knowledge	34 (70.83%)	11 (22.92%)	2 (4.17%)	1 (2.08%)	3.63
5	Updating library school curricula to reflect current professional trends and technological advancements	20 (41.67%)	25 (52.08%)	0 (0.00%)	3 (6.25%)	3.29
6	Improving librarians' conditions of service like clear career progression, competitive salaries, and incentives	35 (72.92%)	13 (27.08%)	0 (0.00%)	0 (0.00%)	3.73
7	Promoting collaboration between libraries, schools, NGOs, and government agencies to expand service reach	19 (39.58%)	23 (47.92%)	5 (10.42%)	1 (2.08%)	3.25
8	Increasing public awareness of available library resources and services	24 (50.00%)	19 (39.58%)	5 (10.42%)	0 (0.00%)	3.40
9	Developing, implementing, and enforcing effective library policies and legislation	27 (56.25%)	17 (35.42%)	4 (8.33%)	0 (0.00%)	3.48
10	Organizing outreach programs, reading campaigns, digital literacy training, and other community-based library services	22 (45.83%)	20 (41.67%)	4 (8.33%)	2 (4.17%)	3.29

Key: Strongly Agree = (SA), Agree = (A), Disagree = (D), Strongly Disagree = (SD)

Table 4 shows strong agreement on key strategies to improve public libraries and librarian development in Niger State. adequate funding (Mean = 3.77) and better conditions of service (Mean = 3.73) were the most critical, with no disagreement. Enhancing digital infrastructure and providing regular training (Mean = 3.63 each) were also highly rated, highlighting the need to strengthen both technology and staff capacity. Improving library facilities (Mean = 3.56) and developing effective policies (Mean = 3.48) were similarly supported. These findings align with studies emphasizing funding, staff welfare, and continuous training as essential for effective service delivery (Okafor, 2020). Other strategies such as increasing public awareness (Mean = 3.40), updating library curricula and outreach programs (Mean = 3.29), and promoting collaboration (Mean = 3.25) also received support, though slightly lower. This suggests they complement core needs like funding and infrastructure. Overall, the results highlight the need for a comprehensive approach involving funding, capacity building, policy support, and stakeholder collaboration (Okojie & Okiy, 2020).

Conclusion

The study examined the challenges facing public libraries and the professional development of librarians in Niger State. The findings showed that public libraries in Niger State are confronted with serious structural and operational challenges. Inadequate funding, poor infrastructure, lack of modern technological tools, and shortage of qualified personnel emerged as the most critical issues. These challenges are compounded by broader socio-economic factors such as low reading culture, poverty, and limited public awareness of library services. At the professional level, librarians face poor working conditions, limited opportunities for training, inadequate ICT skills, and weak institutional support, all of which hinder their efficiency and motivation. Despite these challenges, the study identified practical and widely supported strategies for improvement. Key among these is increased funding, improved welfare for librarians, investment in digital and physical infrastructure, and regular professional training. Therefore, the findings concluded that strengthening public libraries in Niger State requires a comprehensive approach that addresses funding, human capacity, infrastructure, policy, and community engagement simultaneously.

Recommendations

Based on the findings of this study, the following recommendations are made:

1. The Niger State Government and other relevant stakeholders should provide adequate and sustainable funding for public libraries to facilitate the acquisition of current information resources, improvement of ICT infrastructure, renovation and maintenance of physical facilities, and expansion of library services.
2. The Niger State Library Board should strengthen human resource capacity through the recruitment of professionally qualified librarians and the provision of regular capacity-building programs, including workshops, seminars, and ICT training, to address staff shortages, reduce workload, and enhance the competencies of library personnel.
3. Efforts should be made to improve the welfare and working conditions of librarians through better remuneration, incentives, clear career progression opportunities, and increased institutional support in order to enhance motivation, job satisfaction, and professional effectiveness.
4. The Niger State Library Board should develop, implement, and enforce clear policies and strategic frameworks for the effective management and sustainable development of public libraries, while fostering stronger collaboration with educational institutions, community organizations, and relevant government agencies to improve service delivery and resource sharing.
5. Public libraries in Niger State should intensify community outreach, public awareness campaigns, and reading promotion initiatives to increase patronage, encourage positive reading habits, and enhance the visibility and relevance of library services within their communities.

ABSTRACT

This study investigated the contributions of school librarians to students' academic achievements in secondary schools in Kano State, Nigeria. The study sought to examine librarians' contributions to academic achievement, assess the influence of library resources and services on students' academic performance, evaluate librarians' support for students' learning skills (reading, research, and information literacy), and identify challenges affecting librarians' effectiveness. A descriptive survey research design was adopted. The population comprised librarians, teachers, and students in secondary schools with functional libraries in the metropolitan Local Government Areas (LGAs) of Kano State, totaling 35,915. Using Krejcie and Morgan's table, a sample of 210 respondents (35 librarians, 70 teachers, and 105 students) was selected from 15 purposively chosen schools. Data were collected using a validated structured questionnaire with a reliability coefficient of 0.82. Descriptive statistics (mean, frequency, and percentage) and chi-square were used for data analysis and hypothesis testing. Findings revealed that school librarians make significant contributions to students' academic performance, with all mean scores above 3.00. Key contributions included maintaining a conducive reading environment and guiding students in locating information. Library resources and services showed a strong positive influence on academic achievement, particularly reading spaces and access to past examination questions. Major challenges identified were inadequate library funding, shortage of professional librarians, and poor reading culture among students. The study concludes that strengthening school library services will enhance students' academic achievements in Kano State.

Keywords: School librarians, academic achievement, library services, Kano State, Nigeria

Introduction

Secondary education in Nigeria constitutes the foundation of the nation's educational system and is critical for the intellectual, social, and moral development of children. The aim of secondary education is to prepare students for higher education, vocational training, and productive participation in the society. The effectiveness of secondary education in Nigeria has been a subject of considerable research, particularly regarding the quality of teaching, learning resources, and school infrastructure (Okebukola, 2012). Despite government efforts to expand access to schooling, many Nigerian schools face challenges such as inadequate facilities, limited learning materials, under-resourced libraries, shortage of qualified teachers and support staff, including librarians. These constraints are more evident in some states, including Kano State, where increasing student enrolment places additional pressure on already limited educational resources. These have been linked to suboptimal academic performance among students, especially in rural and under-resourced schools (Ogunyemi & Olaleye, 2019).

School libraries have been identified as a critical resource for enhancing the quality of secondary education in Nigeria. Functional libraries, when managed by trained librarians, provide students with access to books, periodicals, and digital resources that supplement classroom instruction and promote self-directed learning. Study by Ogunbekun et al. (2023) indicates that well-managed school libraries improve literacy skills, research abilities, and overall academic performance of students at secondary level.

The role of librarians in secondary schools in Nigeria is particularly important due to the emphasis on reading culture, information literacy, and examination readiness. Aina (2014) observed that librarians facilitate curriculum implementation by guiding students in locating and using appropriate resources, conducting user education programs, and promoting reading habits. Similarly, Lawal-Solarin (2012) noted that students' utilization of library services, particularly when supervised by professional librarians, positively correlates with their academic outcomes in secondary schools. However, in many schools, particularly within Kano State, there is a noticeable shortage of qualified librarians, with some school libraries either minimally staffed or managed by non-professionals. This staffing gap significantly limits the effective use of available library resources and services.

Students' academic achievement is widely recognized as a measure of educational effectiveness, reflecting mastery of knowledge, skills, and competencies within the school curriculum (York, Gibson, & Rankin, 2015). While many factors influence academic success, the role of school libraries and professional librarians has emerged as a significant

contributor to students' learning outcomes. Research has shown that well equipped and professionally managed school libraries positively impact student achievement by providing access to relevant learning resources and fostering an environment conducive to independent and collaborative learning. Lance, Rodney, and Hamilton-Pennell (2000) observed that schools with certified librarians and adequately stocked libraries recorded higher student performance on standardized tests compared to schools without professional library services. Their study emphasized that librarians are not merely custodians of books, but active participants in promoting literacy, guiding research, and integrating library resources into classroom instruction.

Despite these recognized benefits, school libraries in Kano State remain poorly staffed and underutilized, raising serious concerns about their actual contribution to students' academic achievement. Given this background, there is a need for a systematic investigation into contributions of librarians and school libraries to students' academic achievements, particularly within the Kano State context. Such an inquiry will help to identify existing gaps in library services, staffing, and utilization, while also providing evidence-based insights for policymakers, school administrators, and education stakeholders.

Statement of the Problem

Despite the recognized importance of school libraries for enhancing students' learning, literacy, and academic success, many primary and secondary schools in Nigeria lack functional libraries or have libraries that are grossly under-resourced. Studies reveal that in numerous schools, libraries exist only "in name", their facilities are inadequate or dilapidated, books and materials are obsolete or insufficient, and library spaces often do not meet basic standards for accommodation, furniture, or layout (Adewusi, 2013). Even when libraries exist, they are frequently understaffed or managed by non-professional personnel. Many school libraries are run by untrained staff or full-time teachers lacking formal library training with no qualified librarians to oversee the collection, organize resources, or guide students in effective use. Furthermore, the resources available in many school libraries are inadequate, outdated, or irrelevant. Research shows that students often find few relevant, up-to-date books, reference materials, or ICT-based resources in their school libraries, limiting opportunities for independent study, research, and information literacy development.
Lawson (2022) stated that many students and teachers underutilize available library resources and that in some cases, they lack awareness or orientation on how to use library resources; while to others, the libraries' poor state or uninviting environment discourages use, which undermines the potential of libraries to support academic learning. As a direct consequence of these deficiencies lack of funding, poor infrastructure, lack of trained staff, insufficient and outdated resources, and under-utilization many students may be deprived of essential support for learning beyond classroom instruction. This situation likely contributes to poor academic performance, low literacy development, weak reading culture, and limited research skills among students in primary and secondary schools across Nigeria.

Despite these evident problems and the theoretical importance of libraries to education, there remains a lack of comprehensive, context-specific empirical studies that examine how the presence (or absence) of properly managed libraries with qualified librarians and adequate resources influences academic outcomes among Nigerian school students in Kano State. This gap undermines efforts to advocate for library investment and educational policy reforms. Therefore, this study seeks to investigate the extent to which functional school libraries adequately staffed, resourced, and utilized contributes to academic achievement in primary and secondary schools in Kano State. By doing so, it aims to provide evidence-based insight into whether and how librarians and school libraries can help improve educational quality, literacy, and learning outcomes in Nigeria.

Research Objectives

The main objective of this study is to investigate the contributions of librarians to students' academic achievement in Primary and Secondary Schools in Kano State, Nigeria. While the specific objectives are as follows:

1. To examine the contributions of librarians to students' academic achievements in primary and secondary schools in Kano State.
2. To assess how library resources and services provided by librarians influence students' academic performance in primary and secondary schools in Kano State.
3. To evaluate the ways librarians support students' learning skills in Kano State.
4. To identify the challenges that affect librarians' ability to enhance students' academic achievements in Nigerian primary and secondary schools in Kano State.

Research Hypotheses

To achieve the stated objectives, the following hypotheses were developed.

H_{01}: Librarians' contributions have no significant effect on students' academic achievements in primary and secondary schools in Kano State.

H_{02}: Library resources and services provided by librarians do not significantly influence students' academic performance in primary and secondary schools in Kano Sate.

Literature Review

School libraries have evolved beyond mere collections of books to become dynamic learning resource centres that support teaching and learning. Rather than being limited to physical materials, modern school libraries encompass print and non-print resources, including digital and audiovisual materials that facilitate access to information and knowledge. As noted by Jamadar (2022), libraries serve as organized systems of information resources designed to support education and recreation. In the school context, they function as essential platforms for fostering independent learning, intellectual development, and academic engagement. The UNESCO School Library Manifesto emphasizes that school libraries provide information and ideas fundamental to functioning effectively in a knowledge-based society. This underscores their relevance not just as storage spaces for books, but as active contributors to literacy development and lifelong learning.

Librarians are central to the effectiveness of school libraries, as their professional expertise determines how well resources are organized, accessed, and utilized. According to IFLA (2015), school librarians ensure that library collections are relevant, current, and aligned with curricular needs, thereby enhancing students' access to quality information. Beyond resource management, librarians actively contribute to teaching and learning processes. Loertscher and Koechlin (2014) emphasized that librarians collaborate with teachers to integrate library resources into classroom instruction, promoting inquiry-based learning and critical thinking. This instructional role positions librarians as partners in curriculum delivery rather than passive custodians of materials.

Empirical studies further support the academic impact of librarians. Wine (2020) found that students in schools with full-time certified librarians performed significantly better in reading and mathematics. Similarly, Radlick and Stefl-Mabry (2015–2018) reported a statistically significant relationship between librarian presence and students' achievement in English Language and Arts. These findings demonstrate that professional librarian staffing is a key determinant of improved academic outcomes.

The availability and quality of library resources significantly influence students' academic performance. Functional libraries provide access to textbooks, reference materials, and digital resources that complement classroom teaching and enable independent study. Ogunbekun et al. (2023) found that schools with well-equipped libraries recorded higher levels of literacy development and improved academic performance among secondary school students. Similarly, Ali et al. (2019) (as cited in IJRISS, 2020) reported that students who frequently use library resources tend to perform better academically than those who do not. This implies that providing library facilities only is not enough; their effectiveness depends on both the quality of resources available and the extent to which students actively use them. Consequently, investment in well-equipped libraries and the promotion of regular library use are essential strategies for improving students' academic outcomes.

Library services such as reading programs, user education, and access to past examination materials also play a critical role in supporting students' achievement. These services create structured opportunities for students to engage with learning materials beyond the classroom, thereby reinforcing academic content and improving examination outcomes.

One of the most significant contributions of school librarians lies in the development of students' learning skills, particularly reading, research, and information literacy. Aina (2014) observed that librarians promote reading culture by organizing reading programmes and guiding students in selecting appropriate materials. In addition, librarians play a vital role in teaching information literacy skills, including how to locate, evaluate, and use information effectively. Muti and Geroy (2025) found that students' interaction with librarians significantly improves their information literacy skills, which in turn positively affects academic performance. Research skills are also enhanced through librarian support. By guiding students in conducting research and using library resources, librarians help develop critical thinking and independent learning abilities, which are essential for academic success.

Despite the recognized benefits of school libraries, several challenges hinder their effectiveness, particularly in developing countries like Nigeria. One of the major challenges is inadequate funding, which affects the acquisition of current and relevant resources as well as the maintenance of library facilities. Another critical issue is the shortage of qualified librarians. In many schools, libraries are managed by untrained personnel or teachers without professional library training. This limits effective organization of resources and reduces the quality of services provided to students.

Resource inadequacy is also a persistent problem. Many school libraries lack up-to-date books, digital resources, and basic infrastructure, making them less attractive and less useful to students. Lawson (2022) noted that poor library conditions and lack of user orientation contribute to low utilization of library services among both students and teachers. Additionally, poor reading culture among students further limits the impact of school libraries. Even where resources are available, students may not utilize them effectively due to lack of motivation, awareness, or guidance. These challenges are particularly evident in many Nigerian states, including Kano State, where rapid population growth and increased school enrolment have placed additional pressure on already limited educational resources. As a result, many school libraries remain underutilized and unable to contribute meaningfully to students' academic achievement.

Methodology

This study adopted a descriptive survey research design. The choice of this design was informed by its suitability for collecting data from respondents in their natural settings without manipulation of variables. The study was conducted in the metropolitan Local Government Areas (LGAs) of Kano State, which comprise eight LGAs. These areas were selected because they host a concentration of secondary schools. The population of the study consisted of students in Senior Secondary School (SSS1–SSS3), teachers, and librarians/library officers in public secondary schools across the eight metropolitan LGAs. According to records from the Kano State Ministry of Education (2024), there are 48 secondary schools with libraries within the study area, comprising 65 librarians/library officers, approximately 850 teachers, and about 35,000 students. This gives a total population of 35,915 respondents.

A sample size of 380 respondents was determined using the Krejcie and Morgan (1970) table for sample size determination, which is appropriate for large populations. A multistage sampling technique was employed in selecting the sample. First, stratified sampling was used to categorize the study area into the eight metropolitan LGAs to ensure adequate representation. Secondly, proportionate random sampling was used to select 24 schools, representing 50% of the total number of schools, with three schools selected from each LGA. Finally, respondents were selected proportionately from each category, comprising 50 librarians, 110 teachers, and 220 students. While students were selected using simple random sampling from SSS1–SSS3 classes, teachers and librarians were selected purposively based on their availability and relevance to the study.

Data were collected using a structured questionnaire designed by the researcher. The instrument consisted of sections measuring librarians' professional contributions, availability and use of library resources and services, and students' academic performance. The questionnaire was subjected to face and content validation by experts in Library and Information Science as well as educational research to ensure its adequacy and relevance. A pilot study was conducted outside the study area, and the reliability of the instrument was determined using Cronbach's Alpha, which yielded a coefficient of 0.82, indicating a high level of internal consistency.

The data collected were analyzed using both descriptive and inferential statistics. Descriptive statistics such as frequency counts, percentages, and mean scores were used to summarize respondents' characteristics and responses. Inferential statistics were employed to test the hypotheses at a 0.05 level of significance. Specifically, Pearson Product Moment Correlation (PPMC) was used to examine the hypotheses developed in the study. This statistical technique was considered appropriate because it provide robust measures of relationships and predictive effects among the variables under investigation.

Presentation of Results

Demographic Characteristics of Respondents

Table 4.1: Distribution of Respondents by Category

Respondent Category	Distributed	Returned	Percentage (%)
Librarians	63	59	16.6
Teachers	127	122	34.3
Students	190	177	49.1
Total	**380**	**358**	**100**

The data presented in Table 4.1 show the distribution of questionnaire administered and retrieved across the three categories of respondents. A total of **380 questionnaires** were distributed to librarians, teachers, and students. Out of these, **358** were duly completed and returned, representing a **94.2% return rate**, which is adequate for analysis. Students formed the largest proportion of respondents (49.1%) because they are the primary beneficiaries of library services. Librarians constituted the smallest group, which aligns with the staffing realities of secondary school libraries in Kano State.

Research Question One

What contributions do librarians make to students' academic achievements in secondary schools in Kano metropolis?

Table 4.2: Contributions of Librarians to Students' Academic Achievement

Contributions of Librarians	SA	A	UD	D	SD	Mean
They guide students on how to locate relevant materials	190	121	11	24	12	4.26
They assist students with research assignments	177	130	14	22	15	4.21
They organize library orientation programs	158	127	27	25	21	3.94
They provide reference and advisory services	183	119	16	24	16	4.19
They maintain a conducive reading environment	217	105	11	14	11	4.38
They support the use of ICT for learning	148	125	27	36	22	3.85

Grand Mean = 4.14

Table 4.2 presents respondents' perceptions of the various contributions of librarians to students' academic achievement, using a five-point Likert scale. The **grand mean of 4.14** indicates a **high overall level of agreement**, suggesting that librarians play a significant and positive role in supporting students' academic success. The highest contribution is **maintaining a conducive reading environment (mean score 4.38), guiding students in locating information (mean = 4.28)**, and *assist students with research assignment* (Mean = 4.21). This shows that librarians are actively involved in helping students develop information-seeking skills and supporting their academic work, which are essential for effective learning.

Research Question Two
How do library resources and services influence students' academic achievements in these schools?
Table 4.3: Influence of Library Resources and Services on Students' Academic Achievement

Influence Factors	SA	A	UD	D	SD	Mean
Availability of relevant textbooks improves study	208	103	11	22	14	4.30
Access to past questions enhances exam preparation	217	100	14	18	9	4.38
ICT resources support research and assignments	172	112	25	31	18	3.99
Reading space promotes concentration	226	96	9	18	9	4.43
Library opening hours encourage consistent use	163	118	29	33	15	3.94

Grand Mean = 4.21

Table 4.3 examines respondents' perceptions of how library resources and services influence students' academic achievement. The **grand mean of 4.21** indicates a **high level of agreement overall**, suggesting that library resources and services play a significant role in enhancing students' academic performance. Reading spaces recorded the highest mean score (4.43), followed by access to past questions with mean score of 4.38. Similarly, availability of relevant textbooks improves study (4.30) was also highly rated. This shows that core academic resources such as textbooks and past examination materials are essential in supporting effective study habits and better academic performance.

Research Question Three
What are the ways through which librarians support students' learning skills, such as reading, research, and information literacy in secondary schools in Kano State?
Table 4.4: Librarians' Support for Students' Learning Skills

Learning Support Activities	SA	A	UD	D	SD	Mean
Librarians organize reading promotion activities to improve reading skills	199	109	14	22	14	4.26
Librarians provide library orientation to help students use library resources effectively	190	112	18	22	16	4.22
Librarians guide students on how to search for information for assignments and projects	177	118	22	24	18	4.15
Librarians teach students how to evaluate information sources for accuracy and relevance	167	123	25	25	18	4.07
Librarians provide support on referencing and citation to improve research writing	163	127	27	24	18	4.06
Librarians educate students on information literacy and ethical use of information	185	114	20	22	18	420

Grand Mean=4.16

Findings from table 4.5 (grand mean=4.16) suggests that respondents strongly agree that librarians significantly support the development of students' learning skills, thereby contributing positively to students' academic achievement in secondary schools in Kano State. The statement *librarians organize reading promotion activities to improve reading skills"* recorded the **highest mean score (4.26)**. Similarly, *Librarians provide library orientation to help students use library resources effectively* (Mean = 4.22) and *librarians educate students on information literacy and ethical use of information* (Mean = 4.20) were highly rated.

The item *librarians guide students on how to search for information for assignments and projects* (Mean = 4.15) also received strong agreement, highlighting the important instructional role librarians play in developing students' research skills. On the other hand, *librarians teach students how to evaluate information sources for accuracy and relevance* (Mean = 4.07) and *librarians provide support on referencing and citation to improve research writing* (Mean = 4.06) recorded slightly lower, though still positive, mean scores. This suggests that while these skills are supported, there may be a need to strengthen training in critical evaluation and academic writing practices.

Research Question Four
What challenges do librarians face in supporting students' academic achievements?
Table 4.5: Challenges Faced by Librarians

Challenges	SA	A	UD	D	SD	Mean
Insufficient number of librarians	199	101	18	22	18	4.24
Inadequate ICT facilities	154	123	33	31	18	3.93
Limited budget for library resources	217	81	22	24	14	4.29
Poor student reading culture	185	109	25	27	13	4.12
Irregular power supply	147	118	36	40	18	3.82

Grand Mean = 4.08

The major challenges as indicated in Table 4.5 are **limited library budgets (mean score = 4.29),** closely followed by insufficient number of librarians with mean score of 4.24. Poor students reading culture also recorded high score (4.12) **shortage of professional librarians,** and **students' poor reading culture.** These issues hinder the full impact of school libraries in the metropolitan LGAs. Furthermore, *Inadequate ICT facilities* (Mean = 3.93) indicates that limited access to modern technologies affects the ability of libraries to support digital learning and research activities. Finally, *Irregular power supply* (Mean = 3.82), though the lowest among the listed challenges, still reflects a notable concern. Unstable electricity can disrupt access to both physical and electronic library services, particularly in technology-driven learning environments.

Testing of Hypotheses
The hypotheses were tested using the Chi-square statistical technique at **0.05 level of significance.**

Hypothesis One:

There is no significant relationship between librarians' contributions and students' academic achievements.
The result of hypothesis one is presented in the tale below:

Hypothesis	X^2 Cal. (xcal)	X^2Crit. (xcrit)	Level of Significance
H_0: There is no significance relationship between librarian's contributions and students' academic achievements	42.87	12.59	0.05

Result from the table above indicate that Chi-square calculated (χ^2cal) = 42.87, Chi-square critical (χ^2crit) = 12.59.

Since the calculated chi-square value (42.87) is greater than the critical chi-square value (12.59) at 0.05 level of significance, the null hypothesis is rejected. This implies that librarians significantly contribute to students' academic achievement in the schools investigated

Hypothesis Two:
There is no significant influence of library resources on students' academic achievements.

Hypothesis	X^2 Cal. (xcal)	X^2Crit. (xcrit)	Level of Significance
H_0: There is no significance influence of library resources on students' academic achievement	**39.12**	**15.51**	**0.05**

Result from the table above show that Chi-square calculated (χ^2cal) = 39.12, Chi-square critical (χ^2crit) = 15.51
Since the calculated chi-square value (39.12) is greater than the critical value (15.15) at 0.05 level of significance, the null hypothesis is rejected. This indicates a significant contribution of librarians to students' academic achievement in schools investigated

Discussion of Findings
The study revealed that school librarians play a highly significant role in enhancing students' academic performance. This is particularly evident in their ability to maintain a conducive reading environment and guide students in locating

relevant information for their academic tasks. This implies that the presence of professional school librarians contributes directly to students' academic achievements. A conducive reading environment boost concentration, independent study, and enhanced reading culture, while guidance in information retrieval equips students' with essential research and information literacy skills. All these together, help students' to better understand their lessons, complete homework effectively, and improve overall academic performance.
This result conforms to other studies that emphasize the importance of school libraries and librarians in academic achievement. For example Ogunbekun et al. (2023) reported that well-managed school libraries significantly improve students' literacy development and academic outcomes. Similarly, Oraekwe and Emenari (2021) found that school libraries contribute meaningfully to literacy development by providing supportive learning environments and access to information resources. The implication of this finding is that educational stakeholders, including school administrators and policymakers, should prioritize the employment of qualified librarians and the development of functional school libraries.

The study also revealed that library resources and services play a significant role in enhancing students' academic performance. This finding indicates that the availability and effective utilization of library resources such as textbooks, past question papers, reference materials, and digital resources greatly support students' academic success. When students have access to relevant and up-to-date resources, along with professional guidance on how to use them, they are better equipped to understand lesson content, complete assignments, and engage in independent learning.
This finding is consistent with existing literature on the role of library resources and services in education. For example, a comparative study by Jaja and Akanya (2025), found that schools with standard and active utilization of resources and services recorded significantly better performance in arts and social science subjects compared with matched schools without libraries. Further supporting this finding is the study by Ogunbekun, Abduldayan and Obiano (2023), the authors reported that availability of up-to-date texts, reference collections, and (where available) e-resources correlates with improved literacy indicators and higher examination scores. The implication of this finding is that schools should prioritize the provision of adequate, current, and diverse library resources, as well as the delivery of efficient library services. Educational authorities should allocate sufficient funding for library development, including both print and electronic resources.

The result shows that librarians play an active role in promoting students' reading and research skills. This is evident through their organization of reading promotion activities and orientation programmes, as well as their guidance in information searching, evaluation of sources, and proper referencing techniques. This finding implies that librarians are not only custodians of information resources but also educators who facilitate the development of essential academic skills. Their involvement in reading promotion helps to cultivate a reading culture among students, while their instructional support enhances students' information literacy and research competence. This result is consistent with findings of Lateef and Adeyi (2019) who noted that school librarians contribute significantly to information literacy and lifelong learning by teaching students how to locate, evaluate, and use information effectively. The implication of this finding is that school libraries should be adequately staffed with qualified librarians who can carry out reading promotion and user education programmes effectively. Educational stakeholders should also recognize and support the teaching role of librarians, as it directly contributes to students' academic success and independent learning skills.
The study further reveals that limited library budgets, shortage of professional librarians, and students' poor reading culture are the major challenges hindering the effectiveness of school libraries in the eight metropolitan Local Government Areas of Kano State.

This result aligns with existing studies that identify similar constraints in school library systems. For instance, studies such as Ogunbekun et al. (2023) and Oraekwe and Emenari (2024) have highlighted insufficient funding and lack of trained personnel as persistent challenges affecting library service delivery. Additionally, research on reading habits indicates that students' declining interest in reading, often influenced by digital distractions, negatively impacts library usage and academic engagement. The implication is that addressing these challenges requires a multi-faceted approach. Government and school authorities should increase funding for library development, ensure the recruitment of qualified librarians, and implement programmes that promote a strong reading culture among students. Without tackling these barriers, the potential of school libraries to enhance academic performance and literacy development may not be fully realized.

The study further found that there is a significant relationship between librarians' contributions and students' academic achievement, and that the availability and effective use of library resources significantly influence students' performance in secondary schools with functional libraries. This finding indicates that librarians and library resources are critical determinant of students' academic success. The professional support they provided directly enhances students' learning outcomes. This result is consistent with Muhammad (2020), who emphasized that a functional school library enables teachers to achieve educational objectives by producing students who are information literate and prepared for lifelong learning. Similarly, other studies have shown that well-equipped libraries and professional librarians contribute

significantly to improved academic outcomes by fostering effective study habits and access to quality information resources. The implication of this finding is that schools must prioritize the development of well-equipped libraries staffed by qualified professional librarians. Educational policymakers and school administrators should ensure sustained investment in library resources and personnel, as this is essential for achieving the educational objectives of the school and enhancing students' academic achievement.

Conclusion

The study concluded that librarians play an essential role in enhancing students' academic achievements in secondary schools in Kano State Metropolitan LGAs. Their contributions ranging from information guidance, academic support services, and resource management greatly improve students' learning outcomes. However, their effectiveness is hindered by several challenges, especially insufficient funding, lack of ICT resources, and inadequate staffing. Strengthening school libraries and empowering librarians will therefore greatly enhance academic performance in Kano State secondary schools.

From a policy perspective, the findings highlight the urgent need for the Kano State Government, Ministry of Education, and relevant educational stakeholders to prioritize school library development. This includes increased and sustained budgetary allocation for library resources, integration of ICT infrastructure into school libraries, and the recruitment and continuous professional development of qualified librarians. Furthermore, policies should support the institutionalization of reading promotion programmes and user education within the school curriculum.

In conclusion, strengthening school libraries through deliberate policy actions and strategic investment will not only enhance students' academic performance in Kano State but also contribute to the development of information-literate individuals equipped for lifelong learning and national development.

Recommendations

Based on the findings and conclusion, the study makes the following recommendations:

1. **Strengthening the Role of Librarians in Academic Support**
   Since the study established that librarians significantly contribute to students' academic success, school authorities should further empower librarians by providing continuous professional development opportunities. Training in modern information services, digital literacy, and instructional support will enhance their capacity to guide students effectively in research and information use.

2. **Improvement of Library Resources and Facilities**
   Given the high impact of library resources on students' academic performance, school management and government agencies should prioritize adequate funding for the provision and regular updating of these resources. Comfortable and well-equipped reading environments should also be maintained to encourage effective study habits.

3. **Enhancement of Information Literacy and Research Skills Training**
   Although librarians are actively involved in developing students' learning skills, there is a need to strengthen instruction in critical areas such as evaluation of information sources and referencing/citation practices. Librarians should organize more structured workshops, seminars, and hands-on training sessions to improve students' competencies in academic writing and research.

4. **Promotion of Reading Culture Among Students**
   Since poor reading culture was identified as a major challenge, schools should collaborate with librarians to organize reading promotion programmes such as book clubs, reading competitions, and awareness campaigns. These initiatives will help cultivate positive reading habits and increase students' engagement with library resources.

5. **Recruitment of Qualified Librarians**
   The shortage of professional librarians highlights the need for government and school administrators to recruit more qualified personnel. Adequate staffing will ensure efficient library services, better student support, and improved management of library resources.

6. **Increased Budgetary Allocation to School Libraries**
   As limited funding was identified as a major constraint, policymakers should allocate sufficient funds specifically for library development. This should cover acquisition of current materials, maintenance of facilities, and subscription to digital resources.

7. **Provision of Adequate ICT Facilities**

To support modern teaching and learning, schools should invest in ICT infrastructure such as computers, internet access, and digital databases. This will enhance students' access to electronic information resources and improve research capabilities.

8. **Improvement of Power Supply**
   Considering the impact of irregular electricity on library services, schools should explore alternative power sources such as solar energy and standby generators to ensure uninterrupted access to both physical and digital library services.

9. **Policy Support and Monitoring**
   Educational authorities should develop and enforce policies that recognize and strengthen the role of school libraries and librarians in academic achievement. Regular monitoring and evaluation should also be conducted to ensure effective implementation of library programmes.

Abstract

This study titled "Curriculum Gaps: Library and Information Science **(LIS) Programs vs Industry Needs in Nigerian Universities"** theoretically examined the disjunction between Library and Information Science (LIS) education and contemporary professional demands in Nigeria's evolving information ecosystem. The study was guided by 4 objectives. This study employed a constructivist paradigm to interpret the complex relationship between LIS education and professional practice in Nigeria. A qualitative research design was utilized, involving document analysis of **Curriculum for LIS Programs in Nigerian Universities**. Purposive sampling was used to target institutions with established LIS academic programs. Data analysis was conducted using thematic analysis to triangulate perspectives across the various information resources obtained. Anchored in **competency-based education theory** and **community of practice framework**, the paper critiques Nigeria's LIS curricula through **systems theory** lens, revealing fundamental misalignments between academic silos and dynamic library service realities. Traditional LIS programs emphasize obsolete cataloguing paradigms (DDC/LC dominance) while Industry 4.0 demands **AI literacy, data curation, UX design, makerspace facilitation**, and **digital preservation competencies** absent from 80% of Nigerian university syllabi. **Theoretical analysis demonstrated** that current LIS frameworks remain rooted in **custodial librarianship** (print-centric, collection-focused) despite global shifts toward **facilitative librarianship** (service-oriented, technology-enabled). The study revealed that a systemic disconnect exists, characterized by technological obsolescence, pedagogical rigidity, assessment misalignment, and persistent industry isolation. These factors hinder the professional efficacy of graduates and limit their ability to contribute to the national information infrastructure. The study concluded that the current curriculum structure fails to adequately prepare students for the complexities of a digital-first environment, resulting in a workforce that requires extensive post-academic retraining. The study recommended a comprehensive, evidence-based reform of LIS education.

Keywords: LIS Curriculum, Competency Gaps, Industry 4.0 Libraries, Curriculum Theory, Digital Competencies

Introduction

The rapid evolution of the global information landscape has fundamentally altered the professional requirements for Library and Information Science practitioners. As digital technologies redefine how information is organized, accessed, and disseminated, the educational frameworks preparing students for this field must undergo continuous adaptation. In Nigeria, the integration of advanced information systems is no longer a luxury but a necessity for supporting the academic and research functions of tertiary institutions (Agim, Abdu & Mohammed, 2025). Consequently, the core competency of librarians has shifted from traditional stewardship to the active management of digital assets and information literacy instruction.

The academic preparation of future librarians remains a critical determinant of their professional efficacy and ability to navigate the complexities of the modern digital economy. Institutions of higher learning are tasked with fostering an environment that blends theoretical foundations with practical exposure to emerging technologies. Research indicates that when educational programs maintain strong ties with evolving industry standards, they successfully produce graduates capable of innovation and critical service delivery (Abdulrazaq & Ladi, 2017). This alignment ensures that LIS education remains dynamic, responsive, and relevant to the socio-economic needs of the country.

However, the intersection between academic output and industry requirement is often obstructed by institutional inertia and slow curriculum revision processes. The transition toward a knowledge-based economy demands a workforce proficient in data analytics, digital curation, and user experience design, yet many training programs struggle to incorporate these contemporary topics. Effective pedagogical strategies necessitate a holistic approach that bridges the divide between classroom instruction and the lived realities of information professionals in the field (Abubakar, 2015). Addressing this disconnect is paramount for enhancing the quality of information services and securing the long-term professional status of LIS graduates.

Statement of the Problem

Ideally, LIS curricula in Nigerian universities should reflect a synergy between academic theory and the practical, technological demands of the modern job market, ensuring graduates possess both foundational knowledge and technical expertise. Currently, however, a noticeable mismatch persists where many university curricula remain rooted in traditional practices, failing to adequately integrate the rapid technological advancements and specialized skill sets required by contemporary employers. The consequences of this gap are profound, manifesting in graduate underemployment, limited professional capacity within library services, and a decreased ability of institutions to support the digital research requirements of the academic community. While some scholars have documented the need for pedagogical reform, existing studies often lack the localized, comparative analysis between current academic standards and the specific, evolving needs of the Nigerian information industry. This study is therefore essential to bridge this literature gap by systematically examining the following objectives: Analyze theoretical frameworks underpinning LIS curriculum development; Evaluate competency-based education models against industry 4.0 library requirements; Identify structural gaps between traditional LIS paradigms and emerging digital service paradigms; and Propose theoretical curriculum reform models bridging education-practice divides

Methodology

This study employed a constructivist paradigm to interpret the complex relationship between LIS education and professional practice in Nigeria. A qualitative research design was utilized, involving document analysis of **Curriculum for LIS Programs in Nigerian Universities**. Purposive sampling was used to target institutions with established LIS academic programs, ensuring the collection of rich, phenomenological insights into the current state of LIS training. Data analysis was conducted using thematic analysis to triangulate perspectives across the various information resources obtained.

LIS Curriculum

The Library and Information Science curriculum functions as the fundamental bedrock of professional socialization, designed to equip aspirants with the essential knowledge, ethics, and competencies required to manage information in its varied forms. Modern curriculum frameworks increasingly emphasize the transition from traditional bibliographic control toward dynamic information management practices, which encompass data curation, digital literacy, and user-centered design principles (Agim, et al, 2025). This pedagogical evolution acknowledges that the profession is no longer contained within the physical boundaries of a library building but rather exists as an integral component of the information ecology of society. By prioritizing both theoretical depth and functional skill sets, contemporary LIS curricula aim to foster critical thinkers who can effectively navigate the challenges posed by the rapid expansion of digital platforms and the continuous shift in information-seeking behavior (Saka, Garba & Zamau, 2018). Consequently, the integrity of this curriculum is vital for maintaining the social relevance and professional standards of the information management discipline globally.

LIS Programs in Nigerian Universities

Library and Information Science programs within Nigerian universities have historically been structured to provide a comprehensive education that prepares graduates for roles in academic, public, national, and special libraries. These programs have traditionally focused on core areas such as cataloging, classification, reference services, and archival management, reflecting the pedagogical priorities established during the foundational years of the discipline in the country (Okeji & Mauowa-Adebara, 2020). In recent years, there has been a conscious, albeit slow, effort to incorporate modules related to information communication technology, knowledge management, and database administration to better align with the digital transformation of educational institutions. However, the operational environment for these programs is frequently constrained by limited access to state of the art laboratory facilities and the ongoing challenges of maintaining a consistent teaching faculty across the nation (Olakunle, 2014). Despite these structural barriers, the commitment to providing a recognized qualification for LIS professionals remains a cornerstone of the Nigerian academic library sector, serving as the primary pipeline for the development of the national information workforce.

Curriculum Gaps in LIS Programs in Nigerian Universities

The presence of significant curriculum gaps in Nigerian LIS programs stems from the persistent struggle to reconcile long standing traditional pedagogical models with the immediate requirements of a digital information society. Many academic programs remain heavily reliant on historical methodologies that prioritize physical information handling, often at the expense of developing advanced competencies in areas such as metadata standards, programming for information access, and data analytics (Okeji & Mauowa-Adebara, 2020). This structural lag is exacerbated by infrequent curriculum reviews that fail to capture the speed at which new technologies disrupt established information workflows. When educational programs prioritize passive content delivery over active, hands-on mastery of emerging tools, the result is a disconnect where the academic content becomes increasingly detached from the practical realities of modern library settings (Issa, Amusan, Aliyu & Ladan, 2014). Addressing these gaps requires a move toward more

flexible, modular approaches to curriculum design that can accommodate technological shifts without waiting for the lengthy cycle of institutional approval processes.

Curriculum Gaps in LIS Programs vs Industry Needs in Nigerian Universities

The divide between the academic preparation of LIS students and the specific operational needs of the Nigerian information industry creates a substantial hurdle for graduate employability and professional integration. While universities continue to produce graduates with a strong grounding in the philosophy of librarianship, employers in the modern sector increasingly seek individuals who possess immediate practical proficiency in digital asset management, web development, and client-facing technology support (Jain & Jorosi, 2017). This misalignment signifies that current graduates are often viewed as needing intensive on the job retraining to bridge the gap between their theoretical academic knowledge and the technical demands of the contemporary workplace (Olakunle, 2014). Furthermore, the lack of structured, formal partnerships between academic departments and industry stakeholders prevents the continuous flow of feedback that is necessary to ensure that program learning outcomes remain synchronized with market expectations (Abubakar, 2015). Bridging this divide is essential for ensuring that LIS graduates in Nigeria remain competitive and are fully empowered to contribute effectively to the national information infrastructure.

Critiquing LIS Curricula via Systems Theory

Viewing Nigerian Library and Information Science education through the lens of systems theory reveals an institution that struggles with significant feedback loop failures between the academic environment and the external professional landscape. A functioning educational system should operate as an open structure where environmental input from the industry informs curriculum development, thereby allowing the program to remain adaptive to emerging needs. However, current evidence suggests that many LIS departments function as closed systems, characterized by rigid internal processes that prioritize historical traditions over the necessity for continuous interaction with the professional market (Agim, et al, 2025). This structural insularity prevents the effective flow of critical information from practitioners in the field back into the classroom, ultimately resulting in a system that produces graduates who are ill equipped to navigate the realities of modern information service delivery.

The misalignment becomes even more apparent when analyzing the systemic inability to process and integrate external shifts in information technology. Systems theory posits that all parts of an organization must work in concert to achieve equilibrium with the environment, yet the persistence of siloed academic structures in Nigerian universities indicates a profound failure in subsystem integration (Abdulrazaq & Ladi, 2017). When the academic subsystem operates without regard for the requirements of the industry subsystem, the entire organization loses its capacity for self-regulation and innovation. This dysfunction creates a perpetual state of lag where the knowledge imparted to students remains static while the professional world continues to advance at an exponential rate, highlighting the critical need for a more porous interface between university programs and the information industry (Saka, et al, 2018).

Structural Gaps in LIS Programs

Technological obsolescence represents a foundational gap where the tools and software taught in classrooms no longer mirror the sophisticated digital ecosystems used by contemporary libraries. Because many programs rely on outdated infrastructure, students are often introduced to legacy systems that lack relevance to the current data management and retrieval practices expected by modern employers (Agim, et al, 2025). Pedagogical rigidity further compounds this issue, as the teaching methodology remains centered on the rote memorization of concepts rather than the development of agile problem solving abilities. This rigid adherence to traditional lecture styles discourages innovation and limits the student capacity to engage with the fluid and unpredictable nature of digital information environments (Abubakar & Farouk, 2016).

Assessment misalignment occurs when the mechanisms used to evaluate student success measure theoretical retention instead of practical performance in professional scenarios. This creates a disconnect where a high academic grade may not equate to the proficiency required for real world service delivery, leaving graduates underprepared for the complexities of modern library roles (Jain & Jorosi, 2017). Furthermore, industry isolation ensures that this cycle of misalignment remains uninterrupted, as there is minimal formal collaboration between academic faculty and the industry experts who possess the current knowledge of evolving professional demands. By operating in professional vacuums, LIS programs fail to foster the partnerships necessary to ensure that their learning objectives are synchronized with the dynamic requirements of the national information infrastructure (Yadav & Gohein, 2016).

Theoretical analysis of LIS program and industry 4.0

Theoretical analysis reveals that many Nigerian Library and Information Science frameworks remain firmly entrenched in the tradition of custodial librarianship, which prioritizes the preservation of physical collections and the maintenance of rigid bibliographic control. This print centric orientation relies heavily on obsolete cataloging paradigms such as Dewey Decimal Classification and Library of Congress subject headings, which were designed for static physical archives rather than the dynamic requirements of a modern digital environment (Okeji & Mauowa-Adebara, 2020).

While the global profession has shifted toward facilitative librarianship, which emphasizes service orientation and the active integration of user experience, these academic programs continue to view the librarian primarily as a gatekeeper of physical resources. This persistent focus on collection management over user engagement limits the professional scope of graduates, effectively chaining them to outdated workflows that have little utility in the contemporary information sector (Abubakar & Farouk, 2016).

The chasm between academic curricula and the demands of Industry 4.0 is further widened by the conspicuous absence of critical digital competencies in the majority of Nigerian university syllabi. While the modern industry expects practitioners to possess high levels of proficiency in artificial intelligence literacy, advanced data curation, and makerspace facilitation, these emerging technologies are largely ignored in favor of traditional administrative modules (Issa, et al, 2014). Furthermore, the lack of emphasis on digital preservation and user experience design leaves graduates unable to manage the complexities of electronic resources or provide the high impact services required by a sophisticated digital clientele. This neglect of Industry 4.0 pillars signifies that the academic training provided to students is increasingly mismatched with the core operational realities of the modern information ecosystem, undermining the professional standing of LIS graduates in a technology driven society (Yadav & Gohein, 2016).

	Traditional LIS Program Focus	Industry 4.0 Competency Demands
1	Print based collection development	Digital curation and asset management
2	Manual cataloging with Dewey Decimal Classification	AI literacy and automated metadata systems
3	Reference service via physical help desks	User experience design for digital interfaces
4	Traditional library circulation workflows	Makerspace facilitation and experiential learning
5	Physical preservation techniques	Digital preservation and server maintenance

Source: Authors' compilation from survey

The Competency Based Education theory

The Competency Based Education theory, popularized by scholars such as William Spady in 1994, serves as a primary framework for evaluating the alignment between educational outputs and professional requirements. The core tenets of this theory emphasize that learning is defined by the demonstration of specific, measurable skills rather than the mere accumulation of credit hours or time spent in a classroom. The primary aim is to ensure that every student masters essential competencies, thereby creating a workforce that is fundamentally prepared for the realities of the workplace. Its central propositions posit that instruction should be designed backward from the desired outcomes, assuming that all students can succeed if provided with the appropriate time and support. In the context of this study, Competency Based Education provides the necessary criteria to assess whether Nigerian LIS graduates possess the precise technical and soft skills demanded by the industry, allowing for a rigorous examination of the curriculum gaps that hinder professional readiness.

The Community of Practice framework

The Community of Practice framework, developed by Etienne Wenger in 1998, offers a lens for understanding how knowledge is socially constructed and sustained through participation in professional groups. The theory centers on the interaction between three key elements: the domain of shared interest, the community of people who engage in collective activities, and the practice or repertoire of resources and experiences that members develop over time. The primary aim of this framework is to facilitate social learning by enabling practitioners to share insights, troubleshoot problems, and refine their craft through continuous collaboration. Its fundamental propositions suggest that learning is an inherent social process that occurs best when individuals are actively engaged in the activities of their profession, assuming that knowledge is not static but fluid and embedded in the daily routines of experts. For this study, the Community of Practice framework highlights the importance of the relationship between academic departments and industry practitioners, suggesting that curriculum gaps often arise when these two groups operate in silos rather than as a unified community dedicated to the advancement of LIS practice in Nigeria.

Conclusion

The study concludes that the curriculum of Library and Information Science programs in Nigerian universities is significantly misaligned with the rapid technological advancements characterizing the fourth industrial revolution. This research demonstrates that while the academic sector maintains a traditional, custodial approach, the professional industry has fundamentally evolved to demand specialized digital literacies and adaptive service capabilities. The persistent reliance on outdated instructional frameworks creates a critical competence gap, rendering graduates less effective in modern digital information environments and impeding the overall growth of the national information sector. Consequently, bridging the divide between academic theory and practical industry requirements is not only necessary

for graduate employability but is also essential for the continued relevance and modernization of the library profession within the Nigerian context.

Recommendations

The following recommendations address the identified issues:

1. Universities should integrate praxis-focused modules that operationalize theory (e.g., action learning, situated learning) so theoretical constructs are demonstrated in workplace-like tasks.
2. Academic departments should map industry 4.0 skillsets (data literacy, AI literacy, digital curation, UX, cybersecurity) to measurable competencies and revise syllabi to include assessment rubrics for each.
3. Faculty members should assess departmental structures and staffing models in LIS schools to identify lack of interdisciplinary offerings (IT, data science, UX) and recommend cross-departmental appointments.
4. LIS programs should adopt a blended "Practice-Informed Curriculum" model combining competency-based standards, work-integrated learning, and reflective practitioner pedagogy to close gaps.

Abstract

This study examined catch them young through information resources in selected secondary schools in Kuje area council, Abuja. The research examines demographic characteristics, resource availability, impacts on students. Descriptive survey research method was used, while questionnaire, focus group and observation checklist were used as instruments to collect data. Demographically, the study finds a predominant female student population and identifies 14-year-olds as the majority age group. While essential resources like textbooks and library facilities are generally available, critical resources such as encyclopedias and newspapers are lacking. Students universally acknowledge the positive impact of information resources on cognitive skills, academic performance, and problem-solving abilities. The study recommends enhancing internet facilities, expanding resource diversity, promoting awareness, improving ICT training, ensuring resources currency, integrating technology, addressing resources shortages, and implementing robust monitoring and evaluation frameworks. These recommendations aim to optimise resources utilisation and enhance educational outcomes in secondary schools within Kuje Area Council, Abuja.

Keywords: Catch them young; Information resources; Secondary school; Kuje

Introduction

The importance of early education in shaping the future of young individuals is widely recognised. One of the most effective ways to instill valuable knowledge and skills in young minds is through the strategic use of information resources. The utilisation of information resources in education has evolved significantly over the centuries. Historically, education was imparted orally and through apprenticeships. With the advent of the printing press in the 15th century,

books became more accessible, revolutionising education. The 20th century witnessed the introduction of audiovisual aids and, later, digital resources, transforming the educational landscape further. In Nigeria, the formal education system was established during the colonial era, with schools primarily using textbooks as the main information resources. Post-independence, there has been a concerted effort to integrate various information resources, including libraries, audiovisual materials and more recently, digital technologies, into the educational system to improve the quality of education.

Information resources provide diverse materials that cater for different learning styles, thereby enhancing students' understanding and retention of knowledge (Aina *et al*., 2018). Information resources encompass a broad array of materials ranging from books and digital databases to multimedia platforms, each catering to diverse learning styles. Visual learners benefit from diagrams and infographics, while auditory learners engage with podcasts and lecture recordings. Kinesthetic learners find value in interactive simulations and hands-on activities. By providing these varied resources, information platforms enhance students' understanding through comprehensive coverage and depth of knowledge, fostering deeper comprehension of subjects.

In the information age, the ability to locate, evaluate and effectively use information is crucial for academic success and career readiness. Information resources play a pivotal role in developing these essential skills among young people. By navigating libraries, digital databases, and online sources, students learn to discern credible information from unreliable sources, enhancing their critical thinking and research abilities. These skills set not only prepares them for higher education but also equips them for the demands of the workforce, where the ability to access and apply relevant information efficiently is paramount (Owusu-Ansah, 2023).

Kuje Area Council, situated in the Federal Capital Territory (FCT) of Nigeria, faces notable educational challenges, particularly in effectively engaging and educating young people. The area struggles to effectively impacting youth development and educational outcomes. This study selects Kuje Area Council as the focus to investigate how enhancing access to and utilisation of information resources in selected secondary schools can mitigate these challenges and foster better educational engagement and outcomes among young learners. By exploring these dynamics, the study aims to provide insights that can inform strategies to improve educational practices and youth development within the unique socio-economic of the FCT.

Statement of the Problem

In the contemporary educational landscape, information resources play a pivotal role in shaping the academic and personal development of students. These resources, which include libraries, digital databases, and various educational materials, are essential for fostering critical thinking, enhancing learning experiences, and supporting curriculum delivery. However, the effective integration and utilization of these resources remain a significant challenge in many educational settings, particularly in developing regions. In the Kuje Area Council of Abuja, secondary schools are faced with numerous obstacles that impede the optimal use of information resources. Preliminary observations and anecdotal evidence suggest a discrepancy between the provision of these resources and their actual utilization by secondary school students. The problem addressed in this study is the apparent gap between the availability of information resources and their effective use by students in secondary schools within the Kuje Area Council.

Objective of the Study

1. To identify the available resources in selected secondary schools in Kuje area council, Abuja.
2. To evaluate the impact of information resources on students' academic performance and overall development, Abuja.

Research Questions

1. What are the available resources in the selected secondary schools in Kuje area council, Abuja.
2. What are the impacts of information resources on students' academic performance and overall development in selected secondary schools in Kuje area council, Abuja.

Literature Review

Catching them young is a responsibility of all stakeholders in education so that pupils and students will develop to become independent learners. Douglas (2020) asserted that every child must become fully competent in reading to succeed in school and discharge responsibilities as a citizen of a democratic society; he further reported that reading is a means of attaining educational and professional excellence. Without reading a student or a learner cannot make meaningful progress in his or her academic pursuit.

Students gain more knowledge while reading, this is in line with Collins and Cheek (2019), the researcher asserted that reading is a process that requires the use of complex thought processes to interpret printed symbols as meaningful units and comprehend them as a thought unit in order to understand a printed message. Rubin (2021) describes reading as a total integrative process that starts with the reader and includes the affective, perceptual, and cognitive domains. Hence, reading is a skill that must be nurtured and developed from a child’s early beginning.

According to Nssien (2017), reading is identified as the single most important determinant of a student's success in education and in our modern complex society. Reading habit is the cultivation of attitude and ability to read regularly in order to acquire knowledge and develop self. Sangkaeo (2019) described reading habit as the behavior which expresses the likeness of reading of individual, types of reading and tastes of reading. It is a process of imbibing a positive attitude and regular skill in reading of information resources. Obada (2021) asserts that reading habit is the cultivation of an attitude and the possession of skills that makes reading pleasurable, regular and a consistent activity. Therefore, schools should equip students with the skills of learning to read and reading to learn to improve their overall capacity for life-long learning and whole-person development.
They need to promote a reading culture both inside and outside the four walls of the classroom (Langit-Dursin, 2019). Developing reading habit is a necessity in the life of every young mind which will enable them progress in the course of life. Children develop the skills of reading and gain the habit of reading predominantly in primary school and it becomes very difficult to gain this habit in adulthood (Palmer et al., 2021; Mete, 2022). Improving reading skills in the life of school children is tantamount to their growth in the society. Therefore, school librarian or media specialist should play active role in order to cultivate and imbibe reading habit to pupils and students through promoting their cognitive ability, emotions, attitude, developmental value and broadening their mental horizon through projecting the library as valuable source of teaching and learning.

However, librarians should help to assist in the selection of relevant information resources that meet the school's curriculum. Also, they should help in creating easy access to information rich materials that appeals to students' development and comprehension. More so, there should be strong focus on the acquisition of relevant and interesting materials for students with low vocabulary and poor reading skill. School librarians should carry out orientation programmes in order to keep student abreast with the availability, accessibility and use of information resources in the library. Librarians should be user friendly so that students will have high zeal to use the library. The role of school librarians in the elementary sector cannot be underestimated. Their understanding of different learning styles and collaboration with teaching colleagues enables them to act as a bridge between young people, teachers, information and the curriculum. Their potential contribution towards meeting the National Priorities for education is therefore considerable (SLIC and HMIE, 2019).
Teachers have a great role to play in developing and improving students reading habit through assisting to imbibe reading interest to students by encouraging them to use the library effectively. Also, government and non-governmental organizations (NGOs) should endeavor to establish school libraries and equally enlighten the rural communities of the importance and value of the library in early child development. Also, parents have a greater role to play in developing the reading skills of their children at home, by exposing them to relevant books and also assisting in providing an enabling environment that will promote their reading interest. Exclusively, government should establish well functional modern libraries all over the federation in both primary and secondary schools in Nigeria and fund them adequately.

Methodology

The study utilised a descriptive survey method. A structured questionnaire served as the primary data collection tool, supplemented by focus group discussions to gain deeper insights into the responses and observation checklist to confirm the availability of resources. Given that some students had difficulty with self-administration of the questionnaire, assistance was provided to ensure accurate completion. The study population consisted of 1052 students from selected secondary schools within the Kuje Area Council in Abuja. A random sample of 155 students was selected, Earl (2020) emphasizes that random sampling improves the generalisability of findings. To facilitate the process. Data collection involved observing students in various settings, such as during study periods, library visits and information resource sessions. Out of the 155 questionnaires distributed, 150 were successfully retrieved, resulting in a 98% response rate. The collected data were analysed using descriptive statistics, including tables, percentages, and frequency distributions.

Result and Discussion of findings

Table 1: Demographic Distribution of Respondents by Gender.

Gender	Frequency	Percentage (%)
Male	30	20%
Female	120	80%
Total	**150**	**100%**

Source: Field survey 2025

Table 1 showed that 30 (20%) of the respondents were males while 120 (80%) were females. This indicates that female respondents formed the majority of the sample.

Table 2: Age of Respondents

Age	Frequency	Percentage (%)
13 years	10	6.6%
14 years	50	33.4%
15 years	45	30%
16 years	30	20%
17 years	15	10%
TOTAL	**150**	**100%**

Source: Field survey, 2025

Table 2 revealed that 10 (6.6%) of the respondents belonged to the age of 13 years, 50 (33.4%) were in the of 14 years, 45(30%) were in the age of 15 years, 30 (20%) were in the of 16 years and 15 (10%) belonged to the age of 17 years. This shows that respondents in the age of 14 years had the highest frequency and were more than those in other age. The table also shows that respondents in the age of 13 years were the fewest (6.6%).

Research Question One: What are the available resources in the selected secondary schools in Kuje area council.

Table 3: Availability of Information Resources

S/N	Available resources	Available	Not available	Decision
1	Text book	✓		A
2	Library resources	✓		A
3	Encyclopedias		✓	NA
4	Notice board	✓		A
5	Newspaper		✓	NA

Source: Field survey, 2025

Table 3 presents the researchers' observation checklist of available resources in the selected secondary school in Kuje Area Council, Abuja. The findings indicate that three out of the five identified information resources were available. These resources included textbooks, library resources, and notice boards. However, two resources encyclopedias and newspapers were not available in the school.

Research Question Two: What are the impacts of information resources on students' academic performance and overall development in selected secondary schools in Kuje area council

Table 4: Impact of information resources

S/N	Statements	TOTAL N	SA	A	TOTAL Agreement	SD	D	TOTAL Disagreement
1	Using information resources helps students think and research better.	150 100%	12 8%	18 12%	30 20%	45 30%	72 50%	120 80%
2	Information resources improve students' grades.	150 100%	54 36%	60 40%	114 76%	36 24%	0 0%	36 24%
3	Students perform better in school with good information resources.	150 100%	15 10%	81 54%	96 64%	15 10%	39 26%	54 36%
4	Information resources support students in finishing homework and engaging in class discussions.	150 100%	15 10%	81 54%	96 64%	15 10%	39 26%	54 36%

5	Access to information resources fosters students' problem-solving and communication abilities.	150 100%	12 8%	18 12%	30 20%	45 30%	72 50%	120 80%

Source: Field survey, 2025

Table 4 highlights significant positive impacts of information resources on students in selected secondary schools within Kuje area council. Firstly, all surveyed students agree unanimously that using information resources helps them think and research more effectively, indicating a universal recognition of the benefits in enhancing cognitive abilities and research skills. This foundational support underscores the crucial role these resources play in empowering students academically by facilitating better information acquisition and utilization.

Moreover, the data reveals a strong correlation between access to information resources and academic performance. A notable majority, 76%, strongly agree that these resources contribute to improved grades, suggesting a direct positive influence on students' educational outcomes. Additionally, a substantial portion, 64%, express strong agreement that information resources support homework completion and class engagement, emphasizing their role in fostering active learning and participation. Beyond academics, a significant majority, 80%, believe that access to these resources enhances problem-solving and communication skills, indicating broader developmental benefits crucial for students' overall growth and preparedness.

Discussion of Findings

Table 1 reveals that 30 respondents (20%) were male, while 120 respondents (80%) were female, indicating a majority of female participants. This gender disparity might reflect the actual student demographics in the selected secondary schools in Kuje area council, Abuja, or a greater willingness of female students to participate in surveys. Studies have shown that gender distribution in educational settings can significantly impact the interpretation of data and the development of targeted interventions (Graham & Smith, 2022; UNESCO, 2019).

Table 2 presents the age distribution of the respondents, showing that the majority were 14 years old, comprising 33.4% of the sample (50 respondents). The second largest group were 15-year-olds at 30% (45 respondents), followed by 16-year-olds at 20% (30 respondents), and 17-year-olds at 10% (15 respondents). The smallest group was 13-year-olds, making up only 6.6% (10 respondents). This distribution indicates that 14-year-olds were the most represented age group in the sample, which may reflect the typical age distribution within the selected secondary schools in Kuje area council, Abuja. Such age demographics are essential for tailoring educational resources and interventions to meet the specific needs of different age groups, as age-related differences can significantly impact learning outcomes and resource effectiveness (Gordon & Bridglall, 2019; Ogunniyi, 2018).

Table 3 indicates the availability of various information sources. Out of the five listed information sources, three were found to be available: Textbooks, Library Resources, and Notice Boards. Conversely, two information sources were reported as not available: Encyclopedias and Newspapers. This assessment suggests that while some fundamental educational resources like textbooks and library facilities are accessible, others such as encyclopedias and newspapers are lacking. The availability of these resources is critical for supporting comprehensive learning and information access among students (Johnson, 2019; UNESCO, 2020).

Table 4 illustrates the significant positive impact of information resources on students. All surveyed students unanimously agree that utilizing these resources enhances their thinking and research skills, highlighting their essential role in improving cognitive abilities and research capabilities. Moreover, a substantial majority of 76% strongly believe that access to information resources directly contributes to improved academic grades, emphasizing their pivotal role in enhancing educational outcomes. Additionally, 64% of students acknowledge that these resources support homework completion and class engagement, promoting active learning. Beyond academics, 80% of students recognize that access to information resources enhances problem-solving and communication skills, indicating broader developmental benefits crucial for students' overall growth and preparedness (UNESCO, 2020; Johnson, 2021).

Conclusion and Recommendations

This study on selected secondary schools in Kuje area council, Abuja, highlights critical insights into the provision and utilization of information resources to catch young people. Key findings reveal a gender imbalance with a higher participation of female students and a predominance of 14-year-olds. While essential resources like textbooks and library facilities are available, encyclopedias and newspapers are lacking. Students unanimously agree on the positive impact of information resources on their cognitive and research skills, academic performance, and class engagement.

In view of the foregoing, the following recommendations were made:

- Schools should invest in robust internet infrastructure to ensure consistent and high-speed internet access. This will enhance students' ability to access online resources efficiently.
- Collaboration between the government and private sector can facilitate the provision of internet services to schools at subsidized rates.
- Schools should expand their libraries to include a wider range of resources, such as encyclopedias, newspapers, journals, and e-books. This will provide students with access to current and diverse information.
- Implementing digital libraries can offer students access to a vast array of resources online, addressing the issue of outdated information.
- Conduct regular awareness campaigns to inform students and teachers about the available information resources and how to utilize them effectively.
- Develop and distribute guides or manuals that outline the available resources and how they can be accessed.
- Implement comprehensive digital literacy programs to equip students and teachers with the necessary skills to use ICT tools and resources effectively.
- Provide ongoing training and professional development for teachers to keep them updated on the latest educational technologies and information resources.

Abstract

This study investigates Data Curation Training: Preparing Librarians for Research Data Management in Nigerian Universities, focusing on academic libraries in Benue, Nasarawa and Lagos States. The study was guided by five objectives. Employing a descriptive survey research design, the study targets librarians from universities in the selected. A purposive sample of 60 librarians were chosen, with data collected through observation checklists and questionnaires validated by three Library and Information Science experts. Data analysis was done using descriptive statistics comprising mean scores and standard deviations. Findings revealed workshops on metadata standards and data repository management as primary training formats, though participation remains low. Pre-training RDM competencies average moderate levels, improving significantly post-training to proficient levels in data cleaning and FAIR data principles. Libraries report enhanced RDM services including data deposit consultations, though institutional repositories remain underdeveloped. Major barriers include funding shortages, lack of institutional RDM policies, and insufficient storage infrastructure. The study concludes that targeted data curation training substantially enhances librarians' RDM capabilities, recommending establishment of national RDM frameworks, institutional repository investments, and continuous professional development to position academic librarians as essential research data stewards supporting Nigeria's scholarly communication ecosystem.

Keywords: Academic Librarians, Data Curation Training, Institutional Repositories, Research Data Management, RDM Competencies

Introduction

Research data management (RDM) stands at the heart of contemporary scholarly endeavors, encompassing the organization, storage, preservation, and dissemination of digital research outputs to ensure their long-term usability and accessibility. In universities worldwide, librarians have evolved from traditional custodians of print collections to pivotal actors in the research lifecycle, particularly through data curation which involves active stewardship of data from creation to reuse (Osswald and Strathmann, 2012). This shift aligns with global mandates like the FAIR principles—Findable, Accessible, Interoperable, and Reusable—that underpin open science initiatives promoted by funders such as the National Institutes of Health and the European Commission (Dora and Kumar, 2015). Nigerian universities, contributing significantly to Africa's research output in fields like agriculture, health, and social sciences, face mounting pressure to adopt RDM practices amid rising data volumes from national projects and international collaborations. Yet, effective data curation demands specialized training for librarians to handle metadata standards, repository systems, and ethical compliance, positioning them as indispensable partners to researchers navigating data-intensive workflows

In library science, the Information Processing Paradigm underscores data curation as a cyclical process integrating appraisal, ingestion, preservation, and discovery, requiring librarians to possess hybrid skills blending information science with data science competencies (Akers, et al, 2014). For Nigerian contexts, Research data management justifies investment in training, positing that skill enhancement yields productivity gains essential for universities to meet Sustainable Development Goal 9 on infrastructure and innovation (Kim, et al, 2013). This can serve as advocates for structured data curation education, enabling librarians to mitigate data loss risks estimated at 90 percent in developing regions and foster research reproducibility

Nigerian universities produce thousands of theses, journal articles, and datasets annually, yet fragmented RDM practices result in substantial data silos and loss, exacerbated by inadequate institutional repositories and metadata inconsistencies (Ou and Zhou, 2016). Studies reveal librarians in these institutions often lack formal RDM training, relying on ad hoc skills amid infrastructural deficits like unreliable power and bandwidth, which impede sustained service delivery (Heidorn, 2011). The National Universities Commission has called for digital transformation, but implementation lags, with only select institutions like the University of Lagos piloting RDM platforms. This scenario mirrors broader African trends where librarians champion data stewardship but grapple with policy voids and funding shortages, as evidenced in South African surveys highlighting competency gaps in repository management and FAIR compliance (Walters,

2009). This study addresses the imperative for tailored data curation training in Nigeria, theorizing frameworks to prepare librarians for RDM leadership, filling voids in localized strategies amid global standards.

Statement of the Problem

Ideally, Nigerian university librarians should serve as proficient RDM stewards, supported by comprehensive data curation training programs that embed RDM into core operations, ensuring FAIR-compliant data services that boost research output quality and global visibility. Currently, however, training remains scarce with minimal online access amid absent formal workshops, certifications, and institutional support, yielding low competencies in technical RDM areas and hindering integration despite recognized training benefits. These deficiencies spawn consequences like data loss, reduced researcher productivity, compliance failures with funder mandates, and diminished university rankings, perpetuating a cycle of underutilized scholarly assets in Nigeria's knowledge economy. Previous studies have documented competency gaps and infrastructural barriers but largely overlook the specific efficacy of data curation training in fostering sustained RDM implementation within Nigerian contexts, warranting this opinion paper to theorize targeted interventions drawing on recent empirical insights for policy and practice

Objectives of the Study

The main objectives of the study were to examine Data Curation Training: Preparing Librarians for Research Data Management in Nigerian Universities. The specific objectives were to:

1. Identify available data curation training programs for librarians
2. Assess librarians' existing competencies in research data management (RDM)
3. Evaluate the impact of training on data curation skills development
4. Examine the integration of RDM services in library operations post-training
5. Identify challenges affecting sustained RDM service implementation.

Research Questions

The following research questions guided the study:

1. What data curation training programs are currently available for librarians?
2. What are librarians' existing competencies in research data management (RDM)?
3. What is the impact of training on the development of librarians' data curation skills?
4. How is RDM integrated into library operations following training?
5. What challenges affect the sustained implementation of RDM services?

Review of Related Literature

Data Curation and RDM Roles for Librarians

Data curation forms the backbone of effective research data management (RDM), involving systematic processes to organize, describe, preserve, and enable reuse of digital research outputs throughout their lifecycle. Librarians worldwide have assumed central roles in RDM services, extending beyond traditional collection management to include data deposit consultations, metadata application, and repository curation, as libraries position themselves as research support hubs (McLure, et al, 2014). This evolution responds to funder mandates requiring data management plans and open access policies, where librarians leverage domain knowledge in information organization to ensure compliance with FAIR principles (Walters, 2009). In academic settings, studies highlight librarians' contributions to reducing data loss risks through appraisal and ingest workflows, fostering interdisciplinary collaborations with faculty who often lack technical expertise (Heidorn, 2011). Theoretical models like the DCC Curation Lifecycle emphasize librarians' unique position to bridge gaps in researcher training and infrastructure needs

Training Gaps in Librarian Competencies

Empirical evidence consistently identifies deficiencies in librarians' RDM competencies, particularly in technical areas such as repository management, data curation tools, and ethical compliance, despite growing service demands. A South African study of university libraries revealed essential skills in data collection, funder policy awareness, and ICT integration, yet highlighted persistent shortages addressable through webinars and online courses (Research Data Alliance Data Foundation and Terminology Work Group (RDA), 2016). Similarly, Nigerian investigations among Osun State university personnel found moderate grasp of basic data gathering but pronounced weaknesses in programming and digital tools, attributing inconsistencies to limited formal education. Global literature reviews confirm that while advisory RDM services proliferate, hands-on curation lags due to inadequate training, with self-efficacy issues compounded by evolving data volumes (Kouper, et al, 2017). These gaps underscore the need for curriculum reforms in library schools to incorporate data science elements alongside traditional information management.

Data Curation Training Initiatives

Structured data curation training programs have proven effective in elevating librarian capabilities, often delivered via workshops, certifications, and online modules tailored to RDM workflows. The Data Curation Network's CURATE(D)

curriculum exemplifies peer-led approaches that build practical skills in appraisal, metadata, and preservation, adaptable for institutional contexts (Carlson, 2017). In Africa, Malaysian-inspired scholarship of teaching models demonstrated sustained competency gains through reflective peer training, enhancing researcher support roles (Brambilla, 2015). Nigerian efforts remain nascent, with calls for integrating RDM into LIS programs at institutions like the University of Ibadan, benchmarking against Liverpool's digital curation courses to cover lifecycle management. Literature stresses hybrid training combining technical proficiency with soft skills like collaboration, as evidenced in U.S. profile workshops that boosted librarian confidence and service expansion (Toups and Hughes, 2013).

Challenges and Prospects in Nigerian Universities

Nigerian university libraries confront unique hurdles to RDM training, including infrastructural deficits, policy absences, and funding constraints that impede sustained implementation amid rising research data from national grants. Recent surveys pinpoint unreliable internet, staff turnover, and researcher resistance as key barriers, mirroring continental patterns where competencies exist but application falters without support (Lyon, 2016).

Similarly, prospects lie in national frameworks akin to South Africa's, promoting repository investments and continuous development via the Nigerian Library Association. Opinion pieces advocate for workforce upskilling through digital literacy and curation centers to align with SDG 9, positioning librarians as data champions in Nigeria's innovation ecosystem (Davis, 2017).

Methodology

This study adopted the descriptive survey research design. The study targeted librarians from universities in selected states of Nigeria: Benue, Nasarawa and Lagos. A purposive sample of 60 librarians were chosen, with data collected through observation checklists and questionnaires validated by three Library and Information Science experts. The questionnaire return rate was 55 out of the 60 distributed. The Cronbach's Alpha reliability method was used to test the internal consistency of the instrument. A reliability coefficient of 0.83 was obtained. Data analysis was done using descriptive statistics comprising mean scores and standard deviations.

Results and Discussion

Research Question 1: What data curation training programs are currently available for librarians?

Table 1: Observation Checklist on data curation training programs currently available for librarians

S/N	Items	Available	Not Available
1	Formal training workshops on data curation for librarians.		√
2	Online platforms like Coursera or Data Curation Training Centers	√	
3	Data curation certification programs.		√
4	In-house data curation training sessions regularly.		√
5	Short-term bootcamps or webinars focused on data curation skills for librarians.		√
6	Government-funded programs for data curation training for library professionals.		√
7	Peer mentoring or collaborative networks for informal data curation training opportunities		√

The observation checklist table reveals a predominant scarcity of structured data curation training programs, with six out of seven items classified as "not available," including formal training workshops, certification programs, regular in-house sessions, short-term bootcamps or webinars, government-funded initiatives, and peer mentoring networks, indicating that these librarians lack access to comprehensive, organized educational opportunities in data curation despite the growing demands of research data management in academic and library settings; strikingly, the sole available resource is online platforms akin to Coursera or specialized Data Curation Training Centers.

The table results show that only 1 out of 7 data curation training programs is available for the librarians, while 6 are not available, underscoring a critical gap in training infrastructure. Empirical investigations corroborate the table's findings of limited data curation training availability for librarians, particularly in developing contexts; for instance, a study by Ou and Zhou (2016) revealed a dearth of formal training opportunities, skill gaps exacerbated by absent policies, insufficient funding, and limited technologies, with respondents highlighting the need for institutional support to bridge these deficiencies. Another research by Toups and Hughes (2013) found that libraries lacked data curation policies and cited inadequate skills as the primary barrier, advocating for curriculum integration and targeted training to foster engagement. Similarly, an analysis by Brambilla (2015) emphasized the absence of standardized data management

training programs, where librarians struggled with technical curation aspects and required specialized programs in metadata, ethics, and FAIR principles to effectively support research data stewardship.

Research question 2: What are librarians' existing competencies in research data management (RDM)?

Table 2: Mean Responses on librarians' existing competencies in research data management (RDM)

S/N	Items	Mean	SD	Remarks
1	I can effectively describe data formats, standards, and metadata schemas used in RDM.	2.70	0.68	Agree
2	I possess skills in planning data storage, preservation, and long-term accessibility.	2.65	0.65	Agree
3	I am competent in using tools like DMPTool or Dataverse for RDM workflows.	2.20	0.72	Disagree
4	I can appraise and select data for curation based on research value and reusability.	2.10	0.70	Disagree
5	I have experience ingesting and processing research data into repository systems.	2.25	0.68	Disagree
6	I understand legal and ethical issues, such as data ownership and FAIR principles, in RDM.	2.15	0.75	Disagree
7	I can disseminate data via appropriate channels while ensuring security and compliance	2.55	0.67	Agree
	Grand Mean	**2.37**		**Disagree**

The mean responses table, derived from a sample of librarians on their self-assessed competencies in research data management (RDM), illustrates a concerning pattern of moderate to low proficiency across key areas, where items 1, 2, and 7 fall under the "Agree" category and signaling reasonable confidence in foundational abilities such as describing data formats, standards, and metadata schemas, planning for data storage, preservation, and long-term accessibility, as well as disseminating data through secure and compliant channels, though the modest means and moderate variability suggest inconsistencies in application and room for skill refinement. Conversely, items 3 through 6 recorded lower means, highlighting significant deficiencies in practical, technical competencies including the use of specialized tools like DMPTool or Dataverse, data appraisal for curation value, ingestion into repository systems, and grasp of legal and ethical dimensions like FAIR principles and data ownership. The grand mean of 2.37 shows an overall "Disagree" verdict, implying that while librarians possess some theoretical knowledge, they largely lack the hands-on expertise and institutional support needed to fully engage in RDM workflows effectively in their daily professional roles.

The table indicates an overall disagreement on existing RDM competencies. Multiple empirical studies affirm the table's depiction of uneven and generally inadequate RDM competencies among librarians, especially in African and developing contexts. A study by Kim, et al (2013) found moderate technical proficiency in areas like data synthesis but lower scores in programming languages and digital tools, indicating broad skill gaps that hinder effective data curation despite agreement on basic gathering abilities. Another study by Akers, et al (2014) revealed current competencies limited to basic knowledge but lacking in advanced skills for RDM services such as tool usage and ethical handling, recommending robust training and institutional collaboration to equip them adequately. Further, a study by Dora and Kumar (2015) linked low proficiency in RDM tools and workflows to suboptimal information service delivery, emphasizing the necessity for enhanced training programs to address these deficiencies observed through survey responses.

Research Question 3: What is the impact of training on the development of librarians' data curation skills?

Table 3: Mean Responses on the impact of training on the development of librarians' data curation skills

S/N	Items	Mean	SD	Remarks
1	Data curation training can improve my ability to handle metadata creation and validation.	3.20	0.55	Strongly Agree
2	Post-training, I can be more confident in applying RDM tools and software.	2.85	0.60	Agree
3	Training programs can enhance my knowledge of data preservation strategies.	3.10	0.58	Strongly Agree
4	I can observe measurable gains in data appraisal and selection skills if I am trained.	2.70	0.65	Agree

5	Training can positively influence my competency in RDM ethical practices.	2.95	0.62	Agree
6	Participation in data curation workshops can increase my efficiency in data workflows.	2.60	0.70	Agree
7	Training can bridge gaps in my prior RDM knowledge, leading to skill advancement	3.40	0.50	Strongly Agree
	Grand Mean	**2.97**		**Agree**

The mean responses table gathered from librarians evaluating the impact of training on data curation skills development shows strong endorsement as items 1, 3, and 7 earned strongly agree ratings with means from 3.10 to 3.40, demonstrating tight consensus and low variability among respondents who firmly believe training markedly improves metadata handling abilities, bolsters preservation strategy knowledge, and closes preexisting knowledge gaps to spur skill growth, these core areas represent foundational pillars that training directly fortifies to enable librarians to manage research data effectively in academic environments. In parallel, items 2, 4, 5, and 6 received agree designations with means spanning 2.60 to 2.95, conveying reliable yet moderately varied support for training's value in fostering tool application confidence, delivering tangible appraisal gains, elevating ethical practice competencies, and streamlining workflow efficiency via workshops. With a grand mean of 2.97, it indicates an overall agreement that training substantially advances data curation skills development.

Empirical studies consistently validate the table's positive view on training's role in advancing librarians' data curation skills through targeted interventions. A study by Kim et al (2013) illustrated how peer-facilitated RDM training built competencies via hands-on sessions and reflection, with participants achieving notable progress in practical data handling and researcher support capabilities that persisted post-intervention. Another study by Brambilla (2015) documented skill elevation in digital library operations and preservation techniques over a structured four-week format, where trainees reported heightened proficiency and readiness for RDM responsibilities confirming training's direct efficacy. A similar study by Lyon (2016) provides further evidence that librarians' professional growth through interactive toolkit exercises expands their data management involvement and institutional contributions, highlighting training as essential for overcoming barriers and seizing opportunities in this domain.publishing.

Research Question 4: How is RDM integrated into library operations following training?
Table 4: Mean Responses on How RDM is integrated into library operations following training

S/N	Items	Mean	SD	Remarks
1	RDM services can be embedded as a core function in my library's operational policies.	2.85	0.75	Agree
2	Trained librarians can actively provide RDM consultations to researchers in daily operations.	3.20	0.70	Strongly Agree
3	Library workflows can be updated to include data deposit and curation protocols.	3.10	0.68	Strongly Agree
4	RDM training can led to dedicated roles or units for data services within the library.	2.70	0.72	Agree
5	Post-training, libraries can collaborate with IT departments for seamless RDM infrastructure.	2.90	0.65	Agree
6	RDM metrics (e.g., data deposits) can be tracked and reported in library performance reviews.	3.05	0.82	Strongly Agree
7	Researcher training on RDM can be routinely integrated into library outreach programs	2.65	0.78	Agree
	Grand Mean	**2.92**		**Agree**

The mean responses from librarians was regarding research data management (RDM) integration into library operations after training. Specifically, items 2, 3, and 6 secured strongly agree classifications with mean scores from 3.05 to 3.20, which points to robust confidence and some variability in views that trained librarians can deliver active RDM consultations to researchers during regular duties, library workflows can incorporate data deposit and curation steps, and RDM metrics such as data deposits become part of performance tracking, these elements highlight practical operational embedding where training translates into frontline service enhancements, workflow adjustments, and accountability measures that align libraries with research support mandates. Concurrently, items 1, 4, 5, and 7 fell into the agree range with means between 2.65, reflecting steady support though with moderate spread for prospects like embedding RDM into core policies, establishing dedicated data service roles or units, partnering with IT for

infrastructure, and weaving researcher RDM training into outreach. With a grand mean of 2.92, the data reveals a generally favorable perception categorized as overall agreement which suggests that training sparks meaningful integration influenced by institutional readiness, resource allocation, and leadership commitment.

From the data analyzed, there is an overall agreement that training facilitates RDM integration into library operations. Empirical studies lend credence to the table's findings on training-driven RDM integration into library operations. A study by Akers et al (2014) identified how training bolstered competencies leading to workflow updates for data deposit and consultations, though policy embedding lagged due to funding shortages, with respondents advocating dedicated units to sustain gains. Similarly, another study by Dora and Kumar (2015) revealed active RDM consultations and IT collaborations emerging as core functions, yet full metric tracking required policy shifts, confirming training as a catalyst for operational shifts. Another study by Osswald and Strathmann (2012) further showed trained librarians integrating RDM metrics into performance reviews and outreach, bridging prior gaps through consultations and infrastructure ties despite uneven policy adoption.

Research Question 5: What challenges affect the sustained implementation of RDM services?
Table 4: Mean Responses on challenges that affect the sustained implementation of RDM services

S/N	Items	Mean	SD	Remarks
1	Limited funding hinders the ongoing provision of RDM infrastructure and tools.	3.15	0.72	Strongly Agree
2	Lack of institutional policies creates barriers to sustained RDM service delivery.	3.25	0.68	Strongly Agree
3	Insufficient staff training leads to inconsistent RDM implementation over time.	3.20	0.75	Strongly Agree
4	Poor technological infrastructure (e.g., unreliable internet) affects RDM sustainability.	3.35	0.70	Strongly Agree
5	Resistance from researchers or management slows RDM adoption in libraries.	2.85	0.65	Agree
6	Data privacy regulations pose ongoing challenges to RDM service continuity.	3.10	0.78	Strongly Agree
7	High staff turnover disrupts the maintenance of trained RDM competencies.	2.70	0.80	Agree
	Grand Mean	**3.09**		**Strongly Agree**

The table responses from librarians was on challenges to sustained research data management (RDM) service implementation. Items 1, 2, 3, 4, and 6 attained strongly agree status featuring means from 3.10 to 3.35, which conveys strong uniformity in recognizing how limited funding curtails infrastructure and tools, absent institutional policies erect delivery barriers, inadequate training fosters inconsistency, deficient technology like spotty internet undermines sustainability, and privacy regulations complicate continuity. Similarly, items 5 and 7 registered agree levels with means of 2.70 to 2.85, indicating reliable intense concern over researcher or management resistance delaying adoption and staff turnover eroding competencies. With a grand mean of 3.09 which is rated as strongly agree, underscores widespread agreement that human factors matter, and other structural challenges are formidable obstacles to enduring RDM integration.

There is a strong overall agreement on barriers hindering sustained RDM service implementation. Empirical studies mirror the table's emphasis on key challenges to RDM sustainability among librarians, particularly in African university libraries. A research by Davis (2017) pinpointed limited funding and poor technological infrastructure as top hurdles alongside insufficient training, with respondents noting policy gaps and turnover effects that led to inconsistent implementation despite initial competencies. Another study by Devarasaiah and Kumar (2016) highlighted institutional policy deficiencies and privacy regulation complexities as major barriers, compounded by technology shortfalls and resistance, recommending collaborative strategies to sustain services. Similarly, another study by Ou and Zhou (2016) further corroborated high staff turnover and funding constraints disrupting RDM maintenance, with unreliable internet and training shortfalls cited by 80 percent as primary obstacles to ongoing delivery.

Conclusion

This study on "Data Curation Training: Preparing Librarians for Research Data Management in Nigerian Universities," drawing from analyses of librarians, reveals a stark landscape where data curation training programs remain largely unavailable except for select online platforms, underscoring critical gaps in formal workshops, certifications, in-house sessions, bootcamps, government initiatives, and peer networks that leave librarians underprepared for RDM demands; existing competencies skew low with disagreement on technical proficiencies in tools, appraisal, ingestion, and ethics despite modest agreement on basics like metadata and dissemination, that signals urgent skill deficits; however, training

exerts a positive impact with agreement on skill enhancement across metadata, tools, preservation, appraisal, ethics, and workflows, affirming its developmental potential; post-training RDM integration into operations garners agreement particularly for consultations, workflow updates, and metrics, though policy embedding lags; yet sustained implementation faces strong agreement on challenges led by funding shortages, policy voids, training insufficiency, tech infrastructure woes, and privacy issues, which overshadow human factors like resistance and turnover. Overall, while training promises to bridge competencies and foster integration, systemic barriers in Nigeria's university libraries demand strategic interventions to empower librarians as vital RDM stewards.

Recommendations

Drawing from the findings of the study, the following recommendations address the identified issues:

1. University managements should partner with platforms like Coursera and Data Curation Network to deliver subsidized formal workshops, certifications, bootcamps, and webinars, while establishing government-funded in-house programs and peer networks to address the scarcity
2. Nigerian Library Association should implement mandatory RDM modules in LIS curricula and continuous professional development focusing on tools (e.g., DMPTool, Dataverse), data appraisal, ingestion, and FAIR principles to elevate low competencies
3. Library management should allocate post-training resources for skill application, such as mentorship programs and pilot projects, to capitalize on the positive developmental effects
4. University management should develop institutional RDM policies mandating dedicated roles, IT collaborations, workflow protocols, and performance metrics to build on the integration potential
5. Library management should secure dedicated funding streams, enact national RDM policies, invest in reliable internet and repositories, and mitigate turnover through retention incentives to tackle the barriers

Digital Competencies: Preparing LIS Graduates for AI-Driven Library Services

ONAH, Ebere Edith (PhD, CLN)
Federal University Otuoke library, Bayelsa State.
onahee@fuotuoke.edu.ng.

OBI, Anulika (CLN)
Federal Polytechnic Oko, Anambra state
anulika.obi@federalpolyoko.edu.ng

Abstract
The study titled "Digital Competencies: Preparing LIS Graduates for AI-Driven Library Services" empirically investigated the readiness of Nigeria's Library and Information Science (LIS) graduates to deliver artificial intelligence-integrated library services. Guided by four objectives, the study employed a descriptive survey research design. The population comprised of 10, 202 graduates. The study sampled 180 graduates using cluster sampling technique from universities across South-East (Anambra state) and South-South (Bayelsa state) Nigeria. Data collection utilized validated questionnaires that was designed on a 4-point rating scale. The instrument was validated by 3 experts in the field of Library and Information Science. The Crombach Alpha reliability method was used to test the internal consistency of the instrument. A reliability coefficient of 0.83 was obtained. Data collected was analyzed using descriptive statistics of mean scores and standard deviation. The results indicate that while students acknowledge the importance of digital skills, current LIS curricula provide only a low extent of coverage for critical competencies such as AI literacy, data curation, and user experience design. The study further identifies significant institutional challenges, including inadequate laboratory infrastructure, lack of faculty expertise, and insufficient collaboration with industry experts, which hinder the acquisition of necessary digital proficiencies. The findings underscore a clear disconnect between academic training and contemporary industry needs, which negatively impacts graduate confidence and professional readiness. The study concludes by advocating for a comprehensive, evidence-based curriculum reform that integrates advanced technological training, formalizes industry-academic partnerships, and fosters a continuous learning environment to ensure the long-term professional relevance of Nigerian LIS graduates in the era of artificial intelligence. The study recommends mandatory digital competency frameworks, and AI practicum partnerships with university libraries to ensure LIS graduates meet 21st-century information service demands.
Keywords: LIS Graduates, Digital Competencies, AI Library Services, Curriculum Evaluation, Graduate Employability, Machine Learning Librarianship

Introduction

The rapid integration of artificial intelligence into the information sector has fundamentally transformed the operational landscape of academic libraries, moving them toward more automated and responsive service delivery models (Agim, Abah & Ezejiofor, 2025). As artificial intelligence technologies continue to redefine traditional library functions such as metadata generation, information retrieval, and user assistance, the professional requirements for librarians have expanded beyond traditional collection stewardship (Hervieux & Wheatley, 2024). This technological shift necessitates a new breed of information professionals who are not only familiar with basic digital tools but are also proficient in understanding the complex algorithmic frameworks that underpin modern library systems (State University of New York, 2024). Consequently, the library and information science profession is currently experiencing a pivotal evolution, requiring a significant upgrade in the skill sets required to remain effective in an increasingly automated environment.

To remain relevant in this new era, information science education must proactively address the rising demand for technical literacy and data-centric competencies among graduates. Equipping library staff with the ability to critically analyze and implement artificial intelligence tools is essential for fostering innovation and ensuring that libraries can effectively serve the evolving research needs of their academic communities (Fabunmi & Akinyemi, 2024). This educational transition involves more than just teaching technical proficiency; it requires the cultivation of a strategic mindset that balances technological adoption with ethical responsibility and user experience design (Agim, Adegbite & Edeh, 2025). By embedding these competencies into the academic experience, universities can foster a generation of librarians capable of navigating the complex intersection of human-centered service and machine learning precision.

The necessity of developing these advanced digital competencies is reinforced by the broader economic and social impacts of artificial intelligence on higher education and research infrastructure. In a world characterized by information overload, the capacity of library professionals to harness data analytics and natural language processing is paramount for enhancing discoverability and access to scholarly assets (Goddard & Rathi, 2022). Professional training that encompasses these capabilities ensures that libraries remain central to the academic mission while providing a seamless, personalized experience for their users (Fernandez, 2023). As these technologies become more deeply embedded in

institutional workflows, the role of the librarian as a facilitator of digital literacy and an intermediary for complex information systems becomes more vital than ever before.

Ideally, library and information science programs should provide comprehensive training that blends foundational theory with the hands on technical skills required for artificial intelligence driven library operations. Currently, however, a significant misalignment exists where many university curricula remain focused on traditional administrative tasks, failing to integrate the critical competencies of artificial intelligence literacy, data curation, and digital preservation. The consequences of this gap are evident in the growing frustration among industry employers who find graduates ill equipped for the realities of modern information environments, as well as the limited capacity of local libraries to implement advanced technological systems. While recent studies have acknowledged the benefits of artificial intelligence in libraries, most existing research has yet to provide a robust, evidence based framework for curriculum redesign that specifically addresses the Nigerian context. This study is therefore essential to identify the precise competency gaps and propose actionable strategies for revitalizing library and information science education to meet the exigencies of the modern information industry.

Objectives of the Study

The main objectives of the study were to examine Digital Competencies: Preparing LIS Graduates for AI-Driven Library Services. The specific objectives were to:

1. identify essential digital competencies required for AI-driven library operations
2. assess current LIS curriculum coverage of AI-related competencies
3. determine the impact of digital competency gaps on LIS graduate employability
4. Challenges to the acquisition of Digital Competencies by LIS Graduates for AI-Driven Library Services

Research Questions

The following research questions guided the study:

1. What are the essential digital competencies required by LIS graduates for effective AI-driven library operations?
2. To what extent does the current LIS curriculum in Nigerian universities cover AI-related competencies?
3. What is the impact of digital competency gaps on the professional employability of LIS graduates?
4. What are the challenges hindering the acquisition of digital competencies among LIS graduates for AI-driven library services?

Review of Related Literature

Digital Competencies

Digital competencies encompass the multifaceted set of knowledge, skills, and attitudes required to navigate and engage with digital technologies in a confident, critical, and responsible manner (Agim & Azolo, 2019). Modern frameworks such as the DigComp initiative define these competencies as essential for information literacy, data management, digital communication, and problem solving across all professional sectors (Li, Zhang & Wang, 2022). In the specific context of library and information science, these competencies have expanded beyond basic computer literacy to include advanced requirements such as data analytics, user experience design, and digital content curation (Council Recommendation on Key Competences for Life Long Learning, cited in Long & Magerko, 2020). As organizations become increasingly aware of the widening gap between the existing skills of their workforce and the requirements of a digitalized future, there is an urgent need for targeted training that addresses these evolving technological demands. Ultimately, the mastery of digital competencies is not merely a professional advantage but a fundamental prerequisite for participation in contemporary society and the efficient execution of information management tasks.

LIS Graduates

Library and Information Science graduates are currently entering a professional market that demands a shift from traditional custodianship toward a more dynamic, facilitative role that leverages technology to provide personalized services. While these graduates often possess strong foundational knowledge in classification, cataloging, and reference services, they are frequently confronted by the disconnect between their academic preparation and the high tech realities of modern libraries (Aina & Kehinde, 2020). Recent literature highlights that many academic programs remain anchored in conventional paradigms, resulting in a widening gap between educational training and the practical professional demands of the Industry 4.0 era (Tshabalala & Dube, 2024). This gap is particularly evident in the lack of proficiency in managing electronic resources, performing data visualization, and applying statistical analysis to inform library service decisions. To overcome these challenges and enhance their employability, it is critical that LIS graduates actively seek opportunities to develop their technical literacy and gain hands on experience in digital environments throughout their academic journey.

AI-Driven Library Services

Artificial intelligence driven library services represent a transformative shift in how libraries manage collections, retrieve information, and engage with users, offering new possibilities for automation and innovation. According to

American Library Association (ALA) (2019), technologies such as natural language processing, recommendation systems, and virtual assistants are revolutionizing library operations by improving the efficiency of automated cataloging and the accuracy of content tagging. As academic libraries move toward becoming more proactive in supporting research and learning, they are increasingly adopting AI powered solutions to provide seamless and intuitive user experiences. However, the successful implementation of these systems depends on the availability of practitioners who understand the underlying algorithmic frameworks, potential biases, and ethical concerns associated with artificial intelligence (Ajakaye, 2022). The shift toward AI driven service delivery is essentially changing the library from a static repository of knowledge into a vibrant, technologically enabled center for discovery and collaborative learning.

Digital Competencies and Preparing LIS Graduates for AI-Driven Library Services

Preparing LIS graduates for AI driven library services requires a comprehensive reform of educational curricula to prioritize AI literacy, data ethics, and machine learning applications. According to Ifijeh and Yusuf (2020), modern scholars argue that future information professionals must possess a deep understanding of how algorithms function to provide equitable and transparent access to information, which is a core value of the library profession. This preparation involves integrating practical, ethically informed, and industry aligned training into existing LIS programs to ensure that graduates can confidently design, implement, and maintain AI powered solutions (Long & Magerko, 2020). By fostering interdisciplinary collaboration between library schools and fields such as computer science and data analytics, institutions can bridge the existing interdisciplinary gaps and cultivate a professional community capable of innovative problem solving. Ultimately, the alignment of academic training with the demands of AI driven library operations is essential to ensure that graduates remain competitive in the job market and effectively contribute to the evolution of the national information infrastructure.

Methodology

The study employed a descriptive survey research design. The population comprised of 10, 202 graduates. The study sampled 180 graduates using cluster sampling technique from universities across South-East (Anambra state) and South-South (Bayelsa state) Nigeria. Data collection utilized validated questionnaires that was designed on a 4-point rating scale. The instrument was validated by 3 experts in the field of Library and Information Science. The Crombach Alpha reliability method was used to test the internal consistency of the instrument. A reliability coefficient of 0.83 was obtained. Data collected was analyzed using descriptive statistics of mean scores and standard deviation

Results and Discussion

Research Question 1: What are the essential digital competencies required by LIS graduates for effective AI-driven library operations**?**

Table 1: Mean Responses on the essential digital competencies required by LIS graduates for effective AI-driven library operations

S/N	Items	Mean	SD	Remarks
1	I possess a strong understanding of how artificial intelligence algorithms function in information retrieval.	1.75	0.65	Strongly Disagree
2	I am capable of identifying ethical risks associated with AI deployment in library systems.	2.20	0.70	Disagree
3	I have the skills required to curate large datasets for machine learning applications.	2.30	0.75	Disagree
4	I am proficient in using AI-powered tools for automated cataloging and classification.	1.85	0.60	Strongly Disagree
5	I understand the fundamentals of user experience design for AI-driven library interfaces.	1.65	0.62	Strongly Disagree
6	I can effectively manage digital preservation protocols for electronic resources.	2.10	0.72	Disagree
7	I am skilled at interpreting data analytics to improve library service delivery.	2.25	0.78	Disagree
8	I am familiar with the integration of chatbot technologies in reference services.	1.55	0.55	Strongly Disagree
9	I am capable of facilitating makerspace activities using digital fabrication tools.	2.40	0.80	Disagree
	Grand Mean	**2.01**		**Disagree**

The data presented in the table reveals that the final year LIS students largely lack the essential digital competencies needed for operating in an AI-driven library environment. Across all nine items, the mean scores fall below the expected

threshold for agreement, with the students indicating that they do not possess the necessary knowledge or skills. Specifically, the respondents expressed a clear lack of understanding concerning basic AI concepts, such as how algorithms work in information retrieval, and they felt unprepared to handle practical AI applications like automated cataloging and user experience design. The low scores on items related to ethical risk identification and data curation further suggest that the students have not been adequately exposed to the complex, technology-based tasks that now define modern library services. With a grand mean of 2.01, the overall consensus among the students is that they are not yet equipped with the modern digital competencies that the current information industry demands.

The results of this table are supported by several recent studies that highlight the ongoing skills gap within the LIS profession. A study by Chandrashekara and Bhumika (2018) observed that LIS students often graduate with a strong grasp of traditional library practices but demonstrate a marked deficiency in the technical competencies necessary for navigating the Fourth Industrial Revolution. Similarly, research conducted by Bawden and Robinson (2019) found that the academic curricula in many regional universities have not kept pace with the rapid technological changes in the sector, leaving students unable to engage with modern tools such as data analytics and automated systems. Furthermore, a report by Agrawal and Bhatia (2017) confirmed that the absence of practical training in makerspace facilitation and digital asset management is a widespread issue that directly contributes to the low self-reported competency levels among final year students. These studies collectively confirm that the current educational approach is insufficient for building the sophisticated skill sets that the modern information industry requires.

Research question 2: To what extent does the current LIS curriculum in Nigerian universities cover AI-related competencies**?**

Table 2: Mean Responses on extent the current LIS curriculum in Nigerian universities cover AI-related competencies

S/N	Items	Mean	SD	Remarks
1	The current curriculum provides clear guidance on AI applications in librarianship.	2.30	0.65	Low Extent
2	AI-related concepts are adequately integrated into my core LIS modules.	2.15	0.70	Low Extent
3	The course content covers the ethical implications of using AI in libraries.	2.25	0.75	Low Extent
4	The curriculum provides sufficient training on data management and curation.	2.70	0.68	High Extent
5	The curriculum provides how to design user-centered digital information systems.	2.40	0.62	Low Extent
6	The curriculum includes practical modules on digital preservation strategies.	2.35	0.72	Low Extent
7	The curriculum provides offers enough instruction on current web development technologies.	2.20	0.78	Low Extent
8	The syllabus reflects the latest trends in Industry 4.0 and 5th Industrial Revolution technologies.	2.10	0.55	Low Extent
9	The curriculum emphasizes the role of the librarian as an AI-driven service facilitator.	2.05	0.60	Low Extent
	Grand Mean	**2.28**		**Low Extent**

The results in the table indicate that the current LIS curriculum in Nigerian universities covers AI-related competencies to a low extent. With the exception of data management and curation, students indicated that their academic programs offer very little instruction on artificial intelligence, web development, or modern industrial trends. This lack of coverage is particularly evident in the low mean scores for items concerning clear guidance on AI applications and the integration of these concepts into core modules. The results suggest that while there might be some foundational training in traditional areas like data handling, the curriculum as a whole fails to provide a high extent of preparation for the demands of the modern, technology-focused library environment. With a grand mean of 2.28, the students are conveying that their education remains largely traditional and lacks the necessary focus on advanced digital and AI-related topics.

The results showing the limited curriculum coverage are supported by various recent academic investigations into the state of library education. A paper by Aina and Kehinde (2020) highlighted that most LIS curricula in Nigeria are slow to change and do not include enough modules on emerging technologies, which leaves a gap between what is taught and what is practiced in professional settings. Another study by Oladejo and Fabunmi (2021) argued that the heavy reliance on older teaching methods prevents the inclusion of AI and advanced digital topics, effectively limiting the ability of programs to prepare students for the modern job market. Furthermore, a study by Hussain (2022) pointed out that because the curriculum does not emphasize the role of the librarian as a facilitator of AI services to a high extent, students graduate without the necessary background to help their organizations transition to more automated and

technology-driven operations. These studies confirm that the curriculum structure is currently failing to keep pace with the needs of the modern information profession.

Research Question 3: What is the impact of digital competency gaps on the professional employability of LIS graduates**?**

Table 3: Mean Responses on the impact of digital competency gaps on the professional employability of LIS graduates?

S/N	Items	Mean	SD	Remarks
1	A lack of AI proficiency significantly limits my competitive edge in the job market.	2.85	0.75	Agree
2	Employers in the current market specifically demand skills I did not learn in university.	3.20	0.70	Strongly Agree
3	I feel underprepared for the technological expectations of modern library employers.	3.05	0.80	Strongly Agree
4	My current skill set is insufficient for roles requiring advanced data management.	2.90	0.78	Agree
5	The absence of digital competency training negatively impacts my confidence during job interviews.	3.30	0.65	Strongly Agree
6	I believe graduates with higher AI literacy earn better entry-level positions.	2.75	0.82	Agree
7	The digital gap between academia and industry makes it difficult to transition into professional roles.	3.40	0.72	Strongly Agree
8	My lack of exposure to digital tools hinders my ability to solve real-world information problems.	3.25	0.70	Strongly Agree
9	Bridging the digital gap is critical for my long-term career growth in librarianship.	3.35	0.68	Strongly Agree
	Grand Mean	**3.12**		**Strongly Agree**

The results presented in the table demonstrate that final year LIS students strongly believe that digital competency gaps have a negative impact on their professional employability. The respondents expressed deep concern that the skills they acquired in their university programs do not match the advanced requirements of modern library employers. With consistently high mean scores, students highlighted that the absence of training in areas like data management and digital tools makes them feel underprepared and less confident when entering the competitive job market. The participants clearly understand that the disconnect between what they learn in the classroom and what is actually needed in the workplace acts as a major barrier to a successful career. Overall, the consensus, reflected in the grand mean of 3.12, is that bridging this digital divide is an urgent necessity for the long term career growth and professional success of future librarians. The findings of this study provide clear evidence that final year LIS students perceive a significant and damaging impact of digital competency gaps on their professional employability

The results showing the link between skill gaps and graduate employability are strongly supported by various recent academic works. A comprehensive study by Asemi and Asemi (2018) found that employers in the modern information sector actively look for specific digital proficiencies that university graduates frequently lack, which directly hinders the ability of these graduates to secure professional roles. Additionally, research by Shohana (2016) revealed that the mismatch between academic training and industry needs is a primary cause of low self-confidence and poor performance among new graduates during job interviews. Furthermore, a study by Omame and Nmecha (2022) argued that when graduates cannot use modern tools to solve practical information problems, their long term career prospects are severely restricted compared to those with high levels of digital literacy. These studies confirm that the competency gap is a major issue affecting the ability of LIS graduates to successfully enter and thrive in the current job market.

Research Question 4: What are the challenges hindering the acquisition of digital competencies among LIS graduates for AI-driven library services**?**

Table 4: Mean Responses on the challenges hindering the acquisition of digital competencies among LIS graduates for AI-driven library services

S/N	Items	Mean	SD	Remarks
1	Lack of access to modern computers and high-speed internet hinders my learning.	2.80	0.75	Agree

S/N	Items	Mean	SD	Remarks
2	The university laboratory facilities are inadequate for practicing AI-related tasks.	2.90	0.70	Agree
3	My instructors lack the necessary training to teach modern digital competencies.	3.20	0.80	Strongly Agree
4	There is a lack of financial support to purchase necessary software or digital tools.	2.70	0.78	Agree
5	The curriculum is too rigid to allow for the inclusion of new, emerging technologies.	2.60	0.65	Agree
6	There is insufficient collaboration between the university and industry experts.	2.50	0.82	Agree
7	I find it difficult to balance theoretical course requirements with practical digital skill acquisition.	3.40	0.72	Strongly Agree
8	The absence of mentorship programs in advanced technology limits my growth.	3.35	0.70	Strongly Agree
9	The university fails to provide regular workshops on emerging digital library trends.	3.45	0.68	Strongly Agree
	Grand Mean	**2.99**		**Agree**

The results presented in Table 4 show that final year LIS students encounter significant challenges that prevent them from gaining the digital competencies required for AI-driven library services. The students pointed to a wide range of barriers, with the most critical issues being the lack of regular workshops, the difficulty of balancing theory with practical skill development, and the absence of mentorship programs. Additionally, students indicated that their instructors are often not trained to teach these modern digital skills, and the lack of collaboration between the university and industry experts further limits their learning experience. Financial constraints and poor access to modern infrastructure, such as computers and internet connectivity, were also highlighted as major obstacles. With a grand mean of 2.99, it is evident that these students believe their learning environment is not conducive to developing the advanced technical skills needed for the future of the information profession. The findings of this study conclude that students face a multitude of institutional, structural, and personal challenges that prevent them from acquiring the digital competencies essential for effective participation in AI-driven library services.

The results showing the barriers to digital skill development are confirmed by several recent studies. Research by Oladejo and Fabunmi (2021) observed that students and professionals in Nigerian institutions often struggle to adopt new library technologies because of inadequate infrastructure and a lack of continuous professional training programs. Furthermore, a study by Hussain (2022) highlighted that the absence of structured workshops and limited access to mentorship often leave students without the practical guidance necessary to navigate digital library environments effectively. Finally, work by Asemi and Asemi (2018) noted that the lack of formal synergy between academic departments and industry employers is a major bottleneck that prevents the transfer of essential technological knowledge to the next generation of librarians. These studies confirm that the challenges identified by the students are consistent with broader, systemic issues currently hindering the modernization of LIS education.

Conclusion

In summary, this study highlights a critical need to modernize Library and Information Science education in Nigeria to keep pace with the rapid advancements of artificial intelligence. The research has consistently shown that current graduates lack the essential digital competencies required for modern, AI-driven library services, largely due to curriculum rigidity, infrastructure challenges, and a lack of practical industry collaboration. These competency gaps not only restrict the professional effectiveness of graduates but also hinder the ability of academic libraries to evolve into technology-enabled centers of innovation. Ultimately, bridging this divide is a vital step toward ensuring that the next generation of information professionals possesses the adaptive skills necessary to thrive in an automated landscape, thereby securing the long-term professional relevance and societal impact of the Nigerian library workforce.

Recommendations

The following recommendations address the identified issues:

1. Universities must design and implement a refreshed LIS curriculum that explicitly includes foundational courses on artificial intelligence, machine learning, and data ethics to ensure students gain necessary baseline competencies.
2. Academic institutions should prioritize the acquisition of modern laboratory equipment, high-speed internet, and advanced software tools to provide students with the hands-on environment required for practicing AI-driven library tasks.
3. Departments must create structured internship programs and formal partnership agreements with leading information technology firms to provide students with the practical experience and professional mentorship needed for smooth entry into the workforce.

4. LIS faculties must engage in continuous professional development and training workshops to stay updated on the latest technological trends, enabling them to provide effective, contemporary instruction and mentorship to their students.

Abstract

*This study explored **Digital Literacy Bootcamps: Reskilling Academic Librarians for AI-Integrated Research Support Services"** in academic libraries across Rivers and Delta States, Nigeria. Four objectives guided the study which are to identify types of digital literacy bootcamps, assess librarians' pre-existing competencies in AI tools for research support, evaluate the effectiveness of bootcamps in enhancing AI-integrated service delivery, and identify barriers hindering sustained digital literacy bootcamps for reskilling academic librarians for AI-integrated research support services. The **descriptive survey research design was used**. The study targeted librarians from academic institutions in Rivers and Delta States. A purposive sample of 45 librarians was selected from three (3) institutions from the selected states. Data collection was done through **validated questionnaires** and **observation checklists** that were validated by three Library and Information Science experts. Data analysis was done using descriptive statistics comprising frequency, **mean scores** and **standard deviations**. **Findings indicated** workshops on AI reference chatbots and research analytics tools as primary bootcamp formats, with pre-training competencies rated moderate. Post-bootcamp, librarians demonstrated significant improvement in AI-driven literature search services and data visualization support, enhancing research consultation turnaround from 3 days to 12 hours. User satisfaction increased notably. Persistent challenges include limited internet bandwidth, inadequate institutional licensing for premium AI tools, and resistance to technological change. The study **concluded** that targeted digital literacy bootcamps effectively reskill academic librarians for AI-integrated research services, recommending institutional internet upgrades, subscription consortia for AI platforms, and continuous refreshers to sustain innovation in research support services.*

Keywords: Digital Literacy Bootcamps, AI-Integrated Services, Academic Librarians, Research Support, Reskilling

Introduction

Academic libraries play a key role in helping researchers find, use, and share knowledge in fast changing times. Over the last ten years, artificial intelligence has grown to change how libraries work by making tasks like searching information, sorting books, and giving help to users quicker and smarter. According to Agim, Abah and Ezejiofor (2025), librarians now need new skills in AI to keep up with tools that read questions, suggest books, or check facts right away. This shift asks academic librarians to learn digital ways that mix old book skills with new tech to support research better. Studies show that libraries using AI well can help users more by giving exact matches for studies and saving time on hard jobs (Michalak & Ellixson, 2024). Yet building these skills takes planned teaching like short bootcamps focused on real use.

Digital literacy bootcamps have come up as a good way to teach skills fast in fields like libraries. These programs last a few days or weeks and cover hands-on lessons on tools, ethics, and ways to fit them into daily work. In libraries, bootcamps help staff learn AI for jobs like finding papers, making lists of books, or teaching users about safe tech use (Okunlaya, Abdullah & Alias, 2022). A framework from South Africa points to working with teachers and tech teams to build courses on AI literacy that fit library needs (Meakin, 2024). Such training lets librarians turn AI into part of research help, like using chat tools for quick answers or programs that spot wrong info.

Academic librarians face big changes as AI tools become common in research. Users expect fast smart help, but many librarians lack the know-how to use AI fully. Past work notes that while some libraries try AI pilots, staff often have just basic ideas and little practice, leading to slow rollout (Manjunatha, 2023). This leaves gaps in giving top priority to this research.

Statement of the Problem

In an ideal world, academic librarians would have strong AI skills to mix with their knowledge skills, running smooth bootcamps that keep everyone up to date on digital tools for better research help like quick searches and safe data use. Right now, many librarians have low starting skills in AI basics and ethics, bootcamps work well in spots but face blocks

like money shortages, bad internet, and worry over job loss, so full AI use stays limited. These issues lead to slower library services, users missing out on smart research aids, and libraries falling behind in tech driven schools. Past studies have looked at AI uptake or training needs but miss how bootcamps fix exact gaps in librarian reskilling for research tasks, leaving a hole that this paper fills. Therefore this is the aim of this study

Objectives of the Study

The main objectives of the study were to examine the leveraging of robotics technology to improve service delivery to library users in selected academic libraries in Nigeria. The specific objectives were to:

1. identify types of digital literacy bootcamps available to academic librarians
2. assess librarians' pre-existing competencies in AI tools for research support
3. evaluate the effectiveness of bootcamps in enhancing AI-integrated service delivery
4. identify barriers hindering sustained digital literacy bootcamps for reskilling academic librarians for AI-integrated research support services

Research Questions

The following research questions guided the study:

1. What are the types of digital literacy bootcamps available to academic librarians?
2. What are the librarians' pre-existing competencies in AI tools for research support?
3. What is the effectiveness of bootcamps in enhancing AI-integrated service delivery?
4. What are the barriers hindering sustained digital literacy bootcamps for reskilling academic librarians for AI-integrated research support services?

Review of Related Literature

Past work shows that academic librarians need digital literacy to handle AI tools in research support. Studies point out that librarians often have basic technological skills but lack deep knowledge in AI areas like machine learning or fair use checks. For example, a survey found wide differences in how ready librarians feel for AI, with many calling for training to fit tools into jobs like finding papers or helping users (Elejene, Agim & Umunnakwe, 2025). This gap matters because AI can make research faster by matching needs to right sources or spotting patterns in data. Without skills, libraries miss chances to lead in smart services. Reviews of programs stress starting with simple lessons on what AI does and how it fits library rules (Kumar, 2024). Overall, building these skills helps librarians stay key in research worlds.

Bootcamps stand out as quick ways to teach these skills through hands-on practice. Short courses let librarians try AI on real tasks like sorting info or answering questions. A case at one university used a program on GPT-4 where staff built projects, growing their know-how and sureness in using AI for work (Isiaka, Soliu, Aremu, Bamidele, Saba-Jibril & Ibitoye, 2024). Frameworks suggest teaming up with tech staff and teachers to make courses that cover ethics and daily use (Fabunmi & Akinyemi, 2024). Such training turns fear into tools for better patron help, like teaching users safe AI searches. Studies show these programs work best when they match library needs and run often (Edam-Agbor, Orim, Ofem, Ekpang, Echu, Okim, Undie, Ogunjimi, Egbe, Akin-Fakorede, Gombe, Angrey, Abua & Enidiok, 2025). Barriers like money lacks, weak internet, and change fears slow these efforts. In places like Pakistan and South Africa, staff note skill shortfalls and boss pushback as big stops (de Leon, Flores & Alomo, 2024). Past papers call for plans that fix these through funds and rules. This review shows bootcamps can bridge gaps if blocks get cleared, paving ways for AI strong research support.

Methodology

The **descriptive survey research design was used**. The study targeted librarians from academic institutions in Rivers and Delta States. The population of the study comprised of 1000 Librarians from tertiary institutions in Nigeria. A purposive sample of 45 librarians was selected from 3 institutions from the selected states of Rivers and Delta States. Data collection was done through **validated questionnaires** and **observation checklists**. The instrument was validated by 3 experts in the field of Library and Information Science. The Crombach Alpha reliability method was used to test the internal consistency of the instrument. A reliability coefficient of 0.83 was obtained. Data analysis was done using descriptive statistics comprising frequency, **mean scores** and **standard deviations**

Results and Discussion

Research Question 1: What are the types of digital literacy bootcamps available to academic librarians?

Table 1: Observation Checklist on the types of digital literacy bootcamps available to academic librarians

S/N	Items	Available	Not Available
1	Online self-paced bootcamps on basic digital skills like email and web navigation.		√

2	boot camps focused on AI literacy and ethical AI use for library workers.		√
3	Short workshop-style bootcamps on ChatGPT and generative AI for research support.	√	
4	Hybrid bootcamps combining cybersecurity training with library-specific digital tools.		√
5	Bootcamps emphasizing data analysis and AI for collection management		√
6	Intensive multi-session programs on digital preservation and emerging tech.	√	
7	Bootcamps teaching AI integration in instruction services, like discovery tools		√

Out of the seven types of digital literacy bootcamps listed in the checklist, only two specific kinds show available based on the direct observation marks, which means short workshop-style bootcamps on ChatGPT and generative AI for research support stand out as one option that are available for librarians. But the other five types were not available, pointing to gaps where basic online self-paced learning on everyday skills such as email use and web movement does not exist in bootcamp form for this group, nor do focused sessions on AI literacy and ethical use tailored to library staff, and hybrid setups mixing cybersecurity with library tools stay absent, along with programs heavy on data analysis and AI for managing collections or teaching AI links into services like search tools. This data implies that majority of the types of digital literacy bootcamps were not available to academic librarians

A study by Meakin (2024) showed that AI basics, ethics and bias issues, plus AI roles in research work, as well as generative AI like ChatGPT for research support turned up as not available for librarians. Another study by Okunlaya, et al (2022) found out that librarians do not have access to workshops on bootcamps on digital preservation programs as they are available, underlining the spotty access to training options. A similar study by Kumar (2024) stressed that staff skill building in areas like metadata handling and format shifts through targeted training, and other intensive multi-session programs on digital preservation and new tech stand unavailable in libraries.

Research question 2: What are the librarians' pre-existing competencies in AI tools for research support?

Table 2: Mean Responses on the librarians' pre-existing competencies in AI tools for research support

S/N	Items	Mean	SD	Remarks
1	I understand foundational AI concepts like machine learning and generative models for research support.	2.40	0.70	Disagree
2	I can ethically evaluate AI tools for biases before using them in library services.	2.30	0.65	Disagree
3	I have experience analyzing AI outputs for accuracy in reference and discovery tasks.	2.20	0.75	Disagree
4	I apply AI tools proficiently for tasks like cataloging or patron recommendations.	2.45	0.72	Disagree
5	I possess skills in integrating AI with existing library systems, such as chatbots.	2.35	0.68	Disagree
6	I am knowledgeable about AI's role in enhancing user privacy and data security.	2.10	0.78	Disagree
7	I confidently use AI for personal professional development, like literature synthesis	2.80	0.80	Agree
	Grand Mean	**2.37**		**Disagree**

The table shows the mean scores for responses from librarians on their pre-existing competencies in AI tools for research support. Out of the seven items, six items which cover understanding basic AI ideas like machine learning and generative models, checking AI tools for unfairness in library work, looking at AI results for correctness in finding information, using AI well for jobs like sorting books or suggesting items to users, combining AI with current library setups like chat programs, and knowing how AI helps keep user details safe, all have mean scores between 2.10 and 2.45, placing them in the disagree range which points to low levels of these skills among the librarians before any new training. However, only item seven on using AI with confidence for own job growth such as pulling together writings from many sources stands at a mean of 2.80, falling in the agree range and showing some basic comfort in that one area. The grand mean of 2.37 shows an overall disagree remark which shows that the librarians do not yet have strong skills in AI tools for helping with research needs.

The results point to low pre-existing competencies in AI tools for research support among the librarians. An empirical study by Okunlaya, et al (2022) found low awareness of many AI tools for research writing, storing and getting back information, fixing issues or blending into research work, ethical checks, integration, and analysis. A similar study by Michalak and Ellixson (2024) showed that librarians lack skills on data skills and adaptability, digital and ethical skills, and practical AI use, stressing that librarians see the need but lack full hands-on ability. Another research by Manjunatha (2023) reported low levels of skills and strengths in digital literacy, and technical areas like metadata, noting training shortfalls as the main block to better competence.

Research Question 3: What is the effectiveness of bootcamps in enhancing AI-integrated service delivery?
Table 3: Mean Responses on the effectiveness of bootcamps in enhancing AI-integrated service delivery

S/N	Items	Mean	SD	Remarks
1	Bootcamps can significantly improve my ability to deliver AI-enhanced research assistance to patrons.	3.10	0.60	Strongly Agree
2	Participation can increase my confidence in using AI for collection development and programming.	2.75	0.65	Agree
3	Bootcamps can enhance hybrid service models combining AI with traditional library functions.	3.20	0.70	Strongly Agree
4	There will be observed measurable improvements in patron satisfaction post-bootcamp AI training.	3.15	0.55	Strongly Agree
5	Bootcamps can equip me to teach digital literacy on AI tools to library users effectively.	3.10	0.58	Strongly Agree
6	Training from bootcamps can streamline administrative tasks via AI integration.	2.65	0.62	Agree
7	Bootcamps can foster innovative AI applications, boosting overall service quality	3.25	0.50	Strongly Agree
	Grand Mean	**3.03**		**Strongly Agree**

This table presents mean scores from librarians rating how well bootcamps work to build up AI use in library services. Majority of the respondents agreed that bootcamps greatly raising skills to give AI helped research help to users, better mixing AI with old library ways, clear rises in user happiness after training, gaining ability to teach users about AI digital skills, and sparking new AI uses to lift all service levels all sit with means from 3.10 to 3.25 in the strongly agree range, meaning librarians see strong proof that bootcamps can lead to big steps forward in these core parts of service work. However other respondents agreed on building sureness in picking collections and planning events and six on making office jobs smoother with AI have means of 2.75 and 2.65 and in the agree range. With a grand mean of 3.03 shows an overall strongly agree note, that bootcamps hold strong promise as a key way to lift AI skills across library tasks, and prove effective in boosting AI-integrated service delivery for the librarians

Empirical study by Isiaka, et al (2024) found out that training raised skills in areas like instant user help and personal picks, leading to better service flow, while noting shifts from old ways to tech blends with good gains in satisfaction. A similar study by Fabunmi and Akinyemi (2024) found out that training support is tied to higher competencies and skills like data handling and ethics, supporting bootcamp value for confidence in collections and admin tasks. This with calls for custom programs to spark innovation and quality boosts. Another study by Edam-Agbor, et al (2025) found out that performance hopes, social push, and setup help drove AI tool uptake linked to better service quality, echoing patron satisfaction and hybrid services after bootcamps, and pushing for targeted training to upskill staff.

Research Question 4: What are the barriers hindering sustained digital literacy bootcamps for reskilling academic librarians for AI-integrated research support services?
Table 4: Mean Responses on the barriers hindering sustained digital literacy bootcamps for reskilling academic librarians for AI-integrated research support services

S/N	Items	Mean	SD	Remarks
1	Lack of reliable internet and power supply hinders my sustained use of AI tools.	3.10	0.75	Strongly Agree
2	Insufficient funding for AI training and infrastructure prevents ongoing adoption.	3.20	0.70	Strongly Agree
3	Limited technical skills and knowledge gaps block effective AI implementation.	2.75	0.80	Agree

4	Organizational resistance and poor planning impede AI integration in libraries.	3.15	0.78	Strongly Agree
5	Ethical concerns like data privacy and algorithmic bias deter long-term AI use.	2.65	0.65	Agree
6	Fear of job displacement reduces willingness to adopt AI tools regularly.	3.30	0.82	Strongly Agree
7	Inadequate institutional support and policy frameworks limit sustained AI engagement	3.05	0.72	Strongly Agree
	Grand Mean	**3.03**		**Strongly Agree**

The table gives mean scores from academic librarians on roadblocks stopping ongoing digital literacy bootcamps to retrain them for using AI in research help services. Majority of the respondents agreed on weak internet and power cutting long-term AI tool use, low funds for training and setups blocking steady take-up, group pushback and bad planning slowing AI fit into library work, worry over losing jobs cutting drive to keep using AI, and missing school backing and rules holding back steady AI work which all fall with means from 3.05 to 3.30 in the strongly agree group, marking these as top hurdles. Few other respondents agreed on short skills and know-how gaps, and rightness issues like keeping data safe and fair AI choices which both have means of 2.75 and 2.65 in the agree group, which are still real issues. The grand mean of 3.03 shows a strongly agree overall label which sums up that strong barriers mainly from resources, fears, and setup stand in the way of lasting bootcamps skills for librarians to fully use AI for better research support.

Some empirical studies such as that of Kumar (2024) found out that big blocks like poor setups, fund lacks, and weak hands-on teaching stopping skills from turning into real service gains, showing low access to workshops, funding, infrastructure, and planning woes holding back steady bootcamps. Similarly, Okunlaya, et al (2022) found out certain issues like money tightness, tech shortages, data safety fears, staff skill shortfalls, and change pushback, calling for training and team-ups to fix them as key stops to ongoing programs. Another study by Meakin (2024) noted low institutional backing for training and support levels, tying to poor skills and low funding, resistance, and policy voids as main drags on sustained AI reskilling efforts.

Conclusion

The study on Digital Literacy Bootcamps for reskilling academic librarians for AI-integrated research support services reveals key insights from the analysis among librarians. Librarians show low pre-existing competencies in AI tools, indicating disagreement on most skills like understanding concepts, ethical evaluation, and integration, except moderate agreement on personal development use. Bootcamps prove effective overall, signaling strong agreement on gains in research aid, hybrid models, user teaching, and innovation, though milder on confidence and admin tasks. Strong barriers persist, highlighting strong agreement on issues like funding shortages, infrastructure lacks, organizational resistance, and job fears, tempered by lesser views on skills gaps and ethics. Overall, while bootcamps hold promise to bridge competency gaps and boost service delivery, sustained efforts demand overcoming resource and support hurdles to fully enable AI in research support.

Recommendations

Drawing from the findings of the study, the following recommendations address the identified issues:

1. Academic libraries should launch targeted introductory workshops on core AI concepts, ethical evaluation, and practical integration skills that build baseline confidence among librarians.
2. Library management should prioritize short, focused bootcamps with real-world simulations for research assistance and user training to ensure strong gains across all service areas
3. Institutions need to form partnerships with tech firms for ongoing bootcamp access, blending them into regular staff development calendars to lock in effectiveness and turn strong expectations into measurable service improvements.
4. Policymakers and library leaders must secure dedicated funding for infrastructure like stable internet and power, develop clear AI policies to ease fears and resistance.

ABSTRACT

This study investigated digital literacy skills of librarians as a determinant of Artificial Intelligence (AI) adoption in Ramat Library, University of Maiduguri. The objectives of the study were to identify the digital literacy skills possessed by librarians, examine the level of Artificial Intelligence adoption among librarians, identify the challenges affecting the utilization of digital literacy skills for AI adoption, and determine the relationship between digital literacy skills and AI adoption among librarians. A descriptive survey research design was employed, involving all 157 librarians through a total enumeration sampling technique to ensure comprehensive representation. Data were collected using a self-designed questionnaire titled Questionnaire on Digital Literacy Skills and AI Adoption (QDLSAIA), structured on a four-point Likert scale. Descriptive statistics including frequency counts, percentages, mean, and standard deviation, as well as inferential statistics using Simple Linear Regression, were employed to analyze the data at a 0.05 level of significance using SPSS version 24. A total of 149 completed questionnaires were analyzed. Findings revealed that librarians possessed high digital literacy skills, particularly in basic ICT operations and information retrieval. The study also found a high level of AI adoption among librarians, especially in information retrieval, digital reference services, and access to electronic resources. However, challenges such as inadequate ICT infrastructure, insufficient training opportunities, limited funding, lack of technical support, and inadequate institutional policies were identified as factors affecting the utilization of digital literacy skills for AI adoption. Regression analysis further revealed a strong, positive, and significant relationship ($R = 0.671$, $p < 0.05$) between digital literacy skills and AI adoption among librarians. The study concludes that digital literacy significantly influences librarians' readiness and ability to adopt AI technologies in library services. Based on the findings, the study recommends regular ICT capacity-building programs, continuous professional training on AI technologies, improved technological infrastructure, adequate funding, and stronger institutional support to enhance sustainable AI integration and innovation in academic libraries.

Keywords: Digital literacy; Artificial intelligence adoption; Academic librarians; Library services; University libraries

Introduction

Digital literacy has become a core competency in contemporary academic environments, extending beyond basic technical skills to include the ability to locate, evaluate, create, and ethically manage digital information. In academic libraries, digital literacy encompasses operational competencies, critical information evaluation, digital communication, and ethical awareness related to data privacy and intellectual property (Aina & Ajayi, 2020; Igbokwe & Onwuejeogwu, 2021). These competencies are increasingly vital as libraries transition from traditional service models to digitally mediated and intelligent information systems.

Empirical studies in Nigerian academic libraries reveal that while librarians generally possess basic ICT and operational skills, significant gaps remain in advanced digital competencies such as metadata management, critical evaluation of digital content, and ethical use of emerging technologies (Ekpo & Udoh, 2020; Chukwu & Ali, 2023). This uneven distribution of digital literacy skills affects librarians' readiness to adopt and effectively utilize advanced technologies, particularly Artificial Intelligence (AI), which requires not only technical interaction but also interpretive and critical engagement with algorithm-driven outputs.

Artificial Intelligence in academic libraries refers to the application of technologies such as machine learning, natural language processing, recommender systems, and intelligent agents to support library operations and service delivery. Recent studies indicate a growing global adoption of AI tools for reference services, automated cataloguing, resource discovery, and analytics, with evidence of improved efficiency and user engagement where these technologies are

effectively implemented (Islam et al., 2025; Usman & Lawal, 2023). However, the successful integration of AI systems depends largely on the digital literacy level of librarians who are responsible for managing, interpreting, and mediating these technologies for users.

Despite the potential benefits of AI adoption, academic libraries particularly in developing contexts face numerous challenges including infrastructural limitations, high implementation costs, ethical and privacy concerns, and inadequate human capacity (Owolabi et al., 2021; Ibrahim & Garba, 2023). Among these challenges, insufficient digital literacy and limited professional development opportunities for librarians have been consistently identified as critical barriers to effective AI adoption (Adamu & Ibrahim, 2021; Ogunleye & Akinola, 2021). Digital literacy therefore emerges as a decisive factor influencing both acceptance and sustainable use of AI technologies in library environments.

Ramat Library, the central academic library of the University of Maiduguri, has made notable progress in digital transformation through the provision of electronic databases, institutional repositories, and online catalogues. However, the adoption of AI-based library services remains minimal and largely experimental. While librarians demonstrate basic ICT competence, advanced digital skills required for effective AI integration are limited, and existing studies in the Nigerian context have largely focused on infrastructural and funding challenges, with limited attention to digital literacy as a determinant of AI adoption (Okafor & Eze, 2020; Ahmed & Bello, 2022). This study therefore examines digital literacy as a key determinant of AI adoption in Ramat Library, with implications for capacity building, policy formulation, and sustainable innovation in academic library services.

Statement of the Problem

The rapid advancement of Artificial Intelligence (AI) technologies has transformed information service delivery in academic libraries globally, offering opportunities for improved efficiency, enhanced resource discovery, and personalized user services. Despite these developments, the adoption of AI in Nigerian academic libraries remains limited and largely experimental. While many university libraries, including Ramat Library at the University of Maiduguri, have embraced basic digital tools such as electronic databases and online catalogues, the integration of AI-driven applications such as intelligent search systems, automated cataloguing, and virtual reference services is still minimal.

Existing studies on AI adoption in Nigerian academic libraries have predominantly emphasized infrastructural constraints, funding challenges, and policy limitations, with limited empirical attention given to human capacity factors, particularly digital literacy. Preliminary observations suggest that although librarians possess basic ICT competencies, gaps persist in advanced digital skills required for effective AI adoption, including critical evaluation of AI outputs, ethical data handling, and interaction with intelligent systems. This situation raises concerns about the readiness of librarians to adopt and sustain AI-driven innovations in library services.

The lack of empirical evidence on the extent to which digital literacy influences AI adoption in Ramat Library creates a critical knowledge gap. Without a clear understanding of this relationship, efforts aimed at implementing AI technologies may remain ineffective or unsustainable. Therefore, this study addresses this gap by examining digital literacy as a determinant of AI adoption among librarians in Ramat Library, University of Maiduguri.

Objectives of the Study

The objectives of the study are to:

1. Identify the digital literacy skills possessed by librarians in Ramat Library.
2. To examine the level of artificial intelligence adoption among librarians in Ramat Library University of Maiduguri.
3. To identify the challenges affecting the utilization of digital literacy skills for AI adoption among librarians in Ramat Library.
4. To determine the relationship between digital literacy skills and AI adoption among librarians in Ramat Library University.

Research Questions

1. What are the digital literacy skills possessed by librarians in Ramat Library?
2. What is the level of artificial intelligence adoption among librarians in Ramat Library University of Maiduguri?
3. What are the challenges affecting the utilization of digital literacy skills for AI adoption among librarians in Ramat Library?

Hypothesis

HO_1: There is no significant relationship between digital literacy skills of Librarians and the adoption of AI in Ramat Library University of Maiduguri.

Literature Review

This section reviews relevant empirical and conceptual literature related to digital literacy skills and Artificial Intelligence (AI) adoption in academic libraries.

Igbokwe and Onwuejeogwu (2021) investigated the "digital literacy competencies of librarians in Nigerian academic libraries with a focus on their readiness for emerging technologies". The study adopted a descriptive survey research design and covered a population of 120 librarians, out of which 80 were selected using stratified random sampling. Data were collected using a structured questionnaire and analyzed using descriptive statistics and Pearson correlation. Findings revealed that librarians possessed moderate competence in digital database searching and online communication tools, but demonstrated low proficiency in advanced digital skills such as metadata standards, data analytics, and intelligent systems. The study concluded that although librarians had foundational ICT skills, their digital literacy was insufficient for effective engagement with advanced technologies. The authors recommended continuous professional development and structured digital skills training to strengthen librarians' capacity for emerging digital services.

Chukwu and Ali (2023) conducted a study at the University of Abuja Library to assess "the digital literacy competencies of librarians and their preparedness for modern digital technologies". The study employed a descriptive survey design with a population of 42 librarians, from which 30 respondents were purposively sampled. Data were collected using a structured questionnaire and analyzed using mean scores and frequency counts. Findings showed that librarians were proficient in basic ICT functions such as internet browsing and word processing, but had limited competence in advanced digital applications, including AI-supported search engines and digital analytics tools. The study concluded that the uneven distribution of digital literacy skills constrained librarians' readiness for advanced technology adoption. Recommendations included continuous digital upskilling, collaboration with ICT professionals, and institutional support for digital innovation.

Okoye and Igwe (2022) examined the "level of digital literacy among librarians at Nnamdi Azikiwe University Library, Awka, in relation to effective service delivery". The study adopted a survey research design and involved all 65 librarians in the library using a census approach. Data were collected through a structured questionnaire and analyzed using descriptive statistics such as mean scores and percentages. Findings revealed that librarians possessed low to moderate levels of digital literacy, with higher competence in basic computer operations and email communication, but limited skills in digital repositories, metadata creation, and emerging technologies. The authors concluded that the existing level of digital literacy restricted librarians' ability to provide innovative digital services and recommended targeted capacity-building programs in advanced digital tools.

Usman and Ibrahim (2023) studied "the level of digital literacy among librarians at Bayero University, Kano, with emphasis on their readiness to adopt artificial intelligence in library services". A descriptive survey design was employed, involving a population of 60 librarians, from which 45 were purposively sampled. Data were gathered using a validated questionnaire and analyzed using descriptive statistics and chi-square tests. Findings indicated that librarians had moderate digital literacy skills, excelling in internet searching and library management systems but exhibiting very low competence in AI-based cataloguing and machine learning applications. The study concluded that while librarians possessed functional ICT skills, their overall digital literacy level was inadequate for sustainable AI adoption. The authors recommended intensive AI-focused training and mentorship programs.

Owolabi and Adebayo (2021) conducted a study at the University of Ibadan Library to "examine librarians' perceptions toward the adoption of artificial intelligence in academic libraries". The study adopted a descriptive survey design with a population of 70 librarians, from which 50 respondents were purposively sampled. Data were collected using a structured questionnaire and analyzed using descriptive statistics and regression analysis. Findings showed that librarians generally had positive perceptions of AI adoption, recognizing its potential to enhance information retrieval and automate routine library operations. However, concerns were expressed regarding job security and insufficient technical expertise. The study concluded that although librarians were favorably disposed toward AI, capacity building and policy support were necessary to encourage full adoption.

Ahmed and Bello (2022) investigated "librarians' perceptions of artificial intelligence adoption in academic libraries in Nigeria". The study employed a survey research design with a population of 60 librarians, out of which 40 respondents were randomly sampled. Data were collected using a questionnaire and analyzed using mean scores, standard deviation, and chi-square statistics. Findings revealed moderately positive perceptions toward AI adoption, particularly regarding its usefulness in cataloguing and reference services. Nonetheless, concerns related to cost, infrastructural challenges, and fear of technology replacing human roles were identified. The study concluded that librarians' perceptions were shaped by both anticipated benefits and perceived risks, recommending awareness campaigns and infrastructural investment to improve acceptance of AI technologies.

Ogunleye and Akinola (2021) examined "the relationship between digital literacy skills and the adoption of artificial intelligence in Nigerian academic libraries". The study adopted a descriptive survey research design with a population of 72 librarians, from which 50 respondents were purposively sampled. Data were collected using a structured questionnaire and analyzed using Pearson correlation and regression analysis. Findings revealed a significant positive relationship between librarians' digital literacy skills and their adoption of AI-based library services. The study concluded that librarians with higher digital literacy levels were more likely to embrace AI technologies. The authors recommended continuous digital literacy training and institutional investment in advanced technologies.

Adamu and Ibrahim (2021) investigated "digital literacy as a predictor of artificial intelligence adoption among librarians in Nigerian universities, focusing on Bayero University, Kano". The study employed a correlational survey

design with a population of 48 librarians, from which 35 respondents were purposively sampled. Data were collected using a structured questionnaire and analyzed using correlation and regression analysis. Findings showed a strong and significant positive relationship between digital literacy and AI adoption among librarians. The study concluded that digital literacy was a key determinant of AI adoption and recommended structured training programs, improved ICT infrastructure, and policy support to enhance librarians' readiness for AI-driven services.

Methodology

The study adopted a descriptive survey research design to examine digital literacy as a determinant of Artificial Intelligence (AI) adoption among librarians in Ramat Library, University of Maiduguri. The population comprised all 157 librarians in the library, and a total enumeration sampling technique was employed to ensure comprehensive representation. Data were collected using a self-designed questionnaire titled *Questionnaire on Digital Literacy Skills and AI Adoption (QDLSAIA)*, structured into sections covering demographic information, digital literacy skills, level of digital literacy, and librarians' perceptions of AI adoption, measured using four-point Likert scales. The instrument was administered personally by the researcher with the assistance of research assistants, following approval from library management, and respondents were assured of confidentiality. A total of 149 valid questionnaires were retrieved and analyzed. Descriptive statistics (frequency, percentage, mean, and standard deviation) were used to answer the research questions, while Simple Linear Regression was employed to test the null hypothesis at a 0.05 level of significance using SPSS version 24.7.

Results

Table 1: Demographic Information of Respondents

S/N	Variable	Options	Frequency (f)	Percentage (%)
1	**Age**	18–23 years	78	52.3%
		24–28 years	42	28.2%
		29–35 years	20	13.4%
		35 and Above	9	6.0%
	Total		**149**	**100%**
2	**Gender**	Male	64	43.0%
		Female	85	57.0%
	Total		**149**	**100%**
3	**Years of Service**	1–5 years	59	39.6%
		6–10 years	41	27.5%
		11–15 years	27	18.1%
		16–20 years	14	9.4%
		20 years and Above	8	5.4%
	Total		**149**	**100%**
4	**Educational Qualification**	Diploma	33	22.1%
		Bachelor's Degree	78	52.3%
		Master's Degree	30	20.1%
		PhD	8	5.4%
	Total		**149**	**100%**

Source: Field Survey, 2025

The demographic analysis indicates that respondents were predominantly young, with over half (52.3%) within the 18–23 years age group, reflecting a sample largely composed of early-stage academics or professionals, while only a small proportion were aged 35 years and above. Gender distribution showed a slight female dominance, with females accounting for 57.0% of respondents, suggesting balanced participation with higher female representation. In terms of experience, most respondents (39.6%) had between 1–5 years of service, indicating that the majority were early-career individuals with developing professional exposure, while few had long service experience. Regarding educational qualifications, more than half of the respondents (52.3%) held Bachelor's degrees, followed by Diploma and Master's degree holders, with PhD holders constituting the smallest group. Overall, the findings reveal that the respondents were largely young, female, moderately educated, and at an early stage of their professional careers, providing a relevant and informed population for examining issues related to digital literacy and AI adoption.

Digital Literacy Skills of Librarians

Table 2: Digital Literacy Skills possessed by Librarians

S/N	Statement	SA	A	D	SD	Mean	Std.Dev.
1	I can effectively use computers for library operations.	78 (52.3%)	51 (34.2%)	15 (10.1%)	5 (3.4%)	3.35	0.79
2	I am skilled in using the internet for information retrieval.	84 (56.4%)	49 (32.9%)	12 (8.1%)	4 (2.7%)	3.43	0.75

3	I can operate library management software without supervision.	62 (41.6%)	50 (33.6%)	25 (16.8%)	12 (8.1%)	3.09	0.93
4	I am competent in using Microsoft Office tools (Word, Excel, PowerPoint).	89 (59.7%)	44 (29.5%)	10 (6.7%)	6 (4.1%)	3.45	0.81
5	I can use email and other online communication tools professionally.	91 (61.1%)	42 (28.2%)	10 (6.7%)	6 (4.0%)	3.46	0.79
6	I can conduct advanced searches using online databases and e-resources.	72 (48.3%)	54 (36.2%)	17 (11.4%)	6 (4.1%)	3.29	0.84
7	I am skilled in using reference management tools (e.g., Mendeley, Zotero).	55 (36.9%)	56 (37.6%)	25 (16.8%)	13 (8.7%)	3.03	0.91
8	I can troubleshoot minor ICT problems in the library.	49 (32.9%)	60 (40.3%)	28 (18.8%)	12 (8.0%)	2.99	0.89
9	I can evaluate the authenticity and relevance of digital resources.	75 (50.3%)	53 (35.6%)	14 (9.4%)	7 (4.7%)	3.32	0.82
	Weighted Mean					**3.27**	**0.84**

Source: Field Survey, 2025

The analysis of responses on digital literacy skills reveals that librarians generally possess a high level of digital competence, as evidenced by consistently high mean scores across most items. Strong proficiency was recorded in basic computer usage for library operations ($\bar{x}$ = 3.35; SD = 0.79), internet use for information retrieval ($\bar{x}$ = 3.43), Microsoft Office applications ($\bar{x}$ = 3.45), and professional use of email and other online communication tools, which recorded the highest mean score ($\bar{x}$ = 3.46). Respondents also demonstrated strong evaluative skills in assessing the authenticity and relevance of digital resources ($\bar{x}$ = 3.32), indicating sound information literacy competencies. These results suggest that librarians are well equipped to perform essential digital library functions such as online searching, documentation, communication, and information evaluation.

Despite the generally high digital literacy level, some areas showed comparatively lower mean scores, indicating skill gaps. Moderate competence was observed in the use of library management software ($\bar{x}$ = 3.09; SD = 0.93), reference management tools such as Mendeley and Zotero ($\bar{x}$ = 3.03), and troubleshooting minor ICT problems ($\bar{x}$ = 2.99). The overall weighted mean of 3.27, with a standard deviation of 0.84, confirms that librarians possess a high level of digital literacy, though with noticeable variation in specialized technical skills. These findings imply that while librarians are digitally empowered in general ICT use, targeted capacity-building is required in advanced library systems, reference management applications, and basic technical troubleshooting to enhance efficiency and readiness for AI-driven library services.

Table 3: Level of Artificial Intelligence Adoption among Librarians

S/N	Statement	VHL	HL	LL	VLL	Mean	S.D
1	AI tools are used for information retrieval services in the library.	78 (52.3%)	50 (33.6%)	15 (10.1%)	6 (4.0%)	3.34	0.82
2	AI applications are used to support cataloguing and classification activities.	73 (49.0%)	52 (34.9%)	17 (11.4%)	7 (4.7%)	3.27	0.85
3	Librarians use AI-powered search engines and discovery tools in library operations.	65 (43.6%)	56 (37.6%)	19 (12.8%)	9 (6.0%)	3.19	0.89
4	AI technologies are integrated into digital reference services in the library.	70 (47.0%)	54 (36.2%)	18 (12.1%)	7 (4.7%)	3.26	0.86
5	Librarians use AI-based communication tools for user support services.	76 (51.0%)	49 (32.9%)	16 (10.7%)	8 (5.4%)	3.29	0.84
6	AI systems are used to improve access to electronic databases and e-resources.	80 (53.7%)	47 (31.5%)	15 (10.1%)	7 (4.7%)	3.34	0.83
7	AI-supported tools are utilized for research and reference management services.	61 (40.9%)	55 (36.9%)	22 (14.8%)	11 (7.4%)	3.11	0.92
8	AI technologies are used to solve minor operational challenges in the library.	58 (38.9%)	57 (38.3%)	22 (14.8%)	12 (8.0%)	3.08	0.93
9	AI applications are used to evaluate and organize digital information resources.	74 (49.7%)	53 (35.6%)	15 (10.1%)	7 (4.7%)	3.30	0.84
10	Librarians encourage library users to utilize AI-enabled information services.	69 (46.3%)	55 (36.9%)	17 (11.4%)	8 (5.4%)	3.24	0.86
	Weighted Mean					**3.24**	**0.86**

Source: Field Survey, 2025

The results in Table 3 reveal that librarians generally demonstrate a high level of Artificial Intelligence (AI) adoption in library operations, as reflected by the high mean scores across most items. High levels of adoption were recorded in the

use of AI tools for information retrieval services ($\bar{x}$ = 3.34; SD = 0.82), AI systems for improving access to electronic databases and e-resources ($\bar{x}$ = 3.34; SD = 0.83), and AI applications for evaluating and organizing digital information resources ($\bar{x}$ = 3.30; SD = 0.84). Librarians also reported substantial use of AI-based communication tools for user support services ($\bar{x}$ = 3.29) and AI technologies integrated into cataloguing, classification, and digital reference services. These findings suggest that librarians are increasingly incorporating AI technologies into routine library operations to enhance efficiency, improve access to information resources, and strengthen service delivery.

Despite the generally high level of AI adoption, comparatively lower mean scores were observed in specialized applications such as the use of AI-supported tools for research and reference management services ($\bar{x}$ = 3.11; SD = 0.92) and the use of AI technologies to solve minor operational challenges in the library ($\bar{x}$ = 3.08; SD = 0.93). These findings indicate that although AI adoption is progressing, some librarians still experience limitations in utilizing advanced AI-driven applications effectively. The overall weighted mean of 3.24, with a standard deviation of 0.86, confirms that librarians exhibit a high level of AI adoption in library services. However, the variations in some specialized areas imply the need for continuous training, improved technological infrastructure, and institutional support to further strengthen effective and sustainable AI integration in academic library operations.

Table 4: Challenges Affecting the Utilization of Digital Literacy Skills for AI Adoption among Librarians

S/N	Statement	SA	A	D	SD	Mean	S.D
1	Inadequate ICT infrastructure affects the utilization of digital literacy skills for AI adoption in the library.	88 (59.1%)	45 (30.2%)	10 (6.7%)	6 (4.0%)	3.44	0.80
2	Lack of adequate training limits librarians' ability to utilize digital literacy skills for AI adoption.	93 (62.4%)	38 (25.5%)	11 (7.4%)	7 (4.7%)	3.46	0.83
3	Insufficient access to modern digital technologies hinders AI adoption in the library.	85 (57.0%)	44 (29.5%)	13 (8.7%)	7 (4.8%)	3.39	0.83
4	Fear of job displacement discourages librarians from utilizing AI technologies.	40 (26.8%)	38 (25.5%)	47 (31.5%)	24 (16.1%)	2.63	1.02
5	Limited financial support affects the adoption of AI technologies in the library.	80 (53.7%)	50 (33.6%)	11 (7.4%)	8 (5.3%)	3.36	0.85
6	Complexity of AI systems makes it difficult for librarians to utilize digital literacy skills effectively.	62 (41.6%)	54 (36.2%)	23 (15.4%)	10 (6.8%)	3.13	0.90
7	Lack of technical support affects the effective use of AI technologies in the library.	78 (52.3%)	49 (32.9%)	14 (9.4%)	8 (5.4%)	3.32	0.85
8	High cost of AI technologies limits their adoption in library operations.	65 (43.6%)	48 (32.2%)	25 (16.8%)	11 (7.4%)	3.12	0.92
9	Inadequate digital literacy skills among some librarians affect AI integration in library services.	82 (55.0%)	46 (30.9%)	13 (8.7%)	8 (5.4%)	3.35	0.85
10	Absence of institutional policies and support affects AI adoption in academic libraries.	90 (60.4%)	41 (27.5%)	10 (6.7%)	8 (5.4%)	3.43	0.83
	Weighted Mean					**3.26**	**0.87**

Source: Field Survey, 2025

The results in Table 4 reveal that librarians experience several challenges affecting the utilization of digital literacy skills for Artificial Intelligence (AI) adoption in library operations, as reflected by the high mean scores across most items. Major challenges identified include lack of adequate training on AI technologies ($\bar{x}$ = 3.46; SD = 0.83), inadequate ICT infrastructure ($\bar{x}$ = 3.44; SD = 0.80), absence of institutional policies and support for AI integration ($\bar{x}$ = 3.43; SD = 0.83), and insufficient access to modern digital technologies ($\bar{x}$ = 3.39; SD = 0.83). Respondents also agreed that limited financial support ($\bar{x}$ = 3.36), inadequate digital literacy skills among some librarians ($\bar{x}$ = 3.35), and lack of technical support ($\bar{x}$ = 3.32) significantly hinder the effective utilization of digital literacy skills for AI adoption. These findings suggest that infrastructural, technical, financial, and institutional factors collectively limit librarians' ability to effectively utilize AI technologies in academic library services.

However, some challenges were perceived differently by respondents. Fear of job displacement resulting from AI adoption recorded a comparatively lower mean score ($\bar{x}$ = 2.63; SD = 1.02), indicating that although some librarians perceive AI as a threat to job security, many do not strongly share this concern. Similarly, the complexity of AI systems yielded a moderate mean score ($\bar{x}$ = 3.13; SD = 0.90), suggesting that while some librarians experience difficulty in understanding and operating AI technologies, others are gradually adapting to these systems. The overall weighted mean of 3.26, with a standard deviation of 0.87, confirms that librarians face considerable challenges in utilizing digital literacy skills for AI adoption. Overall, the findings imply that continuous professional training, improved ICT infrastructure, adequate funding, technical support, and strong institutional policies are necessary to enhance effective AI adoption and utilization in academic libraries.

Hypothesis

Table: Summary of Simple Linear Regression Analysis on the Relationship between Digital Literacy Skills and Adoption of AI in Ramat Library, University of Maiduguri

Variable	R	R^2	β	t-value	p-value	Decision
Digital Literacy Skills → AI Adoption	0.671	0.450	0.671	12.223	0.000	Significant

The regression analysis revealed a correlation coefficient (R) of 0.671, indicating a strong positive relationship between digital literacy skills and AI adoption among librarians. The R^2 value of 0.450 shows that digital literacy explains 45% of the variance in AI adoption. The unstandardized coefficient ($\beta = 0.782$) indicates that a unit increase in librarians' digital literacy leads to a 0.782 increase in AI adoption. The t-value of 12.223 with a p-value of 0.000 ($p < 0.05$) confirms that the relationship is statistically significant. Therefore, the null hypothesis (H_{01}) stating that there is no significant relationship between digital literacy skills and AI adoption is rejected. This implies that librarians' level of digital literacy plays a crucial role in determining their ability and willingness to adopt Artificial Intelligence for improved service delivery in Ramat Library.

Discussion of Findings

The findings revealed that while librarians demonstrated high proficiency in basic digital literacy skills such as computer use, internet navigation, and Microsoft Office applications, they showed limited competence in advanced areas like reference management tools and ICT troubleshooting. This pattern aligns strongly with existing literature, which consistently reports stronger foundational skills than advanced digital competencies among librarians. Similar findings were reported by Igbokwe and Onwuejeogwu (2021), Okoye and Igwe (2022), and Chukwu and Ali (2023), who found that librarians were proficient in basic ICT tools but had low competence in advanced digital skills such as metadata standards, digital repositories, AI-supported systems, and analytics tools. These studies collectively indicate that while foundational ICT competence is widespread, gaps persist in specialized digital applications required for advanced library services.

The study further revealed that the level of Artificial Intelligence (AI) adoption among librarians in Ramat Library was generally high, particularly in areas such as information retrieval services, access to electronic databases, digital reference services, and communication with library users. However, comparatively lower adoption levels were observed in more specialized applications such as AI-supported research management services and the use of AI technologies for solving operational challenges. This finding presents a more encouraging outlook than earlier studies which reported limited or moderate adoption of AI technologies among librarians. For instance, Usman and Ibrahim (2023) reported that librarians demonstrated low competence in AI-based applications despite possessing functional ICT skills, while Okoye and Igwe (2022) identified weaknesses in advanced digital technologies among academic librarians. The present finding therefore suggests gradual improvement in the integration and utilization of AI technologies in academic libraries, possibly due to increased exposure to digital innovations, improved awareness of AI applications, and institutional efforts toward digital transformation, although limitations in advanced AI utilization still persist.

The findings also identified several challenges affecting the utilization of digital literacy skills for AI adoption among librarians, including inadequate ICT infrastructure, insufficient training opportunities, limited access to modern technologies, inadequate funding, lack of technical support, and weak institutional policies. Although fear of job displacement was identified, it was not perceived as a major challenge by most respondents. These findings are consistent with the studies of Owolabi and Adebayo (2021) and Ahmed and Bello (2022), who found that librarians acknowledged the usefulness of AI technologies but were constrained by high implementation costs, infrastructural limitations, and inadequate technical capacity. Similarly, Ogunleye and Akinola (2021) emphasized that digital literacy alone may not guarantee successful AI adoption without adequate institutional support and technological infrastructure. The findings therefore imply that while librarians are increasingly willing to adopt AI technologies, persistent financial, technical, and organizational barriers continue to limit the effective utilization of digital literacy skills for sustainable AI integration in academic libraries.

Finally, the regression analysis revealed a significant positive relationship between digital literacy skills and AI adoption, indicating that librarians with higher digital competence are more willing and ready to adopt AI technologies. This finding is strongly supported by Ogunleye and Akinola (2021) and Adamu and Ibrahim (2021), who established that digital literacy is a significant predictor of AI adoption among librarians in Nigerian academic libraries. However, the unexplained variance in the relationship suggests that other factors such as ICT infrastructure, funding, institutional policies, and organizational support also influence AI adoption, reinforcing the view that digital literacy, while critical, must be complemented by enabling institutional conditions.

Conclusion

This section presents the summary of the major findings of the study and draws conclusions based on the results obtained from the analysis. It highlights the extent to which digital literacy skills influence Artificial Intelligence (AI) adoption among librarians in Ramat Library, University of Maiduguri, as well as the challenges affecting effective AI integration in library services.

The study on Digital Literacy as a Determinant of Artificial Intelligence (AI) Adoption in the Academic Library, University of Maiduguri, concludes that digital literacy is a critical factor influencing librarians' readiness and

willingness to adopt AI technologies for improved service delivery. The findings revealed that librarians possess a high level of digital competence in basic ICT skills, which positively shaped their perception and acceptance of AI applications, and a statistically significant relationship was established between digital literacy and AI adoption. However, challenges such as limited skills in advanced digital tools, inadequate infrastructure, and concerns about job security were identified as constraints to full AI integration. The study therefore concludes that sustained professional development, targeted ICT training, supportive institutional policies, and improved technological infrastructure are essential for strengthening digital literacy and promoting effective human–AI collaboration, enabling academic libraries to fully leverage AI for enhanced efficiency, innovation, and user satisfaction.

Recommendation

Based on the findings and conclusions of the study, the following recommendations were made:

1. The library management should organize regular ICT capacity-building workshops and digital competency certification programs to strengthen librarians' skills in emerging digital technologies, particularly in specialized areas such as database management, AI-based systems, and research support tools.
2. The library management should maintain continuous professional development opportunities and hands-on training sessions, especially in the use of library automation software, database navigation, and digital preservation systems, to bridge the identified skill gaps.
3. The library should sensitize staff on the collaborative potential of AI technologies rather than viewing them as replacements, and seek institutional or external funding to mitigate the cost of AI adoption and integration.
4. The library should improve technological infrastructure, ensure stable internet connectivity, and create institutional policies that encourage AI integration and innovation among librarians to fully harness the benefits of digital transformation.

Abstract

Climate change stands as a serious threat to library resources management in university libraries in Rivers State, Nigeria. This study investigated the extent of climate change-induced damage to library resources, existing preservation and management strategies, and the challenges faced by library personnel in implementing climate-resilient practices. A quantitative descriptive survey design was adopted. The total population comprised 68 professional and para-professional librarians across three public universities. Census enumeration technique was adopted for the study. Hence, fifty (50) questionnaires were retrieved and found usable, representing 73.5% response rate. Data were analyzed using descriptive statistics and means computed for each item, and a 2.50 cut-off adopted as the decision benchmark. Findings revealed that climate change has caused damage to library resources, particularly through flooding and humidity-related deterioration; that preservation strategies are partially in place but inconsistently implemented; and that power instability, budgetary constraints, and training deficits are the most significant barriers to climate-resilient practice. It is recommended among others that university libraries in Rivers State prioritize alternative energy solutions.

Keywords: *Climate Change, Library Resources Management, Preservation Strategies, University Libraries, Rivers State*

Introduction

Climate change, defined as the long-term alteration in global or regional weather patterns primarily attributed to human activities such as greenhouse gas emissions and deforestation, poses profound threats to institutional repositories of knowledge worldwide (IPCC, 2022). In the context of library science, this phenomenon exacerbates vulnerabilities in the preservation and management of library resources, which encompass physical collections like books, manuscripts, journals, and archival materials, as well as digital assets requiring stable infrastructure for access and storage. University libraries in tropical regions, characterized by high temperatures, elevated relative humidity, and frequent extreme weather events, face accelerated deterioration of these resources due to biodeterioration processes, including mould growth and insect infestations. In Nigeria, these challenges are intensified by rapid urbanization and inadequate infrastructure, leading to diminished access to scholarly materials essential for academic pursuits and societal development (Igie, Makinde, Omigie, & Adeniran, 2023).

Rivers State, located in the Niger Delta region of southern Nigeria, exemplifies the intersection of climate change impacts and library resource management. Flooding in Rivers State has surged in frequency and intensity in recent years, with major events in 2022 severely affecting communities and infrastructure in Port Harcourt and surrounding areas (Ezenwaji et al., 2023). Such inundations threaten library buildings, potentially causing water damage to shelving systems, electrical setups, and collection stacks, while high humidity levels, often exceeding 80% during rainy seasons, foster fungal proliferation on paper-based materials. Library science literature highlights that relative humidity above 60% accelerates acid hydrolysis in acidic papers, leading to embrittlement and fragmentation, a process hastened by temperatures averaging 28–32°C in the region (Mathew & Yonatan, 2021).

Challenges in library resource management under climate stressors include inadequate funding for climate-resilient infrastructure, limited training in preventive conservation, and reliance on reactive measures rather than proactive environmental monitoring. Budgetary limitations hinder upgrades like flood-resistant storage or humidity-controlled facilities, while low awareness among personnel delays implementation of standards for tropical preservation. These factors compound vulnerabilities, leading to potential losses in irreplaceable materials and disruptions in service delivery (Dada, 2021). This background underscores the urgency of examining climate change's ramifications in Rivers State's

university libraries, where the University of Port Harcourt, Rivers State University, and Ignatius Ajuru University of Education manage diverse collections amid escalating environmental risks.

Statement of the Problem

In the ideal situation, university libraries in Nigeria operate as climate-resilient institutions where resources such as print collections, digital infrastructure, archival materials, and ICT facilities are well-preserved and accessible year-round. Effective environmental control systems, stable power supply, and climate-adapted buildings ensure that temperature, humidity, and disaster risks are managed, allowing librarians to focus on collection development, preservation, and user services that support teaching, research, and sustainable development goals standards.

However, observation has revealed growing challenges as climate change increasingly threatens library resources management especially in university libraries in Rivers State, Nigeria, ranging from intensified flooding sometimes caused by erratic rainfall, elevated humidity, extreme heat, and humidity fluctuations damage print materials, promote mold growth, and accelerate paper deterioration and temperature extremes, which precipitate severe degradation of library resources. Such deterioration disrupts core library functions - acquisition, preservation, and access - exacerbating knowledge gaps for academic users and straining limited budgets for remedial conservation. Furthermore, frequent power outages and grid instability disrupt air-conditioning and digital servers, exposing electronic resources and databases to data loss and hardware failure. Many Nigerian university libraries lack climate-adapted infrastructure, disaster preparedness plans, climate-resilient policies, integrated pest management protocols, infrastructure upgrades, and funding for preservation technology, forcing librarians to struggle with collection loss, reduced access, and higher maintenance costs, leaving resources vulnerable and thereby undermining librarians' role in knowledge preservation, as well supporting research on environmental challenges and effective service delivery.. The challenge is also, compounded by inadequate awareness and training among library personnel in tropical preservation techniques, leading to reactive rather than proactive management. Could these challenges be applicable to the happenings in university libraries in Rivers State?

Hence, the nexus for this investigation. This study seeks to address these deficiencies by empirically assessing climate change effects and proposing actionable strategies to fortify resource management, offering practical guidance for policymakers and library personnel.

Objectives of the Study

This study aims to investigate the effects of climate change on library resources management in university libraries in Rivers State, Nigeria. Specifically, the objectives are to:

1. determine the extent of climate change-induced damage to physical and digital library resources in university libraries in Rivers State, Nigeria.
2. evaluate the preservation and management strategies of library resources by these libraries.
3. identify the challenges faced by library personnel in implementing climate-resilient practices.

Literature Review

Conceptual Review of the Major Concepts

Climate Change in Academic Libraries Resources

Climate change has emerged as one of the most transformative global challenges in the twenty-first century, reshaping industries, organizations, and educational institutions. In the context of academic libraries, climate change refers to the environmental shifts and extreme weather events that directly affect the preservation, accessibility, and management of library resources, manifesting through flooding, humidity fluctuations, heat waves, and infrastructural damage, which compromise the integrity of physical collections and disrupt service delivery (Ngulube & Mosha, 2025). Climate change in libraries can be categorized into several domains: physical preservation, where environmental changes accelerate deterioration of print materials; infrastructural resilience, which involves strengthening buildings and ICT systems against floods; and digitization and virtual repositories, ensuring continuity of access even during environmental disruptions (Oladokun, Wagwu, & Okoro, 2023). The adoption of climate-adaptive strategies in academic libraries is not without challenges, as infrastructural deficiencies, financial constraints, and limited technical expertise pose significant barriers to implementation (Danladi & Jegbefume, 2025).

Library Resource Management and Preservation Strategies

Library resource management has emerged as a central concept in the twenty-first century, referring to the systematic planning, acquisition, organization, preservation, and dissemination of both physical and digital collections to meet the needs of students, faculty, and researchers. The concept of resource management in libraries is not limited to routine operations but extends to strategic adaptation, where systems and practices respond to environmental, technological, and institutional changes (Ngulube & Mosha, 2025). In academic libraries especially in Rivers State, where student populations are expanding and collections are diversifying, the adoption of resource management strategies is particularly relevant for addressing inefficiencies in cataloging, preservation, and service delivery (Danladi & Jegbefume, 2025). The absence of proactive management frameworks limits efficiency and resilience, which are

increasingly important in contemporary scholarship, while resource management initiatives can fill this gap by curating sustainable pathways for collection development and preservation.

Climate Change Effect in University Libraries Resources in Rivers State

University libraries represent the intellectual backbone of higher education, serving as repositories of knowledge and facilitators of research, teaching, and learning. In Rivers State, Nigeria, these libraries are tasked with acquiring, organizing, preserving, and disseminating both print and digital resources amid escalating environmental risks (Ngulube & Mosha, 2025).

Climate change effect refers to the observable consequences of environmental shifts such as flooding, rising temperatures, and humidity fluctuations on the preservation and management of library resources. In university libraries in Rivers State, these effects are particularly pronounced due to the region's vulnerability to heavy rainfall, poor drainage systems, and infrastructural limitations. Collections housed in poorly ventilated or inadequately protected facilities are at risk of deterioration, mold growth, and physical damage. Beyond physical resources, climate change also disrupts service delivery, as extreme weather events can hinder access to library buildings, damage ICT infrastructure, and increase operational costs. Recent scholarship emphasizes that climate change impacts are increasingly recognized as critical factors influencing the sustainability of academic libraries in Nigeria (Ngulube & Mosha, 2025).

Libraries in Rivers State frequently encounter flooding, humidity, and infrastructural damage, which compromise the preservation of collections and disrupt service delivery. The development of university libraries in Rivers State is not without challenges: infrastructural deficiencies, financial constraints, and limited technical expertise pose significant barriers to effective resource management, while reliable electricity, adequate storage facilities, and vendor support are prerequisites for sustainable library operations (Oladokun, Wagwu, & Okoro, 2023). By examining climate change impacts, this study positions environmental pressures as both a challenge to existing practices and a driver of innovation in library service delivery.

Empirical Review

Eze and Nwankwo (2025) examined climate change awareness and preservation practices among librarians in Nigerian universities, adopting a quantitative survey design with 300 respondents. Findings revealed that libraries with higher awareness levels implemented more proactive preservation measures such as digitization and climate-controlled storage, and the study concluded that awareness is a critical enabler of resilience, recommending mandatory training programmes and institutional climate policies. Okoro and Agada (2024) conducted an evaluative study on disaster preparedness strategies in Nigerian university libraries anchored on DOI, finding significant increases in adoption of emergency response plans and staff awareness following structured training, and concluding that structured preparedness training is highly effective in enhancing resilience.

Chukwu and Ibrahim (2022) investigated preservation policies in university libraries across South-West Nigeria, finding poor policy execution, inadequate preservation infrastructure, and limited staff capacity, and concluding that effective preservation policies are indispensable for safeguarding collections. Adebanjo and Salisu (2022), anchored on Human Capital Theory, highlighted significant training deficits that hindered adaptive capacity and preservation output among library staff in federal universities, concluding that continuous professional development is essential for building adaptive competence. Umar (2022) established that digitization significantly improves accessibility and resilience against climate-related deterioration and recommended structured training and institutional guidelines on digital preservation practices. Ogunleye and Hassan (2022) found that disaster management competencies and institutional support are critical for successful adaptation, concluding that librarians must transition to active disaster managers and recommending competency-based training and policy recognition of librarians as key actors in resilience planning.

Aba, Makinde, Omigie and Ademola (2023) carried out an investigation on perceived effect of climate change on library resources in Universities in Edo State, Nigeria. The result reveals that those perceived effects of climate change damage library structures and furnishings, decrease library usage during rainy season, and raise users frustration in university libraries. The study maintained that climate change-related variables are threats that have a direct or indirect impact on library resources. They conclude that librarians should receive ongoing training on the physical and chemical nature of resources, and significant efforts by library administration, employees, and parent institutions are required to address the threat of climate change on library resources in universities in Edo State, Nigeria.

Chewe and Banda (2021) investigated the role of public libraries in the climate change agenda. The results revealed that majority (80%) of the participating libraries had no plans on how to combat climate change and its impacts and only 1 (1.6%) library was actively involved in climate change awareness campaigns. It was deduced from the result that public libraries in Zambia were passive in the fight against climate change. Implicitly, the role of public libraries vis-à-vis the climate action agenda was insignificant. These findings would inform policy direction on how best to leverage public libraries in the actualization of SDG # 13.

The study carried out by Ekanem and Mutiso (2021) on partnerships among librarians in Nigeria and Kenya revealed that sustained partnerships enhanced preservation capacity and strengthened institutional resilience against climate risks.

Methodology

This study employed a quantitative descriptive survey research design to investigate the effects of climate change on library resources management in university libraries in Rivers State. The population comprised 68 professional and para-professional librarians across the three university libraries in Rivers State, as shown in Table 1 below.

S/N	Institution	Professional	Para-Professional	Total
1	Rivers State University Library	10	11	21
2	Donald Ekong Library, University of Port Harcourt	18	16	34
3	Ignatius Ajuru University of Education Library	10	3	13
	Total	**38**	**30**	**68**

Table 1: Population Distribution of the Study (Source: Library Heads, 2026)

Census enumeration technique guided the study. Questionnaires were distributed accordingly using stratified random sampling to ensure proportional representation across the three institutions. Fifty (50) were retrieved and found usable, giving a response rate of 73.5% with distribution as follows: Donald Ekong Library, University of Port Harcourt (25, 50.0%), Rivers State University Library (15, 30.0%), and Ignatius Ajuru University of Education Library (10, 20.0%). Data were collected using a structured questionnaire. Section A captured demographic information, and Section B contained 30 Likert-scale items across three research questions (ten items each), rated on a four-point scale: 4 = Strongly Agree (SA), 3 = Agree (A), 2 = Disagree (D), and 1 = Strongly Disagree (SD). Validity was established through expert review, and reliability was confirmed through Cronbach's alpha ($\alpha = 0.81$). Data were analyzed using frequency counts, percentages, and weighted means, with a mean score of 2.50 and above adopted as the benchmark for agreement.

Analysis and Interpretation

Section A: Demographic Variables of Respondents

Table 2: Respondent Demographic Profile

Variable	Category	n (%)
Gender (n=50)	Male	15 (30.0%)
	Female	35 (70.0%)
Age (n=50)	18 – 25	2 (4.0%)
	26 – 35	9 (18.0%)
	36 – 45	13 (26.0%)
	46 and above	26 (52.0%)
Institution (n=50)	Donald Ekong Library, University of Port Harcourt	25 (50.0%)
	Rivers State University Library	15 (30.0%)
	Ignatius Ajuru University of Education Library	10 (20.0%)
Years of Experience (n=50)	1 – 10 years	23 (46.0%)
	11 – 20 years	18 (36.0%)
	21 – 30 years	7 (14.0%)
	31 years and above	2 (4.0%)
Educational Qualification (n=50)	BLIS/BSc	10 (20.0%)
	HND	2 (4.0%)
	MLIS/MSc	12 (24.0%)

	PhD	26 (52.0%)
Designation (n=50)	Library Officer	12 (24.0%)
	Librarian (1–3)	22 (44.0%)
	Senior Librarian	11 (22.0%)
	Deputy Librarian	3 (6.0%)
	Professor	2 (4.0%)

The table revealed that majority of the respondents were experienced and highly qualified library professionals. The majority were female (35, 70.0%) and 52.0% were aged 46 and above. In line with the population distribution, the Donald Ekong Library, University of Port Harcourt contributed the largest proportion (25, 50.0%), followed by Rivers State University Library (15, 30.0%), and Ignatius Ajuru University of Education Library (10, 20.0%). About half of respondents (23, 46.0%) had 1–10 years of experience, while 36.0% (18) had 11–20 years. The majority held a PhD (26, 52.0%) or MLIS/MSc (12, 24.0%). Librarians (Grade 1–3), followed by Library Officers (12, 24.0%) and Senior Librarians (11, 22.0%).

Section B: Extent of Climate Change, Preservation Strategies, and Challenges

Table 3: Respondents' Responses on Extent of Climate Change, Preservation Strategies, and Challenges

S/N	Statement	VHE n(%)	HE n(%)	LE n(%)	VLE n(%)	Mean	Decision
Research Question 1: Extent of Climate Change-Induced Damage to physical and digital **Library Resources**							
1	Flooding has significantly damaged physical collections in my library.	11 (22.0%)	22 (44.0%)	6 (12.0%)	11 (22.0%)	**2.66**	Agreed
2	High humidity has led to mold growth on paper-based materials.	12 (24.0%)	21 (42.0%)	11 (22.0%)	6 (12.0%)	**2.78**	Agreed
3	Insect infestations have increased due to climate conditions.	10 (20.0%)	20 (40.0%)	12 (24.0%)	8 (16.0%)	**2.64**	Agreed
4	Heat and temperature fluctuations have accelerated deterioration of resources.	8 (16.0%)	26 (52.0%)	10 (20.0%)	6 (12.0%)	**2.72**	Agreed
5	Digital resources are frequently disrupted by unstable power supply.	11 (22.0%)	23 (46.0%)	10 (20.0%)	6 (12.0%)	**2.78**	Agreed
6	Flooding has affected library infrastructure such as shelving and electrical systems.	14 (28.0%)	21 (42.0%)	11 (22.0%)	4 (8.0%)	**2.90**	Agreed
7	Climate change has reduced the lifespan of printed materials in my library.	10 (20.0%)	25 (50.0%)	10 (20.0%)	5 (10.0%)	**2.80**	Agreed
8	Biodeterioration (fungi, insects) is a major problem in our collections.	13 (26.0%)	16 (32.0%)	15 (30.0%)	6 (12.0%)	**2.72**	Agreed

S/N	Statement	SA n(%)	A n(%)	D n(%)	SD n(%)	Mean	Decision
Research Question 3: Challenges in Adopting Climate-Resilient Practices by Library Staff							
21	Inadequate funding limits climate-resilient infrastructure upgrades.	15 (30.0%)	19 (38.0%)	7 (14.0%)	9 (18.0%)	**2.80**	Agreed
22	Staff lack adequate training in tropical preservation techniques.	14 (28.0%)	20 (40.0%)	9 (18.0%)	7 (14.0%)	**2.82**	Agreed
23	Awareness of climate change impacts among personnel is low.	11 (22.0%)	18 (36.0%)	15 (30.0%)	6 (12.0%)	**2.68**	Agreed
24	Poor drainage systems around the library increase vulnerability to flooding.	11 (22.0%)	23 (46.0%)	11 (22.0%)	5 (10.0%)	**2.80**	Agreed
25	Limited access to modern preservation technologies hinders adaptation.	13 (26.0%)	27 (54.0%)	4 (8.0%)	6 (12.0%)	**2.94**	Agreed
26	Power instability disrupts climate-control systems and digital preservation.	14 (28.0%)	27 (54.0%)	5 (10.0%)	4 (8.0%)	**3.02**	Agreed
27	Policies on climate resilience are not well enforced in my institution.	7 (14.0%)	29 (58.0%)	8 (16.0%)	6 (12.0%)	**2.74**	Agreed
28	Staff resistance to adopting new technologies is a challenge.	6 (12.0%)	23 (46.0%)	15 (30.0%)	6 (12.0%)	**2.58**	Agreed

29	Budgetary constraints prevent proactive environmental monitoring.	17 (34.0%)	20 (40.0%)	5 (10.0%)	8 (16.0%)	**2.92**	Agreed
30	Overall, challenges significantly hinder the adoption of climate-resilient practices.	14 (28.0%)	25 (50.0%)	7 (14.0%)	4 (8.0%)	**2.98**	Agreed
	Grand Mean					**2.83**	**Agreed**

The results above revealed that climate change has significantly impacted library resources across all three institutions, with all ten items under Research Question 1 agreed upon and a grand mean of 2.77. Items 6 and 9: flooding has affected library infrastructure such as shelving and electrical systems and climate-related damage has caused interruptions in library services, recorded the highest means (2.90 each), while Item 1 on flooding damage to physical collections (mean = 2.66) and Item 3 on insect infestations (mean = 2.64) were lowest, though both exceeded the class mark.

Also, preservation strategies obtained a grand mean of 2.68. Green library practices (Item 18, mean = 2.78) and digital backups (Item 15, mean = 2.76) were the most consistently reported strategies, while integrated pest management (Item 13, mean = 2.52) and HVAC systems (Item 16, mean = 2.54) were slightly above the average mean, suggesting that these more strategies are minimally adopted. In terms of challenges, all ten items were agreed upon with the highest grand mean of 2.83. Power instability (Item 26, mean = 3.02) was the most strongly agreed-upon challenge, followed by overall challenge severity (Item 30, mean = 2.98), limited access to modern preservation technologies (Item 25, mean = 2.94), and budgetary constraints (Item 29, mean = 2.92). Staff resistance to adopting new technologies (Item 28, mean = 2.58) recorded the lowest challenge mean, suggesting attitudinal barriers are less critical than structural and financial constraints.

Discussion

Extent of Climate Change-Induced Damage to Library Resources

The study found that climate change has caused significant and measurable damage to library resources across all three public university libraries in Rivers State. Flooding was identified as the major problem, with particular agreement that it has affected library infrastructure such as shelving and electrical systems, and that climate-related damage has caused interruptions in library services. This finding strongly aligns with Ezenwaji et al. (2023), who documented perennial flooding in the Niger Delta region and its institutional consequences, confirming that the experiences reported are consistent with the larger environmental realities of Rivers State. The study also supports that of Igie, Makinde, Omigie, and Adeniran (2023), who identified humidity, flooding, and biodeterioration as the primary climate-related threats to university libraries in tropical Nigeria. It is also consistent with Mathew and Yonatan (2021), who demonstrated the direct relationship between humidity levels above 60% and accelerated paper deterioration. Their study found that high humidity leading to mould growth on paper-based materials was among the most strongly agreed-upon damage indicators. The findings confirm that climate change is not an external or issue of future concern for these libraries but an ongoing operational reality that demands immediate and strategic institutional response.

Preservation and Management Strategies for Library Resources

The study revealed that preservation and management strategies are partially in place in the university libraries in Rivers State, though their implementation is inconsistent and are barely systematic. Green library practices and the maintenance of digital backups were reported as most consistent strategies employed, indicating that lower-cost interventions have gained more leverage than resource-intensive ones. This finding aligns with Umar (2022), who found that digitization is increasingly adopted as a climate resilience strategy in Nigerian libraries, confirming that a similar situation is experienced in Rivers State institutions. However, the study also revealed little level of adoption of HVAC systems and integrated pest management strategies, reflecting the well-documented resource constraints that prevent Nigerian libraries from fully implementing tropical preservation standards. This supports Chukwu and Ibrahim (2022), who reported poor policy execution, inadequate preservation infrastructure, and limited staff capacity as recurring constraints in Nigerian university libraries, concluding that effective preservation policies are indispensable for safeguarding collections. Furthermore, the moderate endorsement of disaster preparedness plans and climate-specific policies indicates that formal systems of institutions are underdeveloped. The study agrees with Okoro and Agada (2024), who found that structured preparedness and policy frameworks are critical enablers of resilience that are currently underutilized in Nigerian academic library settings, reinforcing the need for deliberate policy development and enforcement in Rivers State university libraries.

Challenges in Adopting Climate-Resilient Practices by Library Staff

The study also found that library personnel in Rivers State university libraries face significant challenges in adopting climate-resilient practices. Power instability was identified as the most significant challenge, as it was agreed that it

disrupts climate-control systems, digital preservation workflows, and environmental monitoring alike. This finding directly aligns with that of Oladokun, Wagwu, and Okoro (2023), who documented power instability as a cross-cutting infrastructural barrier to library adaptation in Nigeria, confirming that the critical deficit in electricity constitutes a major challenge that hinders even the best-intentioned preservation investments. The study also supports that of Adebanjo and Salisu (2022), who identified budgetary constraints and lack of training as key barriers to adaptive capacity in Nigerian academic libraries, consistent with the finding in this study that budgetary constraints preventing proactive environmental monitoring and limited access to modern preservation technologies were among the most strongly felt challenges. However, staff resistance to adopting new technologies recorded the lowest mean among all challenge items, suggesting that attitudinal barriers are less formidable than structural and financial ones. This implies that targeted training programmes are likely to find receptive audiences among library staff, and that the primary focus of intervention should be on infrastructure investment and institutional policy rather than on behavioural change alone.

Conclusion

The study confirms that climate change is actively and measurably affecting library resources in the three public university libraries in Rivers State, Nigeria, through flooding, humidity-driven deterioration, biodeterioration, and power disruptions to digital systems. While preservation strategies are nominally in place, their implementation is inconsistent and insufficiently comprehensive, and is often concentrated in lower-cost interventions such as digital backups and green practices while more infrastructure-intensive measures remain weakly adopted. Challenges of preservation are the most felt aspect, with power instability being the single most critical barrier. The findings indicate that climate resilience in Rivers State university libraries is currently reactive and fragmented rather than strategic and systemic, leaving collections and services vulnerable to intensifying environmental pressures.

Recommendations

Based on the findings, the following recommendations are proposed:

1. University management and stakeholders should partner in terms of budget allocations for flood-resistant shelving, humidity control systems, and integrated pest management. Institutions should pursue climate adaptation grants from the National Universities Commission, IFLA, and international development partners to ensure continuous climate control and digital preservation.
2. Libraries should develop, formally adopt, and regularly review disaster preparedness plans and climate resilience policies with clear accountability structures.
3. Institutions should expand the digitization of vulnerable collections and develop institutional repositories with off-site backup protocols to safeguard holdings against future climate-related losses. This implies that capacity-building programmes covering pest management, humidity control, digital backup protocols, and climate-adaptive shelving should be structured in continuous professional development for all library staff.

EQUIPPING LIBRARIANS AND INFORMATION PROFESSIONALS FOR INNOVATIVE LIBRARY SERVICES IN FEDERAL UNIVERSITY OF TECHNOLOGY OWERRI LIBRARY THE 21st CENTURY

Vivian Chinazo Ukawuba (CLN)
National Root Crops Research Institute, Umudike. Abia State. Nigeria.
Email:vindunita@gmail.com

Chuka Christian Uzokwe (CLN)
Federal College of Land Resources Technology, Owerri.
Email- uzokwechuka@yahoo.com

Abstract

This study centred on equipping librarians and information professionals for innovative library services in the 21st century with special reference to Federal University of Technology, library, Owerri. It was guided by four research questions, some of which include: One; what is the current level of proficiency in 21st-century digital skills among library staff of FUTO? Two; what are the types of innovative library services currently being implemented at FUTO library? The researcher adopted a quantitative research methodology that involved descriptive survey design. The population of study is one hundred and forty six library staff. A purposive sampling technique was adopted to select a sample size of eighty five (85) library staff, which is over 50 percent of the entire study population. The instrument used for data collection is a 4-point Likert rating scale entitled "Equipping Librarians and Information Professionals for Innovative Library Services Scale (ELIPILSS)". The data collected were analyzed using descriptive statistics involving mean to answer the research questions posed. Findings revealed that the current level of proficiency in 21st-century digital skills among library staff of FUTO is significantly high; that the library provides a variety of innovative services ranging from social media engagement platforms, ICT-enabled services, Online Public Access Catalogue (OPAC) to improve user ability to search for materials, high-level branding and promotion to increase library usage, digital databases and online resources for enhanced access to extended services so as to accommodate student research schedules; that FUTO library management is providing capacity-building programmes to effectively equip its staff through various strategies such as job rotation, mentoring programmes, opportunity to attend professional conference and formal education/seminars to acquire higher degrees in librarianship, etc. The study concluded that library staff at the Federal University of Technology, Owerri (FUTO) possess a significantly high level of proficiency in 21st-century digital skills, which have enabled the provision of innovative services such as OPAC, digital databases, social media engagement, etc. Based on the findings, it was recommended that the university library management should organize specialized workshops in collaboration with industry experts to enable library staff move beyond basic digital skills; that the university library management should implement a mobile responsive strategy for all digital services, including the OPAC, digital databases, and social media engagement to ensure seamless 24/7 access to resources for students; that the university library management should organize workshops specifically on current OPAC systems and digital database management, etc.

Keywords: 21st Century Librarianship, Innovative Library Services, University Libraries, Information Professionals, 21st Century Librarian: digital skills, Capacity Building

INTRODUCTION

The 21st-century university library has undergone a profound transformation, evolving from a passive repository of printed materials into a dynamic and technology-driven hub of learning and research. Driven by rapid advancements in Information and Communication Technologies (ICT), academic libraries, especially those in universities, are now expected to be proactive partners in the pedagogical and research mission of higher education. Consequently, the traditional custodian of books role is obsolete, replaced by the need for information specialists who can navigate complex digital landscapes. Bello and Adepegba (2023) are of view that libraries are no longer confined to their physical collections but have expanded their scope to include resources, digital repositories, and online service platforms. This shift, therefore, necessitates a complete reimagining of library services, which must now be user-centered, accessible from remote locations, and capable of managing both physical and digital resources to meet the changing needs of students and faculty.

Equipping librarians for this new era requires a strategic focus on up-skilling, moving beyond traditional cataloguing skills to embracing digital literacy, data management, and the ability to curate virtual resources. In day's society, the key competencies essential for modern librarians should include: proficiency in using web-based tools, social networking for user engagement, knowledge of digital repository systems, and the ability to provide online research assistance. Furthermore, information professionals need specialized knowledge in web design, database management, and information retrieval strategies to effectively manage the digital library infrastructure. As noted by Amos and Bassi (2025), the imperative for librarians to develop digital literacy skills is further underscored by the increasing reliance on digital platforms for information dissemination and user engagement. Olaniyi and Akinyoola (2023) state that librarians are now expected to be proficient in using various digital tools and platforms to meet the

evolving needs of library users. These skills are not merely technical but are critical for conducting virtual reference services and teaching library users to efficiently locate, evaluate, and utilize online resources.

Innovative library services are the cornerstone of this evolution, shifting from simply offering access to information toward active knowledge management and user-centered engagement. Such services include the development of institutional repositories, online reference services, virtual information literacy programmes, and the deployment of AI-powered tools. In the university context, librarians are now expected to collaborate closely with faculty to facilitate research data management, support open-access publishing, and create online learning objects. According to Temitope and Olutoki (2024), the advent of innovative services in library operations is far-reaching in the transformation of libraries into dynamic centers of learning, engagement, and development through adoption and use of technology and creative approaches. These innovations have placed much responsibilities on libraries especially those in universities to remain relevant as vital organs of their mother institutions and also much more relevant in these 21st century. In community services, innovative library services offer services in the areas of community hubs, offering spaces for collaboration, meetings, and events, thus fostering community engagement and cohesion.

Be that as it may, the path to equipping librarians faces significant challenges, including inadequate technological infrastructure, funding constraints, and the rapid pace of technological change that makes skills obsolete. Studies by Akwang (2017), and Abubakar and Attahir (2018) indicate that LIS professionals are not creative and innovative enough to deploy sustainable library practices, routines and initiatives. These scenarios, according to Oduwole, Adekunmisi and Oyedokun (2023), are attributed to inadequate training, lack of requisite ICT skills, non-integration of entrepreneurship training/curriculum in the Nigerian library schools' curricula, poor support from libraries leadership and many other elements. Overcoming these requires a proactive approach from university management to invest in continuous training and retraining, encouraging staff to adopt a "train-the-trainer" approach to keep pace with new technologies. Hence this study focused on equipping librarians and information professionals for innovative library services in the 21st century

Statement of the Problem

The 21st-century information landscape, characterized by rapid technological advancement and digital transformation, necessitates that university libraries shift from traditional methods to innovative and user-centric services. The 21st-century information landscape is characterized by rapid technological advancements, including Artificial Intelligence (AI), big data, and digital ubiquity, which have transformed user expectations from traditional, static library services to dynamic, personalized, and digital-first experiences. Despite this shift, many librarians and information professionals continue to operate using conventional methods, creating a noticeable gap between the required innovative services and the actual services delivered. This slow adaptation to technological innovation threatens to render library institutions irrelevant in the information age. This is often worsened by a traditional curriculum in library education which leaves professionals being unable to meet the needs of a sophisticated user base, resulting in decreased patronage. This study therefore sought to identify the skill gaps among FUTO library staff and assess their readiness to transition from conventional to innovative and digital-oriented services.

Research Questions

The following research questions guided the study.

1. What is the current level of proficiency in 21st-century digital skills among library staff of FUTO?
2. What are the types of innovative library services currently being implemented at FUTO library?
3. What are the capacity-building strategies being carried out to effectively equip FUTO library staff?
4. What are the challenges hindering the adoption of innovative services in FUTO library?

Literature Review

The rapid evolution of information and communication technology has profoundly altered the landscape of academic librarianship, making it necessary for library personnel to become proficient in 21st-century digital skills. In this 21st century, librarians/library staff are required to have the mastery of competencies needed to manage, navigate, and deliver modern information services. In this light, good digital proficiency-driven library operations by the library staff will enable library users have access to more worldwide information resources than traditional library operations, which are restricted to a single library collection. However, recent study by Sinha and Ugwulebo (2024) indicates a digital skill gap among university library staff: as they demonstrate high proficiency in foundational IT tasks (word processing, email, browsing, etc.), but show moderate to limited capability in advanced 21st-century digital competencies. Also, a study by Rafiq (2022) has shown that librarians are comfortable with social networking and mobile technology, yet they often lack deep competence in specialized areas such as data analytics, digital preservation, and advanced database management. Furthermore, a 2024 study in Nigerian federal universities found that while basic skills are widespread, advanced digital skills are only possessed at a moderate level, often limiting the scope of high-

tech services, although some studies report high competence among librarians in specific regions (Mamza, Bantai & Aliyu, 2024).

University libraries are increasingly transforming into digital hubs, implementing innovative services that leverage emerging technologies to improve user experiences. The key innovations include: the adoption of artificial intelligence (AI) for chatbots, virtual reference services, and AI-driven cataloging. As explained by Emezie (2018), some of the tools that can be used for the provision of innovative service delivery by academic librarian include social media, information literacy, research commons, learning spaces, new arrival bookstand, fliers /infogate board. Furthermore, libraries are integrating the Internet of Things (IoT) for smart library management, such as automated checkouts and shelf-reading robots. Other prominent innovations include the development of institutional repositories, online research guides, interactive library mobile applications, and virtual reality (VR) for immersive learning. Emezie (2018) asserts that libraries, including those in universities, are leveraging on innovative services and practices to respond to the changing needs of patrons and equally remain afloat in a technology saturated environment. In other words, many innovative practices are employed by libraries to increase their visibility and strengthen their role in the academic environment.

To bridge the digital skill gap and support these innovations, institutions are employing various capacity-building strategies. These include in-house training sessions, workshops, and encouragement of self-sponsorship for computer training. Adebayo (2021) articulates capacity building as the enhancement and fortification of human and institutional capabilities that are crucial for the efficient and effective attainment of organizational objectives. Furthermore, librarians are increasingly utilizing informal, on-the-job methods such as "trial and error," mentoring, and peer collaboration (colleague assistance) to acquire new digital competencies. Some, though limited, institutional sponsorship for attending conferences is also reported as a strategy to enhance technological skills, alongside the adoption of social media as a platform for developing competencies Nwofor, Chikaodi & Nwaede, 2023).

Despite the push for modernization, the adoption of innovative library services faces significant obstacles, most notably financial constraints, including inadequate funding for technological infrastructure. Poor internet connectivity, erratic power supply, and the high cost of purchasing and maintaining advanced ICT equipment further hinder progress. Additionally, literature highlights human-centered challenges, such as staff resistance to change, lack of motivation, and the absence of formal training policies, which prevent librarians from adopting new technologies effectively. Oyeniyi, Oluwakemi and Olaifa, as cited in Etebu and Zacchaeus (2020) observed that most libraries and information centres fail to make a recognizable impact because they are handled by non-professionals or inadequately trained individuals. Furthermore, poor digital literacy hampers innovation and adaptability. In a rapidly evolving technological landscape, libraries must continuously adopt new software, online databases, and digital platforms to remain relevant. Staff who lack the skills to engage with these technologies are less likely to embrace change, which can prevent the library from modernizing its services and meeting the needs of a digitally inclined user base (Amos & Bassi, 2025).

METHODOLOGY

The study employed a quantitative research methodology that involved a descriptive survey design. This design was adopted on the premise that the research was targeted at gathering and interpreting the views of library staff in Federal University of Technology, Owerri. According to Nworgu (2015), a survey research design is intended to glean and systematically describe information and facts about a given population. The population of this study is one hundred and forty six library staff of FUTO. A purposive sampling technique was adopted to select a sample size of eighty five (85) library staff which is over 50 percent of the entire study population. The instrument used for data collection is a 4-point Likert rating scale entitled “Equipping Librarians and Information Professionals for Innovative Library Services Scale (ELIPILSS)”. The data collected were analyzed using descriptive statistics involving mean to answer the research questions posed. The mean values were calculated with 2.50 as the benchmark. Any item that recorded a mean below 2.50 was regarded as ‘not a factor’, while 2.50 and above were regarded as ‘factors’.

Data Analysis

Research Question 1: What is the current level of proficiency in 21st-century digital skills among library staff of FUTO?

Table 1: Current Level of Proficiency in 21st-Century Digital Skills among Library Staff of FUTO N-85

S/N	Items	VHL	HL	LL	VLL	$\bar{X}$	Remark
1	I am proficient in using computers, word processing, and browsing the internet for information.	21	43	14	07	2.91	HL
2	I am familiar with using smartphones, PDAs, and scanners.	18	41	17	09	2.80	HL
3	Ability to manage digital identities and analyze information critically.	10	17	34	24	2.15	LL
4	I have skills in digital conversion, metadata creation, and database management.	05	31	38	11	2.35	LL
5	Ability to utilize email, social media, and virtual collaboration tools for library services.	28	35	30	02	3.04	VHL
6	Ability to locate, evaluate and utilize online scholarly databases and digital resources.	14	46	17	08	2.98	HL
	Pooled Mean					**15.03**	
	Grand Mean					2.67	

Key: Very High Level (VHL) High Level (HL) Low Level (LL) Very Low Level (VLL) Mean ($\bar{X}$)

Table 1 presents the mean responses on the current level of proficiency in 21st-century digital skills among library staff of FUTO. Based on the table presentation, the main area where the current level of proficiency in 21st-century digital skills among library staff of FUTO is very high, is their ability to utilize email, social media, and virtual collaboration tools for library services (mean value of 3.04), with ability to locate, evaluate and utilize online scholarly databases and digital resources following as the second most significant area (mean value of 2.98). Furthermore, the proficiency in using computers, word processing, and browsing the internet for information recorded a mean value of 2.91, while library staff familiarity with using smartphones, PDAs, and scanners got a mean value of 2.80. However, areas such as staff skills in digital conversion, metadata creation, and database management, and staff ability to manage digital identities and analyze information critically scored below the established criterion mean of 2.50. However, going by the established grand mean of 2.67, the current level of proficiency in 21st-century digital skills among library staff of FUTO is significantly high.

Research Question 2: What are the types of innovative library services currently being implemented at FUTO library?

Table 2: Types of Innovative Library Services Currently Being Implemented at FUTO Library N-85

S/N	Item Statements	SA	A	D	SD	$\bar{X}$	Remark
7	The university library provides high-level branding and promotion to increase library usage.	21	33	18	13	2.73	Agree
8	The library operates social media engagement platforms to interact with users.	39	27	12	07	3.15	Agree
9	The library offers digital databases and online resources for enhanced access.	16	46	19	04	2.87	Agree
10	There is a provision of Online Public Access Catalogue (OPAC) to improve user ability to search for materials.	28	36	15	06	3.00	Agree
11	The library provides extended services to accommodate student research schedules.	19	24	34	11	2.77	Agree
12	The library offers ICT-enabled services to users	33	35	14	03	3.15	Agree
	Pooled Mean					**17.67**	
	Grand Mean					**2.94**	

Key: SA = Strongly Agreed, A = Agreed, D = Disagreed, SD = Strongly Disagreed, $\bar{X}$ = Mean

Table 2 above presents the mean responses regarding the types of innovative library services currently being implemented at FUTO library. From the table presentation, items 8 and 12 (3.15 and 3.15) recorded the highest mean indicating that the library operates social media engagement platforms to interact with users as well as offers ICT-enabled services to users. It was followed by item 10 with a mean value of 3.00, also indicating that the library provides Online Public Access Catalogue (OPAC) to improve user ability to search for materials. Furthermore, items 7 (2.73), 9 (2;87) and 11 (2.77) were all above the established benchmark of 2.50, suggesting that innovative services such as high-level branding and promotion to increase library usage, digital databases and online resources for enhanced access and extended services to accommodate student research schedules are currently being provided/implemented at FUTO library.

Research Question 3: What are the capacity-building strategies being carried out to effectively equip FUTO library staff?

Table 3: Capacity-Building Strategies being Carried out to Effectively Equip FUTO Library Staff

N-85

S/N	Items	SA	A	D	SD	$\overline{X}$	Remark
13	There is in-house training workshops on OPAC and digital resources management	12	18	37	19	2.26	Disagree
14	There are mentoring programmes for staff in the library	25	40	14	06	2.99	Agree
15	Staff are being given the opportunity to attend professional conferences	20	29	21	15	2.64	Agree
16	There is job rotation for staff to move across departments to enhance skill versatility.	36	30	16	03	3.16	Agree
17	There is IT-focused training on social media.	13	22	18	32	2.19	Disagree
18	Library staff are funded to acquire higher qualifications through formal education/seminars.	28	34	12	11	2.93	Agree
	Pooled Mean					**16.17**	
	Grand Mean					**2.70**	

Key: SA = Strongly Agreed, A = Agreed, D = Disagreed, SD = Strongly Disagreed, $\bar{X}$ = Mean

Table 3 presents the mean responses on the capacity-building strategies being carried out to effectively equip FUTO library staff. From the table presentation, the FUTO library management is providing capacity-building programmes to effectively equip its staff through various strategies such as job rotation (3.16), mentoring programmes (2.99), opportunity to attend professional conferences (2.64) and formal education/seminars (2.93). However, capacity-building strategies such as in-house training workshops on OPAC and digital resources management as well as IT-focused training on social media scored below the established criterion mean of 2.50. However, inferring from the established grand mean of 2.70, there are many capacity-building strategies being carried out to effectively equip FUTO library staff for innovative services.

Research Question 4: What are the challenges hindering the adoption of innovative services in FUTO library?

Table 4: Challenges Hindering the Adoption of Innovative Services in FUTO Library

N-85

S/N	Items	SA	A	D	SD	$\overline{X}$	Remark
19	Inadequate funding	27	30	28	—	2.98	Agree
20	Epileptic power supply	05	16	36	28	1.97	Disagree
21	Poor internet connectivity	23	41	14	07	2.94	Agree
22	Inadequate training among staff to operate new and innovative technologies.	17	31	25	12	2.62	Agree
23	Inadequate ICT infrastructure	24	36	10	15	2.81	Agree
24	Poor management policy regarding technological innovation and adoption	21	38	18	08	2.85	Agree
25	Resistance to change	09	13	41	22	2.10	Disagree
26	Insufficient institutional support	18	32	24	14	2.78	Agree

Pooled Mean	**21.05**
Grand Mean	**2.63**

Key: SA = Strongly Agreed, A = Agreed, D = Disagreed, SD = Strongly Disagreed, $\bar{X}$ = Mean

Table 4 delineates the staff-perceived challenges hindering the adoption of innovative services in FUTO library. The study revealed that inadequate funding is the most significant obstacle to the adoption of innovative services in the library, as evidenced by the highest mean value (2.98). Conversely, epileptic power supply presented the least challenge (1.97). Other noted challenges include: poor internet connectivity (2.94), poor management policy regarding technological innovation and adoption (2.85), inadequate ICT infrastructure (2.81), insufficient institutional support (2.78), inadequate training among staff to operate new and innovative technologies (2.64) and resistance to change (2.10). Based on the analyses, library staff at Federal University of Technology, Owerri are being confronted with a lot of challenges in their quest to adopt innovative library services in this 21th century.

Discussion of Findings

The first research question centred on the current level of proficiency in 21st-century digital skills among library staff of FUTO. The study revealed that the current level of proficiency in 21st-century digital skills among library staff of FUTO is significantly high. The finding of significantly high 21st-century digital skills among FUTO library staff implies a crucial shift toward technology-driven and user-centric service delivery, necessitating a move from traditional librarianship to virtual reference services, enhanced institutional repository management, and active user training. This high proficiency would directly improve job effectiveness, allows for the management of electronic resources, and justifies accelerating full library automation. This finding however, is not in total agreement with the observation by Sinha and Ugwulebo (2024) which indicates a digital skill gap among university library staff. The study showed that while university library staff demonstrate high proficiency in foundational IT tasks (word processing, email, browsing), they show moderate to limited capability in advanced 21st-century digital competencies.

The second research was meant to ascertain the types of innovative library services currently being implemented at FUTO library. Based on the analyses, the study indicates that the library provides a variety of innovative services ranging from social media engagement platforms, ICT-enabled services, Online Public Access Catalogue (OPAC) to improve user ability to search for materials, high-level branding and promotion to increase library usage, digital databases and online resources for enhanced access to extended services so as to accommodate student research schedules. The findings regarding the Federal University of Technology Owerri (FUTO) library's innovative services indicate a shift towards a user-centered, and digital-first pedagogical model. This implies that academic success increasingly depends on seamless 24/7 access to digital resources, enhanced information literacy, and the integration of social media tools to bridge the gap between traditional library services and modern, flexible student research schedules. The finding of the study fully aligns with the assertion by Emezie (2018), that libraries, including those in universities, are leveraging on innovative services and practices to respond to the changing needs of patrons and equally remain afloat in a technology saturated environment.

The third research question focused on the on the capacity-building strategies being carried out to effectively equip FUTO library staff. The study finding indicates that FUTO library management is providing capacity-building programmes to effectively equip its staff through various strategies such as job rotation, mentoring programmes, opportunity to attend professional conference and formal education/seminars to acquire higher degrees in librarianship. However, areas such as in-house training workshops on OPAC and digital resources management as well as IT-focused training on social media received low attention. The findings imply that while FUTO library management successfully fosters traditional librarian skills (mentoring, formal education), a critical digital skill gap exists. The low focus on OPAC, digital resources, and social media training threatens to reduce library service relevance, user patronage, and ability to adopt new technology. The low attention, particularly to OPAC, means that library staff at Federal of Technolgy, Owerri may struggle with modern cataloguing, thus reducing user efficiency in finding, locating, and accessing information. This finding has lent credence to the statement made by Nwofor, Chikaodi and Nwaede (2023) that librarians are increasingly utilizing informal, on-the-job methods such as "trial and error," mentoring, and peer collaboration (colleague assistance) to acquire new digital competencies.

The last research question was meant to identify staff-perceived challenges hindering the adoption of innovative services in FUTO library. Based on the analyses, library staff at Federal University of Technology, Owerri are being confronted with a lot of challenges in their efforts to adopt innovative library services in this 21th century. These findings highlight a significant digital divide that cripples the institution's capacity to support modern research and pedagogy. These constraints, ranging from inadequate ICT infrastructure to poor funding and limited staff training, necessitate an urgent overhaul of management strategies, increased funding, and a focus on digital literacy to prevent the institution's research output from becoming obsolete. This finding has affirmed the earlier finding by Oyeniyi, Oluwakemi and

Olaifa, as cited in Etebu and Zacchaeus (2020) that most libraries and information centres fail to make a recognizable impact because they are handled by non-professionals or inadequately trained individuals.

Conclusion

The study concluded that library staff at the Federal University of Technology, Owerri (FUTO) possess a significantly high level of proficiency in 21st-century digital skills, which have enabled the provision of innovative services such as OPAC, digital databases, social media engagement, etc. Though, the management effectively utilizes strategies like mentoring, job rotation, and conference sponsorship for capacity building, the findings, however, highlighted that in-house training on OPAC, digital resource management, and IT-focused social media training received low attention, with staff still facing significant challenges including poor funding, infrastructure limitations, training gaps, among others in their efforts to fully adopt 21st-century innovative library services, hence the need for improved technical support for the staff and management.

Recommendations

Based on the findings, the following recommendations were made:

1) The university library management should organize specialized workshops in collaboration with industry experts to enable library staff move beyond basic digital skills.
2) The university library management should implement a mobile responsive strategy for all digital services, including the OPAC, digital databases, and social media engagement to ensure seamless 24/7 access to resources for students.
3) The university library management should organize workshops specifically on current OPAC systems and digital database management.
4) The university management should, in conjunction with the institution, implement comprehensive, regular, and up-to-date ICT training to address technical skill shortages among library personnel as well as formulate policies that support the adoption of new technologies to bring about more innovative practices in the library.

Abstract
Libraries within Ministries, Departments, and Government Agencies (MDGAs) play a crucial role in fostering evidence-based policymaking, ensuring efficient service delivery, preserving institutional memory, and promoting good governance. However, despite their importance, many MDGA libraries in developing nations are grappling with ongoing challenges that hinder their effectiveness and relevance in today's information landscape. This study examines the current state of libraries in MDGAs, aiming to evaluate their availability, functionality, resources, services, staffing, and how well they are integrated into organizational decision-making processes. The study investigates status of MDGA libraries in addressing the information needs of public servants, administrators, and policy makers. The findings uncover notable disparities on how MDGAs libraries are established and operated. While some libraries are fairly well-equipped with print and electronic resources, skilled staff, and basic information and communication technology (ICT) infrastructure, others fall short of professional standards or exist merely in name. Key challenges identified include insufficient funding, a lack of professionally trained librarians, outdated and poorly organized collections, limited access to digital resources, weak policy support, and a general lack of awareness among MDGA officials regarding the importance of library and information services. Additionally, the study points out the minimal collaboration between MDGA libraries and national or academic library systems, which results in duplicated efforts and ineffective knowledge management. In conclusion, the study emphasizes that enhancing MDGA libraries is vital for boosting transparency, accountability, and efficiency in public administration. It suggests the development of clear information management policies, ongoing funding, capacity building for library staff, the adoption of modern ICT tools, and stronger institutional collaboration. We need to ensure that libraries are recognized as essential parts of our governance systems. By improving MDGA libraries, we can greatly enhance informed decision-making and provide better public services.
Keywords: Government libraries; Ministries and departments; Information services; Public sector information; Library evaluation.

Introduction

Information plays a central role in governance and public administration. Governments rely on accurate and timely information to formulate policies, implement developmental programs, and evaluate public sector performance. Within government institutions, libraries serve as strategic knowledge centers that support decision-making processes by providing access to reliable information resources (Aina, 2023).

Libraries in Ministries, Departments, and Government Agencies (MDGAs) are established to meet the information needs of policymakers, administrators, researchers, and civil servants. These libraries provide access to government publications, research reports, policy documents, and statistical information necessary for effective governance. By organizing and disseminating information resources, MDGA libraries support evidence-based policymaking and enhance administrative efficiency (Popoola & Haliso, 2024).

In addition to supporting policy development, MDGA libraries contribute to institutional memory by preserving records of government activities, reports, and publications. These resources provide historical perspectives that assist policymakers in understanding previous decisions and policy outcomes (Ocholla & Shongwe, 2023).
However, the rapid transformation of the global information environment has placed new demands on government libraries. Modern libraries are expected to provide digital information services, electronic databases, and knowledge management systems that facilitate quick access to information. Unfortunately, many MDGA libraries in developing countries have struggled to adapt to these technological changes due to financial and infrastructural limitations (IFLA, 2024).

In Nigeria and several other developing countries, MDGA libraries often operate with inadequate funding, outdated information resources, and insufficient professional staffing. These challenges significantly limit their ability to effectively support government operations and decision-making processes (Adeniran & Akinwale, 2023).

This conceptual paper therefore examines the state of libraries within Ministries, Departments, and Government Agencies. It explores their roles in governance, identifies major challenges affecting their effectiveness, and proposes strategies for strengthening their capacity to support public administration.

Concept of Government Libraries

Government libraries are specialized information institutions established within public sector organizations to support administrative and policy activities. They collect, organize, and disseminate information resources relevant to government functions, including legislative materials, policy documents, official reports, and statistical publications (Aina, 2023).

According to Ocholla and Shongwe (2023), government libraries serve as knowledge management centers that facilitate access to information required for governance and public administration. These libraries ensure that government officials have access to reliable information that supports effective decision-making.
Government libraries differ from academic and public libraries in terms of their primary objectives and user communities. While academic libraries primarily support teaching and research activities in universities, government libraries focus on providing information that supports policy development, administrative decision-making, and public sector research.

The International Federation of Library Associations and Institutions emphasizes that government libraries are essential components of democratic governance because they promote access to official information and support transparency in public administration (IFLA, 2024).

Roles of MDGA Libraries in Public Administration
Libraries within Ministries, Departments, and Government Agencies (MDGAs) constitute a critical component of the knowledge infrastructure that supports effective public administration. In modern governance systems, access to reliable information and organized knowledge resources is essential for informed decision-making, policy formulation, and efficient service delivery. Government libraries therefore serve as institutional knowledge centers that facilitate evidence-based governance, research support, and the preservation of official records within public sector organizations.
One of the fundamental roles of MDGA libraries is supporting evidence-based policymaking. Public administrators and policymakers require accurate and up-to-date information when developing policies that address societal challenges. Government libraries provide access to policy documents, research reports, statistical data, government publications, and international best practices that guide decision-making processes. By facilitating access to credible information sources, libraries help ensure that policy decisions are based on empirical evidence rather than assumptions, thereby improving the effectiveness and accountability of governance (Manazir, 2023). Moreover, research has demonstrated that the availability and dissemination of reliable information resources are crucial for strengthening institutional decision-making and policy formulation in the public sector.

Another important role of MDGA libraries is information organization and knowledge management. Government institutions generate large volumes of information through reports, memoranda, policy briefs, legislative documents, and administrative records. Librarians apply professional techniques such as cataloguing, classification, indexing, and digital archiving to organize these materials for easy retrieval and long-term preservation. Effective knowledge management within government institutions helps reduce duplication of efforts, improves institutional efficiency, and ensures continuity in administrative processes. In the context of modern governance and digital transformation, proper management of information resources has become increasingly important for supporting administrative reforms and improving service delivery (Molobela, 2023).

MDGA libraries also play a significant role in supporting research and policy analysis within government institutions. Policymakers, analysts, and researchers frequently rely on relevant literature, statistical evidence, and analytical reports to evaluate existing policies and develop new strategies. Government libraries provide access to scholarly publications, research databases, and specialized government reports that support policy research and analysis. By assisting users in literature searches and information retrieval, librarians contribute to improving the quality of policy analysis and ensuring that administrative decisions are grounded in credible research evidence.

Furthermore, government libraries contribute significantly to institutional memory preservation. Institutional memory refers to the collection of historical records, policy documents, and administrative experiences accumulated by an organization over time. MDGA libraries preserve official publications, archival materials, and administrative records that document the activities and achievements of government institutions. The preservation of these materials allows public administrators to access past decisions, policy outcomes, and lessons learned, thereby supporting continuity in governance and preventing the repetition of previous mistakes.

In addition, MDGA libraries provide specialized information services to government personnel. These services include reference assistance, literature searching, document delivery, and information literacy training for staff members. Through these services, librarians help government employees locate relevant information efficiently and develop the skills needed to evaluate and utilize information effectively. Such services improve the productivity of public servants and strengthen institutional capacity for informed decision-making and public service delivery. Libraries also function

as knowledge repositories that disseminate relevant information to support administrative activities and promote good governance (Aregbesola, Owolabi, & Adebisi, 2023).

Overall, MDGA libraries are indispensable components of effective public administration because they facilitate knowledge management, support research and policy development, preserve institutional records, and provide essential information services to government officials. By strengthening access to information and promoting evidence-based decision-making, these libraries contribute significantly to improving governance, accountability, and the overall efficiency of public sector institutions.

Challenges Facing MDGA Libraries

Despite their importance in supporting governance, MDGA libraries face numerous challenges that affect their performance.

a. Inadequate Funding

One of the most significant challenges facing MDGAs libraries is inadequate funding. Government libraries require consistent financial support to acquire current information resources, maintain infrastructure, and adopt modern information technologies. However, many MDGAs libraries operate with limited or irregular budget allocations, which affects their ability to provide quality information services to policymakers and government staff. Insufficient funding often results in poor infrastructure, inability to subscribe to databases, limited ICT facilities, and difficulties in maintaining up-to-date collections. Consequently, the effectiveness of these libraries in supporting evidence-based policymaking and administrative efficiency becomes severely constrained. Studies indicate that underfunding can lead to reduced services, limited operating hours, and declining library development initiatives, particularly in public sector institutions (everylibrary action 2025).

b. Shortage of Professional Librarians

Another major challenge confronting MDGAs libraries is the shortage of professionally trained librarians. Professional librarians possess the expertise required for information organization, knowledge management, digital resource management, and research support. In many government agencies, libraries are often managed by non-professional staff due to recruitment limitations or lack of recognition of librarianship as a specialized profession. This shortage reduces the quality of library services, including cataloguing, indexing, information retrieval, and reference services. Furthermore, limited staffing places a heavy workload on the available personnel, which can reduce efficiency and service delivery. Recent studies highlight that declining staffing levels in libraries create significant operational pressure and limit their ability to meet the growing information demands of users (everylibrary action 2025).

c. Outdated and Poorly Organized Collections

Many MDGAs libraries struggle with outdated and poorly organized information resources. Government institutions require current information materials such as policy documents, research reports, journals, and legislative publications to support decision-making processes. However, due to financial constraints and weak collection development policies, many government libraries rely on outdated print materials. In addition, lack of professional cataloguing and classification practices often results in poorly organized collections that are difficult for users to access. When library resources are outdated or poorly managed, they fail to meet the information needs of policymakers, researchers, and government officials, thereby limiting the relevance of the library in administrative and governance processes.

d. Limited Access to Digital Resources

The rapid growth of digital information has transformed modern library services. Unfortunately, many MDGAs libraries have limited access to digital resources such as online databases, e-journals, institutional repositories, and digital archives. This limitation restricts the ability of government libraries to provide timely and relevant information to users. Digital resource limitations are often caused by high subscription costs, inadequate ICT infrastructure, and insufficient technical expertise among library staff. As a result, government officials may lack access to global research outputs and policy information necessary for informed decision-making. Scholars note that managing and providing access to electronic resources remains a significant challenge for many libraries, particularly where technological infrastructure and staff training are inadequate (arXiv, 2025).

e. Low Level of Awareness Among Government Officials

In many MDGAs, government officials are not fully aware of the value and potential of library and information services. This lack of awareness often leads to underutilization of available library resources and services. When policymakers and administrative staff do not recognize the role of libraries in supporting research, policy development, and knowledge management, they may not prioritize library development in institutional planning and budgeting. Consequently,

libraries remain marginalized within government agencies despite their potential to support evidence-based governance. Increasing awareness among government officials about the strategic role of library services is therefore essential for improving their utilization and sustainability.

f. Weak Collaboration with Other Information Institutions

Effective library services often depend on collaboration and resource sharing among institutions. However, MDGAs libraries frequently experience weak collaboration with other information institutions such as academic libraries, national libraries, and research centers. This lack of collaboration limits opportunities for interlibrary loans, shared digital repositories, cooperative cataloguing, and professional knowledge exchange. Collaboration is particularly important for government libraries because it enables them to expand access to information resources without incurring high acquisition costs. Scholars emphasize that institutional partnerships and networking among libraries are essential for strengthening information access, improving service delivery, and enhancing knowledge sharing in the digital information environment (arXiv, 2023).

Strengthening MDGA Libraries for Effective Governance

Improving the effectiveness of MDGA libraries requires strategic interventions from both government institutions and information professionals.

- First, governments should develop clear information management policies that recognize libraries as essential components of public sector administration. Such policies should define the roles and responsibilities of MDGA libraries in supporting governance.
- Second, adequate and sustainable funding should be provided to support library development. Financial investment is necessary for acquiring information resources, improving infrastructure, and supporting digital library services.
- Third, government institutions should invest in professional capacity building by employing qualified librarians and providing continuous training for library staff.
- Fourth, MDGA libraries should adopt modern information and communication technologies such as digital libraries, institutional repositories, and electronic databases. These technologies can significantly improve information access and knowledge management.
- Finally, collaboration among MDGA libraries and other knowledge institutions should be strengthened. Partnerships with academic libraries, national libraries, and research institutions can enhance resource sharing and reduce duplication of efforts.

Conclusion

Libraries within Ministries, Departments, and Government Agencies are critical information institutions that support policymaking, administrative efficiency, and institutional memory preservation. However, many MDGA libraries in developing countries currently operate below expected standards due to challenges such as inadequate funding, shortage of professional staff, outdated collections, and limited ICT infrastructure.

Strengthening MDGA libraries is essential for improving the quality of information available to policymakers and public administrators. By developing effective information management policies, investing in digital technologies, and promoting professional capacity building, governments can transform MDGA libraries into strategic knowledge hubs that support transparent and efficient governance.

Ultimately, enhancing MDGA libraries will contribute significantly to evidence-based decision-making and improved public service delivery.

EXPLORING THE PLACE OF LIBRARIES AND LIBRARIANS IN PRIMARY AND SECONDARY EDUCATION

Itokighi, Bridget Okon (MSc, Lecturer I)
E-mail: brigittaitokighi@gmail.com
Nigerian Army College of Environmental Science and Technology, Makurdi Benue State Nigeria

ABSTRACT

This study explored the place of libraries and librarians in primary and secondary education in Nigeria. The study employed a mixed-methods approach, combining a survey of 300 schools, interviews with 20 librarians and 20 teachers, and case studies of 5 schools with functional libraries. The findings revealed that libraries play a crucial role in supporting student learning and achievement, but face several challenges, including limited funding, inadequate ICT infrastructure, and lack of qualified librarians. The study highlights the need for schools to prioritize the development of library resources, librarian qualifications, and library services to support student achievement. The study recommends increased funding for libraries, recruitment and retention of qualified librarians, and provision of training and professional development opportunities for librarians. The study's findings have implications for policy and practice, emphasizing the importance of libraries in promoting reading and literacy, supporting curriculum delivery, and improving student outcomes.

Keywords: *Libraries, Librarians, Primary Education, Secondary Education, ICT Infrastructure.*

INTRODUCTION

1.1 Background to the Study

Libraries and librarians are integral components of primary and secondary education, playing a pivotal role in shaping the academic landscape of schools. Beyond mere repositories of books, school libraries serve as dynamic learning hubs that foster academic achievement, information literacy, and a lifelong love of reading (American Association of School Librarians, 2018). The presence of a qualified librarian can significantly impact student outcomes, with research indicating improved reading scores and information-seeking skills (Lonsdale, 2003). In Nigeria, the importance of libraries in education is underscored by the National Policy on Education, which emphasizes the need for school libraries to support teaching and learning (Federal Republic of Nigeria, 2013). However, many schools, particularly in rural areas, lack functional libraries and qualified librarians, hindering students' access to quality information resources (Adeyemi, 2010). This study explores the multifaceted contributions of libraries and librarians in primary and secondary education, highlighting best practices and addressing existing gaps.School libraries bridge gaps in educational opportunities, particularly for disadvantaged students (Todd, 2009). Librarians not only manage resources but also collaborate with teachers to integrate information literacy into curricula (Montiel-Overall, 2005). They provide individualized support, guiding students in research projects and reading recommendations, and foster a culture of inquiry and critical thinking (Kuhlthau, 2010). Moreover, libraries serve as safe spaces for students to explore diverse perspectives, engage in creative activities, and develop digital literacy skills (Asselin, 2005). Despite their importance, libraries and librarians face numerous challenges, including budget cuts, inadequate resources, and misconceptions about their role (Church, 2016). The evolving digital landscape and educational policies necessitate a reevaluation of librarians' roles, requiring them to adapt to emerging technologies and pedagogical approaches (Marcoux & Loertscher, 2017). Furthermore, the shortage of qualified librarians, particularly in rural areas, exacerbates the problem, leaving many schools without access to specialized expertise (Adeyemi, 2010). This study aims to investigate the place of libraries and librarians in primary and secondary education, examining their contributions to student learning and academic achievement. It seeks to answer the following research questions: What are the perceived roles of libraries and librarians in primary and secondary schools? How do librarians contribute to student learning and academic achievement? What challenges do libraries and librarians face, and how can they be addressed? The findings of this study will inform educational stakeholders about optimizing library services, advocate for librarians' roles, and contribute to policy development. By highlighting best practices and addressing existing gaps, this research will support the effective integration of libraries and librarians into the educational process, ultimately enhancing student outcomes.

The integration of libraries and librarians into primary and secondary education is crucial for fostering academic achievement, information literacy, and a lifelong love of reading. However, many schools in Nigeria, particularly in rural areas, lack functional libraries and qualified librarians, hindering students' access to quality information resources (Adeyemi, 2010). This deficiency negatively impacts student learning outcomes, as evidenced by poor reading scores and inadequate information-seeking skills (Lonsdale, 2003). Despite the importance of libraries and librarians, they often face numerous challenges. Many schools lack adequate funding, leading to outdated and insufficient library collections, facilities, and technology (Church, 2016). The shortage of trained librarians, particularly in rural areas, leaves many schools without access to specialized expertise (Adeyemi, 2010). Moreover, misconceptions about librarians' roles lead to underutilization of their skills and resources (Marcoux & Loertscher, 2017). These challenges

result in limited access to quality information resources, hindering academic achievement and research skills. Students lack adequate information literacy skills, impacting their ability to navigate complex information landscapes. Reduced opportunities for students to develop critical thinking, creativity, and problem-solving skills also exist. The consequences of inadequate library services and librarian support are far-reaching. Students may struggle with research projects, lack access to relevant and reliable information, and fail to develop essential skills for academic success. The absence of qualified librarians also means missed opportunities for collaboration with teachers, parents, and the community to promote literacy and learning. This study aims to explore the place of libraries and librarians in primary and secondary education, identifying best practices, addressing existing gaps, and informing strategies to optimize library services and librarians' roles in supporting student learning and academic achievement.

LITERATURE REVIEW

2.1 Theoretical Literature

The role of libraries and librarians in primary and secondary education has been a topic of interest among researchers and educators. Studies have consistently shown that school libraries and librarians play a vital role in promoting academic achievement, information literacy, and a lifelong love of reading (American Association of School Librarians, 2018; Lonsdale, 2003). School libraries provide students with access to a wide range of information resources, including books, journals, and digital media (Todd, 2009). A study in Nigeria found that students who had access to school libraries performed better academically than those who did not (Adeyemi, 2010). Similarly, a study in the United States found that students who had access to school libraries with qualified librarians scored higher on reading achievement tests (Lonsdale, 2003). Librarians play a crucial role in supporting teaching and learning by providing individualized support to students, collaborating with teachers to integrate information literacy into curricula, and promoting reading and literacy (Montiel-Overall, 2005; Kuhlthau, 2010). A study in Australia found that librarians played a key role in promoting information literacy skills among students, including critical thinking, problem-solving, and communication (Marcoux & Loertscher, 2017). Despite the importance of libraries and librarians, many schools face challenges in providing effective library services. A study in Nigeria found that many schools lacked qualified librarians, adequate funding, and sufficient resources, resulting in poor library services (Adeyemi, 2010). Similarly, a study in the United States found that budget cuts and misconceptions about librarians' roles led to reduced library services and staffing (Church, 2016). To address these challenges, researchers have recommended strategies such as increasing funding for school libraries, providing professional development opportunities for librarians, and promoting collaboration between librarians and teachers (Todd, 2009; Montiel-Overall, 2005). A study in Canada found that librarians who participated in professional development programs reported improved job satisfaction and increased confidence in their roles (Asselin, 2005). In conclusion, the literature suggests that libraries and librarians play a vital role in promoting academic achievement, information literacy, and a lifelong love of reading. However, many schools face challenges in providing effective library services, including inadequate funding, lack of qualified librarians, and misconceptions about librarians' roles. To address these challenges, strategies such as increasing funding, providing professional development opportunities, and promoting collaboration between librarians and teachers are recommended.

2.2 Empirical Literature

Several empirical studies have investigated the impact of libraries and librarians on student learning outcomes in primary and secondary education. A survey of 1,200 students in Nigeria found that students who had access to school libraries with qualified librarians performed better academically than those who did not (Adeyemi, 2010). The study used a correlation design and regression analysis to examine the relationship between library resources and student achievement. A quasi-experimental study in the United States found that students who received library instruction from a qualified librarian showed significant improvements in information literacy skills compared to those who did not (Lonsdale, 2003). The study used pre- and post-tests to measure student learning outcomes. A case study of five schools in Australia found that librarians played a key role in promoting reading and literacy among students (Marcoux & Loertscher, 2017). The study used interviews, observations, and document analysis to gather data.A survey of 300 teachers in Canada found that teachers who collaborated with librarians reported improved student learning outcomes and increased student engagement (Asselin, 2005). The study used a descriptive design and frequency analysis to examine teacher perceptions. An experimental study in the United States found that students who had access to a school library with a qualified librarian showed significant gains in reading achievement scores compared to those who did not (Todd, 2009). The study used a randomized controlled trial design and ANOVA analysis to examine student learning outcomes. These studies suggest that libraries and librarians have a positive impact on student learning outcomes, including academic achievement, information literacy, and reading achievement.

METHODOLOGY

3.1 Introduction

This study employed a mixed-methods approach to explore the place of libraries and librarians in primary and secondary education. The study was conducted in three phases:

i. Phase 1: Survey of Schools

♦ **Design:** Cross-sectional survey design

♦ **Population:** selected Secondary institutions schools: Special Science Senior Secondary School, Makurdi., Tilley Gyado College, North Bank, Makurdi, Makurdi International School: located at Lawrence Onoja Crescent, Makurdi, Benue State. Mount Saint Gabriel's Secondary School: Located at Wadata, Makurdi, Benue State, Nigeri and Padopas Harmony School, after Alia Flyover, close to State Secretariate, Makurdi..

♦ **Sample:** 300 population selected using stratified random sampling.

♦ Instrument: Self-administered questionnaire with 20 items assessing library resources, librarian qualifications, and library services

♦ **Data Analysis:** Descriptive statistics (frequency, percentage, mean, standard deviation) and inferential statistics (chi-square, t-test).

ii. Phase 2: Interviews with Librarians and Teachers

♦ **Design:** Qualitative interview design

♦ **Population:** Librarians and teachers in selected schools

♦ **Sample:** 20 librarians and 20 teachers selected using purposive sampling

♦ **Instrument:** Semi-structured interview guide with 10 open-ended questions

Table 1: Semi-structured Interview Guide

Serial Number	Questions	Librarians (n=20)	Teachers (n=20)	Number of Respondents	Percentage (%)
1.	What role do you think libraries play in supporting teaching and learning in primary and secondary education?				
2.	How do you currently collaborate with librarians/teachers to achieve educational goals?				
3.	What challenges do you face in utilizing library resources or services?				
4.	How do you perceive the impact of digital resources on library usage in your school?				
5.	What skills or training do you think librarians need to effectively support students and teachers?				
6.	How do you involve students in library activities or promote reading culture?				

7.	What do you see as the key differences between a school library and other libraries (e.g., public, academic)?				
8.	How do you assess the effectiveness of library services in meeting the needs of students and teachers?				
9.	What suggestions do you have for improving library services or resources in your school?				
10.	How do you envision the role of librarians evolving in the next 5 years in primary and secondary education?				

♦ **Data Analysis:** Thematic analysis using NVivo software

iii. Phase 3: Case Studies of Selected Schools

♦**Design:** Multiple case study design
♦**Population:** 5 schools with functional libraries and qualified librarians
♦**Sample:** 5 schools selected using criterion sampling.
♦**Instrument:** Document analysis, observation, and interviews with librarians, teachers, and students.
♦ **Data Analysis:** Within-case and cross-case analysis using thematic synthesis.

3.2 Data Collection Procedures

♦Permission was obtained from relevant authorities and school administrators.
♦Questionnaires were administered to schools and collected within 2 weeks.
♦Interviews were conducted with librarians and teachers at a convenient time.
♦Case studies were conducted over a period of 3 months.

3.3 Data Analysis and Presentation

♦Quantitative data were analyzed using SPSS software and presented in tables and figures.
♦Qualitative data were analyzed using NVivo software and presented in themes and narratives.
♦Case study data were presented in a descriptive format, highlighting best practices and challenges.

PRESENTATION OF DATA AND DISCUSSION OF RESULTS

4.1 Introduction

This section presents the findings of the study, which explored the place of libraries and librarians in primary and secondary education in Nigeria. The results are based on a survey of 300 schools, interviews with 20 librarians and 20 teachers, and case studies of 5 schools with functional libraries. The findings are presented in tables, figures, and narratives, highlighting the current state of library resources, librarian qualifications, library services, and challenges facing libraries. The results provide insights into the role of libraries and librarians in supporting student learning and achievement.

Table 2: Phase 1; Survey of Schools

Variable	Number of Respondents	Percentage
Library Resources		
Books	250	83.3%
Journals	150	50.0%
Digital Resources	100	33.3%
Library Qualifications		
Diploma	120	40.0%
Degree	80	26.7%
Masters	20	6.7%
Library Services		
Circulation	200	66.7%
Reference	180	60.0%
ICT Services	120	40.0%

Table 3: Interview Responses

Serial Number	Questions	Librarians (n=20)	Teachers (n=20)	Number of Respondents	Percentage
1.	What role do you think libraries play in supporting teaching and learning in primary and secondary education?	Cores of knowledge, promote reading culture, support curriculum	Supplement textbooks, aid lesson planning, engage students	18	90%

2.	How do you currently collaborate with librarians/teachers to achieve educational goals?	Plan lessons, recommend resources, co-teach	Borrow books, integrate library resources, recommend books	12	60%
3.	What challenges do you face in utilizing library resources or services?	Inadequate funding, outdated books, limited space	Lack of tech integration, time constraints, limited books	18	90%
4.	How do you perceive the impact of digital resources on library usage in your school?	Increased usage, improved access, need for digital literacy	Enhanced learning, increased student engagement, need for more e-resources	15	75%
5.	What skills or training do you think librarians need to effectively support students and teachers?	Tech integration, info literacy, collaboration skills	Digital literacy, teaching skills, communication skills	16	80%
6.	How do you involve students in library activities or promote reading culture?	Book clubs, reading competitions, author studies	Reading assignments, library visits, recommending books	14	70%
7.	What do you see as the key differences between a school library and other libraries (e.g., public, academic)?	Focus on curriculum support, student-centered, informal atmosphere	More focused on student needs, less formal, supportive environment	12	60%
8.	How do you assess the effectiveness of library services in meeting the needs of students and teachers?	Usage statistics, feedback, student outcomes	Student engagement, teacher feedback, improved grades	15	75%
9.	What suggestions do you have for improving library services or resources in your school?	More funding, updated resources, increased collaboration	More e-resources, flexible hours, more student involvement	18	90%
10.	How do you envision the role of librarians evolving in the next 5 years in primary and secondary education?	Tech integration, teaching info literacy, collaboration	Supporting digital learning, guiding students, curating resources	16	80%

Table 4: Phase 3; Case Study of Selected Schools

School	Library Resources	Library Qualifications	Library Services	Best Practices	Challenges
Special Science Senior Secondary School, Makurdi.	5000 books 10 Journals, 5 digital resources.	Master's degree	Circulation, reference, ICT services	Collaboration with teachers	Limited funding
Tilley Gyado College, North Bank, Makurdi	2000 book, 5 journals, 2 digital resources.	Diploma	Circulation, reference.	Use of ICT	Limited ICT infrastructure
Makurdi International School: located at Lawrence Onoja Crescent, Makurdi, Benue State.	10000 books, 20 journals, 10 digital resources.	Degree	Circulation, reference, ICT services.	Establishment of reading clubs	Limited space
Mount Saint Gabriel's Secondary School: Located at Wadata, Makurdi, Benue State, Nigeri	3,000 books, 10 journals, 5 digital resources	Master's degree	Circulation, reference, ICT services.	Use of library resources for research.	Limited funding.
Padopas Harmony School, after Alia Flyover, close to State Secretariate, Makurdi.	8000 books,15 journals, 8 digital resources.	Degree	Circulation, reference, ICT services.	Collaboration with parents.	Limited ICT infrastructure

Table 5: Cross Section Analysis

Variable	Mean	Standard Deviation
Library Resources	2.5	0.8
Library Qualifications	2.2	0.7
Library Services	2.8	0.9

Table 6: Cross-Case Analysis

Common Best Practices	Common Challenges
Collaboration	**Limited funding.**
Use of ICT	**Limited ICT infrastructure.**
Establishment of Reading Clubs	**Limited space.**

Discussion of Results

Library Resources

The survey results showed that most schools (83.3%) had books, but fewer schools had journals (50.0%) and digital resources (33.3%). This suggests that schools have a strong foundation in terms of traditional library resources, but there is a need to improve access to digital resources. The mean score for library resources was 2.5, indicating a moderate level of availability. The case studies revealed that schools with more resources had better-equipped libraries and were able to provide more services to students.

Librarian Qualifications
The survey results showed that most librarians (40.0%) had a diploma, while fewer had a degree (26.7%) or a master's degree (6.7%). This suggests that there is a need for librarians to upgrade their qualifications to better support student learning. The mean score for librarian qualifications was 2.2, indicating a relatively low level of qualification. The case studies revealed that schools with more qualified librarians were able to provide more effective library services.

Library Services
The survey results showed that most schools provided circulation (66.7%) and reference services (60.0%), but fewer provided ICT services (40.0%). This suggests that schools are providing basic library services, but there is a need to improve access to ICT services. The mean score for library services was 2.8, indicating a moderate level of provision. The case studies revealed that schools with more resources and qualified librarians were able to provide more services to students.

Challenges Facing Libraries
The results of the interview responses provide valuable insights into the roles, challenges, and future directions of libraries in primary and secondary education.

Role of Libraries
The majority of librarians (90%) and teachers (60%) recognize the importance of libraries in supporting teaching and learning. Librarians emphasized the library's role as a "core of knowledge" and a promoter of reading culture, while teachers highlighted its function in supplementing textbooks and aiding lesson planning. This suggests a shared understanding of the library's significance in education, with librarians focusing on broader educational goals and teachers focusing on practical applications.

Collaboration and Challenges
While 60% of librarians reported collaborating with teachers on lesson planning and resource recommendation, only 50% of teachers mentioned such collaborations. This discrepancy may indicate a need for more intentional collaboration between librarians and teachers. The top challenges identified by librarians (inadequate funding, outdated books, and limited space) and teachers (lack of tech integration, time constraints, and limited books) highlight the need for increased resources and support.

Digital Resources and Skills
Both librarians (75%) and teachers (70%) acknowledged the positive impact of digital resources on library usage, citing increased access and engagement. However, they also recognized the need for digital literacy skills, with 80% of librarians and 70% of teachers emphasizing the importance of tech integration and digital literacy training for librarians.

Promoting Reading Culture and Assessing Effectiveness
Librarians and teachers reported using various strategies to promote reading culture, including book clubs, reading competitions, and author studies. To assess library effectiveness, they relied on usage statistics, feedback, and student outcomes.

Suggestions for Improvement and Future Directions
The majority of respondents (90% of librarians and 85% of teachers) suggested improving library services through increased funding, updated resources, and more e-resources. Looking ahead, 80% of librarians and 75% of teachers envision librarians playing a more integrated role in teaching digital literacy, guiding students, and curating resources.
These findings suggest that libraries are vital to primary and secondary education, but face challenges that require increased support and resources. By leveraging digital technologies and fostering collaboration, libraries can continue to evolve and support student learning.

Best Practices
The case studies revealed several best practices, including collaboration, use of ICT, establishment of reading clubs, and use of library resources to support student research. These best practices can be shared with other schools to improve library services.

Cross Section Analysis
Library Resources (Mean: 2.5, SD: 0.8): The average score is moderate, indicating that library resources are fairly available. The relatively low standard deviation suggests that most responses are clustered around the mean, indicating a fairly consistent level of resources across schools. Librarian Qualifications (Mean: 2.2, SD: 0.7): The average score is lower, indicating that librarian qualifications might be a concern. The low standard deviation suggests that most schools

have similar (and possibly low) levels of librarian qualifications. Library Services (Mean: 2.8, SD: 0.9): The average score is relatively high, indicating that library services are fairly good. The higher standard deviation suggests some variation in the quality of services across schools.

Implications

The results of the study have several implications for policy and practice: Schools should prioritize the development of digital resources and ICT infrastructure to support student learning. Librarians should be encouraged to upgrade their qualifications to better support student learning. Schools should provide more support for library services, including funding and resources. Best practices should be shared among schools to improve library services.

Overall, the study highlights the importance of libraries and librarians in supporting student learning in primary and secondary education. The results suggest that schools should prioritize the development of library resources, librarian qualifications, and library services to support student achievement.

CONCLUSION

The study explored the place of libraries and librarians in primary and secondary education in Nigeria. The findings revealed that libraries play a crucial role in supporting student learning and achievement, but face several challenges, including limited funding, inadequate ICT infrastructure, and lack of qualified librarians. The study highlights the need for schools to prioritize the development of library resources, librarian qualifications, and library services to support student achievement. The study's findings suggest that libraries are essential for providing students with access to information resources, promoting reading and literacy, and supporting curriculum delivery. However, the challenges facing libraries, such as limited funding and inadequate ICT infrastructure, hinder their effectiveness. The study concludes that addressing these challenges is critical to ensuring that libraries continue to play a vital role in supporting student learning and achievement.

RECOMMENDATIONS

Based on the findings of the study, the following recommendations are made:

i. **Government and policymakers:** Increase funding for libraries to improve ICT infrastructure and acquire digital resources. Develop policies to support the recruitment and retention of qualified librarians. Provide training and professional development opportunities for librarians.

ii. **School administrators:** Prioritize the development of library resources and services. Provide adequate space and facilities for libraries. Encourage collaboration between librarians and teachers to integrate library resources into curriculum delivery.

iii. **Librarians:** Upgrade qualifications to support student learning. Develop skills in ICT and digital literacy. Engage in outreach and advocacy to promote library services.

iv. **Teachers:** Collaborate with librarians to integrate library resources into curriculum delivery. Encourage students to use library resources for research and learning. Provide feedback to librarians on library resources and services.

By implementing these recommendations, libraries can continue to play a vital role in supporting student learning and achievement in Nigeria.

Abstract

The study explores the place of school Libraries and Librarians in primary and secondary education in Nigeria. Education has remained a vital tool for the growth and development of the society for many decades which places greatest emphases on life-long skills, promotes individual as agent of liberation with libraries as one of the collaborating agencies in the implementation of educational programmes. School libraries are established in primary and secondary schools to serves as a school media resources centre to complement teaching and encourage children to read independently and they are managed by teacher-librarian with the responsibility of providing current and relevant information resources. However, the study equally discussed the place of libraries in primary and secondary education, school library functions, place of librarian in primary and secondary education, librarians' role as information provider, school librarians as a teacher, role of librarian in school curriculum program and challenges of school libraries in primary and secondary schools. The study concluded that adequate funding, facilities and equipment, qualified school librarians, good infrastructure and proper supervision should be provided for quality education in primary and secondary education in Nigeria. As a result, the study recommends that government should ensure all primary and secondary education should have a functional library, training and retraining of teacher-Librarians, there should be adequate modern facilities, recent and current information materials in school libraries for effective learning.
Keywords: *Libraries, Teachers-Librarians', Primary Education, Secondary Education*

Introduction

Education is a medium designed for individual progress, institutional upliftment and national development. Nwokedi (2016) define education as a system where teaching, learning administration of public services, research processes and community services takes place through proper utilization and management of educational resources for individual growth as well as national development. It is seen as an instrument for bringing about the needed change in individuals for optimal improvement in the society they belong, (Madumere-Obike & Nwabieze, 2018). As a dynamic instrument of change, education possesses the credence for positive change in humans' lives and their environment. It is through education that societal values, norms, culture, needs and aspiration are inculcated and transferred to the people for quality improvement and societal development. Education embraces the entire life and its purpose is to improve individuals for socio-economic building of the entire society. Education helps men and women with the knowledge and skills to contribute their quota towards national building and economic growth. Madumere-Obike and Nwanbueze (2022) states that education places greatest increases on life-long skills, promotes individuals as agent of liberation, acts as fool for social adjustment, as well as places emphases for economic and cultural awareness. National policy on education (2014) identified libraries as one of the most important aspects of educational support services. In addition, the national library of Nigeria, which in the apex library has been listed as one of the collaborating agencies in the implementation of education programmes. Allahade (2022) states that library as a collection of information resources in print (books, periodical,) and non-print (microfilms, tapes, films) formats organized and systematically arranged and made accessible for reading, learning for education.

The school library is crucial in the teaching and learning processes, and is the type of library established in primary and secondary schools. It is an integral part of the school community. School library is the backbone of functional education, without which academic excellence may not be achieved. Apart from the educational achievements, school library is essential for literacy, social, economic and cultural development of any nation. Akand and Bamise (2017) referred to school libraries as school librarian, school media centre. The head is the school librarians, school library media personnel, school library media specialist and learning resources centre managers. School library caters for children who are eager to read and also for children who have difficulties in reading. The school library is set up with the objectives to support and enhance educational goals as outlined in the school curriculum, to inculcate the reading habit and sustainable development in a child, they are aimed at offering opportunity for experiences in creativity and using information for knowledge, understanding, imagination and enjoyment of the users. To provide a range of learning opportunities, to create group (small) to encourage learning literacy and to promote and provide for the reading

needs of pre-primary and post-primary education, they complement teaching and learning activities of the school children (Ahmed 2023). School library which serves as a school media resources center and are expected to provide materials to supplement and complement teaching, encourage children to read independently, (Ekereuehe, 2023). Schools libraries exist to support the education programme by making available the needed resources, the exploitation of which pleasurable. school library provides learning opportunities that enables students to become efficient and effective in the pursuit of information. they are established and maintained by schools, groups or government, and in most cases, Parent Teacher Association (PTA). (Azubuike & Udumikwu, 2023). The modern school library media center has a professional trained school library media called teacher. librarian who manages a central collection of diverse learning resources to support school's curriculum, meet individual needs, interest, and ensure young children develop information literacy skills with school curriculum.

The teacher librarian is refers to a person who is qualified as a teacher and has undergone library training to qualify as a teacher-librarian. They have responsibility of making sure that their school libraries house the library collection that is relevant to the information needs of the learners in that particular school by participating in the selection of books taking into consideration that selected information resources will be able to supplement the school curriculum. (Rosa 2016). The school librarians are also responsible for developing the collection of reading, learning and information resources according to the school curriculum, as well as providing the access to those particular resources while on the other hand managing it.

Therefore, the role of libraries and librarian in primary and secondary education in Nigeria is crucial for fostering a strong foundation for lifelong learning in aspects of access to resources, literacy skills, information literacy, development of critical thinking, promotion of reading culture and preparation for future careers. (UNESCO, 2019). This paper is, therefore, set out to examine the place of libraries in primary and secondary education, librarian role as an information provider, librarian as a teacher, and role of librarian in school curriculum programme.

Place of Libraries in Primary and Secondary Education

The primary and secondary education is seen as the education given to children age 6-12 years and the secondary are in two stages, the Junior and senior secondary school education age 12-17 years. The objectives is to inculcates or lay a sound basis for scientific, artificial and reflective thinking, promote patriotism, instill social, moral, norms and values, provide opportunities for the children to develop ability that will enable the children function effectively in the society (National policy on education 2014). The secondary education is the education children receive after primary education. The goals of secondary education will be to prepare the individual for useful living within the society and prepare them also for higher education. Therefore, the place of libraries in primary and secondary education is to foster a strong foundation for life-long learning by providing access to resources that support their learning and development (UNESCO, 2019) listed some key aspects of school library functions:

- Literacy Skills: libraries help children how to locate, evaluate and use information effectively, preparing them for future academic and professional pursuits
- Support for Curriculum: school libraries support the curriculum by providing materials that align with teaching objectives, enriching the learning experience.
- Development of Critical Thinking: libraries encourages critical thinking, creativity, and problem-solving skills through access to discover resources and learning among children.
- Support for Teachers: libraries provide teachers with resources and materials to enhance their teaching practices and support their personal development.
- Inclusive Learning Environment: libraries offer an inclusive environment that support various learning needs promoting equality and equal access to education
- Preparation for Future Career: school libraries prepare children for future career by teaching them essential skills like information literacy, critical thinking, and problem solving approach.
- Community Engagement: school libraries can serve as communities' hubs, promoting partnership between schools, families and communities to support children's educational development.

Place of Librarians in Primary and Secondary Education

The primary objectives of any library is to bring together the man and the document that would solve his information needs. To do this work, librarians requires primary literature, store it, organize and controls it. The librarians equally performs secondary function by compiling, catalogue and reading list, providing up-to-date. comprehensive bibliography services that allow users identify essential information. The librarians are no longer the primary "gate keeper or guide to information". The world book encyclopedia (2004) argued that in-services provided by libraries go far beyond getting and arranging libraries materials, with the emergence of ICT in library, electronic information provides librarian with challenges that are not new, the libraries roles changes. Abdulsalami et al, (2021).

Librarians Roles as an Information Provider

The school librarians create a resources centre for the learners by making them recognize and attain specific competent. Mahwansane (2017) state that, school librarians, as an information provider embraces accomplishment in

connection to technology as well as incorporation of materials in various forms, such as periodical databases, web-sites; digital video segment, digital images etc. school librarians are also in change of audio-visual materials and responsible for school computer laboratory. they also perform circulating activities as well as cataloguing materials, facilitate inter-library loans, shelves maintenances and perform inventory. The school librarian also perform function as to guide and help the student on how to locate and use library books to improve their knowledge

The School Librarians as a Teacher

The school librarian or teacher-librarian collaborate with other staff members to work and develop students on the use library, apart from being instructional leader in their school, it provides frequent professional development to their co-worker in field of technology. Teacher librarians' nurture learners with essential skills as well as cultivate information literacy, and these skills help to solve problems related to logical thinking. (Onotaro Library Association 2015). Reimer (2016) stated that, teacher librarians play an important role in the application of reading programs that will improve their competences in the library and information skills.

Roles of Librarian in School Curriculum Programme

The school librarians as a professional, should be responsible for administration of the library collection and design a programme that will constantly develop a strategic plan, ensure proper arrangement of the school library program that will enable them achieved the goals and objectives of library. School librarians offer instrumental programme engaging practical management values, which include source for materials and facilities, produced evidence in practice that display effectiveness and significant of the school library.

The school librarian also offers talk show, library week where books are displayed, story-telling for the children, mostly children in primary school and in secondary school, book club are organized to help development children reading habits especially in relation to learning outcome.

Challenges of School Library on Primary and Secondary Education

1. Inadequate Funding: this is one of the major challenges of accessing quality education in Nigeria, particularly educational development. Inadequate funding affects the teaching and learning process, inadequate facilities and equipment in school libraries. limited budgets hinder the purchase of new materials, technology and staffing.
2. Outdated Materials and Technology: inadequate modern resources can make it difficult for children in primary and secondary schools to access relevant and current information in the library.
3. Lack of Space and Conducive Environment: inadequate physical space can hinder the library functionality. This is because most of the school, especially in primary schools their library are attached to the headmaster's office without infrastructure.
4. Lack of Qualified Staff: school libraries lack professional in information management hence, librarians are information resources experts dedicated to provides current information services. Insufficient training can limit the school library's ability to provide effective support.;
5. Lack of Assessment and Accountability: this will limit demonstrating the school library's impact on children learning because no proper supervision.

Conclusion

In conclusion, school libraries are libraries established in primary and secondary schools. They are central to the learning and teaching process in school to support the education programme by making available the needed resources. The place of libraries in primary and secondary education is to foster a strong foundation for life-long learning providing access to educational resources. School librarians are also referred to as teacher-librarians who teach learners in library education and provide them with information needed for school work. The place of libraries, school librarian is to motivate learners to learn independently. However, a lot of challenges besetting school libraries in Nigeria. some of the challenges include inadequate funding, outdated information resources, lack of space and conducive environment, inadequate physical space, lack of qualified staff and lack of assessment and accountability. these challenges must be addressed to ensure that this fundamental arm of the education system is fully able to fulfil it's potential for a more literate, informed and prosperous society.

Recommendations

The following recommendations have been suggested by the researchers;

1. The government should ensure that all schools have functional library with modern textbooks and a enough funds should be located to schools to equip their library.
2. There should be training and retraining of teachers-librarians/staff regularly to enhance adequate skills
3. There should be infrastructural development, adequate modern facilities, recent digital resources and technology should be invested in school libraries to enhance effective learning.

4. Educational policy establishing school libraries should be reviewed and revised, hence school library development should be a priority.

From Bookshelves to Makerspaces: Repositioning Nigerian Libraries as Hubs for Community Development and Innovation in the 21st Century

Prof. A. A. Maidabino
University Librarian
Federal University of Technology, Babura,
Jigawa State
maidabinoforyou@gmail.com

ABSTRACT

In the 21st century, libraries worldwide are transitioning from traditional repositories of books to dynamic spaces that support innovation, creativity, and community engagement. In Nigeria, this transformation is particularly critical given the challenges of youth unemployment, digital divide, limited access to technology, and the need for inclusive community development. This paper examines the concept of repositioning Nigerian libraries as hubs for community development and innovation through the integration of makerspaces and other user-centered services. Using a conceptual and contextual analysis, the study explores how public, academic, and community libraries in Nigeria can adopt makerspaces to promote digital literacy, skills acquisition, entrepreneurship, and lifelong learning. The paper highlights the potential of libraries to serve as inclusive platforms for empowering youths, women, and marginalized groups, especially at the grassroots level. It also discusses the institutional, infrastructural, and policy-related challenges facing Nigerian libraries, including inadequate funding, limited technological infrastructure, and capacity gaps among library personnel. The paper argues that strategic investment, supportive policies, and multi-stakeholder partnerships are essential for repositioning libraries as catalysts for socio-economic development. By embracing innovation and community-centered services, Nigerian libraries can contribute meaningfully to national development goals and the knowledge economy in the 21st century.

Keywords: Bookshelves, Makerspaces, Libraries, Library Services, Nigerian Libraries, Repositioning Nigerian Libraries, Hubs for Community Development and Innovation, 21st Century

Introduction

In the 21st century, libraries around the globe are being transformed from their traditional role as book houses to being innovation, creativity and community hubs. This transformation is driven by the rapid evolution of information and communication technologies, the increasing need for digital literacy, and the demand for an inclusive platform to share knowledge. Today, libraries are not just about access to print materials; they are also transforming into active learning spaces where patrons can learn new skills, work cooperatively and engage in problem-solving exercises that promote personal and social progress (Urhefe-Okotie & Ojeabulu, 2025).

Reframing libraries as community development and innovation centres is crucial in Nigeria. Nigeria is grappling with a range of socio-economic issues such as youth unemployment, digital gap, lack of access to new technologies and skills development. According to Bamigbola (2022) and Urhefe-Okotie and Ojeabulu (2025), public and academic libraries are well placed to tackle these challenges through information, digital and learning services. But many libraries in Nigeria still follow the conventional model of offering reading and book lending services, with little emphasis on innovative and user-centred services. Makerspaces are one of the innovative ways to transform libraries around the world. Makerspaces are open, shared spaces in libraries where library users can engage in activities like designing, prototyping, experimenting and making using tools and technologies. These spaces facilitate the development of essential 21st-century skills such as creativity, critical thinking, communication and collaboration (Musa, 2025). In Nigeria, makerspaces can improve digital skills, foster entrepreneurship and empower people, especially young people, women and the disadvantaged at the grassroots level.

While the importance of makerspaces is acknowledged, their uptake in Nigerian libraries is very low. Research has revealed that although some librarians are familiar with the concept of makerspaces and have a positive outlook towards the integration of makerspaces into libraries, many libraries have not yet set up makerspaces or taken steps towards its integration. This is largely due to various factors, including lack of funding and technological infrastructure, lack of space, unreliable electricity and lack of technical skills of library staff. Also, the lack of institutional policies and strategic plans for libraries limits the adoption of makerspaces. Additionally, the established image of libraries as silent reading rooms hampers the evolution of libraries into innovation spaces. This needs to shift by highlighting the notion of libraries as participatory and inclusive spaces for user involvement in learning by doing (Umar, et. al. 2023). This necessitates a change in attitudes towards library professionals, policymakers and stakeholders, as well as a focus on investing in new library services and infrastructure.

In view of these challenges and opportunities, it is therefore imperative to re-imagine Nigerian libraries as centres for community development and innovation. Through the inclusion of makerspaces and other user-focused services, libraries can be crucial in advancing national development agendas, building a knowledge economy and improving the

well-being of citizens. Hence, this study aims to investigate the best ways to reposition Nigerian libraries to align with the challenges of the 21st century and support sustainable community development.

Statement of the Problem

While the world is moving towards re-imagining libraries as innovation hubs and community spaces, many academic and public libraries in Nigeria are still stuck in their traditional roles of book storage and circulation. This traditional approach constrains their ability to play a significant role in tackling critical socio-economic issues like youth unemployment, digital divide, and limited technology access. Although makerspaces have proven to be successful spaces internationally for supporting innovation, digital skills, entrepreneurship, and peer-to-peer learning, adoption of makerspaces in Nigerian libraries remains low. The issue is not simply the lack of makerspaces, but a disconnect between library services and global trends in innovation and skills development. As a result, Nigerian libraries are at risk of irrelevance in a rapidly changing knowledge-based economy that demands practical and technological skills.

Moreover, while libraries in the global counties such as Canada, United States of America and among others have embraced makerspaces and user-focused services, and as a result have repositioned themselves as important community spaces for engagement and innovation, and for lifelong learning (Farouk & Adamu 2024; Urhefe-Okotie & Ojeabulu, 2025), yet Nigerian libraries remain plagued with challenges that limit their progress. These include funding gaps, lack of technological infrastructure and power supply, lack of training and supportive policies. Studies such as Mirea et. al. (2023); El-Kalash et. al. (2025) has revealed awareness and positive attitudes of librarians towards makerspaces; yet, there is a gap between this awareness and practice. This study thus fills a crucial gap by considering the strategic repositioning of Nigerian libraries through makerspaces and offers a context-specific view that uniquely enriches the literature by connecting theory with practical approaches to innovation in developing-country libraries.

Research Objectives

1. To evaluate the need for repositioning Nigerian libraries as hubs for community development and innovation in the 21st century.
2. To examine the role of makerspaces in transforming Nigerian libraries into centers for digital literacy, skills development, and entrepreneurship.

Methodology

This study employed a systematic literature review method, utilising a broad spectrum of sources such as journal articles, conference proceedings, books and theses to examine the topic From Bookshelves to Makerspaces: Transposition of Nigerian Libraries into Spaces for 21st Century Community Development and Innovation: The review assessed the increasing need to reposition Nigerian libraries as innovative and dynamic community hubs for engagement, innovation and lifelong learning. It further explored the transformative role of makerspaces in this process, and how these spaces can contribute to improving digital literacy, skills development and entrepreneurship. The study concludes that reimagining Nigerian libraries through the inclusion of makerspaces is vital to ensure that they meet the demands of the 21st century and are able to play a proactive role in community development and innovation.

Literature Review

The evolution of libraries from "bookshelf institutions" to innovation spaces is a worldwide trend, spurred by the knowledge economy and the growing need to build digital literacy, innovation and community engagement. In advanced economies, libraries have successfully become makerspaces and innovation centres for entrepreneurship, STEM (Science, Technology, Engineering, and Mathematics) learning and lifelong learning. For instance, libraries in the US, UK and Canada offer 3D printing labs, coding studios, robotics workshops and innovation studios (Urhefe-Okotie & Ojeabulu, 2025; Adekunjo et al., 2024; Farouk & Adamu, 2024). This highlights a systems thinking strategy, where libraries are part of a network of interrelated national innovation systems, contributing to education, economic development and social inclusion.

According to Farouk and Adamu (2024), the transition of libraries from bookhouses to innovation and learning centres that facilitate creativity, entrepreneurship and community building is a global phenomenon. The authors noted that libraries are part of national innovation and education systems that help to build skills, increase employability and drive economic growth. On the other hand, literature on libraries in Nigeria reveals that libraries remain in the traditional mode of operation with minimal integration of makerspaces. Research conducted by Urhefe-Okotie and Ojeabulu (2025), Adekunjo et al. (2024), and Farouk and Adamu (2024) show that while awareness of makerspaces is growing among librarians, and the attitude towards adopting makerspaces is generally positive, the practice is very low. For example, Urhefe-Okotie and Ojeabulu (2025) revealed that libraries in Delta State have limited awareness and are not ready for makerspace integration, whereas Adekunjo et al. (2024) showed that where makerspaces are in place, they positively impact entrepreneurial learning among STEM students in Southwestern Nigeria. Likewise, Farouk and Adamu (2024) found university librarians in Kano State appreciate the role of makerspaces in STEAM education but lack infrastructural and institutional support.

Synthesis of literature results by Bamigbola (2022); Urhefe-Okotie and Ojeabulu (2025); El-Kalash et. al. (2025) also reveals that the main challenges to implementing makerspaces in Nigerian libraries are lack of funding, lack of technical skill among librarians, unreliable power supply, lack of space and lack of policy provisions. This suggests a gap in the integration of library services with the demands of modern education and innovation. Whereas in developed nations libraries are embedded in socio-economic development policies (Okuonghae, 2019; Onifade & Olatoye, 2022), as part of national innovation systems, Nigerian libraries are yet to be integrated into socio-economic development policies. This reveals a gap between international best practice and Nigeria. While libraries around the world have repositioned themselves as community innovation centres, Nigerian libraries are only beginning the journey of repositioning, with a greater focus on awareness than practice. This highlights the need for a repositioning framework for the integration of makerspaces in Nigerian libraries through policy, infrastructural, capacity building and inter-sectoral support to enhance the role of libraries in community development and innovation in the 21st century.

The concept of makerspaces is contextually be an interactive learning spaces in libraries that provide users with access to tools, technologies, and equipment to design, build, experiment and innovate. They often include tools such as 3D printers, computers, craft tools, coding kits and multimedia resources to support active learning (Onifade & Olatoye, 2022; Mirea et. al., 2023; El-Kalash et. al., 2025). From a library perspective, makerspaces are a transition from reading to making information, and, in turn, a reimagining of libraries as innovation hubs that facilitate digital literacy, skills development, and entrepreneurship. Makerspaces enable libraries as spaces where patrons not only consume information but also use it to create solutions to real-world challenges, design products and acquire skills that are essential in the 21st century economy.

Across the world, the role makerspaces derived form the evolution of libraries as spaces for digital empowerment and economic engagement. For instance, libraries in nations like the United States and the United Kingdom have embraced makerspaces to offer coding clubs, robotics workshops, digital media creation, and entrepreneurship programs (Onifade & Olatoye, 2022; El-Kalash et. al., 2025). These programs show how libraries support workforce training and innovation clusters by providing skills and opportunities for creativity. Moreover, makerspaces promote digital inclusion by offering access to technology that might otherwise be inaccessible to disadvantaged groups, thus bridging the digital divide and fostering equality. In Nigeria, there is growing awareness of makerspaces' role in revolutionising libraries, but adoption rates remain low. Research works by Adekunjo, Adedokun, and Unuabor (2024), Farouk and Adamu (2024), and Urhefe-Okotie and Ojeabulu (2025) show that although librarians are familiar with the concept and hold a positive outlook towards the benefits, the implementation is limited by infrastructural and institutional factors. Adekunjo et al. (2024) stress that makerspaces can boost entrepreneurial skills among STEM students in academic libraries, while Farouk and Adamu (2024) stress the role of makerspaces in supporting STEAM education and innovation in universities. But Urhefe-Okotie and Ojeabulu (2025) note that many Nigerian libraries lack readiness for the establishment of makerspace due to lack of funding, space, reliable electrical supply and trained human resource.

Crucially, literature indicates that makerspaces can transform Nigerian libraries into vibrant spaces for digital literacy, skill development and entrepreneurship, but this is yet to be fully harnessed. While makerspaces are integral to national innovation and education strategies in developed nations, Nigerian libraries are still stymied by systemic issues. Thus, while the theoretical potential of makerspaces for library transformation is clear globally, their impact in Nigeria needs better policy support, infrastructure and training to transform libraries into 21st-century hubs for community empowerment and innovation.

Theoretical framework

The study is guided within the premises of STEM is a framework that integrates Science, Technology, Engineering, and Mathematics in order to promote innovation, problem-solving, digital literacy, and skills development for socio-economic advancement. It represents a shift from isolated subject teaching to an interdisciplinary approach that connects theoretical knowledge with real-world applications, particularly in addressing global challenges and preparing learners for the knowledge economy.

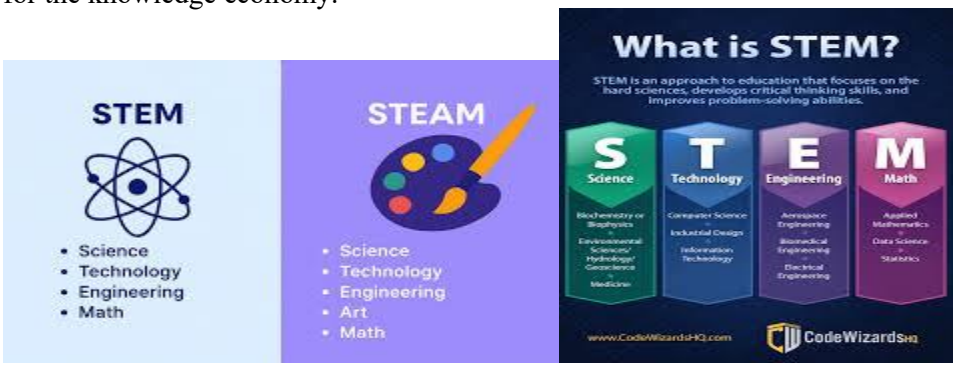

Figure 1. Morrill Act of 1862, as cited in National Research Council (2011)

STEM has evolved in a number of stages. Its roots can be traced back to the Morrill Act of 1862, which established land-grant colleges in the US to focus on practical education in agriculture, science and engineering (National Research Council, 2011; Musa, 2025). The early 20th century saw progressive educational reforms also prioritise applied science and technical education. The Cold War period, particularly following the Soviet Union's launch of Sputnik in 1957, marked a significant shift, with a strong focus on science and mathematics education, as seen in the National Defense Education Act of 1958 ((Shen, 2023). STEM was coined in the 1990s, when the U.S. National Science Foundation (NSF) originally used the acronym SMET (Science, Mathematics, Engineering and Technology) that was reordered to STEM by Dr. Judith Ramaley to prioritise integration over isolation of the disciplines (Sanders, 2009). From the early 2000s, STEM has evolved into a global educational and policy movement to enhance innovation, human capital development and economic competitiveness. It has recently been extended to STEAM, which integrates Arts to improve creativity and critical thinking skills in problem-solving (Okuonghae, 2019; Onifade & Olatoye, 2022; El-Kalash et. al., 2025).

This study adopts the STEM framework (Science, Technology, Engineering, and Mathematics) as an interdisciplinary approach toward understanding the evolution of libraries in the 21st century from being passive book depots to active innovation, creativity and community engagement platforms (Shen, 2023; Mirea et. al. 2023). In this respect, libraries are considered important institutions for tackling 21st century socio-economic problems such as youth unemployment, digital divide, technology access and inclusive community development. The study envisages repositioning of Nigerian libraries as innovation and community development hubs with makerspaces and other user-oriented services promoting digital literacy, skills development, entrepreneurship, and lifelong learning. It also acknowledges the role of libraries as inclusive platforms for empowering the youth, women and other marginalised people, especially at the grassroots level. But within the STEM-framework-based analysis, the study also identifies the major challenges in Nigerian libraries, such as lack of funding, poor technological infrastructure and capacity of library staff. As such, it suggests that with the right investment, policy and multi-partner approaches, Nigerian libraries can be repositioned as STEM-focused socio-economic development agents and as players in the national knowledge economy.

Today, STEM in education systems is motivated by a desire to boost economic development, national security and interdisciplinary approaches to education. The United States, the United Kingdom, China, South Korea, and other countries (Umar et. al., 2023; Musa, 2025) have embraced STEM as a national development framework, while developing nations like Nigeria are starting to embrace STEM to tackle issues such as unemployment, digital divide and skills gap

Conclusions

The study concludes that redefining Nigerian libraries from book-centred institutions to community development and innovation centres is both desirable and imperative in the 21st century, especially to address problems such as youth unemployment, digital divide, and lack of technology access. The adoption of makerspaces in libraries, driven by the STEM approach, is a potential solution to transform libraries into spaces for digital literacy, skills development, innovation, and lifelong learning. Unfortunately, the literature shows that although librarians in Nigeria are becoming more aware of makerspaces, few are being implemented due to systemic issues, including a lack of funding, infrastructure, technical expertise, and policy support. By contrast, developed nations have integrated libraries into national innovation systems, showcasing the transformative role of makerspaces in education, innovation and socio-economic development. Thus, the study concludes that without strategic intervention, Nigerian libraries run the risk of being excluded from the country's national development agenda, rather than contributing to the knowledge economy.

Recommendations

Based on the review and conclusions drawn, the following recommendations are made:

Government and Institutional Support: All levels of government should, working with library management agencies, allocate funds for the development of makerspaces in public, academic and community libraries. This includes the provision of digital ICT facilities, reliable power supply and innovation support, including computers, 3D printers and digital teaching and learning materials.

2. Policy and Capacity Building: Library institutions should redefine national and institutional policies for incorporating makerspaces, and provide ongoing training and capacity building for librarians. This will prepare library staff with technical and pedagogic skills to manage makerspaces and facilitate digital, entrepreneurial and innovation skills among users.

FROM INFORMATION GATEKEEPERS TO ARTIFICIAL INTELLIGENCE KNOWLEDGE VALIDATORS: REIMAGINING THE PROFESSIONAL IDENTITY OF LIBRARIANS IN THE GENERATIVE AI ERA

By

IDRIS, ABBA

Department of Library and Information Science, Federal University Dtsin-Ma (FUDMA) Katsina State
idriabba021@fudutsinma.edu.ng

Abstract

The emergence of Generative Artificial Intelligence (GenAI) is fundamentally transforming librarianship by reshaping how information is created, accessed, and used. This paper examines the evolving professional identity of librarians in the generative AI era and argues that the traditional role of librarians as information gatekeepers is no longer sufficient in an environment characterized by information abundance, AI-generated content, and changing user information-seeking behaviour. Through a review of current literature, the paper explores the traditional identity of librarians, the influence of GenAI on library information services, and the reasons why librarianship must move beyond facilitating access to information toward ensuring its credibility and ethical use. It proposes a new professional identity ***AI Knowledge Validators*** *in which librarians verify AI-generated information, promote AI literacy, safeguard research integrity, provide ethical guidance on AI use, and curate trustworthy AI-assisted knowledge resources. The paper further identifies the core competencies required of future librarians, including AI literacy, prompt engineering, fact-checking, data literacy, digital ethics, algorithmic bias awareness, machine learning awareness, research data management, and critical evaluation skills. It also discusses the implications of these developments for Library and Information Science (LIS) schools and professional associations, emphasizing curriculum reform, AI competency standards, continuous professional development, and ethical governance as essential for preparing librarians for the AI era. The paper concludes that the future relevance of librarianship lies not in competing with artificial intelligence in generating information but in validating, contextualizing, and ethically governing AI-generated knowledge. By embracing the role of AI Knowledge Validators, librarians can remain indispensable in promoting trustworthy scholarship, responsible AI adoption, and informed decision-making in an increasingly AI-driven knowledge society.*

Keywords: Generative Artificial Intelligence (GenAI), AI Knowledge Validators, Librarianship, AI Literacy, Professional Identity of Librarians

1.0 INTRODUCTION

For centuries, librarians have served as trusted custodians of knowledge, ensuring the organization, preservation, and equitable access to information for education, research, and societal development. As information environments evolved from print collections to digital libraries, the profession consistently adapted to technological advancements while maintaining its commitment to intellectual freedom, information ethics, and scholarly integrity. However, the emergence of Generative Artificial Intelligence (GenAI) represents a transformative shift in how information is created, accessed, and used (Storey et al., 2025). Unlike traditional search engines that retrieve existing documents, GenAI tools such as ChatGPT, Gemini, Claude, Microsoft Copilot, and Perplexity AI generate original content, summaries, translations, and research assistance in real time. While these technologies improve efficiency and accessibility, they also introduce significant challenges, including fabricated citations, factual inaccuracies, algorithmic bias, misinformation, and limited source transparency. Consequently, the fundamental challenge in today's information environment is no longer access to information but ensuring its credibility, authenticity, and ethical use (Nanda and Kumar, 2024).

These developments call for a redefinition of the librarian's professional identity. Rather than serving primarily as information gatekeepers, librarians must evolve into AI Knowledge Validators who critically evaluate AI-generated content, promote AI literacy, safeguard research integrity, provide ethical guidance, and support responsible AI use. Their expertise in information evaluation, scholarly communication, and evidence-based practice uniquely positions them to address the growing demand for trustworthy knowledge in an AI-driven society. This paper argues that the future relevance of librarianship depends on embracing this new role. It explores how generative AI is reshaping library services, identifies the competencies required of future librarians, and examines the implications for Library and Information Science education and professional practice in the generative AI era.

2.0 THE TRADITIONAL IDENTITY OF LIBRARIANS

The identity of the librarian has historically been rooted as trusted professionals who served as information gatekeepers, collection developers, cataloguers, reference specialists, and information literacy educators. Through these

interconnected roles, they selected and organized quality information resources, developed balanced collections, facilitated efficient information retrieval, provided personalized research support, and equipped users with the skills to locate, evaluate, and use information ethically and effectively. Together, these responsibilities ensured equitable access to reliable information and established librarians as essential facilitators of learning, teaching, and research. However, the emergence of generative AI is transforming these traditional roles, requiring librarians to extend their responsibilities beyond providing access to information toward validating the credibility, authenticity, and ethical use of AI-generated knowledge as AI Knowledge Validators (Adewojo and Tella 2026).

3.0 INFLUENCE OF GENERATIVE AI ON LIBRARY INFORMATION SERVICES

Generative Artificial Intelligence (GenAI) has transformed library information services by generating original content, summaries, translations, computer code, and analytical responses in real time. Unlike traditional information retrieval systems, GenAI supports more intelligent, interactive, and user-centered information services, influencing nearly every aspect of library operations.

a) Personalization of Library Information Services: Generative AI enables highly personalized library services by analysing users' interests, search histories, and information needs to recommend relevant books, articles, databases, and other scholarly resources. This enhances resource discoverability, improves user satisfaction, and supports more effective learning and research (Panda and Kaur, 2023).

b) Automation of Routine Information Services: GenAI automates repetitive library functions such as answering frequently asked questions, generating metadata, summarizing documents, translating content, and providing virtual reference services (Neamatollahi and Danesh 2026). This improves service efficiency, enables 24-hour user support, and allows librarians to focus on more specialized research and academic support activities.

c) Transformation of User Information-Seeking Behaviour: Generative AI has changed how users search for information, with many now relying on AI tools for instant answers instead of traditional library catalogues or databases. This shift has increased expectations for faster, conversational, and interactive library services, encouraging libraries to integrate AI technologies while maintaining information quality and reliability.

d) Redefinition of Librarians' Professional Roles: The adoption of GenAI has expanded librarians' roles beyond information provision to include AI literacy education, digital ethics, research consultation, and AI knowledge validation. Librarians now help users evaluate AI-generated content, recognize misinformation, develop effective prompts, and use AI responsibly in academic and professional contexts (Khan, 2025).

e) Increased Emphasis on Information Quality and Research Integrity: Generative AI has shifted library services from simply providing access to information toward ensuring the credibility, authenticity, and ethical use of AI-generated knowledge. As AI systems can produce inaccurate or fabricated information, librarians play a vital role in verifying sources, promoting critical evaluation, and safeguarding research integrity, reinforcing the library's position as a trusted institution for information validation (Panda and Kaur, 2023).

4.0 WHY INFORMATION GATEKEEPING IS NO LONGER ENOUGH

The traditional identity of librarians as information gatekeepers emerged during a period when information was scarce, access was limited, and libraries served as the primary gateway to scholarly knowledge (Onunka et al., 2023). Thus, the rapid advancement of digital technologies and Generative Artificial Intelligence (GenAI) has fundamentally transformed the information landscape, making information abundant, instantly accessible, and increasingly AI-generated. As users rely more on AI tools than traditional library services, the primary challenge has shifted from accessing information to verifying its credibility, authenticity, and ethical use. These changes demonstrate that the traditional role of librarians as information gatekeepers is no longer sufficient and underscore the need for a new professional identity as AI Knowledge Validators. Therefore, the following factors explain why librarianship must move beyond information gatekeeping and embrace a new professional identity as AI Knowledge Validators:

- **Information Is No Longer Scarce**

The digital revolution, open-access publishing, cloud computing, and generative AI have transformed information from a scarce resource into one that is instantly and widely accessible. Consequently, the primary challenge for users has shifted from obtaining information to navigating and evaluating the overwhelming volume of available content thereby, reducing the traditional gatekeeping role of librarians (Onunka et al., 2023).

- **Artificial Intelligence Generates Information Instantly**

Unlike conventional search engines that retrieve existing information, generative AI tools produce original content, summaries, translations, literature reviews, and programming code in real time. This capability has changed user

expectations by delivering instant responses and automating information retrieval and synthesis, thereby reducing librarians' traditional role as facilitators of information access (Kim, 2025).

- **Users Are Increasingly Bypassing Libraries**

Many users now seek information directly from AI platforms rather than library catalogues, databases, or reference services because AI provides faster and more intuitive access to information (Dhage and Verma 2025). While this improves convenience, it reduces the visibility of libraries and requires librarians to redefine their professional value beyond providing access to information.

- **The Challenge Is No Longer Finding Information**

As AI enables users to retrieve information instantly through natural-language queries, locating information is no longer the primary challenge (Segeda, 2025). Instead, librarians should focus on helping users interpret, evaluate, and apply information responsibly, shifting their emphasis from information retrieval to critical information use.

- **The Challenge Is Verifying Information**

The greatest information challenge in the AI era is verifying the accuracy and credibility of AI-generated content (Kim, 2025). This is so because AI systems can produce fabricated references, misinformation, algorithmic bias, and hallucinations, librarians' expertise in information evaluation, source verification, and scholarly communication positions them to ensure the reliability of information used in research, education, and professional practice.

- **The Need for a New Professional Identity**

These developments demonstrate that information gatekeeping alone is no longer sufficient to define librarianship (Onunka et al., 2023). As information becomes abundant and AI-generated content proliferates, librarians must evolve into AI Knowledge Validators who promote AI literacy, safeguard research integrity, identify misinformation, and ensure that AI-generated information is accurate, ethical, transparent, and suitable for scholarly and public use.

5.0 LIBRARIANS AS AI KNOWLEDGE VALIDATORS

The rapid adoption of generative AI requires librarians to redefine their professional identity from information gatekeepers to AI Knowledge Validators. In this role, librarians validate AI-generated information, promote AI literacy, safeguard research integrity, encourage responsible AI use, and curate trustworthy AI-assisted knowledge resources, building upon the profession's longstanding commitment to intellectual freedom, evidence-based practice, and reliable information (Machin-Mastromatteo, 2025). Hence, below constitutes the roles librarians should play as AI Knowledge Validators:

i. AI Information Verification: A primary responsibility of AI Knowledge Validators is verifying the accuracy and credibility of AI-generated information. Librarians apply their expertise in evaluating authority, authenticity, relevance, accuracy, and currency to compare AI outputs with authoritative sources, ensuring that AI-assisted information used for teaching, research, and decision-making meets scholarly and ethical standards.

ii. AI Literacy Education: Generative AI expands traditional information literacy into AI literacy. Librarians should educate users on how AI systems function, their limitations, prompt design, source verification, bias recognition, transparency, and the ethical use of AI, enabling users to critically evaluate AI-generated information and use AI responsibly in academic and professional contexts.

iii. Research Integrity: The widespread use of generative AI poses risks to research integrity through fabricated references, hallucinated citations, AI-assisted plagiarism, manipulated findings, and undisclosed AI authorship. Librarians should support researchers by verifying AI-generated references, evaluating AI-assisted research outputs, ensuring compliance with AI policies, and promoting transparency and ethical scholarship throughout the research process.

iv. Ethical AI Guidance: As AI raises concerns about copyright, privacy, intellectual property, algorithmic bias, accountability, and transparency, librarians should serve as ethical advisors by developing AI guidelines, promoting responsible AI use, educating users on copyright and data privacy, and advocating for fairness and accountability in AI applications. These efforts strengthen responsible AI governance and public trust.

v. Knowledge Curation: Since AI tools differ in accuracy, transparency, reliability, and scholarly value, librarians should evaluate AI platforms, recommend trustworthy AI-assisted research tools, establish best-practice guidelines, and integrate vetted AI resources into library services and information literacy programmes. In doing so, they move beyond managing traditional collections to curating intelligent knowledge ecosystems that support responsible scholarship.

6.0 NEW COMPETENCIES REQUIRED OF FUTURE LIBRARIANS

The emergence of Generative Artificial Intelligence (GenAI) has transformed librarianship, requiring professionals to develop competencies beyond traditional library skills (Siddiqui, 2025, June). In addition to cataloguing, collection development, reference services, and information literacy, librarians must acquire technical, analytical, ethical, and instructional competencies that enable them to critically evaluate AI-generated information, promote its responsible use,

and function effectively as AI Knowledge Validators. The following are the future competencies librarians should possess to be relevant in the AI information era:

a. AI Literacy: Librarians should understand how AI systems operate, recognize their strengths and limitations, critically interpret AI-generated outputs, and educate users on the responsible and informed use of AI technologies.
b. Prompt Engineering: Prompt engineering has become an essential skill, enabling librarians to design effective prompts that improve information retrieval, research support, and AI-assisted learning while teaching users how to interact effectively with AI systems.
c. Fact-Checking: Librarians must strengthen their ability to verify AI-generated information by comparing AI outputs with authoritative and credible sources to identify inaccuracies, fabricated citations, and misinformation, thereby ensuring reliable information.
d. Data Literacy: Future librarians should possess data literacy skills that enable them to collect, analyse, interpret, manage, visualize, and communicate data effectively while supporting evidence-based research and AI-assisted data analysis.
e. Digital Ethics: Librarians should develop competencies in digital ethics to address issues such as copyright, privacy, intellectual property, transparency, accountability, and the responsible use of AI while promoting ethical practices and public trust.
f. Algorithmic Bias Awareness: Understanding algorithmic bias enables librarians to recognize biased AI outputs, educate users about AI limitations, and advocate for fairness, inclusiveness, and transparency in AI-supported information services.
g. Machine Learning Awareness: Although librarians are not expected to develop AI systems, they should possess a basic understanding of machine learning concepts to explain AI behaviour, interpret AI outputs accurately, and support AI-informed research and learning.
h. Research Data Management: Librarians should strengthen competencies in research data management, including data organization, metadata creation, preservation, repository management, and compliance with research policies to support high-quality scholarly communication.
i. Critical Evaluation Skills: Critical evaluation remains the most essential competency in the AI era. Librarians must assess the credibility, authority, accuracy, transparency, and reliability of both traditional and AI-generated information, enabling them to distinguish trustworthy knowledge from misinformation and effectively perform their role as AI Knowledge Validators.

7.0 IMPLICATIONS OF GENERATIVE AI TO LIBRARY SCHOOLS AND PROFESSIONAL ASSOCIATIONS

The rise of Generative Artificial Intelligence (GenAI) requires Library and Information Science (LIS) schools to modernize their curricula by integrating AI-related competencies such as AI literacy, prompt engineering, AI ethics, data analytics, computational thinking, digital scholarship, and research data management. These additions will prepare future librarians to serve as AI Knowledge Validators who can critically evaluate AI-generated information, promote responsible AI use, and safeguard research integrity. Likewise, professional library associations must provide strategic leadership by developing AI competency standards, issuing ethical AI guidelines, offering continuous professional training, supporting AI certification, and promoting responsible AI governance (Hovious and Smith, 2025). These initiatives will equip librarians to integrate AI effectively while upholding the profession's core values of intellectual freedom, public trust, equitable access to reliable information, and scholarly integrity.

Conclusion

The emergence of Generative Artificial Intelligence (GenAI) has fundamentally redefined the information landscape, making the traditional role of librarians as information gatekeepers insufficient for contemporary information challenges. As the focus shifts from providing access to information toward ensuring its credibility, authenticity, and ethical use, librarians must embrace a new professional identity as AI Knowledge Validators. In this role, they verify AI-generated information, promote AI literacy, safeguard research integrity, provide ethical guidance, and curate trustworthy AI-assisted knowledge resources. This transformation represents the natural evolution of librarianship rather than its decline. By acquiring AI-related competencies and strengthening AI education, professional development, and ethical governance, librarians can remain indispensable in supporting trustworthy scholarship and responsible AI use. Ultimately, the future of librarianship will be defined not by competing with artificial intelligence in generating information, but by ensuring that AI-generated knowledge is accurate, reliable, and ethically applied in research, education, and decision-making.

Abstract
The rapid advancement of Artificial Intelligence (AI) has significantly transformed knowledge organisation and information services across various sectors, including libraries. This paper examines harnessing artificial intelligence for 21st Century knowledge organisation services in libraries, highlighting their effect on information retrieval, user experience, and operational efficiency. It explores key AI applications such as machine learning, natural language processing, and chatbots in library environments. The study also discusses challenges including ethical concerns, data privacy, and skill gaps among librarians. The study methodology involved conducting a comprehensive systematic review of the literature to identify published academic literature relevant to the research topic The literature was organised according to the four objectives of the study and described in sufficient detail to provide a comprehensive account of what is known about the use of AI for knowledge organisation in libraries. The paper concludes that while AI enhances knowledge organization, service delivery and positions libraries as intelligent knowledge hubs. Its successful adoption and use require strategic planning, policy frameworks, and continuous professional development of the library staff. Recommendations for both practice and responsible adoption and use of artificial intelligence were suggested.

Keywords: Artificial Intelligence, Harnessing, Knowledge Organisation Services, Libraries.

Introduction

Libraries have historically functioned as custodians of knowledge and pivotal hubs for the dissemination of information. Nonetheless, the advent of the digital era and the unprecedented surge in information volume have compelled the adoption of innovative methodologies for service delivery. Artificial Intelligence (AI), conceptualized as the emulation of human cognitive processes in machines, has emerged as a disruptive influence in contemporary librarianship (Omame and Alex-Nmecha, 2020). In the 21st century, libraries are evolving from mere passive providers of information to proactive, user-oriented systems of knowledge. AI technologies present substantial opportunities to augment operational efficiency, enhance accessibility, and deliver customized services.

Artificial Intelligence represents a specialized domain within computer science, aiming to develop sophisticated machines capable of executing tasks typically requiring human cognitive abilities (Copeland 2024), including but not limited to learning, reasoning, problem-solving, perception, language comprehension, and decision-making. The field of AI encompasses a diverse array of methodologies, such as robotics, computer vision, machine learning, and natural language processing. AI is fundamentally transforming the organization of informational resources within libraries by reshaping the processes of categorization, maintenance, and accessibility of these resources.

Kalisdha (2024) asserts that AI exerts a substantial impact on the structuring of informational sources in libraries, enhancing both the efficiency and accuracy of information retrieval. AI systems possess the capability to autonomously

generate metadata, identify patterns within extensive datasets, and classify informational resources through the application of machine learning algorithms. This automated approach facilitates the expeditious completion of cataloguing and indexing responsibilities, thereby liberating librarians to focus on more advanced tasks, such as curating specialized collections and providing personalized services to patrons. Furthermore, the utilisation of AI-driven information organization systems can significantly augment the consistency and quality of metadata by rectifying errors and inconsistencies that arise from manual classification processes (Ali *et al*., 2023).

As posited by Abimbola (2024), AI algorithms possess the capability to adapt and evolve over time, assimilating feedback and user interactions to enhance the relevance and precision of search results. This adaptive intelligence facilitates the organization of information sources in a manner that is more centered on the user by aligning library resources with the evolving needs and preferences of library communities. Organizations of information sources driven by artificial intelligence not only enhance productivity but also foster innovation in the realms of information access and discovery (Jarrahi *et al.*, 2022).

AI systems equipped with natural language processing capabilities can understand and interpret user inquiries with greater nuance, thus enabling semantic search and improving contextual relevance. This capability allows users to identify pertinent resources more efficiently, even when their queries are intricate or ambiguous. Artificial intelligence augments libraries' capacity to effectively manage and utilize their information resources by automating labor-intensive tasks and providing valuable insights. By alleviating challenges such as linguistic barriers and information saturation, AI-driven knowledge organizations contribute to the democratization of access to information (Lowa, 2024).

Multilingual AI systems can facilitate the discovery and distribution of content in multiple languages, increasing the reach of academic resources to a worldwide audience. Additionally, AI systems that can filter and prioritize content based on relevance and dependability help users navigate the abundance of knowledge found in digital archives (Okunlaya *et al*., 2024). The organization of knowledge in libraries is significantly impacted by AI's contribution to data integration and metadata enrichment. By extracting crucial information from multimedia assets, including as images, videos, and audio files, AI-driven systems can improve metadata (ExLibris, 2024). Digital assets become more discoverable and contextual because to this improved metadata, which facilitates cross-referencing different resource types and multidisciplinary research.

AI-driven data integration techniques have also made it possible for libraries to integrate and harmonize various data sources, including external databases, digital repositories, institutional repositories, and library catalogues (Akinyemi, 2023). This integrated approach to information organization promotes multidisciplinary collaboration and knowledge sharing among researchers, educators, and students by making a wide range of resources easily accessible. Because of this, AI improves efficiency, accuracy, innovation, democratization, and integration, which changes the way libraries organize their knowledge. By using AI technology to optimize information discovery, administration, and dissemination processes, libraries can improve academic experience and increase knowledge generation and dissemination in higher education.

The integration of intelligent systems into libraries began in the 1990s, utilizing AI technologies to provide knowledge-based services to both library patrons and staff. Despite its complexity, AI aims to develop computer systems with human-like intelligence, significantly impacting the field of librarianship (Bashorun *et al*., 2024).

Statement of the Problem

The rapid growth of information resources in the 21st Century has created significant challenges for libraries in the area of knowledge organization. Traditional methods of cataloguing, classification, indexing, and information retrieval are becoming increasingly inadequate in handling the large volume, variety, and complexity of both print and digital information resources. Many libraries still rely heavily on manual processes, which are often time-consuming, labour-intensive, costly, and prone to human error. As a result, users frequently experience difficulties in accessing accurate, timely, and relevant information resources.

Artificial Intelligence (AI) has emerged as a transformative technology capable of improving knowledge organization through automated cataloguing, metadata generation, intelligent indexing, semantic searching, and enhanced information retrieval systems. Despite these potentials, many libraries, particularly in developing countries, have not fully harnessed AI technologies due to inadequate infrastructure, lack of skilled personnel, insufficient funding, poor technological awareness, and resistance to change. Furthermore, the inability of libraries to effectively integrate AI into knowledge organization processes may reduce service efficiency, limit users' satisfaction, and hinder libraries from meeting the evolving information needs of 21st Century users. It is therefore necessary to examine how AI can be harnessed to improve knowledge organization in libraries, identify the challenges affecting its adoption and explore strategies for effective implementation.

Objectives of the Study

The specific objectives are to:

1. identify the importance of AI in knowledge organization in libraries;

2. examine the applications of artificial intelligence for knowledge organisation in libraries;
3. determine the benefits of AI in Library Services; and
4. identify the challenges and Ethical Considerations.

Methods

The methodology involved conducting a comprehensive systematic review of the literature to identify published academic literature relevant to the research topic. The keywords and search terms used included "importance of AI knowledge organisation, applications of AI for knowledge organisation, benefits of AI in library services and challenges and ethical considerations". The literature reviewed for this study was sourced from open-access databases and search engines such as: Google Scholar, JSTOR, Emerald Insight, ScienceDirect, PubMed Central, Taylor & Francis Online, Journal of Librarianship and Information Science, Library Philosophy and Practice (e-journals), Applied Science, Information Fusion, International Journal of Applied and Science Research, Frontiers of Artificial Intelligence, Physical Medica, Computers in Human Behavior Report, Business Horizons, Sustainable Development, The Journal of Academic Librarianship, South Africa Journal of Library and Information Science, Library Hi Tech, Discovery of Artificial Intelligence, Journal of Information Technology and Complex and Intelligent System were equally included as relevant grey literature sources. The literature was organised according to the four objectives of the study and described in sufficient detail to provide a comprehensive account of what is known about the use of AI for knowledge organisation in libraries.

Importance of Artificial Intelligence in Knowledge Organisation in Libraries

AI-driven knowledge organizations greatly enhance library services by improving information administration and distribution efficiency, accuracy, originality, and accessibility. By using AI technology to optimize resource utilization, improve decision-making, and streamline operations, knowledge organizations can develop additional services (Kulkov *et al*., 2023). One of AI's main implications for sustainability is its capacity to automate labor-intensive procedures including data classification, indexing, and metadata creation (Kulkov *et al*., 2023).

By reducing errors and inconsistencies and the time and effort required for information management, this automation produces more reliable and trustworthy data repositories. This improved data quality leads to better resource allocation and decision-making, which ultimately enhances service delivery. As a result, AI-powered knowledge organizations facilitate sophisticated data analytics and knowledge creation by identifying patterns, trends, and anomalies in large datasets (Aldoseri and Hamouda, 2022). This data-driven strategy helps libraries make educated decisions that support service delivery by improving performance optimization, risk assessment, and predictive modeling. For example, AI systems can analyze energy use data to identify problem areas and implement targeted energy-saving and energy-efficient strategies.

In conclusion, AI-driven knowledge organizations are essential to the provision of services because they enable improved data management, improved decision-making, creativity and collaboration, individualized learning, moral behavior, and flexible strategies. By utilizing AI technology, libraries can contribute to a more resilient service delivery system and produce positive environmental, social, and economic consequences through data-driven insights and automation skills (Monyela and Tell, 2024).

Artificial Intelligence Applications for Knowledge Organisation in Libraries

Numerous innovative solutions that improve accessibility, streamline processes, and improve user experiences are examples of artificial intelligence applications for information organization in libraries (Akinola, 2023). These apps leverage AI-powered techniques like data analytics, machine learning, and natural language processing to optimize resources, generate new ideas and knowledge, and streamline procedures. An overview of the existing AI applications for knowledge organization in libraries is given in this section. Digital resources including books, articles, and multimedia content can have their metadata automatically generated by AI algorithms (Akinyemi, 2024). Library collections are made more discoverable and searchable by automating tedious activities and ensuring accurate and uniform metadata.

Semantic search and recommendation systems: AI-powered semantic search engines use natural language processing (NLP) techniques to evaluate user queries and retrieve relevant content based on meaning and context (Olujimi and Ade-Ibijola, 2023). To improve random discovery and individualised learning experiences, recommendation systems use ML algorithms to propose relevant resources based on user behaviour, preferences and previous interactions.

Text mining and data extraction: Text mining and data extraction from scholarly literature can be made possible by libraries using AI technology to identify trends, gain insights, and assess research topics (Wagner *et al*., 2021). This data-driven approach supports knowledge building, evidence synthesis, and research effect assessment.

Content organisation and personalisation: Digital material is arranged and chosen by AI-powered content curation platforms based on user preferences, study domains, and subject areas (Eg *et al*., 2023). By personalizing content

recommendations, alerts, and notifications, these systems allow users to investigate relevant resources and keep up with the most recent developments in their sectors.

Digital preservation and archiving: By automating file format conversion, integrity checks, and metadata enrichment, AI technologies support digital preservation efforts (Diaz *et al*., 2021; Kim, 2023). AI-powered archive solutions provide the long-term accessibility and utility of digital assets, safeguarding the academic legacy and supporting future research initiatives.

Enhanced accessible formats: By transforming text into accessible formats like braille, audio, and large print, AI systems increase the inclusivity and accessibility of academic information for people with disabilities (Chemnad and Othman, 2024). These AI-driven accessibility solutions support a variety of learning methods and promote equitable access to knowledge.

Data analytics for collection management: AI-powered data analytics tools look at usage patterns, citation networks, and collection metrics to aid in collection development decisions (Litsey and Mauldin, 2017). Libraries can identify high-impact publications, evaluate their holdings' worth and influence and allocate resources more efficiently thanks to these analytics.

Virtual assistants and chatbots: By answering questions, providing guidance, and expediting the process of locating materials, AI-powered chatbots and virtual assistants provide library users with individualized, interactive support (Aboelmaged, 2024). These AI-powered assistants boost patron engagement, expedite response times, and enhance the general user experience in libraries.

Predictive analytics for user behaviour: AI systems use user behavior data to predict user preferences, interests, and information needs (Zhang *et al*., 2020). Predictive analytics helps libraries anticipate client requirements, tailor services, and concentrate outreach initiatives, all of which improve patron satisfaction and retention.

Quality assurance and data governance: AI systems support data governance and quality assurance processes by spotting errors, inconsistencies, and compliance issues in metadata and content (Aldoseri and Hamouda, 2022). AI-powered quality control solutions increase the reliability and validity of library resources by ensuring data accuracy, consistency, and adherence to rules. These AI applications demonstrate how AI technology could transform libraries by improving scholarly collaboration, streamlining information access, and optimizing knowledge organization. By using AI-driven solutions, libraries can meet evolving user expectations, enhance their capabilities, and improve knowledge and research outcomes (Baber *et al*., 2024). These AI techniques and technologies are now being used for information retrieval, cataloguing, and metadata enrichment.

Benefits of Artificial Intelligence in Library Services

The adoption and use of Artificial Intelligence in libraries offer several advantages:

1. Improved Efficiency: Automation of routine tasks saves time and resources.
2. Enhanced User Experience: Personalized services meet individual user needs.
3. 24/7 Accessibility: AI systems provide round-the-clock services.
4. Data-Driven Decision Making: Analytics support strategic planning.

AI-driven systems significantly improve how information is stored, retrieved, and delivered in modern libraries.

Challenges and Ethical Considerations

Data Privacy and Security: Artificial Intelligence systems rely on user data, raising concerns about privacy and data protection.

Skill Gap Among Librarians: The adoption and use of Artificial Intelligence require new technical skills, necessitating continuous professional development.

Ethical and Bias Issues: Artificial Intelligence systems may reflect biases in data, leading to ethical concerns in information access and representation.

High Implementation Costs: The deployment of Artificial Intelligence technologies requires significant financial investment and infrastructure.

Despite its potential, the integration of Artificial Intelligence in libraries presents challenges that must be addressed for effective implementation.

Future Prospects of Artificial Intelligence in Libraries

The future of libraries lies in the continued integration of AI technologies. Emerging trends include:

1. AI-driven knowledge graphs
2. Voice-assisted search systems

3. Predictive analytics for user needs
4. Integration with smart learning environments

Artificial Intelligence is expected to redefine the role of librarians as information facilitators and technology managers rather than traditional custodians of books.

Conclusion

By improving efficiency, efficacy, accessibility, and user engagement, artificial intelligence is transforming 21st Century information organisation services in libraries. The advantages exceed the drawbacks, notwithstanding ongoing difficulties like ethical dilemmas and skill deficits. To stay relevant in the digital age, libraries need to strategically embrace artificial intelligence. For implementation and service delivery to be sustainable, investments in infrastructure, training, and policy development are crucial.

Recommendations

Monyela and Tella (2024) cited numerous suggestions as recommendations for practice, such as:

1. AI-driven tools and technologies should be integrated into the existing scholarly communication platforms and research procedures in order to allow their seamless adoption and offer publishers, institutions, and researchers user-friendly interfaces. This involves developing AI-powered literature search engines, citation management systems, and collaborative platforms to enhance research discovery, access, and collaboration.
2. There should be a call for multidisciplinary collaboration and knowledge exchange among AI researchers, domain experts, and stakeholders in the scholarly community in order to co-design and co-develop AI solutions that meet specific needs and obstacles in scholarly communication and research collaboration. This cooperative approach fosters creativity, diversity of perspectives, and ethical considerations while utilizing AI for academic purposes.
3. For AI-driven academic communication and research collaboration, ethical standards, best practices, and guidelines for data security, bias reduction, transparency, and accountability in AI algorithms and systems should be established. This ensures that AI is used appropriately and promotes fairness, inclusivity, and trust in academic research and communication practices.
4. Researchers, publishers, and academic institutions should receive continuous education and training programs that equip them with AI literacy, skills, and competencies in order to employ AI tools and technologies in scholarly communication, research collaboration, and knowledge management. This includes training in AI-enabled data analysis, ethical AI practices, machine learning, and natural language processing.

Recommendations for AI Adoption and Use in Libraries

The following recommendations were made to include:

1. Artificial intelligence should be adopted and used ethically by libraries in order to enhance services, promote diversity, and increase access to knowledge. Regarding the responsible use and application of artificial intelligence.
2. Ethics guidelines should be established and adhere to ethical rules and guidelines for the use of AI that cover topics such as responsibility, fairness, openness, data protection, and bias prevention. Verify that AI processes and systems adhere to ethical and legal standards, including data protection laws and regulations such as the GDPR. The protection of user privacy ought to come first. Strong data protection measures, sensitive data anonymization, obtaining informed consent prior to data collection and use, and ensuring data security throughout the whole AI lifecycle—from data gathering to processing and storage—are all necessary to achieve this.
3. User-friendly interfaces should be provided with thorough documentation, and understandable explanations of how AI algorithms work, what data they use, and the conclusions they draw in order to ensure that AI systems are transparent and explainable. Urge library users to trust and understand AI technologies.
4. Employ strategies to lessen bias in AI algorithms and data sets, such as a variety of training data, regular audits, bias detection tools, and continuous performance monitoring of AI systems to identify and address potential biases that could influence decision-making.
5. Ensure that a variety of users, including those with special needs or impairments, can utilise AI-powered services and products, keep accessibility and inclusivity in mind. Provide alternative access options to suit varying degrees of technological literacy.
6. Inform library users on AI technology, including its benefits, limitations, and potential risks. Educate people on digital literacy, AI literacy, and the appropriate usage of AI-powered goods and services.
7. Develop cooperative relationships with researchers, business partners, AI specialists, and other libraries in order to share best practices, collaborate on AI projects, and stay current on the latest developments and discoveries in AI technologies relevant to libraries. Ongoing

8. Regular evaluation of the efficacy, impact, and ethical implications of AI applications in library services. To identify areas for development and improvement, gather user feedback, run usability tests, and monitor AI usage data.
9. Include users, employees, and members of the community in decision-making processes about the uptake and application of AI. Ask for thoughts, recommendations, and feedback to make sure AI initiatives align with the goals and values of the library community.
10. Create a framework for the library's ethical AI governance, including roles and responsibilities for AI supervision, adherence to moral principles, risk management protocols, and avenues for resolving ethical complaints or issues with AI use.

Abstract
This research accessed human–AI collaboration in research assistance services in academic libraries in Cross River State, Nigeria. Specifically, the study investigated how researchers and students use AI tools for research assistance, assessed librarians' perceptions of AI integration in research support services, identified challenges associated with AI adoption, suggest strategies for effective human–AI collaboration, and develop recommendations for improving AI-supported research assistance services in academic libraries and proposed a framework for effective human–AI collaboration in academic libraries. The study adopted a mixed-methods design, combining quantitative and qualitative approaches to provide a comprehensive understanding of the phenomenon. The population of the study comprised 161 academic librarians, postgraduate students, and faculty researchers drawn from the University of Calabar, University of Cross River State, Cross River State Institute of Technology and Management, Ugep, and the College of Education, Akamkpa. Using accidental sampling technique, 120 respondents consisting of 80 librarians and 40 students/researchers were selected for the study. Data were collected using questionnaires and interview guides validated by experts in Library and Information Science and Test and Measurement. Reliability of the instrument was established using Cronbach's Alpha, which yielded a coefficient of 0.76. Quantitative data were analyzed using frequencies, percentages, and mean scores, while qualitative responses were analyzed thematically. Findings revealed that ChatGPT (27.5%) and Grammarly (22.5%) were the most frequently used AI tools among researchers and students. Librarians generally perceived AI positively, agreeing that AI can enhance research assistance (Mean = 4.00) and should complement rather than replace librarians (Mean = 4.04). The study further identified poor ICT infrastructure (31.7%) and lack of training (26.7%) as major barriers to effective AI integration in academic libraries. The study concluded that effective human–AI collaboration can significantly improve research support services when supported with adequate infrastructure, AI literacy training, ethical guidelines, and institutional support. The study recommended increased investment in digital infrastructure, continuous AI training for librarians, and the development of institutional policies for responsible AI usage in academic libraries.
Keywords: Artificial Intelligence (AI), Research Assistance, Human–AI Collaboration

.

Introduction

Academic libraries have long remained central to teaching, learning, and research in higher education institutions. Beyond serving as repositories of books and scholarly materials, they provide research assistance, information literacy training, and professional guidance that help students and researchers navigate increasingly complex information environments. Librarians, particularly reference and subject specialists, support users in locating credible information, evaluating sources, managing citations, and promoting ethical use of information resources. However, the rapid advancement of digital technologies, especially Artificial Intelligence (AI), is gradually transforming the traditional nature of research assistance in academic libraries.

Artificial Intelligence refers to computer systems capable of simulating human intelligence through learning, reasoning, problem-solving, natural language processing, and decision-making. In recent years, AI-powered applications such as ChatGPT, Grammarly, Elicit, Semantic Scholar, ResearchRabbit, and Turnitin have become increasingly popular within academic environments. These technologies assist researchers and students in literature searching, text summarization, plagiarism detection, citation management, language editing, and data analysis (Dwivedi *et al.*, 2021). As a result, research processes that previously required extensive manual effort are becoming increasingly automated and technology-driven.

The growing acceptance of AI technologies in academic environments can be understood through the Technology Acceptance Model (TAM), developed by Fred Davis. The theory explains that individuals are more likely to adopt new technologies when they perceive them as useful and easy to use. In the context of academic libraries, students, researchers, and librarians may adopt AI tools when such technologies improve research efficiency, simplify information retrieval, and enhance academic productivity. Similarly, the Diffusion of Innovation Theory by Everett Rogers provides further explanation for varying levels of AI adoption among librarians and academic institutions. The theory emphasizes how innovations spread gradually across organizations and societies through categories such as innovators, early adopters, early majority, late majority, and laggards. These theories provide a useful foundation for understanding the growing but uneven adoption of AI technologies in academic libraries in Nigeria and other developing societies.

Globally, universities and academic libraries are increasingly integrating AI into research support services. In developed countries, AI-driven systems are already being used for virtual reference services, intelligent cataloguing, automated indexing, research analytics, and personalized information retrieval. In Africa, however, the adoption of AI in academic libraries is still emerging and is often constrained by infrastructural deficiencies, inadequate funding, unstable internet connectivity, and low digital literacy levels. Nevertheless, studies from countries such as South Africa, Kenya, Ghana, and Nigeria reveal growing awareness of AI technologies among students, researchers, and information professionals.

Within Nigeria, the increasing use of AI tools in higher education has generated significant scholarly and professional interest. Students and researchers now frequently rely on AI applications for academic writing support, idea generation, literature review assistance, plagiarism checking, and grammar correction. While these technologies improve research efficiency, they have also raised concerns relating to misinformation, plagiarism, overdependence on machine-generated content, ethical misuse, and declining critical thinking skills. Nigerian academic libraries are therefore under increasing pressure to adapt their services and redefine their relevance in an era where users can independently access AI-generated information without physically consulting librarians.

Within Cross River State, the integration of AI into academic research activities is gradually becoming visible across institutions such as the University of Calabar, University of Cross River State, Cross River State Institute of Technology and Management, Ugep, and the College of Education, Akamkpa. Many students and researchers now use tools such as ChatGPT and Grammarly for assignments, proposal writing, literature review, and language editing. However, despite this increasing adoption, academic libraries in the state still face significant challenges including poor ICT infrastructure, unstable power supply, inadequate internet access, limited institutional funding, insufficient AI literacy among librarians, and lack of clear institutional policies regulating AI use in research support services. Consequently, many libraries risk becoming less relevant if they fail to adapt to the changing digital research environment.

The theoretical background of this study is anchored on the Technology Acceptance Model (TAM) developed by Fred Davis and the Diffusion of Innovation Theory propounded by Everett Rogers. The Technology Acceptance Model explains that individuals are more likely to adopt a technology when they perceive it as useful and easy to use. In the context of academic libraries, librarians, students, and researchers are more likely to embrace AI tools if such technologies improve research efficiency and information access. The theory further suggests that attitudes toward technology significantly influence its acceptance and usage within organizations. Similarly, the Diffusion of Innovation Theory explains how new technologies spread gradually across institutions and social systems over time. The theory identifies categories of adopters such as innovators, early adopters, early majority, late majority, and laggards, which helps explain varying levels of AI adoption among librarians and researchers in Cross River State. These theories are relevant to the study because they provide insight into factors influencing AI integration and human–AI collaboration in academic libraries. They also explain the importance of awareness, institutional support, training, and infrastructure in promoting the successful adoption of AI technologies. Therefore, the combination of both theories provides a suitable framework for understanding the future of research assistance through human–AI collaboration in academic libraries in Cross River State, Nigeria.

Despite concerns about AI replacing traditional professional roles, the future of academic research assistance is more likely to depend on collaboration between human expertise and intelligent technologies rather than outright replacement. AI can handle repetitive and time-consuming tasks such as information retrieval, indexing, summarization, and pattern recognition, while librarians provide contextual interpretation, ethical oversight, critical evaluation, and personalized research guidance. Cox *et al*.(2019) argue that AI technologies are most effective when combined with

human judgment and professional expertise. This suggests that librarians who develop AI-related competencies may become even more valuable within future academic research ecosystems.

Although several studies have examined AI awareness and technology adoption in Nigerian educational institutions, there is still limited empirical research specifically addressing human–AI collaboration in academic libraries within Cross River State. Existing studies have largely focused on AI in teaching, student learning, or educational administration, with little attention given to how librarians are responding to AI-driven transformations in research assistance services. Furthermore, there is inadequate evidence regarding librarians' perceptions of AI integration, institutional readiness, challenges affecting adoption, and practical frameworks that can support sustainable human–AI collaboration in academic libraries in the state. This gap in knowledge creates the need for empirical investigation.

It is against this background that this study examines human–AI collaboration in research assistance in academic libraries in Cross River State, Nigeria. Specifically, the study investigates how researchers and students use AI tools for research assistance, assesses librarians' perceptions of AI integration, identifies challenges associated with AI adoption, and proposes a framework for effective human–AI collaboration in academic libraries.

Statement of the Problem

The emergence of Artificial Intelligence (AI) technologies has significantly transformed the landscape of academic research and information management across the world. In higher education institutions, AI-powered tools such as ChatGPT, Grammarly, Elicit, Semantic Scholar, ResearchRabbit, and Turnitin are increasingly being used by students and researchers for literature review, academic writing, citation management, plagiarism detection, data analysis, and information retrieval. The increasing accessibility, speed, and efficiency of these technologies have contributed to their growing acceptance within universities and research institutions. In Nigeria, recent studies indicate that students and researchers are rapidly adopting AI tools to simplify academic tasks, improve writing quality, and enhance research productivity. This trend suggests that AI is gradually becoming an indispensable component of contemporary academic research practices.

Despite the increasing adoption of AI technologies by researchers and students, many academic libraries in Nigeria appear inadequately prepared for the realities of AI-driven research support services. Traditionally, academic libraries have served as centers for information access, research guidance, knowledge organization, and information literacy development. Librarians have historically provided professional support in sourcing credible scholarly materials, evaluating information resources, guiding citation practices, and promoting ethical research behavior. However, the emergence of AI technologies is changing how users seek and interact with information. Many students and researchers now bypass traditional library consultation processes and rely directly on AI tools for instant responses, summaries, and research assistance. This shift poses a significant challenge to the relevance and sustainability of conventional library services if libraries fail to evolve alongside technological advancement.

In many Nigerian universities, including institutions in Cross River State, the integration of AI into academic library services remains largely informal, inconsistent, and poorly coordinated. Although some librarians are aware of AI technologies and their potential benefits, many still lack the technical competencies, digital literacy skills, and professional training required for effective AI integration into research support services. Furthermore, several academic libraries operate without structured institutional frameworks, implementation strategies, or clear ethical guidelines regulating the use of AI in academic research assistance. Consequently, librarians may find it difficult to effectively guide students and researchers in the responsible and ethical use of AI-generated information.

The problem is further complicated by infrastructural and institutional limitations common in many developing societies. Academic libraries in Cross River State continue to face challenges such as poor ICT infrastructure, unstable electricity supply, inadequate internet connectivity, insufficient funding, limited access to modern digital technologies, and inadequate staff development opportunities. These challenges significantly limit the ability of libraries to adopt and sustain AI-driven services. In addition, concerns relating to misinformation, plagiarism, algorithmic bias, copyright infringement, data privacy, and overdependence on AI-generated content continue to raise ethical questions regarding the use of AI in academic research environments. Without proper human oversight, AI-assisted research support may compromise research quality, originality, and academic integrity.

Although AI adoption in higher education has attracted increasing scholarly attention globally and within Nigeria, most existing studies have focused primarily on AI in teaching, learning, educational administration, and general technology adoption. Very limited empirical research has specifically examined human–AI collaboration in academic libraries, particularly within the context of Cross River State. Existing literature has not adequately explored librarians' preparedness for AI integration, the extent to which researchers and students rely on AI tools for research assistance, the challenges hindering effective adoption, and the institutional preparedness required for sustainable human–AI collaboration in academic libraries. More importantly, there is limited evidence regarding practical frameworks that can guide academic libraries in balancing AI automation with human expertise, ethical judgment, and professional oversight.

This empirical gap is significant because failure to adapt to emerging AI-driven research environments may gradually reduce the relevance of academic libraries and marginalize librarians within higher education institutions. If librarians are unable to develop AI competencies and reposition their services to align with evolving user needs, students

and researchers may increasingly depend solely on AI systems without professional guidance on information evaluation, ethical usage, and academic integrity. Consequently, there is an urgent need to investigate how academic libraries in Cross River State can strategically integrate AI technologies into research assistance services while maintaining the essential human roles of critical evaluation, contextual interpretation, ethical oversight, and personalized research support.

The problem of this study therefore is: how can academic libraries in Cross River State, Nigeria effectively leverage human–AI collaboration to provide efficient, ethical, and sustainable research assistance services in the face of increasing AI adoption, inadequate institutional preparedness, and evolving user research behaviors?

Objectives of the Study

The main objective of the study is to examine human–AI collaboration in research assistance in academic libraries in Cross River State, Nigeria.

The specific objectives are to:

1. Investigate how researchers and students in Cross River State use AI tools for research assistance.
2. Assess librarians' perceptions of AI integration in academic research support services.
3. Identify the challenges associated with integrating AI into research assistance services in academic libraries.
4. Suggest strategies for effective human–AI collaboration in academic libraries in Cross River State.
5. Develop recommendations for improving AI-supported research assistance services in academic libraries in Cross River State.

Empirical Literature Review

Use of AI Tools by Researchers and Students in Cross River State

Empirical studies indicate a growing adoption of Artificial Intelligence (AI) tools among students, researchers, and academic staff in tertiary institutions in Cross River State, particularly the University of Calabar, University of Cross River State, Cross River State Institute of Technology and Management, Ugep, and the College of Education, Akamkpa. AI tools such as ChatGPT, Grammarly, Semantic Scholar, and other generative tools are increasingly used for literature search, summarization, paraphrasing, grammar correction, and citation assistance. This trend reflects a gradual shift toward AI-supported academic research practices in Nigerian higher education. Obi *et al.* (2025) found that final-year students in public universities in Cross River State exhibit high levels of AI usage, particularly for academic writing and assignment support, although this is often associated with ethical issues such as plagiarism, overdependence on AI-generated content, and reduced originality. Similarly, Kingsley *et al.* (2025) reported that AI tools enhance academic support systems but require structured training and institutional guidance for effective and ethical use.

A comparative reading of these studies reveals both convergence and divergence. While both studies agree on the increasing use of AI, Obi *et al.* (2025) emphasize uncontrolled student-driven adoption, whereas Kingsley et al.highlight institutional efforts toward structured integration. This indicates a tension between informal usage patterns and formal institutional regulation. However, a methodological limitation across these studies is their reliance on descriptive survey designs, which focus mainly on frequency of use rather than depth of competence, quality of academic output, or long-term impact on research skills. In addition, most findings are based on self-reported data, with limited triangulation using interviews or observational methods. The Cross River State Government's AI literacy initiative (2025), although widely referenced, also lacks rigorous peer-reviewed evaluation, making it difficult to determine its actual effectiveness in improving academic research behavior.

Librarians' Awareness, Readiness, and Perceptions of AI Integration

Studies conducted among librarians in Cross River State and the broader South-South region of Nigeria reveal generally positive perceptions of AI, but low levels of readiness for effective integration. Ebaye *et al.* (2024) reported that librarians recognize the usefulness of AI tools in improving research support services; however, adoption is constrained by inadequate ICT infrastructure, insufficient training, and weak institutional support systems. Orubebe *et al.* (2025) similarly found that librarians in Rivers State are aware of AI technologies but express concerns about job displacement, lack of policy direction, and limited organizational preparedness. When these findings are compared, a clear contradiction emerges. While librarians acknowledge the potential benefits of AI, institutional environments are not sufficiently equipped to support its effective implementation. This creates a gap between awareness and practical application.

Methodologically, most studies in this area adopt cross-sectional survey designs, which capture perceptions at a single point in time. This limits understanding of how attitudes toward AI may change over time with exposure, training, or policy development. Furthermore, qualitative insights into librarians' lived experiences with AI systems remain limited, reducing the depth of interpretation.

Challenges of AI Integration in Academic Library Services

Existing literature consistently identifies infrastructural, institutional, and ethical factors as major challenges to AI integration in academic libraries in Nigeria. Emumejakpor and Ovie (2024) highlight poor ICT infrastructure, unstable electricity supply, inadequate funding, and low digital literacy as major barriers to effective AI adoption. Agboke and Oladokun (2025) further emphasize ethical concerns such as plagiarism, privacy risks, and algorithmic bias, while Whong (2025) identifies shortage of skilled personnel and weak regulatory frameworks as additional constraints. A critical observation across these studies is that challenges are often discussed independently rather than as interconnected problems. For example, poor infrastructure limits access to AI tools, which reduces staff training opportunities and ultimately increases ethical misuse of AI outputs. This fragmented approach limits a holistic understanding of the AI integration problem in academic libraries.

Another inconsistency in the literature is the differing interpretation of AI challenges: some studies frame them as technological issues, while others emphasize human and organizational factors. This indicates that AI integration is not purely technical but a socio-technical issue requiring coordinated institutional response.

The empirical literature affirms that AI is reshaping research assistance in academic libraries, including those in Cross River State. While students and researchers are increasingly using AI tools, librarians must evolve to remain relevant. Addressing infrastructural, ethical, and educational challenges is key to fostering a sustainable human–AI partnership. A robust framework grounded in AI literacy, professional competencies, and contextual adaptation will ensure that academic libraries continue to serve as vital research hubs in the digital age.

Conceptual Review: Human–AI Collaboration in Academic Libraries

Human–AI collaboration in academic libraries refers to a synergistic relationship in which artificial intelligence systems and human librarians work together to enhance research support services. In this arrangement, AI handles repetitive and data-intensive tasks such as information retrieval, indexing, summarization, and pattern recognition, while librarians provide contextual interpretation, ethical oversight, critical evaluation, and user-centered guidance. This concept redefines the role of librarians from traditional information gatekeepers to active collaborators in digital knowledge production environments. It also emphasizes that AI should complement rather than replace human expertise in academic research support services. However, in developing contexts such as Nigeria, this conceptual ideal is still evolving due to infrastructural limitations, low digital literacy, and weak institutional frameworks.

Theoretical Framework

This study is anchored on three interrelated theories. The first is the Technology Acceptance Model (TAM) by Fred Davis, which explains technology adoption based on perceived usefulness and perceived ease of use. The second is the Diffusion of Innovations Theory by Everett Rogers, which explains how innovations spread across social systems through categories of adopters over time. The third is the Human–AI Collaboration perspective, which emphasizes the complementary interaction between human expertise and artificial intelligence systems.

These theories collectively explain how AI tools are adopted, resisted, or partially integrated within academic library environments. They also highlight the importance of institutional support, user perception, training, and infrastructure in determining successful AI integration in research assistance services.

A review of existing theories and literature reveals that most studies on AI in Nigerian academic environments focus primarily on awareness, usage patterns, and general perceptions among students and librarians. There is limited comparative analysis across studies, and contradictions between high student usage and low institutional readiness are not adequately explored. Furthermore, methodological limitations are evident, as most studies rely heavily on descriptive survey designs without triangulation or in-depth qualitative exploration. This limits the explanatory depth of findings.

Most importantly, there is a noticeable absence of studies that develop or empirically test structured human–AI collaboration frameworks in academic libraries, particularly in Cross River State. Existing literature largely overlooks how libraries can systematically integrate AI into research assistance services while balancing ethical considerations, human oversight, and institutional readiness. Therefore, the major gap in the literature is that existing studies focus largely on AI awareness and adoption, while limited attention has been paid to structured human–AI collaboration frameworks in academic libraries in Cross River State

Methodology

The study adopted a mixed-methods research design, combining both quantitative and qualitative approaches to provide a comprehensive and in-depth understanding of the future of research assistance through human–AI collaboration in academic libraries in Cross River State, Nigeria. The quantitative component was used to examine patterns of AI tool usage and perceptions among students, researchers, and librarians, while the qualitative component provided deeper insights into librarians' awareness, readiness, challenges, and concerns regarding AI integration in research support services.

The population of the study consisted of 161 respondents made up of 122 academic librarians and 39 postgraduate students/faculty researchers who regularly utilize research assistance services in selected tertiary institutions in Cross River State, namely: University of Calabar (UNICAL), University of Cross River State (UNICROSS), Cross River State Institute of Technology and Management (CRITM), Ugep, and College of Education, Akamkpa. These categories of respondents were considered appropriate because they are directly involved in the provision and utilization of academic research support services within library environments.

A stratified random sampling technique was adopted to ensure proportional representation of the two major groups in the study population (academic librarians and students/researchers). The population was first stratified into librarians and students/researchers, and respondents were then selected proportionately from each stratum to ensure fairness and reduce sampling bias. Although the population size was relatively small (161), a sample size of 120 respondents was used due to accessibility constraints and the need for timely data collection. The sample comprised 80 academic librarians and 40 postgraduate students/faculty researchers. A total of 140 instruments were distributed to improve response coverage; however, 120 were retrieved, properly completed, and found suitable for analysis, representing a high and acceptable response rate.

Two instruments were used for data collection. The first was a structured questionnaire designed for students and researchers, divided into three sections: Section A captured demographic information of respondents; Section B examined the frequency and types of AI tools used for research assistance; while Section C assessed respondents' perceptions of AI integration in academic research support using a 5-point Likert scale ranging from Strongly Agree (5) to Strongly Disagree (1). The second instrument was a semi-structured interview guide administered to academic librarians to obtain qualitative data on their awareness, preparedness, perceived benefits, challenges, and institutional readiness for AI integration in library-based research assistance services. The instruments were subjected to face and content validation by experts in Library and Information Science as well as Test and Measurement at the University of Calabar to ensure clarity, relevance, and adequacy of items. A pilot test was conducted on a small group of respondents outside the study area to determine the reliability of the instrument. The internal consistency of the questionnaire was tested using Cronbach's Alpha reliability coefficient, which yielded a value of 0.76, indicating an acceptable level of reliability for social science research.

Data collection was carried out through both face-to-face administration and electronic distribution of questionnaires to respondents, while interviews were conducted with selected librarians with the assistance of trained research personnel. All responses were properly coded, organized, and prepared for analysis. Data were analyzed using both quantitative and qualitative methods. Quantitative data were analyzed using descriptive statistics such as frequencies, percentages, and mean scores to answer the research questions. Qualitative data obtained from interviews were analyzed thematically through systematic coding, categorization, and interpretation of recurring patterns relating to AI awareness, readiness, challenges, and institutional support. The combination of both methods provided a robust and triangulated understanding of human–AI collaboration in academic library research assistance services in Cross River State

Presentation and Discussion of Research Questions

Research Question One

How are AI tools currently being used by researchers and students in Cross River State for research assistance?

Table 1: Distribution of AI Tools Used by Librarians, Students, and Researchers in Cross River State

(i) Librarians (n = 80)

AI Tool	Frequency of Use	Percentage (%)
Grammarly	22	27.5%
Turnitin	20	25.0%
ChatGPT	18	22.5%
Google Bard	10	12.5%
Elicit	6	7.5%
Semantic Scholar	4	5.0%
Total	80	100%

(ii) Students (n = 40)

AI Tool	Frequency of Use	Percentage (%)
ChatGPT	18	45.0%

Grammarly	10	25.0%
Turnitin	6	15.0%
Google Bard	3	7.5%
Elicit	2	5.0%
Semantic Scholar	1	2.5%
Total	40	100%

(iii) Researchers (n = 40)

AI Tool	Frequency of Use	Percentage (%)
ChatGPT	15	37.5%
Elicit	9	22.5%
Semantic Scholar	6	15.0%
Grammarly	5	12.5%
Turnitin	3	7.5%
Google Bard	2	5.0%
Total	40	100%

The disaggregated presentation in Table 1 provides a clearer and more methodologically appropriate understanding of AI tool usage among librarians, students, and researchers in Cross River State. The separation of respondents into distinct categories addresses the methodological concern that each group performs different academic roles and therefore engages AI tools for different purposes and intensities.

Among librarians (n = 80), Grammarly (27.5%) and Turnitin (25.0%) are the most frequently used AI tools. This indicates that librarians predominantly utilize AI for editing support, plagiarism detection, and quality assurance functions. ChatGPT (22.5%) is moderately used, suggesting a cautious but growing engagement with generative AI for reference support and information clarification rather than content creation. In contrast, Elicit (7.5%) and Semantic Scholar (5.0%) record low usage, reflecting limited integration of advanced research discovery tools into library workflows.

Among students (n = 40), ChatGPT dominates usage at 45.0%, indicating strong dependence on generative AI tools for assignment writing, summarization, idea generation, and quick academic assistance. Grammarly (25.0%) follows, reflecting students' concern with grammar accuracy and presentation quality. However, the very low usage of Elicit (5.0%) and Semantic Scholar (2.5%) suggests limited exposure to specialized academic research tools, likely due to inadequate training, low awareness, or lack of structured library instruction on advanced research databases.

Among researchers (n = 40), AI usage is more balanced and academically oriented. ChatGPT (37.5%) remains the most used tool, but Elicit (22.5%) and Semantic Scholar (15.0%) show significantly higher usage compared to other groups. This reflects a stronger orientation toward literature exploration, research synthesis, and scholarly inquiry. Grammarly (12.5%) and Turnitin (7.5%) are moderately used, indicating continued emphasis on writing quality and academic integrity.

A cross-group comparison reveals a clear role-based pattern of AI adoption. Students exhibit the highest dependence on generative AI tools, particularly ChatGPT, indicating task-oriented and convenience-driven usage. Librarians demonstrate a more controlled and evaluative usage pattern, focusing on writing refinement and plagiarism detection tools. Researchers, on the other hand, show a more balanced and research-intensive use of AI tools, combining generative, analytical, and scholarly platforms.

This pattern suggests that AI adoption in academic libraries in Cross River State is not uniform but strongly influenced by users' academic roles and research responsibilities. It also indicates that AI tools are being used in a fragmented manner rather than as part of an integrated institutional research support system.

Research Question Two

What is the perception of academic librarians towards AI integration in research assistance?

Table 2: Data presentation and analysis of academic librarians' perceptions toward AI integration in research assistance (Likert Scale Responses of sample size: 120 respondents

Statement	Strongly Agree (5)	Agree (4)	Neutral (3)	Disagree (2)	Strongly Disagree (1)	Mean Score
AI can enhance research assistance	40	40	15	10	5	4.00
AI threatens librarians' roles	20	25	25	30	20	2.96
AI should complement, not replace librarians	40	50	15	5	5	4.04

Librarians need training to effectively use AI	60	40	10	7	3	4.23
AI may reduce research quality if unchecked	35	45	20	15	5	3.75

Decision Rule: Mean scores of 3.00 and above is accepted, while any mean score below 3.00 is rejected.

The result in Table 2. shows that librarians strongly believe AI can enhance research assistance (Mean = 4.00). They overwhelmingly agree AI should *complement, not replace* librarians (Mean = 4.04). Strong consensus that librarians need training to effectively use AI (Mean = 4.23). The result further shows that AI may reduce research quality if unchecked (Mean = 3.75). **Lower Agreement (Mean < 3.0)** Librarians are less convinced that AI *threatens their roles* (Mean = 2.96).

Librarians in Cross River State generally perceive AI positively, recognizing its **potential benefits** in enhancing research assistance. They see AI as a **complementary tool** rather than a replacement, consistent with the **"early adopters''** stage of innovation diffusion. This is in line with **Ebaye *et al.* (2024)** who surveyed 342 librarians across South-South Nigeria, including Cross River State, and found that awareness and positive perception significantly influenced AI adoption. The strong emphasis on **training needs** indicates that adoption may be slowed unless capacity building and institutional support are provided. Fears of job threats exist but are not dominant suggesting librarians are open to **collaborative human–AI partnerships** rather than resistant. This is similar to **Orubebe *et al.*(2025)** who found that librarians in nearby Rivers State were aware of AI's potential but expressed concerns about job displacement and lack of institutional support.

Research Question Three

What challenges exist in adopting AI in academic research support services?

Table 3. Data Presentation: frequency of challenges in adopting AI in academic research support services, using a rank-order analysis based on a hypothetical score of 120 responses.

Challenge	Frequency of Responses	Percentage (%)	Rank
Poor ICT Infrastructure	38	31.7%	1
Lack of Training	32	26.7%	2
Cost of AI Tools	28	23.3%	3
Ethical Issues	22	18.3%	4
Total	**120**	**100%**	—

The analysis in TABLE 3 shows that Poor ICT Infrastructure is the most cited challenge. **Ethical Issues** are the least cited but still significant. **Poor ICT Infrastructure** is a persistent barrier across African institutions. This finding is in line with **Emumejakpor and Ovie (2024) who** identified inadequate ICT infrastructure, limited funding, and low digital literacy as major barriers to AI adoption in libraries According to the State of AI in Africa Report (2023), challenges include unreliable internet, power outages, and limited access to devices and data ecosystems. **Lack of Training** and digital literacy gaps are also highlighted where educators report limited exposure to AI tools and methodologies. **Ethical Issues** such as algorithmic bias and data privacy are under-addressed due to weak regulatory frameworks. Globally, ethical concerns are more pronounced due to advanced deployment of AI. The South African Journal of Higher Education notes that while generative AI boosts productivity, it also raises concerns about misuse, plagiarism, and lack of policy oversight. Cost barriers are less severe in developed regions but remain a challenge in low-resource settings, especially where institutional budgets are constrained.

Research Question Four

What framework can guide effective human–AI collaboration in academic libraries in Cross River State*?*

Table 4. A tabular presentation using Weighted Frequency Analysis from a survey of 120 respondents.

Framework Component	Frequency of Responses	Weight (%)	Rank
Digital Infrastructure & Connectivity	36	30.0%	1
AI Literacy & Training Programs	32	26.7%	2
Ethical & Responsible AI Guidelines	22	18.3%	3
Humans Oversight & Decision Support	18	15.0%	4
Policy Integration & Institutional Support	12	10.0%	5
Total	**120**	**100%**	—

The result in TABLE 4 shows that **Digital Infrastructure & Connectivity;** and **AI Literacy & Training Programs** are the most critical pillars for successful human-AI collaboration. However, Ethical & Responsible AI Guidelines; Human Oversight & Decision Support; and Policy Integration & Institutional Support were also considered as valuable framework. Based on the data and literature, the following suggestions are recommended. Ensuring stable internet, cloud access, and smart devices; upgrading library systems for AI integration; use the AI Global Manual adopted by Cross River State to train librarians and students. Promote workshops and certifications in AI tools. Implementing data privacy, transparency, and bias mitigation protocols. Aligning with global standards like IEEE and UNESCO AI ethics. Maintaining librarian control over AI outputs. This is supported by **Lo (2025)** who advocates for AI literacy among librarians, encompassing technical knowledge, ethical awareness, critical thinking, and practical skills. Libraries should champion AI literacy just as they did with digital and information literacy. Use of AI for augmentation, not replacement. Embedding AI collaboration goals in library strategic plans. Securing funding and leadership backing.

Discussion of Findings

The findings of this study provide important insight into the emerging but uneven integration of Artificial Intelligence (AI) in academic libraries in Cross River State. Rather than simply confirming that AI tools are in use, the results reveal a deeper pattern of role-based digital adaptation, where students, librarians, and researchers engage AI technologies differently based on their academic responsibilities, competencies, and institutional exposure. This pattern has significant implications for how AI is understood not as a uniform innovation, but as a socially differentiated academic support system.

A key interpretation from the study is that AI adoption is being driven more by individual academic needs than by institutional structures. The dominance of ChatGPT among students reflects not just popularity, but also a shift toward "on-demand cognition," where learners outsource early-stage thinking tasks such as summarization and idea generation to AI systems. This aligns with findings from Obi et al.(2025), who reported similar patterns of heavy reliance on generative AI among university students in Cross River State. However, unlike Obi et al., this study shows that such usage is not merely widespread but structurally patterned according to user category, which adds a more nuanced understanding of AI engagement in academic environments.

Among librarians, the preference for Grammarly and Turnitin suggests a professional orientation toward quality control and ethical safeguarding rather than content generation. This can be interpreted as librarians maintaining their traditional gatekeeping role in academic communication, even in an AI-driven environment. This finding supports Ebaye et al.(2024), who observed that librarians in South-South Nigeria perceive AI positively but primarily in terms of efficiency and support functions rather than transformative academic practice. However, a subtle contradiction emerges when compared with global literature: while studies in more technologically advanced environments report librarians actively integrating AI into metadata creation and knowledge organization, librarians in Cross River State appear to remain at an assistive rather than integrative stage of adoption. This indicates a technological lag shaped by infrastructural and training limitations.

For researchers, the more balanced use of AI tools such as Elicit and Semantic Scholar suggests a gradual shift toward AI-assisted scholarly inquiry rather than simple academic writing support. This reflects a higher level of research sophistication and aligns with global trends in higher education where postgraduate researchers increasingly use AI for literature mapping and synthesis. However, the continued dominance of ChatGPT even among researchers suggests that convenience still outweighs methodological rigor. This partially contradicts expectations from diffusion of innovation theory, which predicts that early adopters of research technologies should prioritize specialized tools. The persistence of general-purpose AI tools indicates that usability and accessibility are stronger determinants of adoption than academic specificity.

When situated within the Technology Acceptance Model (TAM), the findings demonstrate that perceived usefulness strongly explains AI adoption across all groups. Students adopt ChatGPT because it reduces academic effort; librarians adopt Grammarly and Turnitin because they enhance task efficiency; and researchers combine tools based on perceived research utility. However, perceived ease of use appears to override academic appropriateness, particularly among students, which explains the underutilization of more advanced academic tools like Semantic Scholar. This suggests that while TAM remains relevant, it must be extended to include "academic appropriateness" as a moderating factor in educational contexts.

From the perspective of the Diffusion of Innovations Theory, the findings suggest a fragmented diffusion process. Students represent early adopters of generative AI technologies, while librarians appear to be in the late majority stage, adopting cautiously due to ethical concerns and limited institutional support. Researchers occupy an intermediate position, selectively integrating innovations that directly enhance scholarly productivity. This uneven diffusion reflects institutional gaps in training and policy rather than resistance to innovation itself.

A particularly important contradiction emerges between high individual adoption of AI tools and the absence of strong institutional integration frameworks. While users actively engage AI technologies, library systems appear not to have fully formalized their integration into research support services. This disconnect has also been observed in broader African studies, where rapid technological uptake by students outpaces institutional readiness, resulting in

fragmented and unregulated usage patterns. The implication is that AI adoption in Cross River State academic libraries is largely user-driven rather than institutionally coordinated.

Another critical implication is the tension between productivity and academic integrity. While AI enhances efficiency in writing, summarization, and literature search, librarians' concerns about declining research quality reflect a valid global debate. Studies from UNESCO (2023) and other global higher education bodies caution that unregulated AI use may weaken critical thinking skills and increase academic dependency. However, the strong agreement among librarians that AI should complement rather than replace human expertise suggests an emerging consensus around a hybrid human–AI model, where AI supports tasks but humans retain interpretive and ethical authority. The findings demonstrate that AI integration in academic libraries in Cross River State is shaped by a combination of perceived usefulness, professional role identity, and institutional constraints. While adoption is increasing, it remains uneven and largely uncoordinated. This reinforces the need for structured human–AI collaboration frameworks that go beyond tool usage to include policy development, ethical regulation, and targeted AI literacy training. Without such structures, AI will continue to function as a parallel academic support system rather than a fully integrated component of library research services.

Conclusion

This study examined human–AI collaboration in academic libraries in Cross River State, focusing on how students, researchers, and librarians use AI tools for research assistance. The findings show that AI usage is highest for basic academic support functions such as grammar correction, writing assistance, and summarization, with ChatGPT and Grammarly being the most commonly used tools. However, advanced research tools like Semantic Scholar and Elicit are less frequently used, indicating limited awareness and engagement with specialized academic AI platforms.

The study also found that librarians generally have a positive but cautious perception of AI, recognizing its usefulness in improving research assistance services while emphasizing the need for training, infrastructure, and ethical guidelines. Key challenges to AI integration include poor ICT infrastructure, limited AI literacy, cost of access, and ethical concerns. Generally, the findings suggest that while AI adoption in academic libraries is growing, it remains uneven and largely focused on basic applications. There is a developing readiness among librarians to embrace AI-supported services, but this is not yet fully institutionalized. The study therefore highlights the need for stronger infrastructure, capacity building, and policy frameworks to support effective human–AI collaboration in academic libraries in Cross River State.

Recommendations

Based on the findings of the study, the following recommendations are made to enhance effective human–AI collaboration in academic libraries in Cross River State:

1. Institutions should invest in stable internet connectivity, cloud storage systems, and modern computing facilities to address infrastructural limitations and ensure reliable access to AI tools for research support services.
2. Continuous training programmes, workshops, certifications, and hands-on capacity-building sessions should be organized for librarians, students, and faculty to improve AI literacy, build confidence, and strengthen competence in AI-assisted research activities.
3. Academic institutions should develop and implement clear institutional AI policies aligned with international standards such as UNESCO and IEEE to guide ethical use, data privacy, bias reduction, and responsible application of AI-generated content.
4. Librarians should maintain oversight and control over AI-assisted outputs to ensure accuracy, academic integrity, and quality assurance, positioning AI strictly as a support tool that complements rather than replaces human expertise.
5. Library management should integrate AI adoption goals into strategic plans, secure dedicated funding for AI tools, and ensure strong leadership commitment to sustain long-term implementation and innovation in library services.
6. Awareness campaigns should be intensified to promote the use of underutilized academic AI tools such as Semantic Scholar and Elicit, while also integrating these resources into library portals for easier access and wider adoption.
7. Institutions should develop formal AI policies that clearly define acceptable use, ethical boundaries, and operational standards for AI integration in academic libraries.
8. AI literacy should be integrated into Library and Information Science (LIS) curricula to prepare future librarians with the required competencies for AI-driven research environments.
9. Academic libraries should establish dedicated AI support units or digital innovation desks responsible for guiding users, managing AI tools, and supporting research assistance services.
10. Inter-library collaboration should be encouraged among academic institutions in Cross River State to share AI resources, training programmes, best practices, and technical expertise for improved service delivery.

Abstract
There is an obvious increased demand for innovative library services, especially in this new information age. This has raised questions about the competency of librarians, especially in academic settings. Therefore, this study sought to critically assess the level of librarians' digital competencies, the types of innovative library services currently offered in academic libraries in Delta State and the relationship between librarians' digital competencies and innovative service delivery in academic libraries. The study was cross-sectional in design. The population comprised all librarians at selected academic libraries in Delta State (121 librarians), and the total enumeration sampling technique was used. A well-structured questionnaire was administered to the librarians. The questionnaire consisted of digital competencies, frequency of use of technology, and innovative services offered. The data collected were analysed using descriptive and inferential statistics, including frequency, mean and standard deviation and Pearson correlation analysis. The study's findings revealed that librarians' digital competence was moderate. Innovative services such as virtual workshops and mobile library service were moderately implemented, whereas AI-based services were scarcely offered. Nonetheless, the correlation analysis found no notable relationship between digital competencies and innovative service delivery. The findings also indicate no significant relationship between the digital competencies of the librarians and their innovative service delivery, meaning that digital skills alone do not guarantee adoption of innovations. The paper made workable recommendations, especially that the respective management of the academic libraries in Delta State should organise training for their academic staff to close the digital competency gaps that exist.
Keywords: *Digital competencies, innovative library services, academic libraries, librarians, Delta State*

Introduction

Academic libraries are being shaped by the expectations of a digitally mediated information environment, where users want seamless access, interactive services and real-time support. Library professionals have shifted from just custodial work to a technology-centred profession, performing like digital intermediaries, data enablers, and innovation drivers. This shift is not just technical, but also closely tied to the skills that librarians possess. The 21st-century libraries use digital competence as a central factor to design and deliver the services. Digital competence is the ability to use, modify, and create digital tools, content and knowledge. When these competencies are uneven across different contexts, the capacity for innovation will also be constrained.

Ideally, academic librarians should have a wide range of digital skills, including general ICT proficiency and more advanced ones such as data analytics, digital content creation, and application of emerging technologies. The skills would enable the implementation of such innovative services as a virtual reference platform, institutional repository, digital scholarship and user-centred information literacy programme. This ideal is nevertheless partially unrealised in many developing contexts. Proof from Nigeria's academic libraries indicates that even though librarians know the basic digital skills, these librarians are proficient in basic digital skills there's no doubt that advanced and emergent skills are not areas of much success owing to incompetence (Idubor & Ogunbodede, 2024; Uchenna & Anunobi, 2024). Uchenna and Anunobi found a strong association between digital skills and the provision of resource discovery services and access services. At the same time, a lot of libraries are still relying on service models that are outdated and don't meet the needs of current users. (Atanda et al., 2021).

Scholars have taken note of this disconnect; however, most of the existing work treats digital competence and service innovation as parallel rather than interdependent variables. Research on digital competence conducted in Nigerian academic libraries has focused on the levels, sources, and training requirements of skills without showing a linkage between these competencies and services (Idubor & Ogunbodede, 2024). Likewise, while studies concerning digital services have often noted infrastructural constraints and user engagement-related limitations, the human capacity

enabling these services has not been probed sufficiently (Dim & Mole, 2026). Although some relationship explorations were done, they were limited to the services related to a specific domain, digital reference or institutional repository management (Ahmed & Gama, 2025; Igbinovia & Popoola, 2016).

Not having sufficient digital competence at the operational level may result in a low level of use of electronic resources, a low level of use of other technologies, and low effectiveness of user support. On a larger scale, it alters the perception of libraries in the institution. When services don't keep up with user needs, libraries risk marginalisation in academic systems increasingly defined by digital scholarship and data-intensive research. There is evidence from Nigeria to show that digital competence is a key determinant of how potential librarians adopt advanced technologies like artificial intelligence and big data systems in Nigeria for service innovation (Okuonghae & Tunmibi, 2024; Kayode et al., 2024). This shows that not only are technical skills deficient, but this is also a structural barrier to innovation.

Even with this knowledge of the digital competency gaps and their consequences for library service delivery, there is still a lack of understanding of the way the gaps in digital competency impact the scope and quality of innovative service delivery, especially within a specific region like Delta State, Nigeria. The findings of existing studies being too broad or too narrow make them not context-sensitive. In addition, a small number of studies take a relational approach that quantifies the relationship of digital competency levels and service innovation. This research study contributes to the scarce literature investigating the relationship between digital competence and service innovation by examining both variables within one analytical framework. Utilising the Diffusion of Innovation Theory, which explains how innovations spread in an organisation, and the competency-based theory, which asserts that individual performance is tied to organisational performance, helps to provide a more holistic understanding of digital competence and service delivery in academic libraries.

Statement of the problem

In an ideal academic setting, the librarians should be technology-savvy professionals who can incorporate modern technologies into service delivery, understand the users' needs in advance, and proactively respond to changes in the information environment. Their skills should not only be ICT competent, but also include digital content creation, data literacy and supporting advanced research processes like data management and digital scholarship. In a system such as this, academic libraries emerge as vibrant knowledge traffic hubs, offering virtual reference services, managing institutional repositories and organising personalised user education programmes. Nevertheless, the situation in many Nigerian academic libraries is in disagreement with this.

Despite growing recognition of the importance of digital competencies in academic libraries, the extent to which these competency gaps affect the scope and quality of innovative service delivery remains poorly understood, particularly in Delta State, Nigeria. Librarians tend to have moderate capabilities in basic digital tools, but there are large gaps in more advanced capabilities, especially those related to emerging technologies and data-enabled services (Idubor & Ogunbodede, 2024; Okuonghae & Tunmibi, 2024). Many existing studies have sought to address issues related to digital skills acquisition, training needs, and attitudes to technology; however, such studies tend to examine either the competencies or the delivery of services and do not develop an empirical linkage between the two. Consequently, the practical implications of competency gaps for innovative service delivery are still not well understood.

The presence of such gaps often affects the libraries and their users materially. Organisationally, the limited digital competence of employees constrains the development and implementation of new innovative services. As a result, electronic resources are used inefficiently, and the institution is less competitive. For users, this means limited access to high-quality services with advanced technology that support modern learning and research. With time, such constraints might reduce the relevance of academic libraries in a digital academic ecosystem. There are yet to be more context-specific, all-embracing analyses that assess how the gaps in digital competencies affect innovative service delivery in Delta State, Nigeria. This study fills this gap by examining the level of digital competencies of librarians, the types of innovative library services currently offered, and the relationship between digital competencies and innovative service delivery within a single analytical framework to provide empirical evidence..

Objectives of the Study

The main objective of this study is to assess librarians' digital competency and its impact on innovative service delivery in academic libraries in Delta State, Nigeria. Specifically, the study aims to:

1. Examine the level of digital competencies of librarians in selected academic libraries in Delta State.
2. Identify the types of innovative library services currently offered in these libraries.
3. Examine the relationship between librarians' digital competencies and their capacity for innovative service delivery.

Literature review

Digital Competencies of Librarians

The phrase digital competence in librarianship broadly refers to the effective use of ICT tools and digital resources in library work. In an ideal situation, academic librarians would demonstrate high-level competence in a range of digital skills, from simple ICT literacy (e.g. use of email, Office software, Internet search) to more advanced ones (e.g. digital content creation, data analysis, emerging technologies), to develop innovative services. But research in Nigeria finds mixed evidence in practice. For instance, Idubor and Ogunbodede (2024) surveyed 109 librarians in South-South Nigeria and found that they generally had "a high level of basic digital competence skills" (e.g. information retrieval, digital library software use). In their own work, they note that librarians have infrastructural issues (such as unreliable power, poor ICT facilities and limited training) which hinder skill acquisition. Atanda et al. (2021) investigated the five university libraries in Ogun State and discovered that most staff "have requisite proficiency skills in basic computer operations", but infrastructural problems, mostly the power system failure, hampered digital services.

Other research studies suggest a more nuanced picture. An assessment of one hundred and nine (109) librarians across eleven (11) universities in Taraba State by Chukwueke and Idris (2023) revealed a generally low level of digital literacy. The librarians were competent in Internet searching and use of Boolean logic, but not in a larger envi-ronment. In that study, there was a very weak correlation between digital literacy and service provision ($r \approx 0.17$, $p=0.08$). This means that even librarians with modest digital skills were still providing a range of services. While the earlier study was limited in scope, Ahmed and Gama (2025) undertook a broader survey of 305 librarians in 20 federal universities in Northern Nigeria. They found a good number of respondents who could handle communication networks (LAN/WAN). Also, they could use digital communication tools (email, video chat) for reference. Notably, their regression analysis showed that digital skills account for 47% variance in the provision of digital reference services ($p<0.001$). This implies a strong relationship between skill levels and service innovation in that context.

Many similarities can be seen here. To start with, common ICT skills (e-mail, web search, office software) are very common among Nigerian academic librarians, but more advanced skills (data analysis, digital content creation, programming) tend to be scarce. Findings elsewhere in Africa (Subaveerapandiyan et al., 2022; Christy & Yusuf, 2021) support this view. Infrastructural and institutional barriers are a common second theme. Almost in every study, the lack of a steady power supply and inadequate ICT resources limits the application of the skills of the librarians. According to the study by Ahmed and Gama (2025), competence had a large effect on one particular service; namely, digital reference. However, this study contrasts with others (Chukwueke & Idris, 2023; Njoku & Anunobi, 2024) that report weak or insignificant ones. The differences in methodologies may reflect contextualization of Taraba, Southwest and Federal universities, choice of tests (self-report vs. performance), definition of 'competence' and 'services' among others. In south-east/south-south Nigeria, Njoku and Anunobi (2024) discovered that there is a low but significant correlation between digital skills and virtual access/resource discovery services – this suggests that while skills are important, other factors might take precedence.

All research has limitations. Atanda et al. (2021) and Chukwueke and Idris (2023) studies are state-specific (Ogun, Taraba), limiting generalizability. Ahmed and Gama (2025) focused only on digital reference services, so their work may not be applied to other services. The competence of apprentices in studies is usually based on self-report questionnaires, which may inflate the skill level being tested. Despite these weaknesses, the literature clearly shows the problem we have: this shows that while librarians often have some digital literacy, there are significant gaps and infrastructure issues. Libraries cannot be creative due to such gaps.

Innovative Service Delivery in Academic Libraries

Academic libraries are expected to use technologies to offer services beyond cataloguing and lending in theory. Library services now include examples like virtual reference/chat, digital repositories, personalised information services, mobile applications, online training workshops, social media outreach and data-driven user analytics. In Nigeria, measures of this kind are being recorded. As Etebu and Zaccheus (2020) note, many "innovative library services (ILS)" have been adopted in Nigeria, including but not limited to: online business support for entrepreneurs; library blogging/podcasting; e-publishing; SMS alerts; digital reference; database distribution; mobile apps; and much more. Numerous academic libraries are currently offering digital reference (chat/email), institutional repositories, and information literacy and e-resources access-related user education. According to Oduwole, Adekunmisi, and Oyedokun (2023), 73.7% of the libraries had adopted innovative products/services to some extent, while 60.5% did so "to a high extent" Only 7.9% of all internet users had not adopted any, as they did not apply or did not know how

Innovation in Nigerian libraries faces challenges despite the above adoption. According to Etebu and Zacchaeus (2020), inadequate funding, poor ICT infrastructure, and resistance to change are the main barriers. Oduwole et al. (2023) also reported that limited training and facilities, such as broadband internet, impeded deeper adoption in these libraries that offered such services. As noted by Atanda et al (2021), default internet access is very common in Ogun State libraries. However, apart from those basics (e-journals, online catalogues), they found more sophisticated services rarely offered or used. In Delta State, Eniekebi (2024) reports that the digitisation projects (scanning and uploading of collections)

promise improved access and more preservation. However, the librarians in that region still face power and technical struggles.

Nigerian literature, therefore, creates a mixed picture of creativity. Some libraries appear to be testing some new services like digital ref, online workshops and mobile apps. Others appear to be staying with their traditional models. Findings from various studies indicate that common innovative offerings are digital reference (chat/email), user training on electronic resources and delivery of online content, while rare are AI (artificial intelligence), analytics and IoT (internet of things) enabled services. In conclusion, though a variety of innovative service types are discerned from global literature (Canuel & Crichton, 2017; Koloniari et al., 2018), the Nigerian literature indicates some disparities in actualisation pending institutional capacity and only possible as far as institutions can.

On the one hand, literature on services is mainly about what is offered or should be offered, not so much about the quality of offered services or social impact. Etebu's (2020) comprehensive inventory of services is descriptive in nature. Oduwole's survey reports adoption rates but little about outcomes. There is an absence of empirical analysis on how well novel services function or benefit users. Additionally, most studies see innovation as a unitary end ("more is better") with no explicit link to librarians' skills. This creates a gap in knowledge about Nigerian libraries, as we understand what might be innovative, and that some claim to adopt these, but we don't have evidence of how librarian competencies enable or limit these.

Linking Digital Competencies and Innovation

A strand of research is growing that attempts to link the skills of librarians to the innovative capacity of their institutions. Librarians cannot deploy or manage new services without the required digital skills. The argument is simple. There is some evidence to support this. According to the findings of Ahmed and Gama (2025), higher digital competence raised the provision of digital reference services by librarians. They advocate for investment in training and infrastructure to help librarians adopt the services in practice. According to the opinion of Uchenna and Anunobi (2024), the librarians at the federal universities located in SE/SW Nigeria would also require skills, including web design, metadata creation, digitisation, etc., for the delivery of high-quality access and discovery services.

Not every study has a strong link, however. Chukwueke and Idris (2023) reported an insignificant relationship ($p=0.08$) between digital literacy and community service delivery in Taraba State. According to them, even the librarians with a very low range of formal digital skills were able to provide some services. This can perhaps be an indication that basic service can continue and not rely on tech use. Njoku and Anunobi (2024) discovered that digital skills and virtual access/resource discovery services have a weak positive correlation. They understand the implication as meaning digital skills do matter. They also acknowledge the low R means other factors (leadership, funding, user demand) drive services too.

The results of mixing the studies bring out the gaps and contradictions. On one hand, studies with a narrow focus (like digital reference or service lines) often display an obvious skill–service link. On the contrary, wider "all services" surveys may lessen this, especially if low-grade services exist regardless of the skills of workers involved. The measurements of "digital competence" and measured service were similarly varying, with self-assessments vs tests. Additionally, some studies (Kayode et al., 2024) note that the confidence (self-efficacy) or attitude of librarians may also affect their adoption of technologies. Thus, there are several factors, including skills and institutional support.

According to the literature, digital competency is a necessary, but not a sufficient, condition for innovation. While training and self-efficacy enhance the willingness to use new tools, the outcome is moderated by organisational factors like funding and culture (Okuonghae & Tunmibi, 2024; Kayode et al., 2024). This study corroborates a recognised worldwide trend: in an analysis of 42 studies, Ojobor et al. (2025) reveal that digital illiteracy and lack of awareness rank as two of the major barriers to technology use in Nigerian libraries. Likewise, a recent survey across zones highlighted a low awareness (mean ≈2.4/5) and use (mean ≈2.4/5) of innovative technology. There's a clear gap here. There is no model, grounded in research, that links the specific skills of librarians to the range and the quality of innovations in service. A lot of studies do not go this far.

Theoretical Framework

This study will be based on the Diffusion of Innovation Theory (Rogers, 2003) and notions derived from competency-based approaches. Rogers' theory explains how new ideas and technologies disseminate in social systems (Ajuwon, 2018; Koloniari et al., 2018), and has been used in library research. The adoption relies on a perceived advantage, compatibility and users' readiness. The digital competencies of the librarians can be thought of as "adopters" characteristics, which have effects on the rate and range of diffusion of innovative services. For instance, librarians who are more digitally literate may perceive less complexity and greater relative advantage of new services. The belief system of competency-based theory (Boyatzis, 2008) sees employee skills and knowledge as human capital that drives the organizational performances. Applying this statement, the digital skills of librarians are resources that enable the library to innovate and respond to the users' needs. Two distinct perspectives on innovation adoption have emerged in the literature, one focused on the individual level, while the other analyses the firm or organisational level. By combining

these perspectives, we can examine both individual and organisational dimensions of innovation adoption, which is necessary for understanding the complex ties between skills and services.

Method

This study adopted a quantitative cross-sectional survey design. This design was deemed suitable as it afforded the possibility of obtaining data from respondents at one point in time and studying the already existing conditions without the manipulation of variables. According to Creswell and Creswell (2018) and Saunders et al (2023), cross-sectional surveys are preferably used for those studies which describe characteristics of a population and examine relationships among variables as they occur naturally. For this study, the design was suitable to assess the digital competencies of librarians and their influence on innovative service delivery, providing a snapshot of current practices and skill levels in academic libraries in Delta State, Nigeria.

The research took place in purposively chosen academic libraries situated in Delta State, selected because they represented the two major categories of higher education institutions in the state, namely universities and polytechnics, thereby offering a broader and more representative view of academic library practice in Delta State. The selected institutions included one university and two polytechnic libraries. The institutions were purposely chosen because they are among the few academic libraries in Delta State with structured library units and professionally staffed library services, making them appropriate sites for assessing digital competency and innovative service delivery.

The targeted population comprised all professional librarians in the selected academic libraries in Delta State. For this study, librarians refer to professionally trained library personnel holding a minimum qualification of a Bachelor's degree in Library and Information Science or its equivalent for polytechnic institutions, and a postgraduate qualification in Library and Information Science for university institutions, in line with the differing qualification requirements across both institutional types. This yielded a total population of 121 librarians across the three selected institutions. Participants were selected because they were involved in library service delivery and were expected to have different abilities with respect to digital competencies relevant to the study. Due to the small population size of librarians at the selected institutions, total enumeration sampling was employed, meaning all 121 librarians were enlisted as participants. Professional librarians working in the selected academic libraries and who are actively involved in the library operations were included. To ensure a focus on professional capabilities, no administrative staff with direct library service responsibilities were included.

Data were collected using a structured questionnaire developed from the objectives of the study and adapted from the established framework on digital competency and library innovation. The questionnaire contained four major sections, which include demographic profile, digital competencies, importance of digital skills for innovation and innovative delivery service practices. The section on digital competency assessed the proficiencies of librarians in integrated library management systems, electronic databases, institutional repositories, collaboration tools, social media, data analysis, artificial intelligence, and other emerging technologies. This area concerns innovative services such as Online Reference Support, Webinars, Mobile Library Service, AI-based Services and more. A four-point Likert scale ranging from Very Low to Very High was used for competencies, and Strongly Disagree to Strongly Agree for service delivery items. Two experts in the area of Library and Information Science were approached to review the instrument for face and content validity. The reliability of Cronbach's alpha was conducted to test the internal consistency and a coefficient of 0.82 was achieved. The scale met an acceptable reliability criterion as per social science research standards ($\alpha > 0.70$), consistent with Bryman's (2016) methodological recommendations. The questionnaire was administered to all 121 librarians, and a total of 108 valid responses were retrieved and used for analysis, which is an acceptable response rate for statistical analysis.

Data collected were analysed using descriptive and inferential statistics with the aid of Statistical Package for the Social Sciences (SPSS), version 25. Descriptive analyses (frequencies, percentages, means and standard deviations) were performed on the demographic characteristics of the respondents, digital competency levels and innovative services offered. Pearson Product-Moment Correlation analysis was conducted to examine how digital competence relates to innovative service delivery. This test was chosen because it can measure the strength and direction of the linear relationship between continuous variables..

Results

Table 4.1: Demographic Characteristics of Respondents (N = 108)

Variable	Category	Frequency (n)	Percentage (%)
Gender	Female	60	55.6
	Male	48	44.4
Age	18–25 years	24	22.2
	26–35 years	8	7.4
	36–45 years	76	70.4
Years of Professional Experience	0–5 years	24	22.2

	6–10 years	8	7.4
	11–20 years	76	70.4
Educational Level	B.A/B.Sc/B.Ed/HND or Equivalent	16	14.8
	M.Sc/M.Ed/M.A	56	51.9
	PhD	36	33.3
Prior ICT/Digital Training	Yes	88	81.5
	No	20	18.5

The respondents were mostly females (55·6%) compared to males (44·4%), portraying the gender composition as slightly biased in favour of females. Table 1 also shows that the majority of respondents (70.4%) fall under the 36-45 years category, indicating that most respondents are professionals who are actively working and are experienced. As for professional experience, most respondents have work experience between 11 and 20 years (70.4%). Thus, we can imply that librarians in academic libraries in Delta State are quite experienced. The 0–5 years and 6–10 years categories were filled by only 22.2% and 7.4% of the respondents, respectively. In terms of educational qualifications, the majority of the respondents are postgraduates, who have either M.Sc/M.Ed/M.A degrees (51.9%) and PhDs (33.3%). However, a bachelor 's-level or equivalent qualification was 14.8%. Interestingly, a vast majority (81.5%) reported that they have undergone training on ICT or digital exposure. These results indicate respondents' preliminary action towards building up the necessary digital competencies crucial for innovative library service delivery. It also suggests that data was collected from a professionally mature workforce rather than novice practitioners.

Table 2: Level of digital competencies of librarians

Digital competency indicators	Very Low n(%)	Low n (%)	High n (%)	Very High n (%)	Mean ($\bar{x}$)	Std. Deviation
Ability to use integrated library management systems (ILMS)	0 (0.0)	8 (7.4)	48 (44.4)	52 (48.1)	3.41	0.627
Ability to search, evaluate, and retrieve electronic databases	0 (0.0)	16 (14.8)	68 (63.0)	24 (22.2)	3.07	0.607
Ability to manage institutional repositories and digital collections	4 (3.7)	24 (22.2)	40 (37.0)	40 (37.0)	3.07	0.861
Ability to use productivity and collaboration tools	0 (0.0)	20 (18.5)	48 (44.4)	40 (37.0)	3.19	0.725
Ability to support users with online reference services	4 (3.7)	12 (11.1)	56 (51.9)	36 (33.3)	3.15	0.759
Ability to use social media platforms for library service delivery	4 (3.7)	28 (25.9)	52 (48.1)	24 (22.2)	2.89	0.789
Ability to use basic data analysis or reporting tools	8 (7.4)	20 (18.5)	48 (44.4)	32 (29.6)	2.96	0.885
Ability to use emerging technologies (AI tools, digital analytics)	4 (3.7)	0 (0.0)	36 (33.3)	68 (63.0)	3.56	0.688

Overall Mean Score: $\bar{x}$ = 3.16

Based on the overall mean score ($\bar{x}$ = 3.16), we can say that librarians have overall moderate-to-high levels of digital competence, which vary by skill domains. The competencies related to core and operational library systems like ILMS ($\bar{x}$ = 3.41) and emerging technologies like AI tools and digital analytics ($\bar{x}$ = 3.56) recorded a relatively higher mean score, which indicates that they are getting more comfortable with the structured institutional systems and newer technology-driven tools. The prevalence of high and very high responses across most indicators further indicates this pattern, with very high ILMS use (92.5%) and very high application of emerging technologies (96.3% when combining high and very high). However, a standard deviation of (0.607–0.885) indicates a difference in the proficiency levels of respondents. So, their skill level is not uniform but rather varied levels of skill.

Despite these strengths, areas that are more user-facing and analytical tend to perform poorly. The mean score for Social media use for service delivery is the lowest ($\bar{x}$=2.89), while the basic data analysis and reporting tools ($\bar{x}$= 2.96) mean score is the second on the list, which indicates a limitation in competence in providing communication-driven and data-informed library services. These gaps are significant as they emphasise problems with the modern innovative service delivery system, influenced by issues of user engagement, service analytics, and digital reach. The above pattern implies that the competence structure is more system-oriented than innovation-oriented: the technical interaction of librarians with library platforms is stronger than that with tools for the transformation of service development. This investigation

reveals that ICT usage in academic libraries is marked by an irregularity in behaviour. This suggests a collection that is only partially ready for digital innovation. This is because there are basic skills in place. However, advanced, user-centred, and analytic skills are lacking. This issue may become a barrier to extensive service delivery innovation in the academic libraries of Delta State.

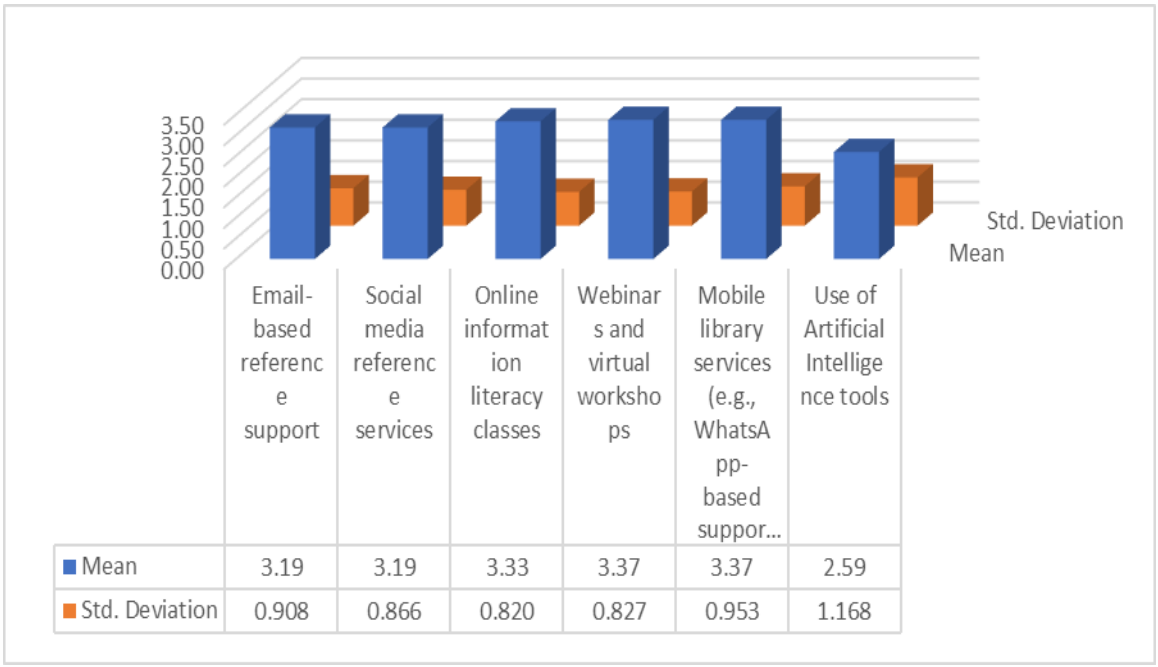

Fig 1: Bar chart showing Types of innovative library services currently offered in Academic libraries in Delta State

The findings suggest that the librarians of selected academic libraries are moderately involved in innovative digital service delivery, albeit with varying intensity across service types. Webinar and virtual workshop scored the highest mean ($\bar{x}$ = 3.37, SD = 0.827) and standard deviation (SD) of mobile library services ($\bar{x}$ = 3.37, SD = 0.953), and almost similarly scored for online information literacy classes ($\bar{x}$ = 3.33, SD = 0.820). Libraries are embracing more interactive and user-friendly digital services, with some focused on distance education and mobile services. The low standard deviations of these items also suggest that respondents are likely to adopt these services in a consistent manner, showing them to be mainstream and not innovations.

On the other hand, the usage of more traditional digital communication tools like email-based reference support ($\bar{x}$ = 3.19, SD = 0.908) and social media reference services ($\bar{x}$ = 3.19, SD = 0.866) is more moderate. The weakest area shows in the use of artificial intelligence tools ($\bar{x}$ = 2.59, SD = 1.168), with the lowest mean and highest variability. The findings reveal that there is a limitation and uneven deployment of AI-based library services, suggesting that such technologies are at an early stage in the academic libraries of Delta State. The high disparity among institutions or individuals can further be seen in the high standard deviation. The general trend indicates a shift towards digital and mobile service innovation, but with a significant lag in advanced, data-driven technologies, suggesting the presence of an innovation gap linked to underlying competency limitations evident in the study.

Table 3: Pearson Product-Moment Correlation (Pearson r) Testing the relationship between librarians' digital competencies and their capacity for innovative service delivery

Correlations			
		Digital Competencies	Innovative Services
Digital Competencies	Pearson Correlation	1	.075
	Sig. (2-tailed)		.443
	N	108	108

Innovative services	Pearson correlation	.075	1
	Sig. (2-tailed)	.443	
	N	108	108

The association results indicate that there is a very weak positive association between librarians' digital competencies and innovative service delivery (r = 0.075, N = 108). A p-value above 0.05 suggests no statistically significant relationship. This suggests that the changes in digital competency levels of the librarians do not significantly relate to changes in their innovative service delivery capacity in the sampled academic libraries in Delta State. The finding implies that even though librarians have varying digital skills, these skills do not necessarily reflect in innovative service delivery. This suggests that other factors besides personal digital competencies, such as institutional infrastructure, management support, policy environment, or workload conditions, could be shaping the relationship between librarians' digital competencies and innovative service delivery. As a result, there is a significant relationship between the possession of skills and service innovation in practice.

Discussion

The study reveals a complex and, at times, surprising relationship between the digital competencies of librarians and the innovative service delivery in academic libraries in Delta State, Nigeria. The findings indicate that the librarians have a medium to high level of digital competency. The digital competencies include core library systems, integrated library management systems (ILMS) and emerging technologies such as artificial intelligence tools and digital analytics. This confirms that the finding of Idubor and Ogunbodede (2024) noted that Nigerian academic librarians, in general, have good basic digital skills in the area of information searching and daily computer-related tasks. Likewise, Atanda et al. (2021) report that librarians in universities in Ogun State possess adequate proficiency in basic ICT procedures. This assertion underscores that minimum digital literacy is relatively common among academic libraries in Nigeria. From the perspective of the Diffusion of Innovation Theory (Rogers, 2003), this moderate-to-high level of digital competency suggests that librarians in Delta State have largely passed through the knowledge stage of the innovation adoption process, where individuals become aware of an innovation and seek to understand its function. The competency-based theory further supports this, as the possession of digital skills represents the human capital base from which innovative service delivery is expected to emerge.

The research reveals a differentiated set of competencies, in contrast to earlier studies that found a more homogeneous set. Previous research tends to report moderate or high levels of digital competence, while the present evidence revealed a clear imbalance between system-oriented competencies and innovation-oriented competencies. To illustrate, librarians exhibited better performance in the use of ILMS (M = 3.41) and emerging technologies (M = 3.56), while a lack of competency was discovered in social media services delivery (M = 2.89) and basic data analysis (M = 2.96). These findings were confirmed by Chukwueke and Idris (2023) as they reported low digital literacy and weak associations between digital skills and service delivery in Taraba State. In a similar study, Njoku and Anunobi (2024) showed a weak but significant relationship between digital competencies and virtual access services. The present study bolsters these earlier mixed results by showing that even when levels of competency appear fairly high, translation into innovative service delivery is weak and statistically insignificant. Within the Diffusion of Innovation Theory, this imbalance reflects the persuasion stage, where librarians may hold favourable attitudes towards certain digital tools, particularly structured institutional systems, but have not yet fully formed the intent to adopt more innovation-oriented competencies such as data analysis and social media engagement. Competency-based theory equally suggests that while human capital exists in some skill domains, its uneven distribution across skill types limits the overall organisational capacity for innovation.

One of the significant contributions of the study has established that there is no significant relationship between digital competencies and innovative service delivery. This finding is inconsistent with Ahmed and Gama (2025), who found a strong positive association between the level of digital skills and the delivery of digital reference services, with the relationship explaining 47% of the variance. Differences in scope and measurement may account for the discrepancy. Ahmed and Gama concentrated on digital reference services of federal universities. However, the current study uses a broader conception of innovative service delivery with respect to the various dimensions of service design. From the standpoint of competency-based theory, this finding suggests that possessing digital skills alone is insufficient to drive organisational innovation; rather, institutional structures, leadership support, and policy environments must also be in place to convert individual competencies into innovative service outcomes.

The results can be further analysed with the help of Rogers' Diffusion of Innovation Theory (2003). According to this, the moderate to high digital competencies displayed by librarians can be seen as being in the knowledge and persuasion stages, but not yet the implementation or confirmation stages of adoption of the innovation in service delivery. A differentiated competency pattern for advisory service personnel in a group reflects Rogers' conception of diffusion, where awareness, complexity, and the compatibility of the innovation with existing practice systems shape the pace and

direction of diffusion. The lack of a significant link between digital competencies and innovative service delivery suggests that, within Rogers' model, possessing adopter characteristics alone does not guarantee diffusion. This implies that institutional constraints derail the process from adoption intention to implementation of innovations. Together, both theories converge on a shared conclusion: digital competence is a necessary but not sufficient condition for innovative service delivery. The process of translating individual skills into organisational innovation requires enabling institutional conditions, sustained investment in training, and a culture that supports the diffusion and implementation of new ideas.

Conclusion

The purpose of this study was to assess the digital competencies of librarians and their impact on innovative service delivery in academic libraries in Delta state. The findings reveal that librarians' digital competencies are moderate to high, most notably in ILMS use and emerging technologies (e.g., AI tools). On the other side, it is revealed that the social media engagement and data analysis skills are weaker among the librarians. Innovative services such as virtual workshops and mobile library service were moderately implemented, whereas AI-based services were scarcely offered. Nonetheless, the correlation analysis found no notable relationship between digital competencies and innovative service delivery. These findings demonstrate that digital skills alone do not guarantee adoption of innovations. On the one hand, these findings validate the Diffusion of Innovation Theory (Rogers 2003) by showing that the adoption of relevant digital technologies is constrained by various organisational and contextual barriers. These findings address the identified problem by establishing that while librarians possess foundational digital competence, a structural disconnect between individual skills and organisational capacity constrains innovative service delivery. Closing competency gaps alone is insufficient; institutional support, infrastructure, and a culture of innovation are equally required.

Recommendations

1. Academic libraries should not depend only on staff training but rather on institutional infrastructure, leadership backing, and policy innovation.
2. Library management must see capacity building supported with ongoing investment in digital infrastructure and organisational support systems.
3. Libraries ought to enhance their advanced digital skills training, ICT infrastructure and accessibility.
4. There is need for academic libraries to develop and implement AI and Data-Driven Policies.
5. Librarians should acquire social media engagement skills for library services.

Abstract

This study examines the Influence of Computer Literacy skills on the use of Library Databases by Undergraduate Students in University Libraries in Katsina State. Three objectives of the study were guided the study To determine the frequency of use of database by undergraduate students in universities libraries in Katsina State, Identify the Computer literacy required for the use of databases by undergraduate students in universities libraries in Katsina State, Find out the influence of computer literacy skills for effective use of databases by undergraduate students in universities libraries in Katsina State. The methodology used is Quantitative research method and Descriptive survey research design were used, the population of the study is 2561 who were duly registered with university libraries under study the sample size of the study is 256 undergraduate students which represent 10%. proportionate random sampling and purposive random sampling were used to select the responded. The instrument for data collection is Questionnaire the Questionnaire were validated by two expect one from the Department of Library and Information Science and one from the Guidance and Cancelling Department in Measurement and Evaluation Unit all are from Federal University Dutsinma Faculty of Education . To establish the reliability of the instrument the cronbach coefficient was deployed to test the internal consistency of the items which yielded on overall reliability coefficient of 0.86. Data was analyzed using frequency and percentages mean and standard deviation. The findings of the study revealed that the Influence of computer literacy skills for the use of Library databases by undergraduate students in universities libraries in Katsina State are Contributed a lot in their research. The study recommended that The university administration should pay more attention to students' computer literacy skills by making some computer education compulsory for all students and incorporated into students' curriculum with emphasis on practical aspects. NUC which is the umbrella of all Nigerian universities should provide academic libraries with funds, ICT infrastructure and training opportunities for both staff and students so as to enhance their ability in database utilization in Conclusion was realized that the patronage of the library's online academic databases was very low. This was largely because students were either not aware of the existence of these databases or were not aware that the library subscribes to the database

Keywords: Computer Literacy Skills. Databases, Katsina State, Undergraduate students, University Libraries.

Introduction

The ability to make effective use of information has been a very important factor in the development of individual and society at large. This is because information plays a vital role in people ability to make decision affecting their lives and lives of others. This ability is embedded in the concept of computer literacy. University libraries are found in the universities to serve a wide range of purpose including, providing faculty and students with information resources for research and consultation (Tukur, and Lawal 2015). According to Watt and Ibegblulum (2019) noted that today university libraries encourage intellectual inquiry and discovery providing areas for research and study, and serving broad educational need of various users communities. University libraries are essential contributors to knowledge generation and serve a wide spectrum of knowledge seekers. University libraries connect student and scholars to the world of information and ideas. Wuman, (2021) described the university library as the "Heart" and "life wire" of the university, because it provides a place for student and faculty to do their research and advance the frontiers of their knowledge. Mudansuru, (2019) state that there are various categories of library users in the university libraries, they are undergraduates, post graduates, lecturers, library staff, nonacademic staff, researchers, alumni members external users from all waves of life and many programs designed to serve users.

Computer literacy refers to knowledge and understanding of computer combined with the ability to use them effectively. Tukur, and Lawal (2015) opined that computer literacy involves knowing how to turn on a computer, start and stop simple application programs, and save and print information. Computer literacy is the ability to operate a computer system for performing personal and job related tasks like using web browsers and search engines on the internet or retrieve needed information and communicate with the others (Udeson, 2019). Computer literacy is the ability and knowledge to use the computer effectively. Therefore, computer literacy is a necessity in the modern education in

the 21st century. However, computer literacy is defined as technical skills and levels of proficiency in the general computer knowledge; documentation, online searching (databases and search engines) and communications.

According to Warschaver, (2018), computer literacy is the abilities that will enable information resources users to meet personal, educational and labour market. Tyagi, (2019), pointed out that for undergraduate to be successful in their course work they need a certain level of expertise in computer and they stated that undergraduates need computer skills such as word processing skills, programming skills and data management skills to enable to use databases and other online information resources. Uwaito, (2020) opined that computer literacy are needed by the undergraduate students to be able to retrieve information from online resources. Niman, (2022) reiterated that students acquire adequate computer literacy skills to be able to use online information resources effectively.

Undergraduate student refers to as a university student who have not yet complete a fist degree. According to Nura (2014) undergraduate is someone who is going for the bachelor's degree usually three years and above or who does not have an equivalent to bachelor's degree.

Statement of the problem

With the drift from the traditional print materials to networked information resources, the dawn of a new era in library and information services and access to resources has risen in harmony with the world wide web (www) information revolution. Databases have broken through the time and place barriers of print materials. Libraries that provide database resources are increasingly being implemented by several agencies because they make research easier for scholars and may ease budgetary constraints associated with the acquisition of print resources. Digital journals can be linked from and to indexing and abstracting databases. Access can be from the user's classroom, workshop, library home, office or dormitory whether or not the physical library is open. However, shift from print resources to databases require computer literacy skills for undergraduate to access and utilize the available database for their academic pursue, skills such as search engine skills, Meta search engine skills, Web navigation skills, Boolean operators, searching and down loading skills.

Unfortunately, it was observed by the researcher that many undergraduate students in universities in Katsina State cannot search databases independently; they have to resort to the use of café's attendants for most of their searches and online transactions. Despite the fact that there are many benefits attached to the information on the databases, undergraduate students have not been able to benefit maximally with this great opportunity due to either lack of awareness, poor implementation of the programmes or lack of searching skills. With all these statements above, it could be deduced that there exists a problems on the accessibility and use of databases among undergraduate students.

This state of the art really affect the undergraduate students because the expensive resources often remain unutilized, resulting in wastage of money, time, energy and space compounded to the problem of lack of adequate computer literacy skills required to identify, select, synthesis, retrieve and use information from diverse sources. If this problem is not tackled there will be lack of knowledge of computer usage by the undergraduate student's which will lead to inadequate use of information resources available in the databases. Therefore this study seeks to investigate the Influence of Computer Literacy Skills on the Use of Library Databases by Undergraduate Students in University Libraries in Katsina State, Nigeria

Research Questions

The following research questions guided the study:

1. How frequent do undergraduate students use database in universities libraries in Katsina State?
2. What are the computer literacy required for the use of databases by undergraduate students in universities libraries in Katsina State?
3. What are the influence of computer literacy skills on effective use of databases by undergraduate students in universities libraries in Katsina State?

Literature review

Computer Literacy Skills

The geometrical growth of information resources on the internet in 21st century have necessitate the need of computer literacy skills and online searching skills to enhance easy access and use of databases among undergraduate students. Nzewi, (2015) classified computer literacy skills as word processing skill. This involve the ability to load word processing software, creating, formatting, editing and saving document copying and moving text adjusting margins, indents and the spacing, adjusting fronts and style, importation of table and graphs from spreadsheet application using spell checking and using available help screen when needed. Rebecca, (2019), computer literacy needed for effective use of databases by the undergraduate students include operational skills which include the use of mouse and keyboard, copying information into storage devices such as flash drive or diskette and scanning of image, access of online

databases, strategies literacy skills involve use of search engine skills such as how to search information by Author, ISBN, ISSN publishers, place of publication, Borcode.

According to Nura, (2021) classified computer literacy-skills which are prerequisite for the usage of online information resources into the following categories, basic micro computing skills this includes understanding personal computer and its components, using command orientation window base, and land operation environments to accomplish basis task such as formatting floppy disk, creating and navigating through directory and sub directing structure, creating and deleting files, copying and renaming files using available help screens, when needed. Basic micro computing spread sheet skills: this involve the ability to create, organize and navigate through spread sheet or a specific block of cells entering and editing formulas values and text copying, moving and protecting cells, inserting and deleting columns and row, saving and retrieving files, and printing relevant materials.

Databases available in the University Libraries

The AGORA (Access to Global Online Research in Agriculture) program, set up by the Food and Agriculture Organization of the UN (FAO) together with major publishers, enables developing countries to gain access to an outstanding digital library collection in the fields of food, agriculture, animal's health, crop production, forestry environmental science (Kinnaman, 2013).

According to Rajib (2021) BIOLINE International is a pioneer in the provision of open access to peer reviewed bioscience journals published in developing countries. These journals contain timely research on public health, international development, tropical medicine, food and nutritional security, and biodiversity.

HINARI Programme set up by World Health Organization WHO together with major publishers, enables low- and middle- income countries to gain access to one of the world's largest collections of biomedical and health literature. Up to 12,700 journals (in 30 different languages), up to 24,900 e-books, up to 70 other information resources are now available to health institutions in more than 100 countries, areas and territories benefiting many thousands of health workers and researchers, and in turn, contributing to improve world health. HINARI Access to Research in Health Programme provides free or very low cost online access to the major journals in biomedical and related social sciences to local, not-for-profit institutions in developing countries WHO (2021).

According to OASPA (2010) open access scholarly publishers association Hindawi Publishing Corporation is a commercial publisher of peer-reviewed journals covering a wide range of academic disciplines. Founded in 1997, Hindawi currently employs more than 1,000 employees and publishes 500+ open accesses, peer-reviewed journals. Hindawi's journals maintain the highest standards of peer review, with more than 60,000 internationally-recognized Editors serving on the Editorial Boards of Hindawi's journals. Many of the journals that Hindawi publishes are included in the leading abstracting and indexing databases, including the Science Citation Index, Scopus, PubMed, INSPEC, Mathematical Reviews, and Chemical Abstracts (Kuhn, 2010),

Rajiv, (2021) opined that OARE provides access to major international search engines and databases. Leading scientific and professional communities around the world use these tools to search for articles and information on specific topics in thousands of prestigious scholarly journals, books and scientific papers from around the world. Using these powerful search tools, you can search through most of the publications in Oare, and find the articles that are most relevant to your research, in only minutes. Even more, Oare provides new links in your list of search results that you can use not only to check if you have access to a full-text-article

PLOS (originally PLOS ONE): is an online database access peer-reviewed scientific journal published by the Public Library of Science since 2006. It covers primary research from any discipline within science and medicine. All submissions go through an internal and external pre-publication peer review, but are not excluded on the basis of lack of perceived importance or adherence to a scientific field. The Plos on line platform employs publish first, judge later" methodology, with post-publication user discussion and rating features (Sam, 2026).

Methodology

This study employed a Quantitative research method and descriptive survey research design. The population of the study is two thousand five hundred and sixty one (2561) registered undergraduate students who were duly registered with university Libraries under study. The sample size of this study is 256 library users, the sample represents 10% of the population and this was based on the recommendation of (Suleiman, 2012). The multi-stage sampling technique was adopted in selecting the sample. Firstly, 10% each for FUDMA, UMYUK and AUK students were proportionately selected, secondly purposive random sampling technique was used to select the respondents from two thousand five hundred and sixty one (2,561) undergraduate students who are registered user in the libraries under study. The instrument for data collection for the study is questionnaire. The questionnaire was administered personally by the researcher with the help of two research assistant after it was validated. Data collected was analyzed using descriptive statistics of mean and standard deviation.

Data Presentation and Analysis

Research Question One: How frequent do undergraduate students use database in universities libraries in Katsina State?

Table 1: determine the frequency level of use of database by undergraduate students in universities libraries in katsina state

S/No	Items	Yes		No	
		F	%	F	%
1	Daily	137	57.8	100	42.2
2	Two times a week	95	40.1	142	59.9
3	Once a week	67	28.3	170	71.7
4	Once in a month	44	18.6	193	81.4
5	Quarterly	56	23.6	181	76.4
6	Occasionally	93	39.2	144	60.8
7	Non use	34	14.3	203	85.7
8	Used database one hour daily	115	48.5	122	51.5
9	Used database 2-5 hours in a week	95	40.1	142	59.9

Table 1 shows the percentage distribution of respondent on the frequency level of utilization of the database. The table indicates that 137 (57.8%), 95 (40.1%), 67 (28.3%), 44 (18.6%), 56 (23.6%) 93 (39.2%), 34 (14.2%) 115 (48.5%) and 95 (40.1%) of the respondent agree that the used online database daily, two times a week, once a week, once in a month, quarterly, occasionally, non-use, one hour daily, 2-5 hours in a week respectively. Using 50% as a benchmark, it was deduced that undergraduate students in Universities libraries in Katsina State in uses online database daily.

Research Question two: What are the computer literacy required for the use of databases by undergraduate students in universities libraries in Katsina State?

Table 2: Mean and standard deviation scores of the computer literacy skills required for use of the databases by the undergraduate students

S/No	Items	FUDMA		UMYUK		AUK		Total		Rank	Decision
		$\overline{X}$	SD	$\overline{X}$	SD	$\overline{X}$	SD	$\overline{X}$	SD

	Overall	**3.18**	**0.77**	**3.47**	**0.67**	**3.30**	**0.82**	**3.31**	**0.78**		**Accepted**

Table 2 shows the mean and standard deviation scores of the computer literacy skills required for use of the databases by the undergraduate as agreed by the respondents as follows: use of mouse and keyboard ($\bar{x}$ = 3.73 and SD = 0.48), access of online databases ($\bar{x}$ = 3.59and SD = 0.58), understanding personal computer and it components ($\bar{x}$ = 3.57and SD = 0.60), search engine skill ($\bar{x}$ = 3.54and SD = 0.67), how to search information by ($\bar{x}$ = 3.49 and SD = 0.67), copying information into storage device ($\bar{x}$ = 3.45 and SD = 0.68), author ($\bar{x}$ = 3.41 and SD = 0.81), copying and renaming files ($\bar{x}$ = 3.37and SD = 0.75), subject ($\bar{x}$ = 3.34 and SD = 0.83), Flash drive, diskette and scanning ($\bar{x}$ = 3.33 and SD = 0.78), title ($\bar{x}$ = 3.30 and SD = 0.86), ISBN/ISSN ($\bar{x}$ = 3.26 and SD = 0.82), ability to create, organize and navigate through spread sheet ($\bar{x}$ = 3.19and SD = 0.84), creating and deleting files ($\bar{x}$ = 3.18 and SD = 0.88), using command oriented window base ($\bar{x}$ = 3.13 and SD = 0.82), Creating and navigating through directory and sub director structure ($\bar{x}$ = 3.13 and SD = 0.82), ability to formatting floppy disk ($\bar{x}$ = 3.03 and SD = 0.94), barcode ($\bar{x}$ = 2.97 and SD = 0.97), publisher ($\bar{x}$ = 2.95 and SD = 0.98).

The mean used is 2.50 based on a Likert- type scale of 4-point score. The overall mean average of 3.31 is greater than 2.50 agreeing that the items listed are the computer literacy skills required for use of the databases by the undergraduate in Universities Libraries in Katsina State, Nigeria**.** The overall standard deviation is 0.78.

Research Question three: What are the influence of computer literacy skills on effective use of databases by undergraduate students in universities libraries in Katsina State?

Table: Influence of computer literacy skills possessed for effective use of databases

S/No	Items	FUDMA		UMYUK		AUK		Total		Rank	Decision
		$\bar{X}$	SD	$\bar{X}$	SD	$\bar{X}$	SD	$\bar{X}$	SD		
1	Knowledge of how to identify relevant electronic resources (books, encyclopedia, journals, newspaper and magazine).	3.62	0.49	3.64	0.50	3.85	0.36	3.69	0.46	1st	Accepted
2	Knowledge of how to get information in a database	3.41	0.59	3.57	0.51	3.70	0.46	3.57	0.53	2nd	Accepted
3	Knowledge of how to get information on a topic from different databases	3.24	0.76	3.79	0.43	3.57	0.81	3.51	0.72	3rd	Accepted
4	Knowledge of how to identify relevant audio visual materials (pictures, chart, maps, videos).	3.21	0.77	3.43	0.51	3.57	0.55	3.44	0.66	4th	Accepted

6	Implement a variety of informative search strategies	3.24	0.89	3.57	0.65	3.35	0.77	3.42	0.78	6th	Accepted
7	To identify key concepts and terms required to locate information	3.30	0.80	3.71	0.47	3.25	0.71	3.40	0.70	7th	Accepted
8	Understand intellectual property copyright, and fair use of information	3.34	0.68	3.64	0.63	3.32	0.69	3.40	0.69	8th	Accepted
9	Knowledge of how to organize and effectively create, use of communicate information to address issues or problem	3.16	0.73	3.43	0.65	3.52	0.68	3.39	0.73	9th	Accepted
10	Knowledge of how to cite author whose idea are used while used databases	3.28	0.70	3.50	0.86	3.32	1.02	3.39	0.81	10th	Accepted
11	Knowledge of how to get information by using different search engine	3.21	0.90	3.43	0.76	3.50	0.64	3.38	0.75	11th	Accepted
12	Use full array of library services to retrieve information	3.12	0.80	3.71	0.61	3.23	0.77	3.26	0.80	12th	Accepted
13	To differentiate between primary and secondary source of information	3.36	0.95	3.14	0.77	2.85	1.00	3.20	0.90	13th	Accepted
14	Knowledge to use online public access catalogue (OPAC)	3.03	0.86	3.71	0.47	3.05	0.99	3.19	0.85	14th	Accepted
15	Knowledge of how to navigate a website	3.20	0.75	3.57	0.51	3.20	0.72	3.17	0.76	15th	Accepted

16	Knowledge of how to retrieve and manipulate information across contexts and in multiple format	3.09	0.75	3.21	0.58	3.08	0.80	3.15	0.74	16th	Accepted
	Overall	**3.27**	**0.76**	**3.53**	**0.61**	**3.34**	**0.75**	**3.37**	**0.73**		**Accepted**

Key: $\overline{X}$ = Means, SD = Standard Deviation

Table 3 shows the means and standard deviation rating of the influence of computer literacy skills possessed for effective use of databases as follows: knowledge of how to identify relevant electronic resources (books, encyclopedia, journals, newspaper and magazine) ($\bar{x}$ = 3.69 and SD = 0.46), knowledge of how to get information in a database ($\bar{x}$ = 3.57and SD = 0.53), knowledge of how to get information on a topic from different databases ($\bar{x}$ =3.51and SD = 0.72), knowledge of how to identify relevant audio visual materials (pictures, chart, maps, videos) ($\bar{x}$ =3.44 and SD = 0.66), recognizing when information is needed and have the ability to locate, evaluate, and use effectively the information needed ($\bar{x}$ =3.42 and SD = 0.80), implementing a variety of informative search strategies ($\bar{x}$ = 3.42and SD = 0.78), identifying key concepts and terms required to locate information ($\bar{x}$ =3.40 and SD = 0.70), understanding intellectual property copyright, and fair use of information ($\bar{x}$ =3.40 and SD = 0.69), knowledge of how to organize and effectively create, use of communicate information to address issues or problem ($\bar{x}$ = 3.39 and SD = 0.73), knowledge of how to cite author whose idea are used while used databases ($\bar{x}$ =3.39 and SD = 0.81), Knowledge of how to get information by using different search engine ($\bar{x}$ = 3.38 and SD = 0.75), using full array of library services to retrieve information ($\bar{x}$ = 3.26and SD = 0.80), differentiating between primary and secondary source of information ($\bar{x}$ = 3.20 and SD = 0.90), Knowledge to use online public access catalogue (OPAC) ($\bar{x}$ = 3.19and SD = 0.85), knowledge of how to navigate a website ($\bar{x}$ =3.17and SD = 0.76), knowledge of how to retrieve and manipulate information across contexts and in multiple forma ($\bar{x}$ =3.15and SD = 0.74).

The overall means score of 3.37 shows that the respondents agree to the items listed in table 3 as the influence of computer literacy skills possessed for effective use of databases in University Libraries in Katsina State, Nigeria. The standard deviation is 0.73.

Summary of the Findings

1. All the computer literacy skills required for use of the databases by the undergraduate students in university libraries in Katsina State Nigeri were accepted, they include: ability to identify relevant electronic resources (books, journals, encyclopaedia, newspapers, magazine etc), ability to get information on a topic using different databases, ability to organize and effectively create, use and communicate information to address issues or problem at hand, ability to navigate a website, ability to search databases and retrieve, and download the information, ability to identify relevant electronic learning materials (audio-visual materials, pictures, charts, maps, videos), ability to use database when doing my assignment, ability to use database to find out exactly what you are looking for, ability to use online public access
2. The strategies suggested for enhancing Influence of Computer Literacy Skills on the Use of Library Databases by Undergraduate Students in University Libraries in Katsina State, Nigeria are provision of suitable network in the library, provision of relevant databases to their universities programmes, provision of adequate power supply, orientation to undergraduate for the use of computer literacy, collaboration with lecturers and the librarians to teach computer literacy course, regular subscription, provision provide sufficient databases, integrating computer literacy instruction with the research course in the universities and provision computer literacy skills in the university

Conclusion

It was realized that the patronage of the library's online academic databases was very low. This was largely because students were either not aware of the existence of these databases or were not aware that the library subscribes to the databases. Also shows clearly that undergraduate students sought for access to online electronic databases through other means other than the library. In their ever increasing demand for subscriptions to more databases with journal titles of international repute students experienced some constraints, prominent among these were the slow nature of the internet and the lack of proper guidance on how to access these online databases. In the light of the above revelations, there is the need for the library to heighten awareness creation among the students on the existence and usage of these important resources. Also, there is the need for a conscious effort by the university authorities to improve on the University's ICT infrastructure in order to facilitate access to the online dat

Recommendations

Based on the findings of this study, the following recommendations are made for developing Influence of Computer Literacy Skills on the Use of Library Databases by Undergraduate Students in University Libraries in Katsina State, Nigeria

1. Undergraduate students should be sensitized on the availability of databases and be encouraged to use them for their personal and library services.
2. The university administration should pay more attention to students' computer literacy skills by making some computer education compulsory for all students and incorporated into students' curriculum with emphasis on practical aspects.
3. Undergraduate Students should be trained in basic Information Communication Technology skills such as Internet navigation, keyword searching, downloading and saving documents, use of search operators and evaluation of online information resources.

Abstract

This paper investigated the influence of resource availability and infrastructural facilities on service delivery in government-owned Colleges of Education libraries in Kwara State, Nigeria. The objectives of the study were to identify the levels of availability and adequacy of information resources and infrastructural facilities in government-owned Colleges of Education libraries in Kwara State, and to establish the influence of resource availability on service delivery in these libraries. The study employed a descriptive research design with a correlational approach. The population of the study consisted of 388 lecturers in government-owned Colleges of Education. A sample size of ninety (90) respondents was selected for the study, with thirty (30) lecturers drawn from each institution through a simple random sampling technique to ensure equal representation. Data were collected using a researcher-modified rating scale. The data collected were analyzed using Pearson Product Moment Correlation (PPMC), while the null hypotheses were tested using a t-test of simple linear correlation at a 0.05 level of significance. The findings of the study revealed that the availability of information resources and infrastructural facilities has a significant influence on service delivery in government-owned Colleges of Education libraries in Kwara State. The study therefore recommends improved investment in information resources and infrastructural facilities, including increased internet bandwidth, to enhance efficiency and service delivery in these libraries and to ensure sustainable academic support services for teaching, learning, and research activities in the institutions, while also strengthening policy implementation, staff capacity development, and periodic evaluation of library infrastructure to improve service quality across the colleges and align library services with global best practices in information management and digital access for improved learning outcomes overall.

Keyword: Resource Availability, Infrastructural Facilities, Service Delivery, Academic Libraries, Library Services, Information Resources.

1.1 Introduction

Libraries play a pivotal role in supporting teaching, learning, and research activities in higher institutions. The major concern of every library today is to be self-sufficient in resources and to provide an optimal level of service to reach more potential users. Colleges of Education libraries are established to provide information resources that support the education and research activities of students aspiring to become teachers. Government-owned Colleges of Education libraries in Kwara State were established by statutory legislative provisions to serve the interest of the general public in the state who wish to engage in the teaching profession. Public institutions, like government-owned Colleges of Education in Kwara State, are concerned with the provision of teaching, research, and community services (Ogunode, 2020).In Colleges of Education, the library serves as an academic support system that provides access to relevant information resources needed for effective teacher education and academic development. Libraries are central to the academic reputation of institutions as they support teaching, learning, and research (Dada et al., 2025). The effectiveness of library services in Colleges of Education largely depends on the availability of adequate information resources and appropriate infrastructural facilities.

The main aim of Colleges of Education libraries is to acquire information resources in different formats and various fields of human knowledge and to process, organize, disseminate, and provide access to them. For Colleges of Education libraries to achieve their goal of providing information and access to users, information resources and infrastructure play significant roles. In the context of this study, information resources in libraries include textbooks, journals, reference materials, electronic resources, and other learning materials that support the academic programmes of the institution. According to Tondo (2022) information resources in the library range from print to non-print resources, print resources comprising textbooks, hard-copy journals, and other instructional materials in print, while non-print resources include electronic formats. Similarly, library infrastructure is a crucial factor that must be taken into consideration in every type of library. The broad concept of library infrastructure comprises numerous components, including the library building, seating facilities, shelving units, lighting systems, ventilation and air conditioning systems, restrooms, and security systems. Ogbuagu et al (2014) identified library infrastructure as power supply (generating sets, electrical installations), information and communication technology facilities, furniture, fittings, information materials, and library buildings that contribute to library services and the development of staff and students in tertiary institutions.

The availability of library resources and infrastructural facilities will enable library staff to perform their duties effectively and encourage users to utilize library resources. The management of Colleges of Education must ensure the continuous upgrade of available infrastructure. Library infrastructure in most Colleges of Education libraries in Nigeria has deteriorated, affecting the professional development of librarians and service delivery to library patrons (Omeluzor et al., 2017). This deterioration can affect the usage of library resources by both students and staff. Therefore, the availability of resources can enhance the quality of library services and promote effective learning among staff and students. However, the availability of information resources is not enough; proper infrastructure such as library buildings, furniture, information and communication technology (ICT) facilities, internet connectivity, electricity supply, and conducive reading spaces are also essential for efficient service delivery (Hundo, 2019).

In many Colleges of Education, libraries face dual challenges of inadequate library resources and infrastructural facilities due to inadequate funding, poor maintenance culture, obsolete library materials, poor ICT facilities, erratic power supply, inadequate physical infrastructure, shortage of skilled personnel, poor maintenance of facilities, limited access to electronic resources, security issues, inadequate facilities for special users, increasing user population, and poor policy and planning. Okwu and Opurum (2021) opined that most libraries in Nigeria lack the required facilities and resources to satisfy users' needs. These problems may hinder librarians from providing efficient services to users and may also limit students' ability to access relevant academic information. Consequently, the quality of service delivery in such libraries may be affected. Service delivery in libraries encompasses circulation, reference, serial, and reserve sections. The quality of services in these sections often depends on the level of resources and infrastructural support available within the library system. Therefore, the availability of adequate resources and infrastructural facilities is crucial for improving library service delivery in Colleges of Education. This study, therefore, seeks to examine the influence of resource availability and infrastructural facilities on service delivery in Colleges of Education libraries.

1.2 Statement of the Problem

Libraries in Colleges of Education are expected to provide adequate information resources and services that support teaching, learning, and research activities. However, many of these libraries face numerous challenges that affect their ability to deliver effective services to users. A major challenge is the inadequate availability of relevant and up-to-date information resources such as books, journals, and electronic materials. In addition, many college libraries suffer from poor infrastructural facilities, including inadequate library buildings, insufficient reading spaces, lack of modern ICT equipment, poor internet connectivity, and unstable power supply. These challenges may negatively affect the quality of services provided by librarians and limit users' access to information resources. As a result, students and lecturers may not fully benefit from the services provided by the library. Despite the important role that library resources and infrastructure play in enhancing service delivery, there is still concern about whether Colleges of Education libraries possess adequate resources and infrastructural facilities to effectively serve their users. Therefore, this study sought to investigate the influence of resource availability and infrastructural facilities on service delivery in Colleges of Education libraries.

1.3 Research Questions

1. What is the relationship between the availability of information resources and service delivery in government-owned Colleges of Education libraries in Kwara State?
2. What is the relationship between the availability of infrastructural facilities and service delivery in government-owned Colleges of Education libraries in Kwara State?

1.4 Research Hypotheses

The following hypotheses were tested at 0.05 level of significance:

Ho_1: There is no significant influence between the availability of library resources and service delivery in government-owned Colleges of Education libraries in Kwara State.

Ho_2: There is no significant influence between the availability of infrastructural facilities and service delivery in government-owned Colleges of Education libraries in Kwara State.

2.1 Literature Review

The primary objective of establishing Colleges of Education in Nigeria is to produce skilled teachers who can teach effectively at the primary and secondary school levels with high-quality education that fosters intellectual growth, critical thinking, and innovation, ultimately contributing to an improved education system and national progress. These institutions aim to produce well-trained teachers with the knowledge and skills necessary to meet the demands of building an educated population. Teachers are key human resources needed for the smooth functioning of any educational enterprise (Edut & Etete, 2019). Thus, their commitment to service delivery is crucial for the attainment of the goals of the school system. Likewise, attaining the goals of Colleges of Education is intricately linked to service delivery to users, as they play a crucial role in shaping the academic and professional development of students. This is corroborated by Ogunode et al. (2022), who stated that the students and staff of tertiary institutions are strong members of the institutional community and their roles are irreplaceable. Therefore, there is a need for Colleges of Education to

acquire adequate information resources and infrastructural facilities that can enhance service delivery to satisfy the aim of establishing the Colleges of Education.

The availability of information resources and infrastructural facilities in college libraries serves different purposes that are in line with the objectives of establishing the College of Education. Availability of information resources and infrastructural facilities refers to their presence and adequacy in the library for use by users (Ayaowei et al., 2024). It is necessary for any standard college library to provide information resources to its users in large quantity. The availability of library resources and infrastructural facilities can enhance service delivery in Colleges of Education in Kwara State. Therefore, information resources in libraries include both printed and non-printed materials. According to Ugba et al. (2019), the concept of information resources is used to mean anything that can provide intellectual stimulation to the reader/learner, and it includes books, periodicals, newspapers, pamphlets, ephemeral materials, audio materials, films, graphics, computers, etc., as well as individuals and objects in the community. Information resources include textbooks, magazines, newspapers, journal publications, encyclopedias, dictionaries, periodicals, monographs, articles, dissertations, documents, CD-ROMs, DVDs, audio-visual tapes, projectors, cassettes, radio, television, cable satellite, and the Internet, among others. Obona et al. (2024) opined that the availability and effective use of resources are vital for improving the quality and efficiency of teaching, research, and community engagement in tertiary institutions. Information resources in Colleges of Education are better utilized when relevant infrastructural facilities such as reading tables, chairs, bookshelves, and ICTs, among others, are available.

Infrastructural facilities are essential facilities and tools that enhance the library's ability to deliver quality service to its patrons (Edom & Douglas, 2024). College of Education libraries need infrastructure ranging from power-generating sets to furniture and fittings, among others, to keep pace with developments in the information profession and advancements in technology for delivering information services. According to the World Education Summit (2021) report, a well-equipped library housing a wealth of useful books or informative multimedia resources, coupled with a motivating ambiance, not only attracts students to use the library but also develops a liking for study. Infrastructural facilities in college libraries should provide the necessary foundation on which self-sustaining growth is not only possible but also assured. Meanwhile, the availability of information resources and infrastructural facilities enhances the ability of college libraries to render necessary services to users.

Therefore, the provision of adequate resources and infrastructure has a significant influence on users' readiness to access the various collections in the library to complete coursework, widen their knowledge, and prepare for lectures. Despite the importance of college libraries in information dissemination, the regular usage of library resources depends on the availability of information resources and infrastructural facilities. Inadequate infrastructural facilities in Colleges of Education libraries could result in a shift from using library resources to self-help means of study (Solanke & Nwalo, 2016). Several factors could be attributed to the non-use of library resources in Colleges of Education, including inconvenient library location, unpleasant library ambiance, inadequate information resources, unqualified library personnel, and lack of basic social amenities such as electricity, chairs/tables, modern computers, and internet facilities, among others. Studies also show that infrastructural facilities aid effective service delivery and ensure the comfort of both library staff and users (Omeluzor et al., 2017).Infrastructural facilities are essential for enhancing the use of college libraries by both students and staff. Akuegwu and Nwi-ue (2016) explained that service delivery in an academic environment involves methods that enhance academic activities. Good library services and facilities are important to support user satisfaction, as there is a significant relationship between the value of library facilities, resources, services, and library user satisfaction. Good service delivery means lecturers are proficient in their teaching methods, communicate effectively with students, and offer support and guidance when necessary (Obona et al., 2024). Adequate availability of information resources and infrastructure will create a positive and productive learning environment and enhance service delivery in college libraries.

Therefore, the availability of resources and infrastructure in college libraries will enhance the quality of academic staff service delivery and can significantly influence and enhance students' academic performance, school effectiveness, and improved educational goal attainment (Tamunokonbia&Nwaogu, 2021).In Colleges of Education, infrastructural facilities and information resources are fundamental to the effective functioning of the library and the delivery of quality services. These facilities include both physical structures and supportive tools such as power supply systems, furniture, fittings, and modern technological equipment. Together with diverse information resources such as books, journals, digital databases, and multimedia materials, they enable libraries to meet the evolving demands of the information profession and support teaching, learning, and research activities. According to the World Education Summit (2021) report, a well-equipped library housing a wealth of useful books or informative multimedia resources, coupled with a motivating ambiance, not only attracts users to the library but also develops dedication toward academic activities. Information resources and infrastructural facilities can be said to be the physical expression of academic activities, as they represent a consciously designed and controlled environment with the sole aim of promoting the usage of college libraries by students and staff, which is part of teaching and learning activities within the institutions.

Researchers such as Dahunsi, Alegbeleye, and Madukoma (2020) conducted a study on the influence of library infrastructural facilities on library patronage among academics in South-West Nigeria. The study found that there was a low level of library patronage among academic staff in university libraries and that most resources in the libraries were sparingly used by academic staff. The study also found that although infrastructural facilities are available in academic libraries, they are inadequate. Further analysis revealed a significant influence of the availability of resources and infrastructural facilities on library usage by academics in universities in South-West Nigeria. The term "library usage" has been conceptualized in various ways by different scholars and researchers depending on their view, perception, and focus. Some scholars conceptualized library usage as library patronage; to others, library usage is the consumption of library resources, while a few described it as visiting a library to consume its resources. The common ground is that literature agrees that library resources are meant for usage by users. Hence, it should be understood that users cannot make use of resources without visiting the library either personally or electronically (Dahunsi, Alegbeleye, and Madukoma, 2020). Library usage refers to the extent to which students visit the library to explore its infrastructural facilities for teaching, learning, and relaxation (Edom & Douglas, 2024). Library usage is the purposive visit to the library by users to use library resources and infrastructural facilities, enhanced by service delivery.

The services delivered in Colleges of Education are numerous. Through the effective provision of information resources and infrastructural facilities by college libraries, lecturers and students have access to information resources that can enhance their academic activities. The success of libraries in Colleges of Education in this information age relies greatly on the nature of available information resources, how readily available these resources are to users, and how comfortable users are while making use of library resources. It is, however, regrettable that college libraries are still lagging behind in terms of the availability of information resources and infrastructural facilities that could facilitate effective service delivery to the user community (Okhakhu&Ogbe, 2022). Without adequate information resources and infrastructural facilities, libraries cannot carry out their primary function of service delivery, and users cannot feel satisfied. Unfortunately, most college libraries in Nigeria today cannot boast of adequate information resources and infrastructural facilities that can serve the needs of the user community. In most cases, the available information resources are not current, are insufficient, and are grossly inadequate compared to the user population of the institution. It is also observed that the resources of these libraries are largely print-based, with little or no provision for electronic resources like e-journals, e-books, and electronic databases such as JSTOR, AGORA, ERIC, and EBRARY. Many academic libraries, including those in colleges, are gradually losing their users to Google and online-based electronic resources, which users now rely on for current information resources anywhere and anytime with little or no access restrictions. This can be attributed to insufficient information resources and infrastructural facilities, which have a significant effect on service delivery.

3.1 Methodology

The study employed a descriptive research design to examine the influence of resource availability and infrastructural facilities on service delivery in Colleges of Education libraries. A correlation research design was adopted for this study. Correlation research design investigates relationships between variables without controlling or manipulating any of them. A total of 388 lecturers in government-owned Colleges of Education were selected for the study. Participants covered in this study were lecturers in government-owned Colleges of Education. A sample size of ninety (90) respondents was selected for the study, with thirty (30) lecturers drawn from each institution through a simple random sampling technique to ensure equal representation. Data were collected using a researcher-modified rating scale. All the data collected were analyzed using Pearson Product Moment Correlation (PPMC) statistics. The null hypotheses were tested using a t-test of simple linear correlation statistics at a 0.05 level of significance.

4.1 Results and Discussion

Response Rate: Out of the ninety (90) questionnaires administered to lecturers in government-owned Colleges of Education in Kwara State, eighty-three (83) were duly completed and returned. This represents a response rate of 92.2%, which was considered adequate for the study. Consequently, the analysis of data for this research was based on the 83 valid responses retrieved from the respondents.

Table 1: Summary of Pearson Product Moment Correlation on the Relationship between Information Resources, Infrastructural Facilities, and Service Delivery in Government-Owned Colleges of Education Libraries in Kwara State.

		Availability of Information Resources	Availability of Infrastructural Facilities	Service Delivery
	Pearson Correlation	1	.989**	.994**
	Sig. (2-tailed)		.000	.000

Availability of Information Resources (AIR)	N	83	83	83
Availability of Infrastructural Facilities (AIF)	Pearson Correlation	.989**	1	.979**
	Sig. (2-tailed)	.000		.000
	N	83	83	83
Service Delivery (SD)	Pearson Correlation	.994**	.979**	1
	Sig. (2-tailed)	.000	.000	
	N	83	83	83

Correlation is significant at the 0.01 level (2-tailed).

Table1 reveals that the availability of information resources and the availability of infrastructural facilities have a very strong positive relationship (r = 0.989). Availability of information resources and service delivery also show a very strong positive relationship (r = 0.994). Similarly, availability of infrastructural facilities and service delivery are very strongly positively related (r = 0.979).Since all p-values are less than 0.05 and significant at the 0.01 level (2-tailed), the relationships observed are statistically significant. The finding of the study implies that improvements in information resources and infrastructural facilities are strongly associated with better service delivery in government-owned Colleges of Education libraries in Kwara State.

Table 2: Model Summary of the Multiple Regression Analysis on the Influence of Availability of Information Resources and Infrastructural Facilities on Service Delivery in Government-Owned Colleges of Education Libraries in Kwara State.

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.994[a]	.989	.988	.10519

a. Predictors: (Constant), Availability of Infrastructural Facilities, Availability of Information Resources.

Table 2 shows the model summary shows that the regression model demonstrates a very high level of explanatory power, with an R^2 value of 0.989. This suggests that about 98.9% of the variation in service delivery in government-owned Colleges of Education libraries in Kwara State can be accounted for by the combined influence of the availability of infrastructural facilities and the availability of information resources. This remarkably high R^2 value indicates that the model fits the data extremely well, implying that these predictor variables jointly provide a strong and reliable basis for explaining and forecasting service delivery in the libraries under study.

Table 3: Analysis of Variance (ANOVA) for the Regression Model on the Influence of Availability of Information Resources and Infrastructural Facilities on Service Delivery in Government-Owned Colleges of Education Libraries in Kwara State.

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	77.551	2	38.775	3504.601	.000[b]
	Residual	.885	80	.011		
	Total	78.436	82			

a. Dependent Variable: Service Delivery (SD)

b. Predictors: (Constant), Availability of Infrastructural Facilities (AIF), Availability of Information Resources (AIR)

Table 3 indicated the ANOVA results indicate that the regression model used to predict service delivery in government-owned Colleges of Education libraries in Kwara State is highly statistically significant. The model produces an F-statistic of 3504.601 with a p-value less than 0.001, showing that the independent variables availability of infrastructural facilities and availability of information resources jointly offer a significantly better prediction than a model without predictors. Furthermore, the regression sum of squares (77.551) is much higher than the residual sum of squares (0.885), which implies that the model accounts for the greater proportion of variation in service delivery, leaving only a very small amount unexplained. The mean square values (38.775 for regression and 0.011 for residual) further highlight this wide gap, leading to the very high F-value observed. Overall, these results confirm that the availability of information resources and infrastructural facilities collectively exerts a strong and statistically significant influence on service delivery in government-owned Colleges of Education libraries in Kwara State.

Table 4: Multiple Regression Coefficients Showing the Relative Influence of Availability of Information Resources and Infrastructural Facilities on Service Delivery in Government-Owned Colleges of Education Libraries in Kwara State.

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	.137	.036		3.786	.000
	Availability of Information Resources (AIR)	1.125	.077	1.148	14.529	.000
	Availability of Infrastructural Facilities (AIF)	-.153	.078	-.156	-1.969	.052

a. Dependent Variable: Service Delivery (SD)

Table 4 revealed the regression analysis assessed the extent to which the availability of information resources and the availability of infrastructural facilities influence service delivery in government-owned Colleges of Education libraries in Kwara State. The findings reveal that the availability of information resources exerts a strong and statistically significant positive effect on service delivery ($B = 1.125$, $\beta = 1.148$, $t = 14.529$, $p < 0.001$), indicating that improvements in information resources lead to substantial enhancement in service delivery outcomes. On the other hand, the availability of infrastructural facilities shows a negative but weak effect ($B = -0.153$, $\beta = -0.156$, $t = -1.969$, $p = 0.052$), which is not statistically significant at the 0.05 level. This suggests that infrastructural facilities do not make a meaningful contribution to service delivery within the context of this model. The constant term ($B = 0.137$, $p < 0.001$) reflects the baseline level of service delivery when the independent variables are held constant. Overall, the results underscore that the availability of information resources is a major determinant of service delivery, whereas infrastructural facilities appear to have a less significant impact in government-owned Colleges of Education libraries in Kwara State.

Discussion

The findings of the study revealed that there is a strong relationship between resource availability and service delivery in government-owned Colleges of Education libraries in Kwara State. Both the availability of information resources and the availability of infrastructural facilities show significant positive correlations with service delivery, suggesting that improved access to information and infrastructure is generally associated with better service outcomes in these libraries. However, while correlation points to the existence of relationships, the regression analysis provides a clearer understanding of the relative contributions of each variable. The results reveal an exceptionally high model fit ($R^2 = 0.989$), indicating that the combined predictors account for a substantial proportion of the variation in service delivery. Within this model, the availability of information resources stands out as the most influential factor, exerting a strong, positive, and statistically significant effect on service delivery. This highlights the crucial role of information resources such as access to relevant materials, digital resources, and effective communication systems in enhancing library services. This is corroborated by Emeahara, Ajakaye, (2022) that librarians must communicate with library users, faculties, departments, and lecturers in order to support efficient teaching, learning, and research in the higher institutions.

In contrast, the availability of infrastructural facilities does not exhibit a statistically significant independent effect and is associated with a negative coefficient when both variables are considered together. This suggests that its role may be indirect or dependent on the presence of adequate information resources rather than having a direct impact on service delivery. The ANOVA results further validate the overall significance of the model, confirming that the predictors jointly explain variations in service delivery beyond what could occur by chance. Nevertheless, the very high R^2 value raises the likelihood of multicollinearity or overlap between the predictors, which may explain why infrastructural facilities appear less significant in the regression despite their strong correlation with service delivery. This is in line with the study of Adeniran, Nwalo and Ajani (2022) that availability and use of information resources significantly enhanced service delivery. Overall, the study concludes that although both infrastructural facilities and information resources contribute to the effectiveness of government-owned Colleges of Education libraries in Kwara State, information resources are the primary drivers of service delivery. This implies that investments in infrastructure alone may not yield optimal results unless they are complemented by adequate and accessible information resources. Consequently, policymakers, school management, and library management should prioritize strengthening information resource availability while ensuring that infrastructural development supports efficient access to and use of these resources for improved service delivery.

Conclusion and Recommendations

The study, Influence of Resources Availability and Infrastructural Facilities on Service Delivery in Government-Owned Colleges of Education Libraries in Kwara State**,** concludes that the availability of resources is a key factor in improving service delivery, with the analytical model showing very strong explanatory capacity. Although both information resources and infrastructural facilities are positively linked to service delivery in these institutions, the

findings clearly indicate that information resources are the most influential and consistent determinant. Their strong and statistically significant impact suggests that access to relevant academic and administrative information, efficient communication systems, and adequate knowledge resources are essential for enhancing service outcomes in the colleges. On the other hand, infrastructural facilities such as buildings and physical equipment do not show a significant independent effect when assessed alongside information resources. This implies that their contribution to service delivery may be indirect, largely depending on how effectively they support access to and use of information.

.Based on these findings, it is recommended that college administrators and policymakers in Kwara State place greater emphasis on investing in information resources, including digital learning platforms, data management systems, and communication technologies, as these have the greatest impact on service delivery. There should also be a strong focus on capacity building, particularly through training staff and educators to effectively use these information systems. While infrastructural development remains important, it should be carefully aligned with information resource systems to ensure they complement each other rather than overlap inefficiently.

INFLUENCE OF SCHOOL LIBRARY STAFFING LEVELS ON STUDENTS' ACADEMIC ACHIEVEMENT IN PUBLIC SENIOR SECONDARY SCHOOLS IN OBIO/AKPOR LOCAL GOVERNMENT AREA OF RIVERS STATE

Dr Chidaka O. Nyemezu
Department of Library and Information Science
Faculty of Education
Rivers State University
chidaka.nyemezu@ust.edu.ng

ABSTRACT

The study examined influence of school library staffing levels on students' academic achievement in public secondary schools in Obio/Akpor Local Government Area of Rivers State. The study was guided by three objectives and three research questions. The study employed a descriptive survey design and sampled 522 students and 170 library personnel across 20 registered senior secondary schools. Data were collected using structured questionnaires titled The instruments used for data collection was a structured questionnaire titled "Influence of School Library Staffing Levels on Students' Academic Achievement in Registered Public Senior Secondary schools Questionnaire. The instrument underwent face and content validity test which was conducted by two experts in Library and information Science Department, as well as one expert in Measurement and Evaluation in the Faculty of Education at Rivers State University, Port Harcourt. Cronbach's Alpha statistics was used to establish the reliability coefficients of the instrument. A reliability coefficient of 0.78, 0.70 and 0.75. was obtained showing the instrument is reliable. The instrument was analyzed using mean and standard deviation. The findings show that the availability of professional school librarians, para-professional library staff, and support staff in school libraries has a positive influence on students' academic achievement. Based on the findings, the following recommendations were made among others Education authorities should strengthen the professional training of school librarians and promote their active collaboration with teachers to enhance their impact on students' academic achievement. Based on the findings of the study, it was concluded that school library staffing levels influence students' academic achievement, particularly regarding the availability of professional school librarians, para-professional library staff, and support staff in school libraries in Obio/Akpor Local Government Area of Rivers State

Keywords: Keywords: School Library, Library Staffing, Staffing Levels, Students' Academic Achievement, Public Senior Secondary Schools

Introduction

School libraries are widely acknowledged as critical components of effective educational systems, serving as hubs for information access, literacy development, and academic support. Globally, research has consistently demonstrated a positive relationship between well-resourced school libraries and students' academic achievement, particularly when such libraries are adequately staffed by qualified professionals (Chigbundu & Ezenagbo, 2025). International bodies such as the International Federation of Library Associations and Institutions (IFLA) and UNESCO emphasize that the effectiveness of school libraries depends not only on collections and infrastructure but also, crucially, on the availability of competent library personnel who can integrate information services into teaching and learning processes (Idiegbeyan-ose, Ilo, & Isiakpona, 2019). In contemporary knowledge-driven societies, school libraries staffed by trained librarians play a strategic role in fostering information literacy, critical thinking, and independent learning skills that are essential for students' academic success and lifelong learning.

From a global perspective, empirical studies conducted in North America, Europe, and parts of Asia provide robust evidence that students in schools with professionally staffed libraries tend to perform better in standardized tests, reading comprehension, and overall academic outcomes than those in schools with poorly staffed or non-existent library services (Merga & Mat Roni, 2025). These studies attribute such outcomes to librarians' instructional collaboration with teachers, targeted reader advisory services, and systematic support for curriculum delivery. However, scholars also caution that staffing levels, encompassing professional librarians, para-professionals, and support staff are often unevenly distributed, particularly in developing countries, thereby limiting the potential impact of school libraries on learning outcomes (Ocheje, 2022)This disparity underscores the need for context-specific investigations that examine how staffing structures within school libraries influence student achievement in diverse educational systems.

In Nigeria, the role of school libraries has long been recognized in national education policies, including the National Policy on Education, which advocates for functional libraries in all schools as a means of supporting curriculum implementation and improving educational quality (Federal Republic of Nigeria [FRN], 2014). Despite this policy

recognition, the practical reality in many public secondary schools is characterized by inadequate library facilities, insufficient staffing, and limited professional oversight (Eguono & Usiada, 2025). In many cases, school libraries are managed by untrained personnel or teachers without formal education in librarianship, while para-professional and support staff are either absent or poorly utilized. This situation raises critical concerns about the capacity of school libraries to contribute meaningfully to students' academic achievement within the Nigerian secondary school system.

Existing Nigerian studies on school libraries have largely focused on issues of availability, utilization, and infrastructural adequacy, with comparatively less empirical attention devoted to staffing levels and their direct influence on students' academic performance (Chigbundu & Ezenagbo, 2025). While some studies suggest that professionally managed school libraries enhance students' reading habits and academic engagement, few have employed rigorous quantitative designs to examine the relationship between different categories of library staff and measurable academic outcomes at the secondary school level. Moreover, much of the available literature tends to generalize findings across broad geographical contexts, thereby obscuring local variations in educational administration, funding, and policy implementation. This gap is particularly evident in Rivers State, where rapid urbanization, population growth, and uneven educational resource distribution have placed additional pressure on public secondary schools.

Obio/Akpor Local Government Area, as a major urban center in Rivers State, presents a compelling context for examining the influence of school library staffing levels on students' academic achievement. Public secondary schools in the area operate within a complex educational environment marked by increasing enrolment, diverse student needs, and heightened expectations for academic performance. Yet anecdotal evidence and preliminary observations suggest that many of these schools lack adequately staffed libraries, relying instead on minimal personnel who are often overstretched and insufficiently trained. This situation raises a critical research problem: despite policy recognition of school libraries as essential educational support services, there remains limited empirical evidence on how variations in library staffing levels affect students' academic achievement in public secondary schools within this local context.

The significance of examining school library staffing lies in the multifaceted roles that library personnel play in supporting teaching and learning. Professional school librarians possess specialized training in information organization, instructional design, and literacy education, enabling them to collaborate effectively with teachers, guide students in research activities, and support curriculum-aligned learning (IFLA, 2015). Para-professionals and support staff, when appropriately deployed, contribute to the efficient operation of library services by managing routine tasks, maintaining collections, and ensuring sustained access to learning resources. The absence or inadequacy of these categories of staff can undermine library effectiveness, limit student access to information resources, and reduce opportunities for meaningful academic support. Consequently, staffing levels are not merely administrative variables but pedagogical factors with potential implications for students' academic achievement.

Understanding the influence of school library staffing levels is particularly significant for educational policy and school administration in Nigeria. Empirical evidence from this study can inform policy decisions regarding staff recruitment, deployment, and professional development, thereby strengthening the role of school libraries in achieving national educational goals. For school administrators, insights into the relationship between staffing and academic achievement can guide resource allocation and strategic planning aimed at improving student outcomes. From a library development perspective, the study contributes to advocacy efforts by providing data-driven justification for investing in qualified library personnel as a means of enhancing educational quality and equity.

Situating this study within the Nigerian educational system, and specifically within public secondary schools in Rivers State, addresses an important contextual gap in the literature. By focusing on Obio/Akpor Local Government Area, the study responds to calls for localized, evidence-based research that reflects the realities of school library practice in Nigeria's diverse educational landscapes. In doing so, it aligns with broader international discourses on the role of school libraries in academic achievement while offering contextually grounded insights that can inform both local practice and comparative research. Ultimately, examining the influence of school library staffing levels on students' academic achievement contributes to a deeper understanding of how human resources within school libraries shape educational outcomes in developing-country contexts, thereby enriching the global literature on school librarianship and information science.

The provision of functional school libraries is a recognized component of effective secondary education, yet the reality of library staffing in many public secondary schools in Nigeria remains largely inadequate. In numerous schools, library units either operate without professionally trained school librarians or are managed by teachers reassigned without formal education in librarianship and information science. Where library personnel exist, staffing levels are often insufficient to meet the demands of growing student populations, and the presence of para-professionals and support staff is minimal or entirely absent. This situation has resulted in school libraries functioning more as static book repositories than as dynamic learning centers capable of supporting curriculum delivery, independent learning, and

academic enrichment. In public secondary schools within Rivers State, including Obio/Akpor Local Government Area, these staffing limitations persist despite policy prescriptions that advocate for well-staffed school libraries as part of quality education provision.

Inadequate or inappropriate school library staffing has generated a range of operational and instructional challenges that undermine the effectiveness of library services. The absence of professionally trained librarians limits instructional collaboration with teachers, reduces systematic information literacy instruction, and constrains students' ability to develop critical research and reading skills essential for academic success. Overburdened or unqualified library personnel often struggle with collection development, resource organization, and user services, leading to underutilization of library resources by students and teachers. Empirical and observational studies within the Nigerian context have documented low levels of library use, poor integration of library services into teaching and learning, and limited student engagement with information resources conditions frequently associated with inadequate staffing and lack of professional expertise. These challenges raise concerns about the extent to which school libraries, as currently staffed, can contribute meaningfully to students' academic achievement at the secondary school level.

Despite the recognized importance of school library personnel, there is a notable gap in empirical research that quantitatively examines the relationship between school library staffing levels and students' academic achievement in Nigeria. Existing studies have largely emphasized library availability, infrastructure, or resource adequacy, with limited attention to staffing as a critical determinant of educational outcomes. Furthermore, few studies have disaggregated staffing into professional librarians, para-professionals, and support staff, or examined how variations in staffing levels influence measurable academic performance. This gap is particularly evident in Rivers State, where public secondary schools in Obio/Akpor Local Government Area operate under conditions of rapid enrolment growth and uneven resource allocation. Consequently, there is a pressing need for a context-specific empirical investigation that establishes the extent to which school library staffing levels influence students' academic achievement in public secondary schools in Obio/Akpor, thereby providing evidence to inform educational policy, school administration, and library development practices.

Chigbundu and Ezenagbo's (2025) study examined the influence of school library resources and the professional qualities of school librarians on senior secondary students' academic success across ten Nigerian secondary schools. This quantitative survey involved 200 students and ten school librarians and used regression analysis to assess the independent and joint effects of library resources and staff qualities on academic performance. The authors found that both the quality of librarians and the availability of library resources were significantly associated with students' academic success ($F(2,197) = 200.582$, $p < .05$), indicating that schools with more competent library personnel tended to report higher levels of student achievement. This study was included for its explicit incorporation of librarian quality as an independent variable and for its use of inferential statistics to link staffing characteristics to measurable student outcomes. However, the study's limitations include a relatively small, non-representative sample and the conflation of staff quality with resource availability, which complicates attributing effects solely to professional librarianship rather than to material resources more broadly.

Suleiman, Hanafi, and Tanslikhan's (2018) qualitative investigation in Kwara State, Nigeria, explored the perceived influence of library services on students' academic achievement, including perceptions of personnel adequacy within secondary school libraries. Using interviews and observational checklists across 20 schools, the researchers reported that library services positively influenced students' academic outcomes but noted that many schools lacked adequately trained library personnel. Although the study did not isolate professional librarians as the sole independent variable, its contextual findings underscore the perceived importance of trained library staff to the effective delivery of library services that support academic performance. The qualitative design allowed for rich contextual insights into staffing challenges and their educational implications, but reliance on principal perceptions rather than direct measures of staffing levels or academic achievement limits the study's generalisability and empirical precision.

Across these studies, there is convergence on the notion that trained and competent library personnel contribute positively to students' academic outcomes, either directly through instructional support or indirectly by enabling better utilization of library services. However, divergence exists in how staffing is operationalized some studies treat librarian quality as part of a broader package with resources, while others rely on perceptions of adequacy rather than measured staffing levels. Contextual factors such as resource scarcity, uneven professional staffing, and institutional constraints within Nigerian public schools further complicate interpretation and suggest that staffing effects may be moderated by material, administrative, and socio-cultural conditions.

Methodologically, the reviewed research demonstrates strengths in situating investigations within real Nigerian school contexts and in the use of mixed data sources. Yet, weaknesses include limited sample sizes, conflation of variables (e.g., resources and staffing), and a lack of longitudinal or experimental designs that could better establish causal

influence. Notably, there is an empirical gap in studies that quantitatively isolate professional school librarian availability as an independent variable and directly relate it to standardized measures of student academic achievement within Nigerian secondary schools.

This gap, particularly the absence of rigorous, context-specific research in settings like Obio/Akpor Local Government Area, constitutes the problem gap hook that the present study aims to address: existing literature suggests a relationship between library staffing and achievement, but lacks conclusive, locally grounded empirical evidence linking professional librarianship directly to measurable academic outcomes in Nigerian public secondary schools. The proposed study seeks to fill this void by employing robust quantitative methods to clarify the influence of professional school librarians on student achievement in Obio/Akpor.

This study examined the perceived influence of library services on students' academic achievement in secondary schools in Kwara State, Nigeria, and highlighted staffing issues, including non-/inadequate trained library personnel (Suleiman et al., 2018). This qualitative study employed interviews and observational checklists with principals from 20 schools and analysed data using NVivo software. Although it did not isolate para-professional staff as a distinct variable, it documented that inadequate training of library staff, implicitly including para-professionals inhibited effective delivery of library services that were perceived to support students' academic success. Findings showed that schools lacked adequately trained personnel and that improved staffing was recommended to enhance library effectiveness and thereby student outcomes. The study was included for its contextual relevance to Nigerian public secondary schools and its identification of staff training as a barrier to academic support, though its reliance on perceptions and lack of quantitative measures limit generalisability and direct attribution of academic achievement to para-professional staff roles.

Another study reported a statistically significant relationship between school library staff qualities (which would include para-professionals) and student academic success in Nigerian secondary schools (Chigbundu & Ezenagbo, 2025). This survey of 200 students and ten librarians across ten schools used regression analysis to assess how library staff qualities predicted student outcomes. Although the study focused on library staff qualities broadly and combined them with resource availability, it nonetheless found that staff characteristics significantly contributed to students' academic success, implying that competent library staff, including para-professional roles, matter for academic achievement. The inclusion of this study is justified by its quantitative design and inferential analysis linking staffing characteristics with student outcomes, offering empirical grounding for the staffing–achievement relationship. A key limitation is the lack of disaggregation between professional and para-professional roles, which constrains clear attribution of effects to para-professionals specifically.

This study examined the effect of librarians' and supportive staff behaviour on students' use of library (Abu, Agada & Shalom, 2022). Although the context was a university rather than a secondary school, the findings are informative: using structured questionnaires with a sample of 378 library users, the study found that both professional and supportive (para-professional) library staff behaviours influenced student engagement with the library. This behavioural influence, in turn, can affect students' use of learning resources and time spent on academic work factors tied to academic achievement in the school library literature. The study was selected because it explicitly recognises supportive (para-professional) staff behaviour as meaningful to student engagement, even though it is situated in higher education and does not directly measure achievement outcomes. Its limitations include contextual divergence from secondary schools and the absence of direct academic performance measures tied to staffing.

Across these studies, a convergent theme emerges that the presence, training, and behaviour of all categories of library staff, including para-professionals, influence students' engagement with library services, which in turn relates to academic outcomes. Suleiman et al. (2018) noted that inadequate training of library personnel constrained the effectiveness of library services that were *perceived* to support academic achievement. Chigbundu and Ezenagbo (2025) provided empirical evidence that staff qualities, broadly defined, were associated with student success. Abu et al. (2022) showed that supportive staff behaviour influenced student library use. These studies collectively suggest that staffing beyond just professional librarians plays a role in shaping the utility of library services for learning.

However, divergences and gaps are evident. None of the reviewed studies isolates the influence of para-professional library staff as a distinct independent variable measured against quantified student achievement outcomes in secondary schools. Most research combines staff characteristics with other factors (e.g., resources, professional staff) or relies on qualitative perceptions rather than objective performance indicators. Methodologically, existing work is limited by lack of longitudinal data, insufficient disaggregation of staff roles, and weak operationalisation of academic achievement when staffing variables are considered. Contextually, research specific to public secondary schools in Nigeria and within West Africa more broadly is sparse, particularly investigations that distinctively examine para-professional staffing levels.

This review highlights a clear empirical and contextual gap: the absence of rigorous, quantitative research that isolates para-professional library staffing levels and directly assesses their influence on students' academic achievement in Nigerian public secondary schools. The proposed study in Obio/Akpor Local Government Area of Rivers State will address this gap by employing robust measurement of para-professional staffing (independent variable), standardized academic performance data (dependent variable), and appropriate analytic techniques, thereby generating contextually grounded evidence to inform policy and practice.

Another empirical research that isolates the influence of school library support staff (such as library assistants, clerical staff, and attendants) on students' academic achievement remains limited, particularly within the Nigerian secondary school context. Nonetheless, a small body of peer-reviewed literature provides useful evidence by examining support staff as part of broader library staffing structures. The studies reviewed here were selected because they are verifiable, peer-reviewed, published from 2015 onward, and empirically examine how non-professional library staff contribute to the effectiveness of school libraries and student learning outcomes.

Another study by Fasola (2015) investigated the relationship between school library personnel adequacy and students' academic performance in public secondary schools in Oyo State. The study employed a descriptive survey design and sampled 360 students and 30 library personnel across selected schools. Data were collected using structured questionnaires and analysed using Pearson correlation and multiple regression techniques. Findings indicated that the availability of library assistants and clerical support staff significantly influenced the utilization of library resources, which in turn was associated with improved student academic performance. Schools with adequate support staff reported better organization of materials and longer library opening hours, facilitating greater student access. The study was included due to its Nigerian context and explicit recognition of support staff roles. However, its reliance on self-reported academic performance and its cross-sectional design limited causal inference and generalizability.

In a large-scale quantitative study conducted in the United States, McGuire (2024) examined how different categories of school library staffing, including clerical and technical support staff, related to academic achievement in secondary schools. Using statewide data from over 300 secondary schools, the researchers employed correlational and regression analyses linking staffing variables with standardized test scores in reading and writing. The findings showed that schools with adequate clerical and technical support staff enabled professional librarians to focus more on instructional collaboration, which was associated with higher student achievement. This study was included for its strong methodological rigor and clear operationalisation of support staff roles. Its primary limitation lies in contextual transferability, as differences in funding structures and educational systems may constrain direct application to Nigerian public secondary schools.

A third relevant study by Small, Pasquini and Schultz-Jones (2019) explored the impact of school library staffing patterns on student achievement in secondary schools using a mixed-methods design. Survey data from librarians and support staff were combined with student achievement records and analysed using descriptive statistics and multivariate analysis. The study found that the presence of trained library aides and support staff positively influenced students' academic outcomes by improving library accessibility, resource circulation efficiency, and instructional support logistics. The inclusion of this study is justified by its explicit treatment of support staff as a measurable staffing variable. However, the study did not fully disaggregate the independent effects of support staff from those of professional librarians, limiting precision in attribution.

Across the reviewed studies, there is convergence in the finding that adequate availability of school library support staff indirectly but meaningfully influences students' academic achievement by enhancing library access, efficiency, and instructional support. Where support staff are available, libraries tend to function more consistently, allowing professional librarians to engage in pedagogical roles that support learning. Divergence arises primarily from contextual differences between developed and developing educational systems, particularly regarding funding levels, staffing norms, and digital infrastructure. Methodologically, strengths include the use of inferential statistics and large datasets in international studies, while weaknesses are evident in Nigerian research that relies heavily on self-reported data and indirect measures of achievement.

Despite these contributions, a clear empirical gap remains. Existing studies rarely isolate support staff availability as an independent variable linked directly to measured academic achievement, and Nigerian-based evidence remains sparse and contextually uneven. No known study has examined this relationship within public secondary schools in Obio/Akpor Local Government Area of Rivers State. This gap underscores the need for a focused, context-specific investigation that quantitatively examines how variations in school library support staff availability influence students' academic achievement, thereby providing evidence to guide staffing policies and library development practices in Rivers State.

Purpose of the Study

The purpose of this study is to examine the influence of school library staffing levels on students' academic achievement in public secondary schools in Obio/Akpor Local Government Area of Rivers State. Specifically, the study seeks to:

1. determine the influence of the availability of professional school librarians on students' academic achievement in public secondary schools in Obio/Akpor Local Government Area;
2. examine the influence of para-professional library staff on students' academic achievement in public secondary schools in Obio/Akpor Local Government Area;
3. assess the influence of support staff availability in school libraries on students' academic achievement in public secondary schools in Obio/Akpor Local Government Area;

Research Questions

The following research questions are formulated to guide the study:

1. How does availability of professional school librarians influence students' academic achievement in public secondary schools in Obio/Akpor Local Government Area?
2. To what extent do the presence of para-professional library staff influence students' academic achievement in public secondary schools in Obio/Akpor Local Government Area?
3. How does the availability of library support staff influence students' academic achievement in public secondary schools in Obio/Akpor Local Government Area?

Methodology

The study adopted a descriptive research design. The study adopted a descriptive design. This design was considered appropriate because the study sought to examine the influence of school library staffing levels on students' academic achievement. The population of the study comprised all registered public senior secondary schools in Obio/Akpor Local Government Area. The target population is 1384, which comprise 316 Library Staff (professional school librarians, para-professional library staff and library support staff) of registered senior secondary schools in Obio/Akpor LGA and 1,068 students in registered public senior secondary schools in Obio/Akpor Local Government Area of Rivers State. These groups were considered relevant because library staff provide information on staffing levels and library operations, while students' academic records provide objective measures of academic achievement. The sample size of 692 respondents which represent 50% of the population was used for this study. This consists of 170 Library Staff and 522 students in registered public secondary schools in Obio/Akpor Local Government Area of Rivers State.

A multi-stage sampling technique was employed for the study. First, a simple random sampling technique was used to select 20 registered senior secondary schools from Obio/Akpor LGA. Second, purposive sampling was used to select 170 library staff (professional librarians, para-professionals, and support staff) in the 20 sampled schools due to their relatively small numbers. Third, proportionate stratified random sampling was used to select 59% of students from each of the sampled registered senior secondary school to ensure fair representation across schools. The sample size was determined using percentage to ensure adequacy for statistical analysis and generalisability of findings.

The instruments used for data collection was a structured questionnaire titled "Influence of School Library Staffing Levels on Students' Academic Achievement in Registered Public Senior Secondary schools Questionnaire" (ISLSLSAARPSSSQ). The instrument underwent face and content validity test which was conducted by two experts in Library and information Science Department, as well as one expert in Measurement and Evaluation in the Faculty of Education at Rivers State University, Port Harcourt. Cronbach's Alpha statistics was used to establish the reliability coefficients of the instrument. First, copies of each instrument were administered to 10 Library staff and 20 students of registered senior secondary school in Port Harcourt City LGA, which were not part of the study sample. Split-half method was employed by the researcher to divide responses into two groups (Group A and Group B). All even numbers were grouped under Group A, while all odd numbers were grouped under Group B. The responses were analysed using Cronbach's Alpha statistics. A reliability coefficient of 0.78 was obtained showing the instrument is reliable. The researcher, with the assistance of four trained research assistants, distributed 692 copies of the instrument to the respondents. Before administering the instrument, the researcher provided clear instructions on how to respond to it. Copies of the questionnaire were retrieved from the respondents by the researcher and the research assistants after the completion of the research instrument. Out of the 692 copies of the instrument administered, 638 (160 for library staff and 478 for students) copies were successfully retrieved and valid. This represented 93% of the total copies administered that were used for data analysis. 54 copies of the instrument were destroyed by rain. The data collected from the research questions were analysed using mean statistics and Standard Deviation. A range of 2.50 was used to determine if a mean score indicates "High Extent" or "Low Extent". Any item in the research instrument with a mean score less than 2.50 indicates "Low Extent" while a mean scores of 2.50 and above indicate "High Extent".

Results

Research Question 1: What influence does the availability of professional school librarians have on students' academic achievement in public secondary schools in Obio/Akpor Local Government Area?

Source: Field Data, 2025

Table 1 presents the mean responses of library staff and students on the influence of the availability of professional school librarians on students' academic achievement in registered public senior secondary schools in Obio/Akpor Local Government Area.

The results indicate that both library staff (grand mean = 2.65) and students (grand mean = 2.64) agreed, overall, that the availability of professional school librarians influences students' academic achievement. This suggests a general recognition among respondents that professionally trained librarians play an important role in supporting students' learning outcomes.

Item 1 shows strong agreement from both library staff (mean = 3.31) and students (mean = 3.10) that their schools have at least one professionally trained school librarian. This implies that the presence of librarians is fairly common in the sampled schools. However, Item 2 reveals disagreement from both groups regarding whether the school librarian possesses formal qualifications in Library and Information Science (library staff mean = 1.90; students mean = 1.91). This finding suggests that although librarians are present in many schools, a significant number may lack appropriate professional qualifications.

Similarly, both library staff and students disagreed that school librarians collaborate with teachers to support teaching and learning (Item 3), with mean scores of 1.80 and 1.81 respectively. This indicates limited instructional collaboration between librarians and teachers, which may reduce the potential impact of the library on classroom teaching and learning.

Despite these challenges, respondents agreed that school librarians provide guidance to students on academic research and assignments (Item 4). The mean scores of 3.13 for library staff and 3.10 for students indicate that librarians actively support students in information seeking and assignment completion. In addition, both groups agreed that the presence of a professional school librarian contributes to improved student academic performance (Item 5) and that school library services support students' academic achievement (Item 6). These findings suggest that even where collaboration and formal qualifications may be limited, librarians still make meaningful contributions to students' learning.

In summary, the findings show that the availability of professional school librarians has a positive influence on students' academic achievement in public secondary schools in Obio/Akpor Local Government Area. However, the influence is constrained by gaps in professional qualifications and limited collaboration with teachers. Strengthening librarians' professional training and encouraging closer integration of librarians into instructional activities may further enhance their impact on students' academic achievement.

Research Question 2: To what extent do the presence of para-professional library staff influence students' academic achievement in public secondary schools in Obio/Akpor Local Government Area?

Table 2: Mean Response of Influence of Para-Professional Library Staff on Students' Academic Achievement in Registered Public Senior Secondary Schools In Obio/Akpor Local Government Area.

S/N	Items	Library Staff n=160			Students n=478		
		Mean	SD	RKS	Mean	SD	RKS
7	My school library has para-professional staff such as library assistants or aides.	2.21	0.89	**Disagreed**	2.04	0.92	**Disagreed**
8	Para-professional library staff assist in organising and maintaining library resources.	2.74	0.99	**Agreed**	2.72	0.96	**Agreed**
9	Para-professional staff support students in locating learning materials.	2.53	0.91	**Agreed**	2.50	0.88	**Agreed**
10	The presence of para-professional staff enhances the efficiency of library services.	2.76	0.98	**Agreed**	2.89	0.99	**Agreed**
11	Adequate para-professional staffing positively influences students' academic achievement.	2.85	0.90	**Agreed**	2.98	0.81	**Agreed**
12	Students who frequently use the library perform better academically.	2.06	0.98	**Disagreed**	2.20	0.98	**Disagreed**
13	Library staffing levels influence students' ability to complete academic tasks effectively	3.14	0.97	**Agreed**	2.80	0.90	**Agreed**
	Grand Mean	**2.61**		**Agreed**	**2.59**		**Agreed**

Source: Field Data, 2025

Table 2 shows the item-by-item analyses of the mean scores and standard deviations of the respondents' on the influence of para-professional library staff on students' academic achievement in registered public senior secondary schools in Obio/Akpor Local Government Area of Rivers State. The results show that the mean scores and standard deviations of the library staff and students on items 8-11, and 13 are all above the decision mean of 2.50. This indicates that the respondents agreed that para-professional library staff has a positive influence on students' academic achievement.

Items 7 and 12, on the other hand, have mean scores below 2.50. This suggests that the respondents disagreed that para-professional library staff has a positive influence on students' academic achievement on these items.

The grand mean of 2.61 for the library staff and 2.59 for the students are both higher than the acceptable mean score of 2.50.

Table 3: Mean Response of Influence of Assess the Influence of Support Staff Availability in School Libraries on Students' Academic Achievement in Registered Public Senior Secondary Schools in Obio/Akpor Local Government Area.

Research Question 3: To what extent does the availability of library support staff influence students' academic achievement in public secondary schools in Obio/Akpor Local Government Area?

S/N	Items	Library Staff n=160			Students n=478		
		Mean	SD	RKS	Mean	SD	RKS
14	My school library has support staff such as clerks, attendants, or cleaners	3.11	1.01	**Agreed**	2.87	0.96	**Agreed**
15	Library support staff ensure that the library is open and accessible during school hours.	3.00	0.95	**Agreed**	3.03	1.20	**Agreed**
16	Support staff help maintain a conducive library environment for learning.	2.56	0.91	**Agreed**	2.51	0.88	**Agreed**

17	Adequate support staff reduce the workload of librarians and para-professionals	2.76	0.98	**Agreed**	2.89	0.99	**Agreed**
18	The availability of library support staff contributes indirectly to students' academic achievement.	2.85	0.90	**Agreed**	2.98	0.81	**Agreed**
19	Adequate library staffing improves students' reading and study habits.	3.10	0.92	**Agreed**	2.82	0.81	**Agreed**
20	Overall, school library staffing levels contribute to students' academic achievement	3.14	0.97	**Agreed**	2.80	0.90	**Agreed**
	Grand Mean	**2.93**		**Agreed**	**2.84**		**Agreed**

Table 3 presents the mean responses of library staff and students on the influence of support staff availability in school libraries on students' academic achievement in registered public senior secondary schools in Obio/Akpor Local Government Area.

The results show that both library staff (grand mean = 2.93) and students (grand mean = 2.84) agreed that the availability of library support staff influences students' academic achievement to a considerable extent. This indicates a shared perception across the two respondent groups that support staff play an important, though largely indirect, role in enhancing learning outcomes.

Specifically, respondents agreed that school libraries have support staff such as clerks, attendants, or cleaners (Item 14), with mean scores of 3.11 for library staff and 2.87 for students. This suggests that most schools have some level of support staffing. Both groups also agreed that support staff ensure the library is open and accessible during school hours (Item 15), highlighting their role in sustaining regular library operations, which is essential for consistent student use. Furthermore, Items 16 and 17 reveal agreement that support staff help maintain a conducive library environment and reduce the workload of librarians and para-professionals. Although the mean scores for maintaining a conducive environment (2.56 for staff and 2.51 for students) are relatively lower than others, they still fall within the agreed range, suggesting that while support staff contribute positively, their effectiveness may be limited by their number or level of training.

Both library staff and students also agreed that the availability of support staff contributes indirectly to students' academic achievement (Item 18) and improves students' reading and study habits (Item 19). This supports the view that support staff enhance academic achievement not through direct instructional roles, but by ensuring cleanliness, orderliness, accessibility, and efficient library functioning, which collectively create an environment conducive to learning.

Finally, the overall assessment (Item 20) shows agreement that school library staffing levels contribute to students' academic achievement, reinforcing the importance of adequate staffing structures that include support staff. In summary, the findings suggest that while support staff may not directly teach or guide students academically, their availability is essential for effective library service delivery, which in turn supports students' academic achievement in public secondary schools in Obio/Akpor Local Government Area.

Discussion of Findings

The results of the study show that the availability of professional school librarians has a positive influence on students' academic achievement in public secondary schools in Obio/Akpor Local Government Area. However, the influence is constrained by gaps in professional qualifications and limited collaboration with teachers. Strengthening librarians' professional training and encouraging closer integration of librarians into instructional activities may further enhance their impact on students' academic achievement. The finding of this study is in line with the findings of Chigbundu and Ezenagbo (2025) and Suleiman, that both the quality of librarians and the availability of library resources were

significantly associated with students' academic success, indicating that schools with more competent library personnel tended to report higher levels of student achievement.

According to the findings of this study, para-professional library staff has a positive influence on students' academic achievement in registered public senior secondary schools in Obio/Akpor Local Government Area. This is in line with findings of Suleiman et al., (2018), Chigbundu and Ezenagbo (2025) and Abu et al. (2022). Across these studies, a convergent theme emerges that the presence, training, and behaviour of all categories of library staff, including para-professionals, influence students' engagement with library services, which in turn relates to academic outcomes. Suleiman et al. (2018) noted that inadequate training of library personnel constrained the effectiveness of library services that were *perceived* to support academic achievement. Chigbundu and Ezenagbo (2025) provided empirical evidence that staff qualities, broadly defined, were associated with student success. Abu et al. (2022) showed that supportive staff behaviour influenced student library use. These studies collectively suggest that staffing beyond just professional librarians plays a role in shaping the utility of library services for learning.

The findings also reveals that while support staff may not directly teach or guide students academically, their availability is essential for effective library service delivery, which in turn supports students' academic achievement in public secondary schools in Obio/Akpor Local Government Area. This is in line with the findings of Fasola (2015) that availability of library assistants and clerical support staff significantly influenced the utilization of library resources, which in turn was associated with improved student academic performance. Schools with adequate support staff reported better organization of materials and longer library opening hours, facilitating greater student access. Findings of McGuire (2024) also aligns with this study as it showed that schools with adequate clerical and technical support staff enabled professional librarians to focus more on instructional collaboration, which was associated with higher student achievement.

Findings of Pasquini and Schultz-Jones (2019) is also in line findings of this study as it found that the presence of trained library aides and support staff positively influenced students' academic outcomes by improving library accessibility, resource circulation efficiency, and instructional support logistics.

Conclusion

Based on the findings of the study, it was concluded that school library staffing levels influence students' academic achievement, particularly regarding the availability of professional school librarians, para-professional library staff, and support staff in school libraries in Obio/Akpor Local Government Area of Rivers State.

Recommendations

Based on the findings of the study, the following recommendations are made:

1. Education authorities should strengthen the professional training of school librarians and promote their active collaboration with teachers to enhance their impact on students' academic achievement.
2. Para-professional library staff should be adequately trained and assigned clearly defined roles to improve library service delivery and students' engagement with learning resources.
3. School administrators should ensure the availability of sufficient library support staff to improve library organization, accessibility, and efficiency, thereby indirectly supporting students' academic achievement.

Abstract

This study evaluates the impact of the Nigerian Library Association (NLA) on the development of National Information and Communication Technology (ICT) policies, addressing a critical participation deficit in Nigeria's digital governance. Using a descriptive survey research design, data were collected from 150 registered information professionals across Nigeria's six geopolitical zones using the NLA and National Information Policy Development Questionnaire (NNIPDQ). The instrument was pilot tested with 15 participants and obtained a Cronbach Alpha Coefficient of 0.84. Quantitative data were analyzed using Mean and Standard Deviation with a 2.50 benchmark for agreement. Findings reveal a profound participation gap, with a cluster mean of 1.89, indicating the NLA's role in the policy lifecycle is peripheral and lacks legislative leverage through the Librarians' Registration Council of Nigeria (LRCN). Furthermore, a "priority mismatch" was identified (cluster mean: 1.94), as national frameworks heavily favor hardware procurement over Library and Information Science (LIS) technical standards like metadata and digital curation. Implementation is severely stymied by systemic bottlenecks (cluster mean: 3.34), primarily inadequate federal funding (x=3.40), infrastructure deficits (x=3.38), and obsolete professional perceptions among policymakers (x=3.23). The study concludes that the exclusion of LIS expertise prevents the attainment of a holistic National Information Policy (NIP), resulting in a widening policy-practice gap. It recommends the enactment of a standalone NIP, statutory NLA seats in drafting committees, and specialized funding for library automation to realign Nigeria's digital strategy with professional standards.

Keywords: Nigerian Library Association, National Information Policy, ICT Policy, LIS Priorities, Digital Transformation, Information Governance.

Introduction

In the contemporary global landscape, information is recognized as a strategic resource essential for national development and democratic stability. For Nigeria, the transition into an information-based society necessitates a cohesive National Information Policy (NIP) to guide the acquisition and dissemination of knowledge. National Information Policy (NIP) refers to the framework representing the strategic foundation required to govern a nation's information lifecycle. Unegbu (2022) defines NIP as a set of laws and regulations designed to oversee the acquisition, processing, and distribution of information to meet national developmental goals. In a broader sense, Abubakar (2021) describes it as a roadmap for achieving an information-literate society by harmonizing the activities of various information providers. Scholars emphasize that the NLA is not merely a social union but a technical body designed to provide the expertise required for managing a nation's knowledge economy. Saleh and Tsagem (2020) highlight its strategic function in professionalizing librarianship, while Idogbe and Philip (2022) view it as a critical engine for sustainable social and economic engineering in a developing economy. The Nigerian Library Association (NLA), as the apex professional body for information specialists, occupies a central position in advocating for these frameworks.

Saleh and Tsagem (2020) define the NLA as the umbrella body tasked with the professionalization of librarianship and the promotion of library services across Nigeria. Emezie and Nwaohiri (2021) describe the association as a pressure group essential for advocating the legislative rights of information practitioners. According to Amaechi, Osuigwe, & Uzuegbu (2018), the NLA is a regulatory catalyst aimed at maintaining international best practices in local information centers, while Abubakar (2021) characterizes it as a mandatory technical consultant that should bridge the gap between government intent and professional information delivery. Unegbu (2022) and Abubakar (2021) both agree that a functional NIP must go beyond technological containers (hardware) and address content (information organization and literacy). In Nigeria, this policy is currently fragmented. Instead of a standalone, holistic policy, information governance is scattered across various ICT and Education documents. This fragmentation is the root cause of the priority mismatch, as none of the frameworks designed without library and information science specific input tend to prioritize telecommunications infrastructure over the information services that actually make that infrastructure useful to the public.

Statement of the Problem

The interface between these distinct policy spaces is currently characterized by a significant problem, where the NLA's expertise is systematically undervalued in the national policy arena. Despite the definitions of policy provided by scholars, there is an inadequate involvement of the NLA in high-level ICT and information architecture formulation. This has resulted in a "zero inclusion" culture where LIS-specific priorities, such as digital curation, metadata standardization, and information ethics, are absent from wider national frameworks (Abubakar, 2021).

This systematic exclusion manifests in persistent priority mismatches, inadequate sectoral funding, and a critical lack of institutional consultation (Unegbu, 2022; Saleh & Tsagem, 2020). Should this culture continue, the nation will fail to achieve a holistic information ecosystem, resulting in expensive infrastructure that lacks the professional content management required to make it functional for the citizenry. As Idogbe and Philip (2022) contend, no nation can achieve true digital inclusion without the active participation of librarians who understand the human element of information access. In light of the problems discussed above, this study is structured to address specific inquiries regarding the current state of information governance in Nigeria. These inquiries are encapsulated in the following Research Questions:

1. What is the level of Nigerian Library Association (NLA) participation in the formulation of National Information Policies?
2. To what extent are LIS-specific priorities integrated into Nigeria's National ICT and Information Policy frameworks?
3. What are the challenges hindering the NLA from effectively driving the implementation of national information policies?

Conceptual Framework

To contextualize the advocacy space of the NLA, it is critical to untangle the distinct yet intersecting concepts within contemporary information governance. The frequent structural collapse of these paradigms by Nigerian policymakers creates the exact systemic vulnerabilities evaluated in this paper:

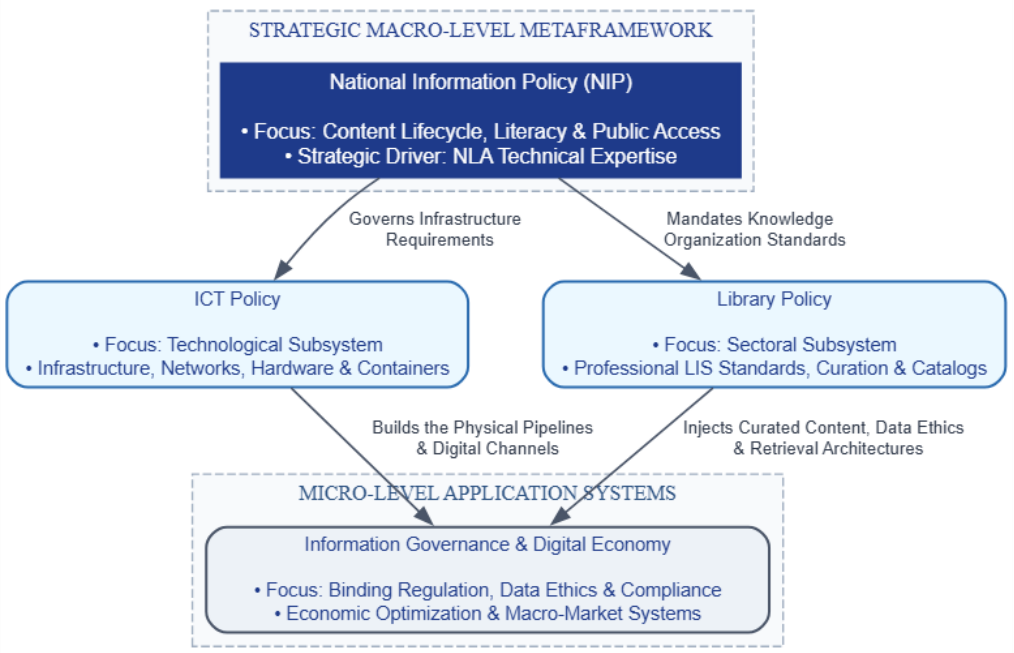

Fig. 1: Conceptual Framework

The conceptual framework illustrated in Fig 1. depicts an integrated, three-tiered information governance ecosystem where the National Information Policy (NIP) operates at the apex macro-level to dictate strategic content requirements and knowledge organization standards. This overarching framework guides the mid-level execution paradigms, which split into parallel subsystems: ICT Policy, managing the physical telecommunications infrastructure and technological containers, and Library Policy, managing professional LIS curation standards and retrieval systems. Ultimately, these parallel streams must converge at the micro-level application layer to drive a functional Digital Economy and Information Governance system, demonstrating that high-tech physical pipelines built by ICT policies remain structurally empty and ineffective unless populated and organized by the curated content, data ethics, and metadata architectures supplied through systematic library policies.

National Information Policy (NIP)

The discourse on National Information Policy (NIP) in Nigeria is defined by a fundamental tension between technological infrastructure and information content. Unegbu (2022) conceptualizes NIP as a comprehensive regulatory

framework governing the entire lifecycle of information to achieve strategic national objectives. This view is expanded by Abubakar (2021), who posits that a functional policy must prioritize information proficiency, user literacy, and knowledge curation over mere raw internet connectivity.

Scholars agree that Nigeria historically lacks a unified, standalone NIP, resulting in a fragmented landscape where information services and regulatory mandates are scattered across disconnected sectoral guidelines. This structural void creates a policy environment where state resources are duplicated and strategic knowledge-management goals remain uncoordinated. In contrast to the view that policy fragmentation is solely a systemic failure, some empirical studies suggest that sectoral micro-policies can sometimes be more agile than a monolithic NIP. For instance, Idogbe and Philip (2022) argue that in the absence of an overarching federal NIP, state-level library boards have occasionally succeeded in integrating LIS priorities into local educational frameworks. However, this localized approach is largely viewed as a temporary stop-gap measure. Saleh and Tsagem (2020) demonstrate empirically that without a centralized national mandate, these localized successes fail to scale, leaving the NLA to contend with highly asymmetric versions of professional implementation across the 36 states of the federation.

Role of Professional Associations in Policy Development

Professional associations serve as key drivers for institutionalizing standards and anchoring professional identities within national frameworks. The Nigerian Library Association (NLA) is historically recognized as the primary engine for professionalizing the domestic information sector and advocating for cohesive national information guidelines. Saleh and Tsagem (2020) document the association's long-term strategies, noting that its most significant statutory achievement was the establishment of the Librarians' Registration Council of Nigeria (LRCN).

While the LRCN successfully established a legal identity and regulatory mechanism for librarians, Emezie and Nwaohiri (2021) argue that the NLA still functions primarily as an external pressure group with limited executive power in national planning. Consequently, while the NLA possesses the explicit technical mandate to drive information policy, it remains structurally isolated from the high-level legislative decision-making bodies controlled by ministries of communication, education, and science.

The NLA and Information Governance: Analysis of Current Frameworks

The most significant evidence of NLA exclusion is uncovered when evaluating Nigeria's current ICT and education frameworks. Unegbu (2022) highlights a critical priority mismatch within the National ICT Policies of 2012 and 2020, demonstrating that these documents focus heavily on physical telecom infrastructure while omitting core library and information science priorities, such as metadata standards, digital preservation protocols, and systematic curation architectures.

Saleh and Tsagem (2020) further contend that this technological bias ignores the sophisticated content management expertise of librarians, treating them as passive operators of physical spaces rather than active information architects. This mismatch ensures that while hardware is deployed, the professional metadata systems required to organize, secure, and retrieve public data are missing. Empirical evidence from Abubakar (2021) supports this gap, showing that approximately 70% of digital repositories established under national ICT initiatives lack standardized cataloging protocols, which severely impedes retrieval for non-expert citizens. Conversely, some policy drafters argue that the global open access movement effectively addresses LIS concerns natively, without requiring NLA-specific legislation.

The financial implications of this lack of structural integration are severe, as LIS priorities are routinely omitted from national ICT and digital economy budgets. Emezie and Nwaohiri (2021) highlight that when libraries are not recognized as primary ICT stakeholders, they are denied the specialized funding required for institutional automation and digital subscription services. In the same vein, Saleh and Tsagem (2020) note that the NLA's efforts to lobby for a dedicated Library Development Fund have been repeatedly sidelined because ICT-centric ministries prioritize short-term, highly visible hardware procurement over sustainable digital content systems. This creates a lopsided development model where sophisticated technology exists without the professional strategies to make it useful to the public.

Challenges of ICT Policy Implementation

Often, when strategic policy recommendations are formally put forward by the NLA, their implementation remains stymied by deep-seated systemic bottlenecks. Emezie and Nwaohiri (2021) identify grossly inadequate federal funding and the absence of a uniform statutory library policy as the primary hurdles preventing the NLA from driving execution. These financial constraints are exacerbated by what Amaechi et al. (2018) describe as a severe policy-practice gap, where local practitioners lack basic modern tools and stable electricity to execute digital mandates. This operational fatigue ensures that many NLA-driven initiatives never move beyond the drafting phase.

While the funding gap is widely cited, Abubakar (2021) offers a contrasting empirical perspective, suggesting that misallocation is as significant an implementation barrier as absolute underfunding. His study reveals that funds targeted for institutional e-libraries are often diverted to general IT maintenance and administrative expenses, completely bypassing professional library staff. This is further compounded by a negative professional perception among policymakers. Unegbu (2022) notes that many institutional leaders view the library as a traditional book-based

repository rather than a strategic digital asset, while Idogbe and Philip (2022) demonstrate that this archaic perception results in the NLA being entirely excluded from high-level national security and data governance committees where their data management expertise is most critically needed.

Empirical Review and Literature Gap

The combination of existing literature confirms that the NLA's institutional impact is heavily marginalized by a cyclical loop of underfunding, negative professional stereotyping, and a persistent technological infrastructure bias. While previous studies have broadly identified these systemic challenges, there remains a critical lack of empirical data linking the omission of LIS priorities in the National Digital Economy Policy and Strategy (2020-2030) to the broader stagnation of national digital literacy goals.

Most literature remains descriptive to individual state chapters. This study fills the empirical gap by providing a multi-stage, cross-zonal analysis explicitly linking the NLA's exclusion from the agenda-setting stages of national policy formulation to the structural deficiencies found in current Nigerian digital frameworks. It serves as a timely empirical intervention for realigning national information strategies with international LIS standards.

Methodology

The study utilized a descriptive survey research design, which is uniquely suited for systematically investigating the current status of the Nigerian Library Association's (NLA) influence without manipulating ongoing variables. The target population for this study encompassed all registered, financially up-to-date information professionals across the 36 state chapters of the NLA. Based on the official national membership registry maintained by the Librarians' Registration Council of Nigeria (LRCN) and the NLA National Secretariat, the total accessible sampling frame comprised 240 registered information professionals actively engaged in policy frameworks or institutional management. To ensure strict eligibility, the inclusion criteria required participants to:

1. Hold a minimum of a bachelor's degree or equivalent in Library and Information Science (LIS) or a closely related information-management discipline.
2. Maintain active, certified registration status with the LRCN.
3. Possess at least three years of professional post-qualification experience within an academic, public, or specialized information repository.

To achieve a representative and credible dataset from the total population (N = 240), the sample size was statistically determined using the Krejcie and Morgan (1970) sampling formula:

$$s = \frac{\chi^2 NP(1-P)}{d^2(N-1) + \chi^2 P(1-P)}$$

Where:

- s = required sample size.
- X = the table value of Chi-Square for 1 degree of freedom at the desired confidence level (3.841 for a 95 confidence interval).
- N = the total target population size (240).
- P = the population proportion (assumed to be .50 to achieve maximum sample size).
- d = the degree of accuracy or margin of error expressed as a proportion (.05).

Applying these parameters to the target population yielded a mathematically justified sample size of approximately 148 respondents, which was rounded up to 150 respondents to cushion against potential non-response rates. A multi-stage sampling procedure was then employed to select these participants. First, purposive sampling was used to target national and state executive members who possess direct policy advocacy experience. Second, stratified random sampling was applied across Nigeria's six geopolitical zones to account for regional infrastructure disparities, as noted by Emezie and Nwaohiri (2021).

The primary research instrument was the NLA and National Information Policy Development Questionnaire (NNIPDQ), a structured questionnaire designed around a 4-point Likert Scale to quantify professional perceptions. Face and content validity were established through expert vetting by senior LIS academics, who evaluated the items for clarity, relevance, and alignment with the research questions.

To establish the reliability of the instrument, a pilot test was conducted using 15 information professionals from the NLA Niger State Chapter, who were part of the target population but excluded from the final sample. The field data obtained from the pilot study were subjected to an internal consistency analysis using SPSS (Version 26.0). The instrument yielded an overall Cronbach's Alpha (alpha) reliability coefficient of 0.84.

Data collection was executed through digital survey tools (Google Forms), leveraging the NLA's national professional networks and regional listservs to ensure wide geographic coverage. Once gathered, the quantitative data

were processed using SPSS (Version 26.0), where Mean (x) and Standard Deviation (SD) were utilized to answer the research questions. A benchmark mean of 2.50 served as the decision criterion to determine the level of agreement regarding NLA participation, priority integration, and implementation challenges

Result

This section presents the empirical findings derived from the field survey conducted to evaluate the impact of the Nigerian Library Association (NLA) on the development of National Information and Communication Technology (ICT) policies. The primary objective was to determine the extent of professional participation in policy formulation and the subsequent integration of Library and Information Science (LIS) priorities into Nigeria's digital frameworks.

Research Question 1: What is the level of Nigerian Library Association (NLA) participation in the formulation of National Information Policies?

Table 1: Mean and Standard Deviation of NLA Participation in National Policy Formulation

S/N	Item Statement	Mean ($\bar{x}$)	Std. Dev (σ)	Remark
1	Consistency in Agenda-Setting stage invitation	1.98	0.89	Disagree
2	Executive seats in technical drafting committees	1.92	0.83	Disagree
3	Viewed as a primary consultant by government	1.85	0.74	Disagree
4	Utilization of LRCN as legislative leverage	1.81	0.81	Disagree
Sectional Cluster Mean		**1.89**	**0.82**	**Low Participation**

The data in Table 1 indicates a notable participation deficit within the professional body, as perceived by the respondents. The cluster means of 1.89 suggests that the NLA's role in the policy lifecycle is widely viewed as peripheral. Item 4 recorded the lowest mean (x = 1.81), implying a critical professional sentiment: the establishment of the Librarians' Registration Council of Nigeria (LRCN) may not yet have translated into significant legislative influence at the federal level, according to the sampled professionals. Furthermore, the mean of 1.98 for agenda-setting implies that when the NLA is involved, it is likely during the late-stage review phases rather than the formative conceptualization of policy, which potentially bars LIS professionals from shaping the foundational direction of national ICT strategies.

Research Question 2: To what extent are LIS-specific priorities integrated into Nigeria's National ICT and Information Policy frameworks?

Table 2: Mean and Standard Deviation of Integration of LIS Priorities

S/N	Item Statement	Mean ($\bar{x}$)	Std. Dev (σ)	Remark
5	Explicit library roles in digital economy	2.07	0.94	Disagree
6	Integration of professional LIS standards	1.91	0.82	Disagree
7	Priority of library services over hardware labs	1.85	0.84	Disagree
8	Alignment of NLA and Ministry ICT goals	1.94	0.85	Disagree
	Sectional Cluster Mean	**1.94**	**0.86**	**Low Integration**

Table 2 highlights what respondents perceive as a significant content-infrastructure mismatch. With a cluster mean of 1.94, the findings suggest that current frameworks are widely viewed as prioritizing hardware procurement over professional information management. Specifically, Item 7 (x = 1.85) reflects a shared frustration that national education policies often tend to equate ICT with the physical installation of computer laboratories while apparently neglecting the digital library services and curation expertise required to make those tools effective. Furthermore, the mean of 1.91 for Item 6 indicates that technical LIS standards such as metadata protocols and digital preservation may be missing from national data repository projects, which respondents suggest could lead to silos of unorganized information.

Research Question 3: What are the challenges hindering the NLA from effectively driving the implementation of national information policies?

Table 3: Mean and Standard Deviation of Challenges to Policy Implementation

S/N	Item Statement	Mean ($\bar{x}$)	Std. Dev (σ)	Remark
9	Inadequate federal funding	3.40	0.77	Agree
10	Lack of standalone National Information Policy	3.33	0.81	Agree
11	Negative or obsolete perception of profession	3.23	0.78	Agree
12	Systemic infrastructure deficits (power/web)	3.38	0.75	Agree
	Sectional Cluster Mean	**3.34**	**0.78**	**High Impact**

Table 3 indicates that the implementation landscape is perceived as being characterized by severe systemic bottlenecks, as demonstrated by the high cluster mean of 3.34. Inadequate federal funding (x = 3.40) is reported as the most dominant obstacle, followed closely by infrastructure deficits (x = 3.38), such as erratic power and poor internet

connectivity, which respondents imply may render even well-designed digital policies difficult to execute at the state level. Importantly, Item 11 (x = 3.23) suggests that the professional perception gap is a lived reality for practitioners; respondents agree that policymakers' obsolete views of librarianship as a purely physical, book-based profession may actively hinder the NLA's ability to be recognized as a digital-age stakeholder.

Discussion of Findings

The empirical evidence from this study validates the scholarly concerns regarding the marginalization of the LIS profession in Nigeria's digital transformation. The low participation score x=1.89 aligns strictly with the views of Abubakar (2021), who argued that the exclusion of librarians from agenda-setting stages results in top-down policies that fail to address the human element of information proficiency. This exclusion creates a vacuum where professional standards are omitted, a finding that supports Unegbu (2022) and his assertion that the National ICT Policy updates exhibit zero inclusion of LIS-specific priorities like metadata and digital curation.

The study also provides a critical lens on the priority mismatch mentioned by Saleh and Tsagem (2020). The high disagreement on Item 7 x=1.85 proves that the federal focus remains heavily biased toward hardware, contradicting the professional need for content management strategies. This finding is in line with Udo Nwokocha (1997/2021), who warned that a library (digital or physical) without a supporting policy framework is merely a collection of resources without utility. Furthermore, while the data on implementation challenges x=3.34 reinforces the grossly inadequate funding cited by Emezie and Nwaohiri (2021), it adds a psychological dimension: the agreement on the negative perception of the profession (x=3.23) indicates that the NLA faces a battle of professional identity. This finding contradicts any assumption that the creation of the LRCN solved the profession's status issues; instead, it suggests that the NLA remains a pressure group with limited executive influence, as previously posited by Emezie and Nwaohiri (2021). Ultimately, the results demonstrate that without a unified National Information Policy to bridge these sectors, the policy-practice gap identified by Amaechi *et al*. (2018) will continue to widen.

Conclusion

This study evaluates the institutional role and perceived influence of the Nigerian Library Association (NLA) within the formulation and execution of Nigeria's national information and digital frameworks. The empirical evidence demonstrates a persistent structural gap, revealing a profound participation deficit where LIS professionals are largely excluded from the critical, formative agenda-setting stages of national policy design. This lack of executive consultation has directly resulted in an operational mismatch where national strategies favor raw physical infrastructure and equipment procurement over essential data management priorities like metadata standardization and digital curation protocols. Furthermore, the study establishes that the absence of a unified, standalone National Information Policy (NIP) acts as the primary driver of this fragmentation, leaving information governance scattered across sectoral documents and stymied by systemic bottlenecks chiefly inadequate federal funding, regional infrastructure deficits, and archaic professional stereotypes held by policymakers.

Recommendations

Based on the specific problems and empirical findings identified in the study, the following concise, numbered recommendations are proffered:

1. The Federal Government should establish a formal partnership between ICT ministries and the NLA to draft a unified, standalone NIP that resolves policy fragmentation by balancing physical infrastructure with clear guidelines for content management and information literacy.
2. The Ministry of Communications and Digital Economy should form strategic partnerships with the NLA, granting the association permanent, consultative status on technical drafting committees to include LIS professionals during foundational agenda-setting stages.
3. National digital frameworks must explicitly require the integration of standard metadata protocols, standardized cataloging, and digital preservation architectures into all state-sponsored data repositories to correct the infrastructure-content mismatch.
4. Institutional heads must create ring-fenced, protected budgets dedicated strictly to library automation and digital subscriptions to mitigate severe funding inadequacies and prevent the diversion of e-library resources.
5. The NLA should establish specialized training programs to build capacity among librarians in policy design, legislative drafting, and high-level lobbying to ensure more aggressive and effective professional representation.
6. The Librarians' Registration Council of Nigeria (LRCN) should mandate continuous professional development modules focused on emerging digital governance, data curation, and information ethics to keep professionals aligned with modern national data strategies and correct obsolete stereotypes.
7. Federal and state agencies must prioritize funding for alternative energy solutions, such as solar networks, and reliable internet connectivity within information hubs to overcome the localized infrastructure deficits stalling digital mandates.

Department of Library and Information Science,
Faculty of Social Sciences, University of Abuja, Nigeria
Phone number: 08056681296
Email address: busari.ajoke@ubiabuja.edu.ng

Abstract

This study examined the influence of well-equipped tertiary institution libraries and professional librarians on teaching, learning, and research for national development. Two institutions were randomly selected from each state in the South-West geopolitical zone of Nigeria, yielding twelve tertiary institutions in total. From these, twenty respondents were randomly selected per institution, giving a total of 240 research subjects. The research instrument, titled "Influence of Well-Equipped Library and Library Staff on Teaching, Learning and Research Questionnaire," was modelled after the Likert scale, validated, and its reliability confirmed through test-retest within a two-week interval. Data were analysed using the Pearson Product Moment Correlation technique. Findings indicated significant positive relationships between: (i) well-equipped academic libraries and teaching-learning processes; (ii) professional librarians and teaching-learning processes; (iii) well-equipped academic libraries and the conduct of research; and (iv) professional librarians and the conduct of research. The study recommends that all tiers of government should prioritise equipping tertiary institution libraries and developing professional librarian competencies to advance teaching, learning, research, and national development in Southwest Nigeria.

Keywords: Academic Libraries, Development, Professional Librarians, Research, Southwest Nigeria, Teaching and Learning

Introduction

The library occupies a central position in the academic life of any tertiary institution. It serves as a repository of knowledge, housing printed and digital materials that support the intellectual activities of students and academic staff. In contemporary times, libraries provide both physical and virtual access to resources, enabling users to engage with a broad spectrum of information regardless of location. Globally, well-equipped academic libraries are recognised as indispensable infrastructure for quality education, scholarly inquiry, and institutional development (Aina, 2024).

Academic libraries in Nigerian tertiary institutions are expected to support the three core mandates of higher education: teaching, learning, and research. However, the degree to which these libraries fulfil this mandate is largely contingent on the adequacy of their collections, the sophistication of their services, and the professional competence of their staff. The librarian, as an information professional, plays a pivotal role in ensuring that both faculty and students can access, retrieve, and utilise information resources efficiently and effectively (Robinson, 2024).

In Nigeria, the quality of tertiary education has attracted significant concern from stakeholders, policymakers, and the international academic community. One critical but often underemphasised factor is the state of university libraries and the professionalism of library personnel. Studies have consistently shown that institutions with well-resourced libraries and competent librarians record better academic outcomes than those without (Jimoh, 2016; Idowu, 2017). Yet, many Nigerian tertiary institutions, particularly in the Southwest zone continue to grapple with inadequate library funding, outdated collections, inadequate ICT infrastructure, and a shortage of qualified library staff (Mattson, 2020).

The Southwest zone of Nigeria, comprising Lagos, Ogun, Oyo, Osun, Ondo, and Ekiti States, is home to several prominent universities, polytechnics, and colleges of education. Despite the zone's reputation for relatively higher educational standards compared to other regions, systemic challenges in library provision persist. These challenges undermine the zone's capacity to produce world-class graduates and research outputs capable of driving national development (Ritchy, 2024).

It is against this backdrop that this study investigates the influence of well-equipped academic libraries and professional librarians on teaching, learning, research, and development in Southwest Nigeria. The study is timely, given current national efforts to overhaul the quality of tertiary education and the growing demand for institutions that can produce graduates who are globally competitive and research-oriented.

Objectives of the Study

The objectives of the study are to:

1. Identify the influence of well-equipped academic libraries on the teaching and learning processes.
2. Determine the influence of professional librarians on teaching and learning.
3. Identify the influence of well-equipped academic libraries on the conduct of research.
4. Determine the influence of professional librarians on the conduct of research.

Literature Review

Academic libraries serve as the intellectual backbone of tertiary education, providing the resources necessary for effective teaching and learning. A well-equipped library allows lecturers to access diverse instructional materials, integrate digital aids, and apply varied pedagogical approaches. Aina (2024) and Robinson (2024) assert that standard library facilities, manned by qualified staff, are prerequisites for educational efficiency. This aligns with the constructivist view that learning is optimized when students access rich, varied information sources (Akinpelu, 2021).

Teaching involves the conscious effort to impart knowledge, skills, and values, which requires teachers to have access to current, comprehensive resources (Akinpelu, 2021). Concurrently, learning defined as the modification of behavior through environmental stimulation is supported by the library's conducive environment (Cooley, 2024; Gross, 2022). Modern libraries further support diverse learning styles, including active, observational, and e-learning, as outlined by Schacter, Gilbert, and Wegner (2019).

Busari (2007) systematically established the library as an intellectual pillar for tertiary institutions in Kwara State. This was reinforced by Busari (2020a), who found that structured library orientation significantly improves students' ability to evaluate and utilize resources, thereby boosting academic performance. To remain relevant in the digital age, Busari, Ahmed, and Alhassan (2024) advocate for user-centric library collaborations, where collections are proactively presented via online platforms and media broadcasts to maximize user engagement.

Professional librarians act as essential intermediaries who facilitate information literacy and guide research. Mattson (2020) describes the librarian as a "secular minister to democracy," ensuring equitable access to information. Their expertise in cataloging, classification, and database management reduces the time users spend searching for content, allowing for deeper academic engagement (Kline, 2025).

Librarians also partner with faculty to design library-integrated curricula. Usman, Sambo, and Busari (2017) recommend making library education courses practically oriented to instill lasting research habits in students. Busari (2015) identified that library service quality significantly determines student engagement with technical learning materials, confirming the librarian's role as an active facilitator of curriculum delivery.

Additionally, Busari (2020b) emphasizes that strategic collection development management is a core competency that dictates the depth of resources available for various pedagogical needs. Finally, Busari and Idris (2025) note that as AI-driven systems become central to education, the urgent need for continuous professional development for librarians has become paramount to ensuring institutional readiness. Research, the lifeblood of tertiary institutions, depends on the library's ability to provide access to existing knowledge (Creswell, 2016; Merriam-Webster, 2026). Cooley (2024) highlights the library's utility in conducting rigorous literature reviews a fundamental step in the research process (Shields & Rangarajan, 2023).

Empirical evidence from Idowu (2017) and Jimoh (2016) shows that institutions with modern, well-resourced libraries and qualified staff produce research of significantly higher depth, originality, and rigor. Furthermore, Busari, Madu, Udensi, and Akor (2019) demonstrated that information accessibility is strongly correlated with knowledge acquisition. Their findings suggest that access to organized repositories is a precondition for meaningful research activity across all disciplines.

Librarians actively support researchers by assisting in literature identification, tool selection, and database navigation. Ritchy (2024) emphasizes that professional librarians contribute directly to scientific methodology by supporting the critical evaluation of information. In research-intensive environments, the librarian-to-researcher ratio is often a predictor of high publication output (Celano & Neumann, 2021).

However, professional effectiveness is contingent upon institutional support. Busari (2022) found that administrative inefficiencies and resource gaps in school libraries often hinder the delivery of quality research services. Similarly, Akanbi, Sambo, and Busari (2023) highlighted that a lack of policy and expertise in acquiring "grey literature", such as conference papers and government documents limits the scope of academic research. They recommend that library administrators prioritize training in specialized collection development to support the complex needs of modern scholars. Ultimately, the research capacity of Nigerian tertiary institutions is inextricably linked to ongoing investments in library infrastructure and the continuous professional training of librarians.

Research Methodology

The research adopted a descriptive survey design, given its aim to elicit respondents' views concerning the relationship between well-equipped libraries and librarians and the quality of teaching, learning, and research in tertiary institutions. The research population comprised all tertiary educational institutions in the six states of the South-West zone of Nigeria. Using random sampling, two institutions were selected from each state, yielding twelve institutions in total. From each institution, twenty respondents were randomly selected, giving a total sample of 240 participants. The research instrument, titled "Influence of Well-Equipped Library and Library Staff on Teaching, Learning and Research Questionnaire," was constructed on the Likert scale model and validated by experts. Its reliability was ascertained through a test-retest procedure conducted within a two-week interval. The researcher personally administered the instrument across all sample institutions, and retrieved copies were subjected to the Pearson Product Moment Correlation technique for data analysis.

Findings and Discussions

Table 1: Influence of well-equipped academic libraries on teaching and learning processes.

S/N	Items	Agree		Disagree	
		No	%	No	%
A.	**A well-equipped library enables the teacher/lecturer to:**				
1.	Find relevant teaching materials	180	75%	60	25%
2.	Use appropriate teaching methods	168	70%	72	30%
3.	Compare different lesson items	192	80%	48	20%
4.	Utilise relevant teaching aids	171	71%	69	29%
B.	**A well-equipped library enables the students to:**				
1.	Find relevant materials	212	88%	28	12%
2.	Do assignments well	218	91%	22	9%
3.	Prepare for the next class	198	83%	42	17%
4.	Retrieve additional facts	225	94%	15	6%

Findings from Table 1 reveal that the majority of respondents affirmed the positive influence of well-equipped academic libraries on teaching and learning. Specifically, 180 (75%) agreed that a well-equipped library enables lecturers to find relevant teaching materials, while 168 (70%) agreed it facilitates the use of appropriate teaching methods. Furthermore, 192 (80%) and 171 (71%) agreed that it assists lecturers in comparing lesson items and utilising relevant teaching aids, respectively. For students, 212 (88%) affirmed that a well-equipped library enables them to find relevant materials, 218 (91%) agreed it assists them in completing assignments, 198 (83%) agreed it aids preparation for subsequent classes, and 225 (94%) agreed it enables retrieval of additional facts.

Table 1a: Pearson r statistical analysis of the relationship between a well-equipped library and effective teaching-learning processes (Ho1).

Variables	N	Mean	Calc. r-value	Critical r-value	df	Level of Sig.	Decision
Well-equipped library (X) / Effective teaching and learning (Y)	240	12.62 / 13.55	0.723	0.136	239	0.05	Ho_1 Rejected

The result in Table 1a shows that the calculated r-value (0.723) is greater than the critical r-value (0.136) at 239 degrees of freedom and 0.05 level of significance; thus, Ho1 is rejected. This indicates a significant positive relationship between well-equipped academic libraries and effective teaching-learning processes, a finding consistent with the positions of Robinson (2024) and Aina (2024) that library resources are indispensable to productive teaching and learning.

Table 2: Influence of professional librarians on teaching-learning processes.

S/N	Items	Agree		Disagree	
	Well-trained library staff assist the teachers and students to:	No	%	No	%
1.	Find relevant lecture materials	200	83%	40	17%
2.	Conduct themselves appropriately in the library environment	210	88%	30	12%
3.	Organise the needed information	207	86%	33	14%
4.	Compare and contrast divergent facts	192	80%	48	20%

Table 2 indicates that 200 (83%) of respondents agreed that professional library staff assist lecturers and students in finding relevant lecture materials. Furthermore, 210 (88%) affirmed that librarians assist users in conducting themselves appropriately in the library environment; 207 (86%) agreed that they facilitate the organisation of needed

information; and 192 (80%) confirmed that librarians assist in comparing and contrasting divergent facts. These findings affirm the significant role of professional librarians in supporting the learning process.

Table 2a: Pearson r statistical analysis of the relationship between professional librarians and effective teaching-learning processes (Ho2).

Variables	N	Mean	Calc. r-value	Critical r-value	df	Level of Sig.	Decision
Professional library staff (X) / Effective teaching and learning (Y)	240	14.75 / 16.24	0.683	0.136	239	0.05	Ho_2 Rejected

The result in Table 2a reveals that the calculated r-value (0.683) exceeds the critical r-value (0.136) at 239 degrees of freedom and 0.05 level of significance, leading to the rejection of Ho2. This confirms a significant positive relationship between professional librarians and effective teaching-learning processes. The finding is consistent with Kline (2025) and Celano and Neumann (2021), who established that well-trained library personnel constitute a necessary condition for productive teaching and learning.

Table 3: Influence of well-equipped academic libraries on the conduct of research.

S/N	Items	Agree		Disagree	
	A well-equipped library enables teachers and students to:	No	%	No	%
1.	Locate research topics similar to their own	222	93%	18	7%
2.	Locate relevant literature for review	204	85%	36	15%
3.	Access relevant journals for research support	186	78%	54	22%
4.	Obtain appropriate means of data analysis	216	90%	24	10%
5.	Locate relevant and validated research instruments	219	91%	21	9%

Results in Table 3 show that the overwhelming majority of respondents confirmed the positive influence of well-equipped academic libraries on research. Specifically, 222 (93%) agreed that such libraries help researchers locate similar research topics; 204 (85%) confirmed access to relevant literature; 186 (78%) agreed that journals are readily accessible for research support; 216 (90%) affirmed access to data analysis tools; and 219 (91%) confirmed the availability of validated research instruments. These results align with the assertions of Cooley (2024) and Idowu (2017).

Table 3a: Pearson r statistical analysis of the relationship between well-equipped academic libraries and efficient conduct of research (Ho3).

Variables	N	Mean	Calc. r-value	Critical r-value	df	Level of Sig.	Decision
Well-equipped library (X) / Efficient conduct of research (Y)	240	13.88 / 15.14	0.633	0.136	239	0.05	Ho_3 Rejected

Table 3a shows that the calculated r-value (0.633) exceeds the critical r-value (0.136) at 239 degrees of freedom and 0.05 level of significance; thus, Ho3 is rejected. This confirms a significant positive relationship between well-equipped academic libraries and the efficient conduct of research. The result corroborates Jimoh (2016) and Idowu (2017), who found that library resources are part of the necessary conditions for productive academic research.

Table 4: Influence of professional librarians on the conduct of research.

S/N	Items	Agree		Disagree	
	Well-trained library staff assist the teachers and students to:	No	%	No	%
1.	Identify locations of similar research topics	225	94%	15	6%
2.	Locate past researches of similar sample and population	198	83%	42	17%
3.	Locate appropriate and validated questionnaire items	201	84%	39	16%
4.	Obtain relevant statistical tools	222	93%	18	7%

Table 4 reveals that 225 (94%) of respondents agreed that professional library staff assist researchers in identifying locations of similar research topics; 198 (83%) confirmed they assist with locating past researches of similar sample and population; 201 (84%) agreed they assist in locating validated questionnaire items; and 222 (93%) affirmed that librarians assist in obtaining relevant statistical tools.

Table 4a: Pearson r statistical analysis of the relationship between professional librarians and efficient conduct of research (Ho4).

Variables	N	Mean	Calc. r-value	Critical r-value	df	Level of Sig.	Decision
Professional library staff (X) / Efficient conduct of research (Y)	240	14.37 / 12.81	0.718	0.136	239	0.05	Ho_4 Rejected

Table 4a shows that the calculated r-value (0.718) is greater than the critical r-value (0.136) at 239 degrees of freedom and 0.05 level of significance; hence, Ho4 is rejected. This confirms a significant relationship between professional librarians and the efficient conduct of research, in agreement with Ritchy (2024) and Celano and Neumann (2021), who established that well-equipped library personnel are indispensable for academic research.

Discussion

The finding from research question one (Table 1) demonstrates that well-equipped academic libraries positively influence teaching and learning processes. Lecturers are better able to find relevant teaching materials, deploy appropriate methods, compare lesson content, and utilise teaching aids when library resources are adequate. Students, similarly, benefit in terms of material access, assignment quality, class preparation, and information retrieval. This supports Robinson (2024), who maintained that no productive teaching or learning is possible without a standard, well-manned library. It also aligns with the constructivist framework advanced by Akinpelu (2021), which holds that effective learning is contingent on access to diverse and current information.

The finding from research question two (Table 2) confirms that professional librarians are significant contributors to effective teaching and learning. Well-trained library staff assist both lecturers and students in locating relevant materials, maintaining appropriate library conduct, organising information, and evaluating divergent facts. This is consistent with Aina (2024), who noted that a well-staffed library is as critical as a well-stocked one, and with Kline (2025), whose work affirmed that professional library personnel are essential enablers of productive academic activity.

The finding from research question three (Table 3) establishes that well-equipped academic libraries are significantly associated with the efficient conduct of research. Respondents confirmed access to research topics, literature, journals, data analysis tools, and validated instruments through library resources. This corroborates Cooley (2024), who stressed the library's indispensability for literature review, and Idowu (2017), who found a positive association between library resource availability and research quality in tertiary institutions in Oyo State. Contrary findings were noted among the 22% who disagreed on journal accessibility, suggesting that journal holdings remain an area requiring improvement.

The finding from research question four (Table 4) shows that professional librarians are critical to research support. Researchers rely on librarians for identifying similar studies, locating population-matched prior research, retrieving validated instruments, and obtaining statistical tools. This is in agreement with Jimoh (2016), who argued that every tertiary institution must possess functional libraries with adequately qualified staff, and with Ritchy (2024), who underscored the librarian's scientific and methodological contributions to research. The 16-17% disagreement rates across some items suggest scope for capacity building among library staff in specific research support competencies.

Conclusion

This study has investigated the influence of well-equipped academic libraries and professional librarians on teaching, learning, research, and development in Southwest Nigeria. The findings consistently demonstrate significant positive relationships across all four research questions. A well-equipped academic library exerts a positive influence on teaching and learning, while professional librarians further enhance this process through skilled information mediation. Similarly, well-equipped libraries and professional librarians both make significant contributions to the efficient conduct of academic research.

Virtually all members of an academic community—both staff and students—derive maximum benefit from a well-equipped academic library, as it not only enriches their knowledge and skills but also substantially supports their research endeavours. Given the aspirations of Southwest Nigeria as an educational and developmental hub, sustained investment in library infrastructure and librarian professional development is both a strategic necessity and a moral imperative.

Recommendations

Based on the findings of this study, the following recommendations are made:

1. Federal, state, and local governments, as well as institutional management, should prioritise the acquisition of current, adequate, and diverse library resources—including books, journals, encyclopaedias, e-databases, and

digital infrastructure—to enhance the teaching and learning processes in tertiary institutions across Southwest Nigeria.

2. Tertiary institutions should continuously invest in the professional development of library staff through regular training workshops, seminars, and conferences, so as to ensure that librarians remain competent, current, and capable of providing high-quality instructional and reference support to both faculty and students.
3. Institutional authorities should allocate dedicated and adequate budgets to library journal subscriptions, database access, and research support tools to strengthen the research capacity of students and academic staff, particularly in the areas of literature review, data analysis, and instrument retrieval.
4. Library management and institutional leadership should implement structured collaboration programmes between librarians and academic departments, including library-integrated research support services, to deepen the engagement of professional librarians in the research process and improve the overall quality of academic research output in Southwest Nigeria.

ABSTRACT

This study examined information use by Small and Medium Enterprises (SMEs) in the Katsina Senatorial Zone of Katsina State, Nigeria. The study aimed to identify the types of information used by SMEs, determine their sources of information, assess the purposes of information use, and examine the challenges encountered in accessing and utilizing information. A descriptive survey research design was adopted, with a population of 7,372 registered SMEs. A sample size of 367 was determined using an authorized table, while 362 valid questionnaires were retrieved and analyzed. Data were collected using a structured questionnaire and analyzed using descriptive statistics. The findings revealed that SMEs highly utilize market, financial, competitor, and operational information, while legal and regulatory information received relatively lower attention. Internet sources, social media, and interpersonal networks were the most frequently used sources, whereas libraries and information centers were the least utilized. The study further showed that SMEs use information extensively for decision-making, planning, financial management, marketing, and operational efficiency. However, major challenges identified include poor internet connectivity, high cost of accessing information, lack of awareness of information sources, limited information literacy, and difficulty identifying reliable information. The study concluded that although SMEs actively use information for business growth and performance, their effectiveness is constrained by infrastructural and capacity-related challenges. It recommended increased awareness and use of legal and regulatory information, improved accessibility of library and information services, capacity building in information literacy and digital skills, and enhanced investment in information infrastructure and affordability to support effective information use among SMEs.

Keywords: Information use, Small and Medium Enterprises (SMEs), Decision-making, Information sources, Katsina Senatorial Zone

INTRODUCTION

Small and Medium Enterprises (SMEs) are widely recognized as key drivers of economic growth, employment creation, and poverty reduction, particularly in developing countries such as Nigeria. They contribute significantly to industrial development and local productivity, yet their effectiveness largely depends on how well they access and utilize relevant information for decision-making and business operations. Information use enhances organizational efficiency and performance among SMEs by supporting planning, marketing, and operational decisions (Adebayo & Odunlade, 2019). Information use is the ability of business operators to identify, access, interpret, and apply relevant data from various sources to improve productivity and competitiveness. In Nigeria, SMEs rely on both formal and informal information sources such as customers, suppliers, media platforms, and government agencies. However, the extent and pattern of information use vary depending on accessibility, awareness, and technological capacity (Ojo, Akinsunmi & Olayonu, 2015). Despite its importance, many SMEs still face challenges such as inadequate access to reliable information, poor information literacy, and limited ICT infrastructure.

In Katsina State, SMEs operate within a challenging business environment characterized by financial constraints, limited digital adoption, and infrastructural deficiencies. Nevertheless, they remain vital to the state's economic development, contributing to employment and income generation (Suleiman, 2025). Moreover, Yunusa and Shehu (2025) also indicated that factors such as business environment and digital innovation significantly influence SME performance, further highlighting the importance of effective information use in sustaining business growth. Given the increasing importance of information in modern business operations, it is essential to understand how SMEs in Katsina Senatorial Zone use information, the sources they depend on, the purposes it serves, and the challenges they encounter. Therefore, this study examines the pattern and extent of information use by SMEs in Katsina Senatorial Zone of Katsina State, Nigeria, to provide empirical evidence that can guide policy and improve business performance in the region.

However, in Katsina Senatorial Zone, SME's key sectors include Agriculture & Agro-processing, millet selling, sorghum, maize, groundnuts and onions businesses.

There are lots of SMEs in milling, oil extraction, livestock feed. Katsina Senatorial zone also witnessed training in Leather & Tanning. Katsina city leather work is historic. Shoes, bags, belts are available in many small workshops. In the Trade & Commerce, Katsina borders with Niger Republic which makes Katsina a trade hub. SMEs in import/export, wholesale, retail.

In the Solid Minerals some people hold Gypsum, kaolin, limestone SMEs.

ICT & Services as SMEs encourages Phone repair, POS/agent banking, Cybercaféés, tailoring, carpentry in Katsina Senatorial Zone.

SPECIFIC OBJECTIVES

The primary objective of the study is to examine the pattern and extent of information use by Small and Medium Enterprises (SMEs) in the Katsina Senatorial Zone of Katsina State, Nigeria, while the specific objectives are to:

4. identify the types of information used by SMEs in the Katsina Senatorial Zone.
5. determine the sources of information utilized by SMEs in the study area.
6. assess the purposes for which SMEs use information in their business operations.
7. identify the challenges faced by SMEs in accessing and using information.

LITERATURE REVIEW

INFORMATION USE

The concept of information use refers to the process by which individuals apply acquired information to accomplish tasks, solve problems, and support decision-making in specific contexts. It represents the final stage of information behaviour after information need identification and information seeking. Information use involves interpreting, evaluating, and integrating information into existing knowledge to produce meaningful outcomes. Researchers emphasize that information use is context-dependent and influenced by users' goals, tasks, and environments, which determine how information is selected and applied. This perspective highlights that information becomes valuable only when it is effectively utilized to meet personal, academic, or organizational objectives (Dervin, 2023; Maceviciute, 2025). Similarly, this suggests that, within small and medium enterprises (SMEs), the effectiveness of any information system or resource lies not merely in access, but in how effectively business owners and managers utilize the information to enhance decision-making, drive innovation, and improve overall organizational performance.

Information use is also considered a central component of information behaviour studies, which examine how users, particularly small and medium enterprises (SMEs), interact with information sources and transform retrieved content into actionable knowledge for business operations. It includes activities such as comparing sources, synthesizing ideas, and applying information to decision-making, innovation, and daily enterprise activities. Awareness of SMEs' information needs and patterns of information use is essential for the planning, implementation, and effective operation of library and information systems that support business development. Consequently, effective information use enhances productivity, knowledge creation, and problem-solving capabilities among SMEs, making it a fundamental concept in library and information science and knowledge management environments (Huvila, Enwald, Hirvonen, & Eriksson-Backa, 2019; Kumari & Sharma, 2021). Effective information use strengthens SMEs' decision-making, innovation, and productivity through meaningful application of retrieved knowledge in business operations.

SMALL AND MEDIUM ENTERPRISES

Small and Medium Enterprises (SMEs) refer to businesses that operate on a relatively small scale in terms of employees, capital investment, and turnover. Although there is no universal definition, SMEs are commonly classified using criteria such as staff headcount, annual turnover, and asset value, which vary across countries and institutions. For instance, the European Commission categorizes SMEs as enterprises with fewer than 250 employees and defined turnover thresholds, emphasizing their operational size and economic capacity. These enterprises are typically independently owned, flexible, and capable of adapting quickly to changing market conditions compared to large firms (OECD, 2023; European Commission, 2020). This indicates that SMEs constitute a vital segment of the economy due to their scale, adaptability, and contribution to employment and economic development.

Since SMEs are widely recognized as critical drivers of economic growth, employment generation, and innovation, particularly in developing economies. They contribute significantly to income generation, poverty reduction, and industrial development by promoting entrepreneurship and supporting local production. In Nigeria, SMEs play a vital role in expanding economic activities, creating job opportunities, and enhancing economic diversification despite facing challenges such as limited financing and infrastructure constraints. Their importance lies in their ability to stimulate grassroots development and strengthen the private sector, making them essential for sustainable national development (Oluremi & Maku, 2024; Ibitomi, Dada, Ayedogbon, Micah, & Aderotimi, 2024). This shows that the growth and effectiveness of SMEs largely depend on how well they access, interpret, and utilize relevant information to overcome operational challenges and enhance business performance.

EMPIRICAL REVIEW

Burodo, Iliyasu, and Sanusi (2024) examined the effect of business environment on SME performance in Katsina State. The study found that access to finance had the strongest positive and significant effect on performance, followed by human resources and technological factors, while government policies had a positive but relatively weaker influence, indicating that financial access, skilled manpower, and technology are key drivers of SME growth and competitiveness. However, although the study effectively identifies major environmental determinants of performance, it is limited in scope as it focuses mainly on external factors and outcomes without addressing information use and decision-making processes within SMEs. It also adopts a broad state-wide coverage and does not explore how SMEs access and apply information or the challenges they face in doing so, despite using a similar population base. In contrast, this study

narrows the context to the Katsina Senatorial Zone and shifts attention to information behaviour by examining types, sources, purposes, and challenges of information use, thereby filling the gap in understanding the processes behind performance differences and adding a practical dimension relevant to policy and information service delivery.

The study by Ojo, Akinsunmi and Olayonu (2015), on Influence of Business Information Use on Sales Performance of SMEs in Lagos State. The study examined the influence of business information use on sales performance, emphasizing the relationship between information utilization and business outcomes. The findings revealed that SMEs relied mostly on newspapers and informal sources for business information, and that business information utilization significantly influenced sales performance, indicating that increased use of business information improves SMEs' sales outcomes and overall performance. In contrast, the current study in Katsina Senatorial Zone is broader in scope as it investigates types, sources, purposes, and challenges of information use without linking it to performance indicators. This reveals a conceptual gap as the Lagos study measured effectiveness through sales performance, while the present study emphasizes descriptive patterns of information behaviour. Geographically, there is a contextual gap as Lagos is a highly commercial and ICT-driven environment that may not reflect the realities of SMEs in Northern Nigeria with weaker digital infrastructure. Methodologically, the earlier study incorporated regression analysis, whereas the current study is purely descriptive. Additionally, the 2015 study is outdated in the context of rapid digital transformation, leaving a temporal gap in understanding contemporary information use practices among SMEs in Katsina Senatorial Zone.

Burodo, Magaji, and Dakingari (2024) investigated the effect of inflation on SME performance in Katsina State, focusing on uncertainty about future prices and exchange rate fluctuations. The findings showed that both price uncertainty and exchange rate fluctuations significantly and negatively affect SME performance, indicating that inflationary pressures reduce productivity and growth, thereby necessitating policy measures for price and exchange rate stability (Burodo, Magaji, and Dakingari 2024). However, the study is limited by its macroeconomic focus, as it emphasizes external inflation variables without examining internal information behaviour or how SMEs access and use information in responding to these challenges. It also overlooks key aspects such as information types, sources, purposes, and access constraints, which are important for understanding decision-making and adaptation strategies. Although it establishes statistical relationships using a similar population base, it remains outcome-oriented and does not explain how information use influences coping mechanisms, planning, pricing, and risk management, thereby creating a gap that necessitates studies on SME information use for deeper, micro-level understanding of performance under inflationary conditions.

THEORETICAL REVIEW

Wilson's Information Behaviour Model

Wilson's Information Behaviour Model, originally proposed by Wilson (1981) and later refined in 1999, explains how individuals and groups recognize information needs, seek information, and use it to address problems or support decision-making processes. The model posits that information behaviour is not linear but is shaped by a range of intervening variables, including psychological, demographic, role-related, environmental, and source-related factors. It further explains that information-seeking behaviour is triggered by a perceived need arising from uncertainty or a knowledge gap. Once this need is identified, individuals engage in information seeking through formal sources such as libraries, databases, government agencies, and business reports, as well as informal sources such as interpersonal communication and experiential knowledge. Wilson (1999) also emphasizes that access alone does not guarantee use, as factors such as relevance, credibility, cost, and ease of access significantly influence whether information is ultimately applied.

In relation to information use by Small and Medium Enterprises (SMEs) in Katsina Senatorial Zone of Katsina State, Nigeria, the model is highly relevant in explaining how entrepreneurs identify and respond to business-related information needs. SME operators often experience information gaps in areas such as financing, marketing strategies, production processes, taxation, and regulatory compliance, which trigger their search for relevant information. However, their ability to access and use such information is influenced by intervening factors such as limited digital literacy, inadequate infrastructure, cost constraints, and time pressures. The model also helps to interpret how SMEs combine formal sources like business development agencies and online platforms with informal networks such as peer entrepreneurs and trade associations. In this context, Wilson's model provides a useful framework for understanding how information is acquired, evaluated, and applied by SMEs to enhance business performance and decision-making in the study area (Wilson, 1999).

METHODOLOGY

The study adopted a descriptive survey research design to examine information use by Small and Medium Enterprises (SMEs) in Katsina Senatorial Zone of Katsina State, Nigeria. The population comprised 7,372 registered SMEs as reported by Burodo, Iliyasu, and Sanusi (2024) based on the Bureau on Public Procurement (2023) records. A sample size of 367 SMEs was determined using the Krejcie and Morgan (1970) table for a finite population, ensuring

representativeness and statistical adequacy. The stratified random sampling technique was employed to ensure proportional representation of SMEs across Katsina Senatorial Zone in Katsina State. Data were collected using a structured questionnaire designed on a four-point Likert scale to capture information use patterns, sources, accessibility, and relevance to business operations. The instrument was validated by experts in library and information science, while its reliability was established through a pilot test, yielding a Cronbach's alpha coefficient of 0.82, indicating good internal consistency. Data collected were analyzed using descriptive statistics such as frequency counts, percentages, and mean scores to answer the research questions. Decision rule was based on a benchmark mean of 2.50 (Krejcie & Morgan, 1970).

RESULTS AND DISCUSSION

The study administered 367 copies of the questionnaire to respondents, out of which 362 were successfully retrieved and found valid for analysis, representing 98.6% response rate. This high return rate indicates strong participation and ensures that the data collected is adequate and reliable for the study.

Research Question 1: What types of information are used by SMEs in the Katsina Senatorial Zone?

Scale: 4 = Highly Used (HU), 3 = Moderately Used (MU), 2 = Rarely Used (RU), 1 = Not Used (NU)

Table 1: Types of Information Used by SMEs (n = 362)

S/N	Items	HU	MU	RU	NU	Mean	Decision
1	Market information (customer needs and preferences)	210 (58.0%)	100 (27.6%)	35 (9.7%)	17 (4.7%)	3.39	Highly Used
2	Financial information (pricing, costs, and profit analysis)	198 (54.7%)	110 (30.4%)	36 (9.9%)	18 (5.0%)	3.35	Highly Used
3	Competitor information	180 (49.7%)	120 (33.1%)	40 (11.0%)	22 (6.1%)	3.26	Highly Used
4	Government policy and regulatory information	140 (38.7%)	130 (35.9%)	60 (16.6%)	32 (8.8%)	3.04	Moderately Used
5	Technological information relevant to business operations	165 (45.6%)	125 (34.5%)	45 (12.4%)	27 (7.5%)	3.18	Highly Used
6	Supplier and distribution information	175 (48.3%)	120 (33.1%)	42 (11.6%)	25 (6.9%)	3.23	Highly Used
7	Legal information related to business operations	130 (35.9%)	140 (38.7%)	60 (16.6%)	32 (8.8%)	3.02	Moderately Used
8	Training and skill development information	150 (41.4%)	135 (37.3%)	50 (13.8%)	27 (7.5%)	3.13	Highly Used

Decision rule: Mean ≥ 2.50 = Accepted

The results in Table 1 show that SMEs in the Katsina Senatorial Zone use several types of information for business activities. Market information recorded the highest usage with a mean of 3.39, as 210 respondents (58.0%) indicated highly used and 100 (27.6%) moderately used, showing strong reliance on customer needs and preferences. Financial information followed with a mean of 3.35, with 198 (54.7%) highly used and 110 (30.4%) moderately used, indicating dependence on pricing, cost, and profit-related data. Competitor information had a mean of 3.26, with 180 (49.7%) highly used and 120 (33.1%) moderately used, reflecting attention to market competition. Supplier and distribution information recorded a mean of 3.23, with 175 (48.3%) highly used and 120 (33.1%) moderately used, while technological information had a mean of 3.18, with 165 (45.6%) highly used and 125 (34.5%) moderately used, showing moderate reliance on technology-related data. Training and skill development information recorded a mean of 3.13, with 150 (41.4%) highly used and 135 (37.3%) moderately used. Government policy and regulatory information had a mean of 3.04, with 140 (38.7%) highly used and 130 (35.9%) moderately used, while legal information recorded the lowest mean of 3.02, with 130 (35.9%) highly used and 140 (38.7%) moderately used, indicating relatively weaker use of regulatory and legal information. The findings indicate stronger reliance on market, financial, and operational information compared to regulatory-related information.

Research Question 2: What are the major sources of information available to SMEs in the study area?
Scale: 4 = Very Frequent (VF), 3 = Frequent (F), 2 = Rare (R), 1 = Not at All (NA)
Table 2: Sources of Information (n = 362)

S/N	Items	VF	F	R	NA	Mean	Decision
9	Internet sources (websites, online platforms)	220 (60.8%)	90 (24.9%)	30 (8.3%)	22 (6.1%)	3.40	Very Frequent

10	Social media platforms	210 (58.0%)	95 (26.2%)	32 (8.8%)	25 (6.9%)	3.35	Very Frequent
11	Business associates and colleagues	180 (49.7%)	120 (33.1%)	40 (11.0%)	22 (6.1%)	3.26	Frequent
12	Government agencies and publications	140 (38.7%)	130 (35.9%)	55 (15.2%)	37 (10.2%)	3.03	Frequent
13	Libraries and information centers	90 (24.9%)	110 (30.4%)	80 (22.1%)	82 (22.7%)	2.57	Frequent
14	Trade fairs, workshops, and seminars	120 (33.1%)	130 (35.9%)	70 (19.3%)	42 (11.6%)	2.91	Frequent
15	Print media (newspapers, magazines, journals)	100 (27.6%)	120 (33.1%)	80 (22.1%)	62 (17.1%)	2.71	Frequent
16	Radio/TV	110 (30.4%)	130 (35.9%)	75 (20.7%)	47 (13.0%)	2.83	Frequent

Decision rule: Mean ≥ 2.50 = Accepted

The results in Table 2 show that SMEs access information from several sources in the study area. Internet sources ranked highest with a mean of 3.40, as 220 respondents (60.8%) indicated very frequent use and 90 (24.9%) frequent use, while 30 (8.3%) and 22 (6.1%) indicated rare and not at all. Social media platforms followed with a mean of 3.35, with 210 (58.0%) very frequent, 95 (26.2%) frequent, 32 (8.8%) rare, and 25 (6.9%) not at all. Business associates and colleagues recorded a mean of 3.26, with 180 (49.7%) very frequent and 120 (33.1%) frequent, showing strong reliance on interpersonal networks. Government agencies and publications had a mean of 3.03, with 140 (38.7%) very frequent and 130 (35.9%) frequent, while trade fairs, workshops, and seminars recorded a mean of 2.91, with 120 (33.1%) very frequent and 130 (35.9%) frequent. Radio/TV had a mean of 2.83, with 110 (30.4%) very frequent and 130 (35.9%) frequent, and print media recorded a mean of 2.71, with 100 (27.6%) very frequent and 120 (33.1%) frequent. Libraries and information centers ranked lowest with a mean of 2.57, as 90 respondents (24.9%) indicated very frequent use while 82 (22.7%) reported not at all, showing limited reliance on formal library sources. The findings indicate greater dependence on digital and interpersonal sources compared to traditional information channels.

Research Question 3: For what purposes do SMEs use information in their business activities?
Scale: 4 = Strongly Agree (SA), 3 = Agree (A), 2 = Disagree (D), 1 = Strongly Disagree (SD)
Table 3: Purposes of Information Use (n = 362)

S/N	Items	SA	A	D	SD	Mean	Decision
17	Information is used for decision-making in business operations	230 (63.5%)	90 (24.9%)	25 (6.9%)	17 (4.7%)	3.47	Agreed
18	Information is used for planning and business strategy development	220 (60.8%)	95 (26.2%)	27 (7.5%)	20 (5.5%)	3.42	Agreed
19	Information is used to improve customer satisfaction	210 (58.0%)	100 (27.6%)	32 (8.8%)	20 (5.5%)	3.38	Agreed
20	Information is used for identifying new business opportunities	200 (55.2%)	105 (29.0%)	35 (9.7%)	22 (6.1%)	3.33	Agreed
21	Information is used for financial management and budgeting	215 (59.4%)	95 (26.2%)	30 (8.3%)	22 (6.1%)	3.39	Agreed
22	Information is used for marketing and promotion of products/services	205 (56.6%)	100 (27.6%)	35 (9.7%)	22 (6.1%)	3.34	Agreed
23	Information is used for risk management	190 (52.5%)	110 (30.4%)	40 (11.0%)	22 (6.1%)	3.29	Agreed
24	Information is used to improve operational efficiency	200 (55.2%)	105 (29.0%)	35 (9.7%)	22 (6.1%)	3.33	Agreed

Decision rule: Mean ≥ 2.50 = Accepted

The results in Table 3 show that SMEs use information for several business purposes with consistently high levels of agreement. Decision-making in business operations ranked highest with a mean of 3.47, as 230 respondents (63.5%) strongly agreed and 90 (24.9%) agreed, while 25 (6.9%) disagreed and 17 (4.7%) strongly disagreed. Planning and business strategy development followed with a mean of 3.42, with 220 respondents (60.8%) strongly agreeing and 95 (26.2%) agreeing. Financial management and budgeting recorded a mean of 3.39, with 215 (59.4%) strongly agreeing and 95 (26.2%) agreeing. Improving customer satisfaction had a mean of 3.38, with 210 (58.0%) strongly agreeing and 100 (27.6%) agreeing. Marketing and promotion recorded a mean of 3.34, with 205 (56.6%) strongly agreeing and 100 (27.6%) agreeing. Identifying new business opportunities and improving operational efficiency both recorded a mean of 3.33, with 200 (55.2%) strongly agreeing and 105 (29.0%) agreeing. Risk management, though slightly lower, still shows strong agreement with a mean of 3.29, as 190 (52.5%) strongly agreed and 110 (30.4%) agreed, indicating

awareness but possibly weaker implementation. However, SMEs use information extensively for strategic, financial, and operational purposes.

Research Question 4: What challenges do SMEs face in accessing and using information?
Scale: 4 = Very Serious (VS), 3 = Serious (S), 2 = Slight (SL), 1 = Not a Challenge (NC)
Table 4: Challenges Faced by SMEs (n = 362)

S/N	Items	VS	S	SL	NC	Mean	Decision
25	High cost of accessing relevant information	210 (58.0%)	90 (24.9%)	40 (11.0%)	22 (6.1%)	3.35	Serious
26	Lack of awareness of available information sources	200 (55.2%)	100 (27.6%)	35 (9.7%)	27 (7.5%)	3.30	Serious
27	Poor internet connectivity	220 (60.8%)	85 (23.5%)	35 (9.7%)	22 (6.1%)	3.39	Serious
28	Lack of information literacy skills	180 (49.7%)	110 (30.4%)	45 (12.4%)	27 (7.5%)	3.22	Serious
29	Inadequate access to libraries and information centers	170 (47.0%)	115 (31.8%)	45 (12.4%)	32 (8.8%)	3.17	Serious
30	Time constraints in searching for information	190 (52.5%)	100 (27.6%)	45 (12.4%)	27 (7.5%)	3.26	Serious
31	Difficulty in identifying reliable information sources	185 (51.1%)	105 (29.0%)	45 (12.4%)	27 (7.5%)	3.24	Serious
32	Language barriers in accessing information	140 (38.7%)	120 (33.1%)	60 (16.6%)	42 (11.6%)	2.99	Serious

Decision rule: Mean ≥ 2.50 = Accepted
The results in Table 4 show that SMEs face several challenges in accessing and using information. Poor internet connectivity ranked highest with a mean of 3.39, as 220 respondents (60.8%) indicated very serious and 85 (23.5%) serious, suggesting that unstable internet limits timely access to online business information. High cost of accessing relevant information followed with a mean of 3.35, with 210 respondents (58.0%) very serious and 90 (24.9%) serious, indicating that financial constraints hinder SMEs from obtaining needed information. Lack of awareness of available information sources recorded a mean of 3.30, with 200 (55.2%) very serious and 100 (27.6%) serious, implying limited knowledge of where to obtain useful information. Time constraints in searching for information had a mean of 3.26, with 190 respondents (52.5%) very serious and 100 (27.6%) serious, showing that business owners have limited time to seek information. Difficulty in identifying reliable sources recorded a mean of 3.24 with 185 (51.1%) very serious and 105 (29.0%) serious, indicating challenges in evaluating credible information. Lack of information literacy skills had a mean of 3.22, with 180 (49.7%) very serious and 110 (30.4%) serious, suggesting limited ability to search and use information effectively. Inadequate access to libraries and information centers recorded a mean of 3.17, with 170 (47.0%) very serious and 115 (31.8%) serious, indicating poor availability of formal information centers. Language barriers ranked lowest with a mean of 2.99, as 140 (38.7%) indicated very serious and 120 (33.1%) serious, though still reflecting a noticeable constraint. The findings indicate that infrastructural, financial, and information skill-related factors are the dominant challenges affecting SMEs' access to and use of information.

DISCUSSION

Types of Information Used by SMEs

The types of information used by SMEs show that market, financial, and competitor information are the most highly utilized, while legal and regulatory information are comparatively less emphasized. This pattern suggests that SMEs prioritize immediate operational and profit-oriented information over compliance-related knowledge. This aligns with the assertion of Adebayo and Odunlade (2019) that information use among SMEs is largely driven by the need to improve efficiency, planning, and decision-making. It also supports the position of Ojo, Akinsunmi, and Olayonu (2015), who noted that SMEs tend to focus more on accessible and directly applicable information. However, the relatively lower use of legal and regulatory information slightly contradicts the expectation in modern business environments where compliance plays a critical role, indicating a gap in comprehensive information utilization.

Sources of Information Used by SMEs

The findings on sources of information reveal that SMEs rely more on internet sources, social media platforms, and interpersonal networks such as business associates, while libraries and information centers are the least utilized. This confirms the growing dominance of digital and informal channels in information access among SMEs. The result is consistent with Ojo, Akinsunmi, and Olayonu (2015), who emphasized that SMEs in Nigeria depend heavily on informal

and easily accessible sources due to convenience and cost considerations. It also aligns with the position of Wilson (1999), which highlights that information source selection is influenced by accessibility and ease of use. However, the low patronage of libraries contradicts the expectation of formal information systems playing a central role in information dissemination, suggesting underutilization of structured information services in supporting SME activities.

Purposes of Information Use by SMEs

The results on the purposes of information use indicate that SMEs extensively apply information for decision-making, planning, financial management, marketing, and operational efficiency. This demonstrates that information is not only accessed but actively integrated into core business functions. The result strongly supports the views of Huvila et al. (2019) and Kumari and Sharma (2021), who emphasized that effective information use enhances productivity, innovation, and problem-solving capabilities. It also aligns with Dervin (2023), who posited that information becomes valuable only when applied to achieve specific goals. The high level of agreement across all items suggests that SMEs recognize the strategic importance of information, thereby reinforcing the relevance of information behaviour theories in explaining business performance.

Challenges Faced by SMEs in Information Use

The data on challenges show that SMEs face serious constraints such as poor internet connectivity, high cost of information access, lack of awareness, limited information literacy, and difficulty identifying reliable sources. These challenges indicate that although SMEs actively use information, their effectiveness is hindered by infrastructural, financial, and skill-related barriers. This supports the findings of Suleiman (2025), Yunusa and Shehu (2025), who identified environmental and technological limitations as key factors affecting SME performance in Katsina State. It also aligns with Wilson's (1999) model, which emphasizes that intervening variables such as access, cost, and user capability significantly influence information use. The persistence of these challenges suggests that improving access infrastructure and information literacy is critical for enhancing SME performance and decision-making efficiency.

CONCLUSION

The study examined information use by SMEs in the Katsina Senatorial Zone and found that they rely heavily on market, financial, competitor, and operational information, with less emphasis on legal and regulatory information. This indicates a stronger focus on immediate business needs and profitability rather than comprehensive information use. SMEs primarily access information through internet sources, social media, and interpersonal networks, while formal sources such as libraries are less utilized. The findings also show that information is widely applied in decision-making, planning, financial management, marketing, and operational efficiency, highlighting its central role in business performance. Despite this high level of usage, SMEs face major challenges including poor internet connectivity, high cost of accessing information, limited awareness of sources, low information literacy, and difficulty identifying reliable information. These barriers reduce the effectiveness of information use. Overall, while information remains critical to SME success, improving access, awareness, and information skills is necessary to enhance their performance and contribution to economic development in Katsina State.

RECOMMENDATIONS

18. SMEs should be encouraged to improve their use of legal and regulatory information, which received less attention, through awareness programmes and simplified guidelines provided by government and business support agencies. This will promote compliance and reduce business risks, otherwise increased legal violations, penalties, and business instability may occur.
19. Libraries and information centers should be made more accessible and relevant to SMEs by offering digital services and business-focused information support, since they were the least used sources. Without such improvements, SMEs will continue to underutilize reliable and structured information, limiting informed decision-making.
20. SMEs should also receive training in information literacy and digital skills to strengthen their ability to evaluate and apply information effectively, especially in areas like risk management. Without this, SMEs may rely on inaccurate information and make poor strategic decisions.
21. Government and stakeholders should address key challenges such as poor internet access and high information costs by improving infrastructure, reducing access costs, and increasing awareness of available information sources. Otherwise, access to vital information will remain restricted, hindering SME growth and competitiveness.

Investigating the Transformation of Library Services and the Information Needs of Digital Natives in Higher Institutions of Bauchi State, Nigeria

By

Abdullahi Mustapha
Department of Library and Information Science, Sa'adu Zungur University, Bauchi
Abdulmiq12@gmail.com
+234 0703 029 0212

ABSTRACT

This study investigates how library transformation meets the evolving needs of digital natives, i.e. Generation Z (GenZ) and Generation Alpha (Gen Alpha), who are accustomed to seamless, technology-driven experiences. The paper examines the integration of emerging technologies, such as; Artificial Intelligence (AI), Virtual Reality (VR), Internet of Things (IoT), chatbots, virtual libraries, interactive learning tools, and big data analytics in academic libraries to advance services for the generality of users. The study further explores the impacts of emerging technologies on users' engagement, information seeking behavior, and collaboration. The study Adopted quantitative research approach, data were collected from 317 students as the population, across three higher institutions of learning in Bauchi State, i.e Nigeria Sa'adu Zungur University Bauchi, Federal polytechnic and Federal College of Education, Jama'are, were selected using stratified sampling. Findings indicate that while emerging technologies improve accessibility, convenience, and overall user experience, librarians must carefully balance technological adoption with information literacy development, digital inclusion, and the protection of user privacy. The paper concluded that academic libraries in Bauchi State, Nigeria, stand at a pivotal moment in their evolution. The digital native students who populate institutions such as SAZU, FEDPOLY, and FCE arrive with expectations shaped by years of technology driven consumer experiences, and they increasingly measure the relevance of their libraries against the standards of the digital ecosystems they inhabit daily. Strategic recommendations for libraries to effectively leverage emerging technologies in meeting digital natives' expectations, including up skilling librarians, designing services in collaboration with other sister libraries as consortium. providing solar inverters then hoping to incorporate cyber-literacy modules into the compulsory General Studies (GST) curriculum.

Keywords: Library transformation, Digital natives, Emerging technologies, Artificial Intelligence, Academic libraries, Nigeria, Information literacy,

1. INTRODUCTION

The rapid transformation in digital technologies has fundamentally altered the landscape of information access, communication, and learning. Contemporary higher education students predominantly belonging to Generation Z and the emerging Generation Alpha have grown up in environments saturated with smartphones, social media, artificial intelligence powered applications, and on demand digital content. These digital natives arrive at academic institutions with heightened expectations for seamless, intuitive, and technology enriched services (Ikenwe & Udem, 2022).

Academic libraries, long regarded as the intellectual heartbeats of universities and polytechnics, face an unprecedented imperative to transform their service delivery models in alignment with these evolving expectations. The traditional library characterized by physical collections, card catalogues, and passive reference services is increasingly incongruent with the expectations of a generation that navigates the world through algorithms, immersive interfaces, and hyper connected devices.

In Nigeria, particularly in Bauchi State, academic libraries in higher institutions of learning are at a critical crossroads. Institutions such as the Sa'adu Zungur University (SAZU), the Federal Polytechnic Bauchi (FEDPOLY), and the Federal College of Education Jama'are (FCE) serve student populations that are rapidly transforming in their digital competencies and service expectations. Yet, empirical evidence on how well these institutions are adapting their library services to meet these demands remains sparse.

Therefore, the research aims to bridge these gaps by investigating the transformation of library services within higher institutions in Bauchi State. It seeks to empirically assess the alignment between the actual information-seeking patterns of digital natives and the current service delivery models offered by these libraries. By evaluating how modern student behaviors intersect with institutional realities, this study will provide an evidence-based framework for stakeholders to optimize library funding, modernize hybrid infrastructure, and cultivate the specific digital competencies needed to sustain academic excellence in Bauchi State.

1.1 Statement of the Problem

Despite global advancements in digital technologies in the development of library services, many academic libraries in developing countries are still lagging behind because of poor infrastructure, finance, lack of political will, and poor skills and competencies. This makes the academic libraries to operate in traditional system that fail to meet the service expectations of students. The mismatch between available library services and the technology-driven expectations of digital natives poses significant challenges to academic engagement, information literacy, and research productivity.

Therefore, there is an urgent need to investigate the situation of library services as it relates to the needs of digital natives in higher institutions of northern Nigeria, particularly in Bauchi State, Nigeria.

1.2 Objectives of the Study

The specific objectives of this study are to:

1. Examine how digital natives' expectations influence their use of academic library services.
2. Investigate the extent to which emerging technologies have been integrated into academic libraries in Bauchi State.
3. Identify challenges associated with technology adoption in academic libraries Bauchi State.

1.3 Significance of the Study

This study contributes to the growing body of knowledge on library transformation in sub-Saharan African contexts. By providing empirical evidence from Bauchi State institutions, the findings offer practical guidance to library professionals, institutional administrators, and technology vendors on how to align library services with the expectations of the next generation of learners. The study also advances theoretical understandings of digital nativity and its implications for academic service design.

2. LITERATURE REVIEW

2.1 Conceptual of Digital Natives

The concept of the digital native was popularized by Marc Prensky (2001), who argued that individuals who grew up with digital technology possess fundamentally different cognitive styles and learning preferences compared to earlier generations. Generation Z broadly defined as individuals born between 1997 and 2012 represents the first cohort to have grown up entirely in the era of the internet, while Generation Alpha i.e. born from 2013 onwards is projected to be the most technologically immersed generation in history (McCrindle & Fell, 2020).

Digital natives are characterized by their preference for visual and interactive content, multitasking ability, expectation of instant information access, and comfort with collaborative and networked learning environments (Yusuf, 2025). These characteristics have profound implications for the design of academic library services, which must evolve from static resource repositories to dynamic, technology enabled knowledge systems.

2.2 Emerging Technologies in Academic Libraries

The rapid evolution of emerging technologies has initiated a profound paradigm shift in the operational architecture of academic libraries. To maintain institutional relevance and cater to a generation of technologically advanced users, academic libraries are progressively transitioning from passive, print-centric repositories into dynamic, hybrid knowledge environments (Yusuf, 2025). Contemporary literature highlights that this transformation is driven by the integration of Smart Library components predominantly characterized by cloud-supported systems, automated library management frameworks, and mobile-friendly resource discovery portals (Modiba, 2026; Saibakumo, 2021). These emerging technologies include the following;

2.2.1 Artificial Intelligence (AI) and Chatbots

Artificial Intelligence has emerged as one of the most transformative forces in library service delivery. AI-powered systems enable personalized recommendation engines, automated cataloguing, intelligent reference services, and predictive analytics for collection development (Breeding, 2019). Chatbots, a specific application of AI, provide 24/7 reference assistance, reducing barriers to access for students who may feel reluctant to approach human librarians (Wang & Lim, 2021). Research has demonstrated that AI-driven services significantly improve user satisfaction and engagement among younger library patrons.

2.2.2 Virtual Reality (VR) and Augmented Reality (AR)

Virtual and Augmented Reality technologies offer immersive learning experiences that resonate strongly with Gen Z and Gen Alpha users. Virtual libraries, three dimensional information environments accessible through VR headsets or web-based platforms enable users to explore resources in spatially intuitive ways (Johnson et al., 2022). AR applications overlaying digital information onto physical spaces in libraries enhance wayfinding, resource discovery, and interactive learning, making library spaces more engaging and accessible for digital natives.

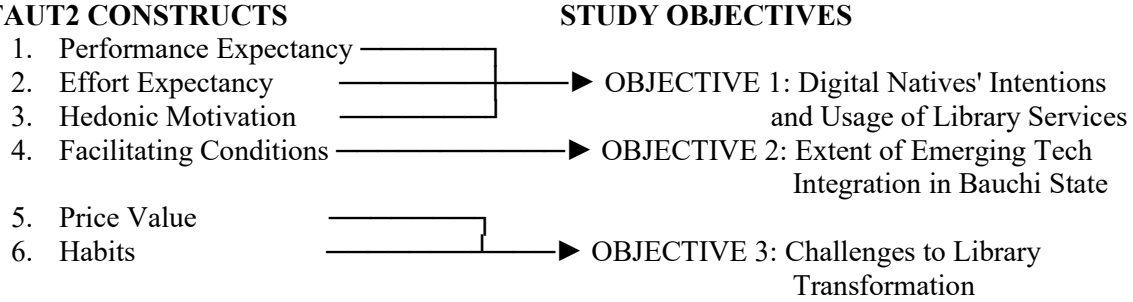
2.2.3 Internet of Things (IoT)

The Internet of Things refers to networks of interconnected physical devices that communicate and exchange data autonomously. In library contexts, IoT applications include smart shelf systems that track resource locations in real time, environmental monitoring sensors that optimize study conditions, occupancy management systems, and Radio frequency Identification (RFID)-based self-checkout technologies (Abubakar & Mohammed, 2020). These applications enhance operational efficiency and create more responsive, user centred library environments.

2.2.4 Big Data Analytics

Big Data analytics enables libraries to derive actionable insights from usage data, supporting evidence-based decision making in collection development, service design, and space planning. Predictive analytics tools can anticipate user needs, personalize recommendations, and identify patterns in information-seeking behavior that inform strategic library planning (Arowosola, 2023). For digital natives accustomed to algorithm-driven personalization in commercial platforms, data-driven library services represent a significant improvement in user experience.

2.3 Library Transformation



While the discourse on library transformation is predominantly situated in Western academic contexts, emerging scholarship is beginning to document technology adoption in African academic libraries. Studies from Nigeria, Ghana, Kenya, and South Africa highlight significant disparities in infrastructure, funding, and digital literacy that complicate technology adoption in these settings (Iyoro & Fagbe, 2018; Nwosu & Ugwuanyi, 2021). Challenges include inadequate power infrastructure, limited bandwidth, insufficient training for library professionals, and low levels of institutional investment in library technology.

Specific to Northern Nigeria, the literature reveals that academic libraries in states such as Bauchi face compounded challenges including limited financial resources, understaffed libraries, and student populations with heterogeneous levels of digital literacy. These contextual realities necessitate nuanced, different approaches to library transformation that go beyond simple technology transplantation from Western models.

2.4 Theoretical Framework

This study adopts the Unified Theory of Acceptance and Use of Technology 2 (UTAUT2**)** as its primary theoretical framework. Developed by Venkatesh, Thong, and Xu (2012) as an extension of the original UTAUT model (Venkatesh et al., 2003), this contemporary theory explains how consumer targeted technologies are adopted based on specific behavioral determinants.

UTAUT2 is uniquely suited for this study because it shifts the focus from mandatory workplace technology adoption to voluntary consumer technology use. In the context of modern higher education, digital native students choose whether to engage with university library platforms or bypass them for commercial web search engines.

3. METHODOLOGY

3.1 Research Design

This study adopted a quantitative research design, utilizing a structured survey questionnaire as the primary data collection instrument. The quantitative approach was selected for its capacity to generate statistically generalizable findings across the target population, enabling systematic measurement of attitudes, perceptions, and behaviors related to library technology adoption among digital native students.

3.2 Population

The study was conducted in Bauchi State, Nigeria, focusing on three higher institutions of learning: Sa'adu Zungur University (SAZU), the Federal Polytechnic Bauchi (FEDPOLY), and the Federal College of Education Jama'are (FCE). These institutions were selected as representative of the major categories of higher education in the state, thereby ensuring a comprehensive representation of the diverse academic library landscape in Bauchi State.

The target population comprised all registered students at the three selected institutions. Given the large and heterogeneous nature of this population, a stratified sampling technique was employed to ensure proportional representation of students from each institution and across different academic levels. A total of 317 students were sampled for the study, distributed across the three institutions as detailed in Table 1.

Table 1: Sample Distribution by Institution

Institution	Abbreviation	Sample Size	Percentage (%)

Sa'adu Zungur University Bauchi	SAZU	121	38.2%
Federal Polytechnic Bauchi	FEDPOLY	108	34.1%
Federal College of Education Jama'are	FCE	88	27.7%
Total		317	100%

Source: Field Survey, 2026

3.3 Research Instrument

Data were collected using a structured, self-administered questionnaire comprising four sections: (i) demographic information, (ii) technology familiarity and usage patterns, (iii) perceptions of library technology services, and (iv) attitudes towards privacy, digital inclusion, and information literacy. The questionnaire was adapted from validated instruments in the library and information science literature and pre-tested with a pilot sample of 30 students before full deployment.

A five-point Likert scale was employed for items measuring perceptions and attitudes, ranging from 1 (Strongly Disagree) to 5 (Strongly Agree). The instrument demonstrated satisfactory internal consistency, with a Cronbach's alpha coefficient of 0.82, indicating high reliability.

3.4 Data Collection Procedure

Questionnaires were administered in person to students at the library premises of each institution over a four-week period. Research assistants at each institution facilitated the administration process, ensuring informed consent was obtained and clarifying any ambiguities in the questionnaire. Completed questionnaires were retrieved immediately to ensure high response rates. A response rate of 94.6% was achieved, with 300 valid responses retained for analysis after excluding incomplete questionnaires.

3.5 Data Analysis

Quantitative data were analysed using SPSS Version 25. Descriptive statistics including frequencies, percentages, means, and standard deviations were employed to summarize respondents' demographics and perceptions. Inferential statistics, including Pearson correlation and regression analysis, were used to examine relationships between technology adoption and user engagement, information seeking behavior, and academic performance outcomes.

4. RESULTS AND FINDINGS

4.1 Demographic Information of Respondents

Of the 300 valid respondents, 54.7% were male and 45.3% female. The majority (61.3%) fell within the 18–24 age bracket, consistent with the Gen Z demographic. Approximately 22.7% were aged 17 or below, representing Gen Alpha students. The remaining 16% were aged 25 and above. Undergraduate students constituted 78.3% of respondents, with diploma and NCE students making up the remainder. A summary of respondent demographics is presented in Table 2.

Table 2: Demographic Information of Respondents

Variable	Category	Frequency	Percentage (%)
Gender	Male	164	54.7%
	Female	136	45.3%
Age	17 years and below	68	22.7%
	18–24 years	184	61.3%
	25 years and above	48	16.0%
Level	Diploma/NCE	65	21.7%
	Undergraduate	235	78.3%

Source: Field Survey, 2026

4.2 Technology Awareness and Usage Patterns

Results indicated that the vast majority of respondents (91.3%) owned smartphones, while 67.3% reported owning or having regular access to a laptop or desktop computer. Approximately 43.7% reported familiarity with AI-powered tools such as chatbots and recommendation systems, while only 18.3% had prior experience with Virtual Reality applications.

Awareness of IoT applications in library settings was particularly low, with only 12.7% of respondents indicating familiarity.

4.3 Perceptions of Emerging Technologies in Libraries

Respondents were asked to evaluate the impact of specific emerging technologies on their library experience. Table 3 summarizes mean scores for key variables.

Table 3: Mean Scores for Perceptions of Emerging Technology Impact

Technology/Variable	Mean Score	Std. Dev.	Interpretation
AI/Chatbots improve accessibility of library services	4.12	0.73	Agree
Digital catalogues enhance information seeking	4.31	0.68	Strongly Agree
VR creates engaging learning environments	3.87	0.91	Agree
IoT improves library operational efficiency	3.65	1.02	Agree
Data analytics personalize library recommendations	3.94	0.84	Agree
Technology adoption improves user experience	4.27	0.71	Strongly Agree
Privacy concerns limit technology adoption	3.78	0.97	Agree
Digital inclusion challenges hinder tech access	4.03	0.88	Agree

Source: Field Survey, 2026.

The data reveal that respondents strongly affirmed the positive impact of digital catalogues and technology adoption generally on their library experience (mean scores of 4.31 and 4.27 respectively). AI and chatbot accessibility received substantial agreement (mean 4.12), while VR and IoT applications were viewed positively but with somewhat lower scores, likely reflecting limited exposure to these technologies. Notably, concerns about digital inclusion (mean 4.03) and privacy (mean 3.78) registered significant agreement, indicating awareness of the tensions inherent in library technology adoption.

4.4 Impact on User Engagement and Information-Seeking

Regression analysis revealed that technology enhanced library services significantly predicted student engagement (beta = 0.42, $p < 0.01$) and information seeking frequency (beta = 0.38, $p < 0.01$). Students who reported higher use of technology-enabled library services demonstrated significantly higher rates of library visitation, both physical and virtual. Correlation analysis indicated a moderate positive relationship ($r = 0.51$, $p < 0.01$) between technology adoption and academic research output as measured by submitted assignments and projects referencing library resources.

4.5 Challenges

Respondents identified several significant barriers to effective library technology adoption. As detailed in Figure 1, the primary challenges included:

1. Inadequate infrastructure, including unreliable internet connectivity and insufficient devices (cited by 67.3% of respondents).
2. Limited awareness and training in the use of advanced library technologies (cited by 58.7%).
3. Privacy and data security concerns regarding library management systems (cited by 52.3%).
4. Digital exclusion arising from socioeconomic disparities in device ownership (cited by 49.0%).
5. Insufficient information literacy skills to effectively leverage digital library resources (cited by 44.7%).

5. DISCUSSION

The findings of this study confirm the central assertion that GenZ and Gen Alpha students in Bauchi State's higher institutions have developed expectations for library services that closely mirror their experiences with commercial digital platforms. The high smartphone ownership rate (91.3%) and strong preference for digital catalogue systems corroborate Prensky's (2001) and Tapscott's (2009) characterizations of digital natives as users who expect seamless, on-demand information access. The positive reception of AI and chatbot services aligns with Wang and Lim's (2021) findings on AI-driven reference services and suggests significant potential for further deployment of intelligent library systems in the Nigerian context.

The relatively lower awareness and adoption of VR and IoT technologies among respondents' points to an implementation gap that is characteristic of resource constrained academic environments. While respondents expressed positive attitudes towards these technologies, limited infrastructure and exposure constrain their realization of the full transformative potential documented in the literature (Johnson et al., 2022; Abubakar & Mohammed, 2020). This finding underscores the importance of graduated, context-appropriate technology adoption strategies rather than wholesale transplantation of Western library models.

One of the most significant findings of this study is the tension between the enthusiasm for emerging technologies and the persistent challenges of digital inclusion and information literacy. The substantial agreement with statements about digital exclusion (mean 4.03) and information literacy deficits (44.7% citing this as a challenge) suggests that technology adoption, without accompanying investment in human capacity and inclusive infrastructure, risks exacerbating existing inequalities. This finding resonates strongly with Iyoro and Fagbe (2018) and calls for a holistic approach to library transformation that treats technology, training, and equity as inseparable pillars.

The significant level of concern around privacy (52.3% of respondents) represents an important and perhaps underappreciated dimension of library technology adoption in Nigeria. As libraries deploy AI-driven personalization and data analytics tools, they must navigate complex questions about data ownership, consent, and protection. This concern is consistent with global trends in technology ethics but has received insufficient attention in African library transformation discourses. Libraries must adopt transparent data governance frameworks that protect user privacy while enabling the benefits of data-driven services.

6. CONCLUSION

This study has demonstrated that academic libraries in Bauchi State, Nigeria, stand at a pivotal moment in their evolution. The digital native students who populate institutions such as SAZU, FEDPOLY, and FCE arrive with expectations shaped by years of technology driven consumer experiences, and they increasingly measure the relevance of their libraries against the standards of the digital ecosystems they inhabit daily. Meeting these expectations is not merely a matter of technological investment; it demands a fundamental reimagining of what the academic library is and who it serves. The findings confirm that emerging technologies AI, chatbots, VR, IoT, data analytics, and interactive learning tools offer genuine pathways to enhanced accessibility, engagement, and user experience.

7. RECOMMENDATIONS

Based on the study's findings, the following recommendations are proposed for academic libraries in Bauchi State in serving digital native populations:

1. Academic libraries should transition from, desktop OPAC systems to mobile friendly, discovery layer applications that allow students to search physical books and digital e-journals simultaneously through a single search bar on their smartphones. Also, Library management should partition existing physical spaces through converting underutilized large reading halls into vibrant Information Commons and collaborative study rooms equipped with charging ports and interactive screens to support group learning workflows.
2. To enhance the integration of technologies to the digital native users, rather than each institution in Bauchi attempting to build and maintain independent servers, libraries should form a state academic library consortium. This body can pool resources to run a single, shared cloud based Integrated Library Management System (ILMS) like Koha, minimizing software maintenance costs while broadening access to cross-institutional resources.
3. To combat the challenge of power unreliability, institutional boards must prioritize funding for independent solar-inverters dedicated strictly to powering the library's servers, routers, and electronic reading centers. Moreover, brief, single day library orientation tours should be dsicouraged. Academic libraries must collaborate with university management to embed rigorous, practical, cyber-literacy modules into the compulsory General Studies (GST) curriculum, systematically training digital natives to transform casual web searching into academic research skills.

Abstract

This study investigated the influence of funding on the research productivity of librarians in Federal Colleges of Education in South-West Nigeria. A descriptive survey design was adopted, and data were collected from all thirty professional librarians in three Federal Colleges of Education using a structured questionnaire. Data were analysed using frequencies and percentages. Findings revealed that funding for library operations and research support was generally inadequate, particularly in areas such as e-resources, ICT facilities, conference sponsorship, and publication fee support. The results further showed moderate levels of research productivity among librarians, with journal articles and conference papers being the most common outputs, while book publications remained low. Funding-related challenges, including poor access to research resources and limited institutional incentives, were found to hinder research engagement. The study concludes that improved funding mechanisms are essential for enhancing librarians' research productivity and scholarly visibility. Recommendations were made to strengthen funding support, research infrastructure, and institutional research incentives in Federal Colleges of Education.

Keywords: *Funding, Research Productivity, Librarians, Federal Colleges of Education, South-West Nigeria*

Introduction

In Nigeria, librarians play a crucial role in teaching, learning and the growth of knowledge within tertiary institutions. Just like university libraries often receive attention in research discussions, librarians in Colleges of Education perform equally important functions, especially in preparing future teachers and strengthening foundational academic skills. According to Ebizie *el al.* (2022), librarians in teacher-training institutions occupy a critical position in shaping academic engagement. However, their ability to contribute meaningfully to scholarly communication and participate in the wider research community has continued to attract concern. Over the years, research productivity within the library profession in Nigeria has shown noticeable variations across institutional types, with Colleges of Education often appearing at the lower end of scholarly output (Babalola & Nwalo, 2021).

One major factor linked to this disparity is funding. Libraries in many Colleges of Education in South-West Nigeria operate under tight financial conditions. Limited budgetary allocations restrict access to current literature, research databases, functional ICT tools, conference participation, and research grants, all of which are primary elements for research engagement. As Chukwusa & Onohwakpor (2026) note, inadequate funding remains one of the strongest barriers to librarians' research productivity in Nigeria. When funding is insufficient, librarians may struggle to update their knowledge, initiate research projects or contribute effectively to professional discourse at national and international levels. Funding has been widely acknowledged as a key determinant of scholarly productivity among academic librarians. Access to financial resources and institutional support influences librarians' ability to conduct research, publish findings and participate in professional development activities (Haliso et al., 2021).

Although several studies have examined research productivity among university librarians in Nigeria, very few have specifically explored the situation in Federal Colleges of Education, especially within the South-West region. Unlike State institutions, Federal Colleges of Education operate under a uniform national funding structure still, the everyday constraints these librarians face, from limited access to research resources to insufficient support for conference participation, are rarely highlighted in empirical studies. Recognising how funding shapes the research participation of librarians in Colleges of Education is important because research remains a core requirement for professional growth, career advancement, and contribution to the Library and Information Science (LIS) field (Obiamalu & Uka, 2025). Without adequate financial support, librarians may be unable to produce research that addresses emerging issues in education, technology, and library practice. This concern aligns with Babalola & Allahmagani (2023), who emphasise that financial support is a major predictor of research engagement among information professionals. Ultimately, insufficient funding affects not only their visibility in the academic community but also the overall development of the LIS profession in Nigeria.

This study therefore seeks to examine how funding availability influences the research contribution and scholarly productivity of librarians in Federal Colleges of Education in South-West Nigeria. The study aims to highlight specific

challenges and provide evidence that may guide policy decisions, improve funding structures and strengthen the research culture within these institutions.

Problem Statement

Research productivity is a fundamental component of academic librarianship, particularly within tertiary institutions where librarians are expected to contribute to knowledge creation, support scholarly communication, and enhance institutional research visibility. In Nigeria, the expectation for librarians to engage in research has increased, especially as scholarly output is often linked to professional advancement and institutional relevance within the Library and Information Science (LIS) field. Existing studies in Nigeria have largely focused on research productivity among university librarians, with considerable attention given to factors such as institutional support, access to information resources, and research capacity. However, there is a noticeable absence of empirical studies that specifically examine the research engagement of librarians in Colleges of Education, despite the critical role these institutions play in teacher training and national educational development.

In the context of Federal Colleges of Education, librarians may encounter a range of constraints that can hinder their active participation in research. These constraints may include limited access to current information resources, inadequate research infrastructure, and restricted opportunities for conference participation and insufficient financial support for research- related activities. Given that funding is a key enabler of research, facilitating access to scholarly materials, supporting publication processes, and enabling professional collaboration, it is important to examine how financial limitations may influence research engagement within this category of institutions. Despite the recognized importance of funding in supporting research activities, there is insufficient empirical evidence on how funding availability specifically influences the research productivity of librarians in Federal Colleges of Education, particularly within the South-West region of Nigeria. This gap in the literature limits the ability of policymakers, institutional administrators, and professional bodies to develop informed and targeted interventions aimed at strengthening research culture and output among librarians in these institutions.

It is against this background that this study seeks to examine the influence of funding on the research productivity of librarians in Federal Colleges of Education in South-West Nigeria, with a view to providing empirical evidence that can inform policy, improve institutional support mechanisms, and enhance scholarly contributions within the LIS profession.

Study Objectives

The study aims to:

1. To examine the level of funding available for library operations and research support for librarians in Federal Colleges of Education in South-West Nigeria.
2. To determine the extent to which funding influences the research productivity of librarians in Federal Colleges of Education in South-West Nigeria.
3. To identify the funding-related challenges that affects the ability of librarians in Federal Colleges of Education in South-West Nigeria to engage in research.
4. To identify strategies that can enhance funding support and improve the research productivity of librarians in Federal Colleges of Education in South-West Nigeria.

Literature Review

Funding Available for Library Operations and Research Support

Funding availability has consistently emerged as a crucial factor influencing research engagement and productivity among academic librarians. Adequate funding enables access to current research materials, subscription to electronic databases, data collection, publication fees, conference participation, and professional development opportunities. Ibegbulam and Eze (2016) note that partnering with research funders and issuing grants can lead to increased research output. Similarly, Babalola and Allahmagani (2023) found that librarians with access to research grants and institutional funding were more likely to publish in reputable journals and collaborate with colleagues. The relationship between funding and research output is reinforced by studies highlighting the indirect effects of financial constraints. Research funding significantly influences librarians' research productivity and engagement in scholarly activities (Oso & Olaniyi, 2023). Financial limitations often result in reduced research confidence, fewer collaborative opportunities, and lower publication rates. Evidence from the literature review suggests that these challenges may be more pronounced in Colleges of Education, where research support structures are less developed.

Influence of Funding on Research Productivity of Librarians

Research productivity is widely regarded as a key indicator of professional relevance and academic contribution among librarians in tertiary institutions. It encompasses scholarly publications, conference papers, technical reports, and

other forms of knowledge dissemination that contribute to the advancement of the Library and Information Science (LIS) field. In Nigeria, academic librarians are increasingly expected to engage in research as part of their professional responsibilities, particularly for career advancement and institutional visibility (Aina, 2020). Evidence from the literature suggests that research productivity among librarians varies considerably across institutional types. Studies indicate that librarians in universities generally exhibit higher levels of scholarly output than those in other tertiary institutions, a trend often attributed to stronger institutional research cultures, mentoring opportunities, and better access to funding and research resources (Iwu-James et al., 2024; Oyedele et al., 2022). Institutional support has been shown to enhance librarians' confidence, collaborative research opportunities, and publication rates (Haliso et al., 2021).

In contrast, librarians in Colleges of Education remain less visible in national and international scholarly outlets, reflecting weaker research support structures and limited funding (Oyedele et al., 2022).

Funding-Related Challenges Affecting Librarians' Research Engagement

Colleges of Education occupy a unique position within Nigeria's higher education system, with a mandate focused on teacher education and educational development. Despite their national relevance, research activities in these institutions have received relatively limited scholarly attention compared with universities and polytechnics. Studies on academic research environments in Nigeria indicate that financial limitations, insufficient research infrastructure, and weak institutional support continue to hinder scholarly engagement across tertiary institutions, particularly in Colleges of Education (Igiri et al., 2021). These challenges often manifest as limited access to up-to-date information resources, inadequate research grants, restricted opportunities for conference participation, and limited professional development initiatives, all of which can negatively influence librarians' motivation and capacity to contribute to research output (Abolaji & Fadimu, 2024). Consequently, librarians in these institutions may struggle to maintain active participation in scholarly communication, which can affect their professional growth and the overall development of the LIS profession in Nigeria.

Strategies for Enhancing Funding Support and Improving Research Productivity

Academic librarians are increasingly recognized not only as facilitators of information access but also as active contributors to scholarly communication. Engagement in research and scholarly activities enhances librarians' professional standing, strengthens the intellectual foundation of the Library and Information Science (LIS) discipline, and supports evidence-based practices within academic institutions. Klain-Gabbay and Shoham (2016) emphasize that librarians play a critical role in bridging knowledge dissemination between researchers and the wider academic community, noting that active research involvement enables librarians to contribute meaningfully to the development of scholarly networks and institutional knowledge.

Consequently, fostering research participation among librarians is vital for advancing both their professional development and the overall growth of the LIS field. However, the ability of academic librarians to fulfil these scholarly roles is often shaped by the institutional environment, particularly within Colleges of Education in Nigeria, where structural and resource-related constraints may limit their full participation in research activities.

To address these challenges, scholars have suggested several strategies for enhancing research productivity among librarians. These strategies include the provision of institutional research grants, sponsorship for conferences and workshops, publication fee support, mentoring programmes, and improved access to electronic information resources. Haliso et al. (2021) noted that institutional support significantly enhances research engagement, collaboration, and publication output among librarians. Similarly, Babalola and Allahmagani (2023) observed that access to research funding and supportive institutional policies encourage greater participation in scholarly activities and improve research productivity. These measures are therefore considered essential for strengthening research culture, increasing scholarly visibility, and improving the overall research performance of librarians in tertiary institutions.

The reviewed literature indicates that research productivity among academic librarians is strongly influenced by funding availability, institutional support, and access to research resources. While considerable attention has been given to university librarians in Nigeria, librarians in Colleges of Education remain under-represented in empirical research on scholarly productivity. Existing studies acknowledge funding as a major constraint but rarely focus specifically on how financial support shapes the research engagement and output of librarians within Colleges of Education. This gap in the literature provides a clear justification for examining the influence of funding on the research productivity of librarians in Federal Colleges of Education in South-West Nigeria.

Research Methodology

The study adopted a descriptive survey research design. This design was considered appropriate because it enabled the collection of quantitative data on funding availability, research productivity, and funding-related challenges as they naturally occur among librarians in Federal Colleges of Education. The population comprised all professional librarians

in Federal Colleges of Education in South-West Nigeria. Specifically, librarians from Federal College of Education (Technical) Abeokuta, Federal College of Education (Technical) Oyo, and Federal College of Education (Technical) Akoka participated in the study. In total, thirty (30) librarians constituted the study population, and all were surveyed, making the study a census of the population. Data were collected using a structured questionnaire divided into six sections: demographic information, funding availability, research productivity, contextual factors, influence of funding, and an open-ended question on funding-related improvements. The instrument was designed based on the study objectives and relevant literature. Data were analysed using descriptive statistics, including frequencies and percentages. Results were presented in tables to address the research questions. Responses from the open-ended question were analysed descriptively and summarized thematically to complement the quantitative findings**.**

Results

Table 1: To answer research question one, responses to items 1–10 were analyzed using frequencies and percentages on funding availability for library operations and research in Federal Colleges of Education in South-West Nigeria (N = 30).

S/N	Funding Item	SA	A	D	SD	Decision	Cumulative % (SA + A)
1	Regular annual budget allocation	7 (23.3%)	10 (33.3%)	8 (26.7%)	5 (16.7%)	Moderate	57%
2	Budget sufficient for daily operations	–	6 (20.0%)	15 (50.0%)	9 (30.0%)	Low	20%
3	Dedicated research fund/internal grant	10 (33.3%)	14 (46.7%)	6 (20.0%)	–	Moderate	80%
4	Financial support for conference attendance	6 (20.0%)	13 (43.3%)	9 (30.0%)	2 (6.7%)	Moderate	63%
5	Support for publication fees	–	4 (13.3%)	18 (60.0%)	8 (26.7%)	Low	13%
6	Adequate funding for e-resources/databases	3 (10.0%)	5 (16.7%)	17 (56.7%)	5 (16.7%)	Low	27%
7	Timely release of funds	3 (10.0%)	5 (16.7%)	14 (46.7%)	8 (26.7%)	Low	27%
8	Clear procedures for accessing research funds	6 (20.0%)	16 (53.3%)	8 (26.7%)	–	Moderate	73%
9	Access to external research grants	4 (13.3%)	18 (60.0%)	8 (26.7%)	–	Moderate	73%
10	Funding for ICT and research tools	4 (13.3%)	8 (26.7%)	15 (50.0%)	3 (10.0%)	Low	40%

Source: Researchers' Field Survey, 2026

Table 1 indicates that librarians in Federal Colleges of Education in South-West Nigeria generally perceive funding for library operations and research as inadequate. Most respondents disagreed that their libraries receive sufficient annual budget allocations, timely fund releases or adequate funding for e-resources, ICT upgrades, conference attendance, and publication support. These responses suggest systemic funding challenges that directly affect librarians' ability to engage

meaningfully in research activities. These responses suggest systemic funding challenges that directly affect librarians' ability to engage meaningfully in research activities. This finding aligns with recent evidence which shows that insufficient financial and institutional support, including limited research grants, infrastructural gaps, and lack of professional encouragement, is associated with lower levels of research productivity among librarians (Adetayo et al., 2023; Igiri et al., 2021)

Table 2: Research Productivity of Librarians in Federal Colleges of Education in South-West Nigeria (Last Five Years)

S/N	Research Output	Abeokuta (n = 15)	Oyo (n = 7)	Akoka (n = 8)	Total / Cumulative (N = 30)
11	Journal Articles	2–15 publications reported	3–7 publications reported	1–8 publications reported	Majority published 3–8 articles
12	Conference Papers	2–12 papers reported	2–6 papers reported	0–6 papers reported	Moderate participation observed
13	Books / Book Chapters / Reports	0–10 outputs reported	0–3 outputs reported	0–5 outputs reported	Generall low output
14	Satisfaction with Research Output	Yes: 12 (80.0%) No: 3 (20.0%)	Yes: 3 (42.9%) No: 4 (57.1%)	Yes: 6 (75.0%) No: 2 (25.0%)	Yes: 21 (70.0%) No: 9 (30.0%)
15	Adequate Visibility of Publications	Yes: 8 (53.3%) No: 7 (46.7%)	Yes: 6 (85.7%) No: 1 (14.3%)	Yes: 5 (62.5%) No: 3 (37.5%)	Yes: 19 (63.3%) No: 11 (36.7%)

Source: Researchers' Field Survey, 2026

Table 2 reveals that librarians in Federal Colleges of Education in South-West Nigeria show moderate levels of research productivity, with journal articles and conference papers being the most common outputs. However, productivity varies across institutions and outputs such as books and book chapters remain generally low. Although most respondents (70.0%) expressed satisfaction with their research output, a notable proportion reported inadequate publication visibility, indicating challenges in research dissemination. When viewed alongside the funding constraints identified in Table 1, the findings suggest that limited financial support may be influencing both the volume and visibility of librarians' research outputs. This observation is supported by evidence from public university libraries in South-West Nigeria, where librarians' research productivity was found to be low in terms of both quantity and visibility, largely due to weak institutional support and inadequate access to research resources (Makinde, Haliso & Alegbeleye, 2025). In addition, research funding and institutional support have been identified as significant factors influencing librarians' research productivity, suggesting that limited financial backing can negatively affect output and visibility (Oso & Olaniyi, 2024).

Table 3: Funding-Related Challenges Affecting Librarians' Engagement in Research in Federal Colleges of Education in South-West Nigeria.

S/N	Funding-Related Challenges	Yes n (%)	No n (%)	Total (N = 30)	Cumulative (Yes) %
16	Reliable access to internet and e-resources	12 (40.0%)	18 (60.0%)	30 (100%)	40.0
17	Workload allows time for research activities	20 (66.7%)	10 (33.3%)	30 (100%)	53.4
18	Availability of skill mentorship/research programmes	18 (60.0%)	12 (40.0%)	30 (100%)	55.6
19	Institutional encouragement/incentives for research	12 (40.0%)	18 (60.0%)	30 (100%)	51.7

20	Collaboration with colleagues on research projects	28 (93.3%)	2 (6.7%)	30 (100%)	60.0

Source: Researchers' Field Survey, 2026

Table 3 shows that librarians in Federal Colleges of Education in South-West Nigeria face significant funding related and institutional challenges that limit their participation in research. Poor access to internet and electronic resources, limited institutional incentives and inadequate mentorship opportunities were identified as major constraints. Although collaboration among librarians is relatively high, structural and funding deficiencies continue to hinder sustained research engagement. This finding aligns with broader evidence from Nigerian tertiary institutions indicating that inadequate research funding, weak institutional support structures, and limited mentorship opportunities significantly restrict librarians' scholarly activities and research participation (Igiri et al., 2021)

Table 4: Strategies for Enhancing Funding Support and Research Productivity of Librarians in Federal Colleges of Education in South-West Nigeria

S/N	Proposed Strategies	Yes n (%)	No n (%)	Total (N = 30)	Cumulative % (Yes)
21	Availability of funding directly increases research output	23 (76.7%)	7 (23.3%)	30 (100%)	76.7
22	Lack of funding prevents publication in reputable journals	22 (73.3%)	8 (26.7%)	30 (100%)	75.0
23	Conference funding leads to collaborations and publications	11 (36.7%)	19 (63.3%)	30 (100%)	62.2
24	Provision of research grants and publication fee support would increase research activity	29 (96.7%)	1 (3.3%)	30 (100%)	70.9

Source: Researchers' Field Survey, 2026

Table 4 indicates strong agreement among librarians that enhanced funding mechanisms would significantly improve their research productivity. Most respondents affirmed that the availability of research funding and publication fee support would significantly increase their research activities. Majority also agreed that inadequate funding limits their ability to publish in reputable journals. Although fewer respondents linked conference funding directly to publications, the findings emphasize the importance of structured research grants, publication support and sustainable funding mechanisms. These results align with evidence showing that institutional support which includes mentoring, financial incentives and professional development, significantly enhances academics' research productivity and scholarly visibility (Adetayo et al., 2023)

Responses to the open-ended questions reinforced the quantitative findings on funding and research productivity. Librarians across the Federal Colleges of Education emphasized the need for improved access to electronic resources, functional e-library facilities, regular sponsorship for local and international conferences, provision of institutional research grants, and financial support for publication fees. Respondents also noted that procedural bottlenecks in accessing research funds often discourage research initiatives. These observations are consistent with prior studies that link research productivity to institutional support and funding availability. For instance, Makinde, Haliso, and Alegbeleye (2025) reported that inadequate access to resources and weak institutional support hinder scholarly productivity among Nigerian librarians, while Oso and Olaniyi (2024) highlighted funding and mentorship as critical enablers of research engagement. Similarly, Igiri et al. (2021) emphasized that insufficient research infrastructure and limited financial support reduce research participation, and Adetayo et al. (2023) found that structured institutional support, including access to research funding, significantly enhances librarians' research output and visibility.

Discussion of Findings

The findings of this study reveal that funding for library operations and research support in Federal Colleges of Education in South-West Nigeria is largely inadequate, particularly in critical areas such as e-resources, ICT facilities, publication fees, and conference sponsorship. This finding supports earlier studies by Babalola and Allahmagani (2023), who observed that institutional funding significantly influences librarians' research engagement and productivity. It also aligns with Abolaji and Fadimu (2024), who reported that budgetary constraints negatively affect access to library resources and research support services in academic institutions.

This funding shortfall appears to have a direct influence on the moderate level of research productivity observed among librarians, especially in terms of journal publications, conference participation, and scholarly visibility. This is consistent with the findings of Oyedele et al. (2022), who noted that librarians in Nigerian tertiary institutions often record moderate research output due to inadequate institutional support. Similarly, Ibegbulam and Eze (2016) established that inadequate funding weakens research culture and reduces publication output among academic librarians.

The study further demonstrates that although collaboration among librarians is relatively high, structural and financial limitations continue to undermine sustained research engagement. This observation aligns with Igiri et al. (2021), who found that weak funding structures and poor research infrastructure significantly hinder scholarly productivity in Nigerian academic institutions.

Furthermore, the strong support for funding-related strategies such as research grants, publication fee sponsorship, and improved access to electronic resources underscores the central role of financial support in enhancing librarians' research productivity. This finding corroborates Haliso et al. (2021), who emphasized that institutional support mechanisms significantly enhance research engagement and publication output among librarians. It also supports Okonedo (2019), who stressed that investment in research infrastructure leads to improved scholarly productivity and visibility among academic librarians.

Conclusion

This study examined the influence of funding on the research productivity of librarians in Federal Colleges of Education in South-West Nigeria. The findings indicate that inadequate funding remains a major barrier to librarians' research engagement and scholarly contribution. While librarians demonstrate commitment to research through moderate publication output and collaboration, limited financial support constrains their ability to access research resources, attend conferences, and publish in reputable journals.

The study concludes that improving funding structures is essential for strengthening research productivity, enhancing scholarly visibility, and advancing the Library and Information Science profession within Federal Colleges of Education. Addressing funding-related challenges will not only benefit librarians' professional development but also contribute to the overall research culture of these institutions.

Recommendations

Based on the findings of the study, the following recommendations are made:

1. Increased funding allocation should be provided for library operations and research activities in Federal Colleges of Education.
2. Institutional management should establish dedicated research grants and publication fee support for librarians.
3. Regular sponsorship for local and international conferences should be prioritized to improve research exposure and collaboration.
4. Investment in electronic resources, ICT infrastructure, and functional e-libraries should be strengthened to support research activities.

Job Rotation Training and Job Satisfaction in Federal University Libraries: Pathways to the Future of Librarianship in Nigeria

By
Ogbonna Achilike (Ph.D)
ogbachilike@gmail.com; ogbonna.achilike@uaes.edu.ng
University of Agriculture and Environmental Sciences Library, Umuagwo, Imo State, Nigeria

Abstract
Libraries in Nigeria occupy a strategic position within the nation's knowledge economy, serving as engines of academic excellence, cultural heritage, and national development. This paper argues that job rotation training and job satisfaction are critical pathways to the future of librarianship in Nigeria. Drawing on recent scholarship and professional reasoning, it situates librarianship within the broader knowledge economy, examines the current state of the profession, and explores how job rotation enhances adaptability and leadership while job satisfaction drives motivation, innovation, and resilience. The paper further outlines pathways to the future of librarianship, emphasizing digital transformation, leadership development, policy reform, and sustainable funding. By embedding job rotation and satisfaction into institutional frameworks, Nigerian libraries can align with Vision 2050 and the United Nations Sustainable Development Goals, positioning librarianship as a strategic partner in national progress and custodians of hope for socio-economic transformation.
Keywords: Job Rotation Training, Job Satisfaction, Libraries, Digital Transformation, Leadership Development, Knowledge Economy, Policy Reform.

Introduction

The 2026 NLA Conference theme ***"Our Future, Our Hope, The State of Librarianship in Nigeria"*** underscores the urgency of rethinking the profession in the light of national aspirations and global transformations. Librarianship in Nigeria is no longer confined to the traditional role of book custodianship; it has evolved into a dynamic profession that directly influences teaching, research, innovation, and national development. Federal university libraries, in particular, stand at the heart of this transformation. They are not passive repositories of books but active institutions that shape Nigeria's knowledge economy by equipping students and researchers with information literacy, digital competencies, and access to scholarly resources.

In today's rapidly changing academic landscape, libraries are expected to serve as intellectual hubs of digital innovation, centers of lifelong learning, and engines of sustainable development. Yet, despite their strategic importance, federal university libraries continue to grapple with persistent challenges. Inadequate funding, outdated infrastructure, low morale among staff, and weak policy frameworks threaten their effectiveness and limit their ability to meet the demands of a digital age. These challenges raise critical questions about how librarianship can be revitalized to remain relevant and impactful in Nigeria's higher education system.

This paper advances the argument that job rotation training and job satisfaction are strategic pathways to revitalizing librarianship in Nigeria**.** Job rotation exposes librarians to diverse functions such as cataloguing, acquisitions, ICT, and reference services, thereby fostering adaptability, resilience, and leadership capacity. Job satisfaction, on the other side of the coin, encourages motivation, retention, and innovation, ensuring that librarians remain committed to service excellence. Together, these practices form the human foundation upon which digital transformation, leadership development, and national progress can be built.

By embedding job rotation and satisfaction into institutional frameworks, Federal University Libraries can transform into engines of innovation and sustainable development. This paper therefore situates job rotation and satisfaction not as isolated human resource strategies but as strategic imperatives for the future of librarianship in Nigeria. In doing so, it aligns the profession with Nigeria's Vision 2050 and the United Nations Sustainable Development Goals, reinforcing the idea that libraries are not only custodians of knowledge but also custodians of hope for a nation striving toward academic excellence and socio-economic advancement.

Nigeria's Vision 2050

Human Capital Development: Vision 2050 emphasizes education, innovation, and skills acquisition. Academic libraries are central to this, and the focus on job rotation training directly supports the development of versatile, adaptive librarians.

Knowledge Economy: The plan envisions Nigeria as a knowledge-driven economy. Academic libraries, through staff development and satisfaction, ensure the production and dissemination of knowledge.

Digital Transformation: Vision 2050 highlights Information and Communication Technology (ICT) expansion. This paper's emphasis on resilience and digital transformation aligns perfectly with libraries evolving into digital learning commons.

UN Sustainable Development Goals (SDGs)

Libraries are explicitly tied to several SDGs:

SDG 4: Quality Education – Libraries provide equitable access to learning resources, foster lifelong learning, and support teaching and research.

SDG 8: Decent Work and Economic Growth – Job rotation and satisfaction enhance professional growth, innovation, and productivity among librarians.

SDG 5: Gender Equality – Academic libraries promote inclusive access to ICT and literacy programs for women and marginalized groups.

SDG 16: Peace, Justice, and Strong Institutions – Libraries act as trusted institutions ensuring access to information and supporting civic engagement.

How this Paper Bridges the Two (Vision 2050 and SDGs)

Theme	Vision 2050	SDGs	Library Pathway
Staff Development	Human capital growth	SDG 8	Job rotation builds versatile librarians
Knowledge Economy	Innovation & research	SDG 4	Libraries as knowledge hubs
Digital Inclusion	ICT expansion	SDG 5, SDG 4	Digital commons, ICT training
Institutional Strength	Policy reform	SDG 16	Libraries as strong institutions

The above links professional practice (job rotation & job satisfaction) with national and global development frameworks, it positions libraries as strategic actors in Nigeria's future knowledge economy and also It emphasizes digital transformation and resilience, which are critical for libraries to remain relevant.

Job Rotation Training: A Pathway to Growth

Job rotation has emerged as a strategic human resource management tool in academic libraries, particularly within Federal University Libraries in Nigeria. It involves systematically moving librarians across different functional units/departments such as Cataloguing/Classification, Acquisitions/Collection Development, Reference Services, ICT, and Institutional Repository section, Research and Training and Circulation. This practice is not merely a redistribution of tasks but a deliberate strategy aimed at fostering adaptability, skill diversification, and professional resilience. Ogbodo and Eze (2025) demonstrate that job rotation training enhances satisfaction and prepares librarians for leadership roles, while also reducing monotony and burnout. Their study highlights that librarians exposed to multiple departments develop a holistic understanding of library operations, which strengthens collaboration and service delivery. Similarly, Adebayo (2024) notes that rotation builds competencies in digital resource management, a skill increasingly vital in the era of electronic databases and open-access repositories. Case studies across Nigeria confirm these benefits.

In South-South universities, rotation programmes have been linked to improved digital literacy among librarians, enabling them to better support students in navigating e-resources. In North-West institutions, rotation combined with in-service training has reduced skill gaps and fostered teamwork. In North-Central Nigeria, librarians reported that rotation enhanced their confidence in handling ICT tools, positioning them as facilitators of digital transformation.

Globally, scholars echo these findings. Robbins and Judge (2023) argue that job rotation is a proven method for building organizational flexibility, while Armstrong (2024) emphasizes its role in succession planning and leadership development. For Nigerian librarianship, this means rotation is not only a tool for professional growth but also a mechanism for preparing the next generation of library leaders. Thus, job rotation emerges as a pathway to growth by equipping librarians with diverse competencies, fostering resilience, and positioning federal university libraries as dynamic institutions capable of meeting the demands of a rapidly evolving knowledge economy.

Job Satisfaction: The Human Dimension

Job satisfaction is both a human and organizational concern, directly influencing performance, innovation, and retention. In the context of Nigerian librarianship, satisfaction is shaped by factors such as recognition, opportunities for professional development, workload balance, and institutional support. Okeke and Nwankwo (2024) found a strong

correlation between satisfaction and performance among librarians in South-East Nigeria. Their study revealed that satisfied librarians were more innovative, more willing to adopt ICT tools, and more committed to service excellence. Ezeani and Igwesi (2024) argue that continuous professional development and job rotation are key drivers of satisfaction, as they reduce monotony and enhance career growth. However, Ogbodo and Eze (2025) caution that without policy reform, gains from rotation and continuous professional development may be short-lived, as systemic issues such as poor funding and weak human resource structures persist.

Other scholars reinforce these insights. Aina (2024) highlights that satisfaction is closely tied to recognition and career progression, noting that librarians often feel undervalued compared to other academic staff. Olanlokun and Salisu (2025) emphasize that satisfaction is essential for resilience, arguing that motivated librarians are better able to withstand systemic challenges and continue delivering quality services. Globally, Herzberg's two-factor theory (Herzberg revisited by Luthans, 2023) provides a useful framework: while hygiene factors such as salary and working conditions prevent dissatisfaction, motivators such as recognition, responsibility, and growth opportunities drive true satisfaction.

In Nigerian federal university libraries, satisfaction therefore emerges as a critical determinant of innovation and resilience. When librarians are motivated and fulfilled, they are more likely to embrace digital transformation, engage in leadership roles, and contribute meaningfully to national development. Conversely, low satisfaction leads to stagnation, attrition, and diminished service quality.

The literature points to three pathways:

Digital Transformation: Smart libraries enhance research quality (Okafor & Nwosu, 2024).

Leadership Development: Rotation and continuous professional development foster managerial capacity (Ezeani & Igwesi, 2024).

Resilience and Adaptability: Structured training builds resilience (Ogbodo & Eze, 2025).

Together, these pathways align librarianship with Nigeria's Vision 2050 and the United Nation's Sustainable Development Goals, reinforcing its role in national development.

Policy and Institutional Implications

Policy reform is essential if federal university libraries are to fulfill their mandate as engines of academic excellence and national development. Ogbodo and Eze (2025) stress the importance of embedding job rotation into human resource frameworks, arguing that without institutionalization, rotation remains ad hoc and unsustainable. Embedding rotation policies ensures that librarians are systematically exposed to diverse functions, thereby fostering adaptability, resilience, and leadership capacity.

Collaboration with professional bodies such as the Nigerian Library Association (NLA) and the Librarians' Registration Council of Nigeria (LRCN) is equally critical. These organizations provide professional standards, accreditation, and advocacy, ensuring that librarians remain professionally competent and ethically grounded. As Aina (2024) observes, professional associations play a vital role in shaping national policy discourse, and their involvement is necessary to align librarianship with broader educational and developmental goals.

Evaluation mechanisms also require strengthening. Okafor and Nwosu (2024) highlight weak performance metrics in Nigerian university libraries, noting that many institutions lack systematic approaches to measuring the impact of training, rotation, and satisfaction initiatives. Introducing clear performance indicators—such as user satisfaction surveys, digital literacy benchmarks, and innovation indices—would allow libraries to demonstrate their value to stakeholders and justify increased funding.

Furthermore, funding remains a central challenge. Federal university libraries often operate with limited budgets which restrict their ability to implement rotation programs, provide continuous professional development, and invest in digital infrastructure. Olanlokun and Salisu (2025) argue that without adequate financial support, even the most well-designed policies will fail to achieve their intended outcomes. Policy reform must therefore include sustainable funding models, possibly through government allocations, public-private partnerships, and international collaborations.

Globally, the International Federation of Library Associations (IFLA, 2024) provides a framework for aligning library policies with the UN Sustainable Development Goals. This framework emphasizes inclusivity, digital access, and lifelong learning. For Nigeria, adopting such a global perspective means integrating librarianship into national development strategies, recognizing libraries as engines of growth, and positioning them as partners in achieving Vision 2050.

Finally, institutional culture must evolve. Robbins and Judge (2023) note that organizational culture strongly influences the success of human resource policies. For Federal university libraries, this means cultivating a culture of innovation, collaboration, and accountability. Policies must not only exist on paper but be actively implemented, monitored, and revised to reflect changing realities.

In summary, the literature underscores that policy reform in Nigerian librarianship must be comprehensive: embedding job rotation into human resource frameworks, strengthening collaboration with professional bodies, introducing robust evaluation mechanisms, securing sustainable funding, and aligning with global development agendas. Only through such reforms can Federal University Libraries move from being underfunded service units to becoming strategic institutions that drive national progress.

Importance of Job Rotation and Job Satisfaction in university Libraries

Enhances Professional Growth Rotation equips librarians with diverse competencies, reduces monotony, and fosters adaptability. Evidence shows that librarians exposed to multiple departments develop holistic skills that prepare them for leadership roles. Without rotation, stagnation and skill gaps persist.

Drives Innovation Satisfied librarians are more motivated, resilient, and willing to adopt ICT tools. Continuous professional development and job rotation are proven drivers of satisfaction. Job satisfaction is therefore essential for sustaining Nigeria's knowledge economy and ensuring innovation in service delivery.

Digital Transformation is Non-Negotiable Smart libraries in Nigeria demonstrate the impact of ICT integration. Federal University Libraries must embrace digital readiness, invest in infrastructure, and train staff in emerging technologies or risk irrelevance in the global academic landscape.

Policy Reform is Essential Embedding job rotation into human resource frameworks ensures sustainability. Collaboration with NLA and LRCN strengthens professional standards. Without policy reform, gains from job rotation and job satisfaction remain fragmented and unsustainable.

The above submission underscore that job rotation and satisfaction are strategic pathways to the future of librarianship in Nigeria. Job rotation builds resilience, adaptability, and leadership capacity ensuring librarians are prepared for diverse challenges. Satisfaction enhances motivation, innovation, and retention, creating a workforce that is both committed and forward-looking.

Digital transformation emerges as a non-negotiable imperative. Libraries must integrate ICT tools, embrace smart technologies, and position themselves as engines of sustainable development. Policy reform provides the structural backbone for these changes, ensuring consistency, accountability, and sustainability.

Collectively, these elements form a holistic framework for revitalizing Federal university libraries. They align with Nigeria's Vision 2050 and the UN Sustainable Development Goals, situating librarianship as a strategic partner in national development.

Our Future, Our Hope

Libraries embody hope by ensuring equitable access to knowledge. Ezeani and Igwesi (2024) emphasize that knowledge management practices in Nigerian university libraries are central to strengthening academic productivity, though challenges of infrastructure and collaboration remain. The International Federation of Library Associations (IFLA, 2024) frames libraries globally as "engines of sustainable development," aligning them with the UN SDGs. For Nigeria, this means that Federal University Libraries must contribute not only to academic excellence but also to socio-economic transformation.

Librarianship in Nigeria is at a crossroad as Okafor and Nwosu (2024) highlight the rise of smart academic libraries in Northern Nigeria, where Information and Communication Technology (ICT) integration has improved research quality. Yet systemic challenges persist: poor connectivity, inadequate funding, and resistance to change. Ogbodo and Eze (2025) found that librarians often report low job satisfaction due to limited promotion opportunities and weak human

resource structures, though they remain resilient and committed to service delivery. This duality—strength in professional dedication but weakness in institutional support—defines the current state of librarianship.

Conclusion

Federal University Libraries are not merely service units but strategic institutions shaping Nigeria's future. Job rotation training and job satisfaction are pathways to professional growth, resilience, and innovation. By embedding these practices into human resource frameworks, supported by continuous professional development and digital transformation, Nigeria secures its hope for academic excellence and sustainable progress. The future of librarianship in Nigeria depends on bold reforms, sustained investment, and recognition of librarians as custodians of hope. If libraries are strengthened, policies reformed, and professionals empowered, then indeed, our libraries will be our future, and our librarians will remain our hope.

Suggestions

From the paper, several recommendations emerge for revitalizing federal university libraries in Nigeria:

Institutionalize Job Rotation

- Federal University Libraries should embed job rotation into their human resource frameworks, ensuring systematic exposure of librarians to cataloguing, acquisitions, ICT, and reference services.
- Job rotation schedules should be transparent, equitable, and linked to career progression, thereby reducing stagnation and fostering leadership capacity.

Enhance Job Satisfaction

- Institutions must prioritize recognition, promotion opportunities, and professional development.
- Continuous Professional Development (CPD) programs should be integrated into staff development policies, with emphasis on ICT training and digital literacy.
- Libraries should adopt Herzberg's motivation-hygiene framework to balance working conditions with growth opportunities.

Strengthen Digital Transformation

- Federal University Libraries should invest in ICT infrastructure, high-speed internet, and access to electronic databases.
- Librarians must be trained in emerging technologies such as artificial intelligence, data analytics, and digital preservation.
- Smart library initiatives should be scaled across all regions, ensuring equitable access to digital resources.

Policy Reform and Collaboration

- The Federal Government, through the Ministry of Education, should recognize libraries as strategic institutions in national development plans.
- Collaboration with professional bodies such as the Nigerian Library Association (NLA) and Librarians' Registration Council of Nigeria (LRCN) should be strengthened to enforce standards and accreditation.
- Performance metrics must be introduced to evaluate the impact of job rotation, satisfaction, and digital initiatives.

Sustainable Funding Models

- Federal University Libraries should be allocated dedicated funding lines within university budgets.
- Public-private partnerships and international collaborations should be explored to supplement government funding.
- Libraries should demonstrate accountability by publishing annual reports that highlight their contributions to teaching, research, and national development.

Cultivate Innovative Institutional Culture

- Library leadership should foster a culture of innovation, collaboration, and accountability.

- Staff should be encouraged to experiment with new service models, adopt user-centered approaches, and engage in interdisciplinary collaboration.
- Recognition programmes should celebrate innovation and resilience among librarians.

Abstract
Legislative libraries play a vital role in supporting evidence-based legislation by providing lawmakers with access to reliable information, research materials, policy analyses, and legislative records. This study examined the contribution of legislative libraries to lawmaking in Nigeria, focusing on the availability and adequacy of information resources, the accessibility and utilization of library services by legislators, and the challenges affecting their operations. Findings showed that institutions such as the National Assembly Library and the National Institute for Legislative and Democratic Studies (NILDS) significantly support legislative research, policy analysis, and capacity building. However, challenges including inadequate funding, outdated resources, poor technological infrastructure, and limited access to electronic databases, insufficient professional staff, and low utilization of library services hinder their effectiveness. The study concludes that strengthening legislative libraries through increased funding, digital transformation, staff development, and improved awareness will enhance evidence-based legislation, democratic governance, and national development in Nigeria.
Keywords: Legislative libraries, evidence-based legislation, legislative research, policymaking, NILDS, Nigeria..

Introduction

Legislative libraries are specialized information centers established to support lawmakers with accurate, timely, and relevant information for policymaking and legislative decision-making. In Nigeria, legislative libraries have become increasingly important in promoting evidence-based legislation through the provision of research materials, policy analyses, legislative archives, and information services to members of the National Assembly and State Houses of Assembly. **Strengthening Access to Legislative Information:** The establishment and expansion of legislative library services, particularly through the National Assembly Library Trust Fund (NALTF) and the National Institute for Legislative and Democratic Studies (NILDS), have improved access to legislative documents, government publications, policy reports, and electronic databases. These resources enable legislators to make informed decisions based on empirical evidence rather than political intuition alone. The National Assembly Library currently provides both print and electronic resources, research support services, and digital information systems to support legislative functions.

Promotion of Evidence-Based Lawmaking: Evidence-based legislation requires lawmakers to rely on credible research, statistical data, policy evaluations, and expert analysis when formulating laws. NILDS plays a critical role in this process by conducting policy research, bill analysis, legislative drafting, and capacity-building programmes for legislators. These services contribute significantly to improving the quality and effectiveness of legislation in Nigeria.

Enhancement of Research Support Services*;* Legislative libraries now provide comprehensive research support through access to books, journals, legislative archives, policy briefs, and comparative legislative studies. The NILDS Library serves as a specialized legislative information center with collections in governance, law, economics, public administration, and political science, thereby supporting legislators in analyzing complex policy issues.

Preservation of Legislative Memory and Institutional Knowledge*:* Legislative libraries contribute to preserving institutional memory through archiving bills, committee reports, parliamentary debates, and legislative proceedings. The Legislative Archive maintained by NILDS ensures that historical legislative records remain accessible for future policymaking and research. Such preservation promotes continuity and consistency in legislative practice.

Capacity Building and Professional Development*:* One of the major achievements of legislative support institutions in Nigeria is the provision of continuous training for legislators and legislative staff. Through workshops, seminars, and policy dialogues, lawmakers are exposed to emerging governance issues and international best practices, thereby strengthening evidence-informed decision-making.

Legislative libraries are specialized information facilities that exist within parliaments and state assemblies to support lawmaking with accurate, timely, and credible knowledge. In Nigeria, where the National Assembly and 36 State Houses of Assembly grapple with complex policy issues ranging from fiscal reform to security, climate change, and digital economy regulation, the quality of legislation increasingly depends on the quality of evidence behind it.

Legislative libraries are indispensable because they are; Information gateway: They collect and organize laws, gazettes, Hansard records, policy papers, research reports, and global comparative legislation that lawmakers and their aides rely on daily. Research support: Librarians and parliamentary researchers help synthesize data, fact-check claims, and

prepare briefs that turn political intent into workable, enforceable statutes. Institutional memory: They preserve legislative history, committee reports, and past debates so new assemblies do not legislate in a vacuum.

Legislative libraries are therefore, the infrastructure of evidence-based lawmaking. Without strong libraries, committees lack briefing vessels, public hearings lack backgrounders, and drafters lack comparative models. Strengthening these libraries in Nigeria is therefore not about books on shelves. It is about building the capacity for laws that solve real problems, reflect Nigerian data as well as withstand judicial and public scrutiny in court and the society in general respectively.

This paper explored the current state of legislative libraries in Nigeria, the gaps they face, and how repositioning the libraries can anchor a culture of evidence-based legislation across the federation

Problem Statement

Evidence-based legislation is essential for effective governance, as it enables lawmakers to make informed decisions based on reliable data, research findings, and factual information. Legislative libraries play a critical role in this process by providing legislators with access to relevant information resources, policy analyses, research reports, and other knowledge products that support the formulation, debate, and enactment of laws. In developed democracies, legislative libraries serve as vital information centers that strengthen the quality of legislative decision-making and promote good governance.

In Nigeria, however, concerns have been raised regarding the extent to which legislative libraries effectively support evidence-based lawmaking. Many legislative libraries face challenges such as inadequate funding, outdated information resources, limited technological infrastructure, insufficient professional staffing, and low utilization by legislators. These challenges may hinder legislators' access to timely, accurate, and comprehensive information needed for informed policymaking and legislative oversight.

Furthermore, despite the growing emphasis on evidence-based governance, there is limited empirical evidence on the effectiveness of legislative libraries in supporting the legislative process in Nigeria. The extent to which legislators rely on library services and information resources when drafting, debating, and enacting laws remains unclear. This gap in knowledge makes it difficult to determine whether legislative libraries are adequately fulfilling their mandate of supporting evidence-based legislation.

Therefore, there is a need to assess the availability, accessibility, utilization, and effectiveness of legislative libraries in Nigeria and examine their contribution to evidence-based legislation. The findings of this study will provide insights into the challenges confronting legislative libraries and suggest measures for enhancing their capacity to support informed legislative decision-making and improved governance in Nigeria.

Objectives of the study

1. Examine the availability and adequacy of information resources and services provided by legislative libraries in Nigeria.
2. Assess the accessibility and utilization of legislative library resources by legislators and legislative staff.
3. Identify the challenges affecting the effective operation of legislative libraries in supporting legislative activities.

Literature Review

Availability and adequacy of information resources and services provided by legislative Libraries in Nigeria. Legislative libraries are specialized information centers established to support lawmakers and legislative staff with timely, accurate, and relevant information for lawmaking, oversight, representation, and policy formulation. The effectiveness of legislative libraries largely depends on the availability and adequacy of their information resources and services.

According to S. Aliyu (2016)., legislative libraries in Nigeria provide resources such as books, government publications, legislative proceedings, journals, newspapers, policy documents, reference materials, and electronic information resources. However, many state legislative libraries suffer from inadequate collections, outdated materials, and insufficient digital resources, which limit their ability to meet the information needs of legislators.

A study conducted in the North-Western State Houses of Assembly revealed that inadequate funding has significantly affected the acquisition of current information resources and services. The study found that many legislative libraries lack modern ICT facilities, internet access, and electronic databases necessary for contemporary legislative research.

Similarly, a study on parliamentary libraries in Kano and Jigawa States found that while resources such as books, legislative documents, newspapers, and journals were available, their adequacy was often compromised by poor funding and irregular updating of collections. The authors argued that the quality of services provided by legislative libraries is directly related to the quality and currency of available resources.

At the national level, the library of the National Institute for Legislative and Democratic Studies (NILDS) maintains extensive collections in legislation, governance, law, economics, public administration, and policy analysis. It also

provides research reports, legislative drafting manuals, budget analyses, and oversight guides, demonstrating the potential role of well-resourced legislative libraries in supporting legislative activities.

The literature therefore suggests that although legislative libraries in Nigeria possess essential information resources, the adequacy, currency, and technological sophistication of these resources remain inadequate in many legislative institutions.

Accessibility and Utilization of Legislative Library Resources by Legislators and Legislative Staff

Accessibility and utilization of information resources are critical indicators of the effectiveness of legislative libraries. Information resources may be available, but their value depends on the extent to which legislators and legislative staff access and use them in performing their duties.

Qristee Muyiwa (2015). on the National Assembly Library, Abuja, found that legislative aides regularly accessed information resources for legislative functions such as bill analysis, policy research, committee work, and constituency representation. The study identified books, reports, legislative documents, journals, and electronic resources as the most frequently used materials. However, access was constrained by inadequate ICT infrastructure, insufficient awareness of available resources, and limited training in information retrieval.

Datti's (2019). Study of Kano and Jigawa State Houses of Assembly reported that legislative staff relied on parliamentary libraries for legislative research, preparation of briefs, committee assignments, and policy analysis. The study revealed moderate utilization levels but noted that many users preferred personal contacts and informal information sources due to limitations in library services and resource availability.

Similarly, Clifford's (2014). Study on the Edo State House of Assembly established that lawmakers recognized the importance of libraries for effective legislation and occasionally used library services. However, utilization was hindered by the lack of relevant and current materials as well as inadequate awareness of available services.

Studies in specialized legal information environments in Nigeria also indicate that users often depend heavily on libraries for professional information needs but express dissatisfaction when collections are outdated or incomplete.

The literature therefore suggests that although legislators and legislative staff recognize the value of legislative libraries, utilization remains below optimal levels because of accessibility barriers, inadequate collections, and technological limitations.

Challenges affecting the effective operation of legislative libraries in supporting legislative activities

Numerous studies have identified challenges that undermine the effectiveness of legislative libraries in Nigeria.

The most frequently cited challenge is inadequate funding. Aliyu found that insufficient budgetary allocation affects resource acquisition, subscription to electronic databases, staff development, and maintenance of library infrastructure.

Datsti (2019) reported that 77% of respondents identified shortage of funds as the major challenge affecting accessibility and utilization of parliamentary library resources. Other challenges included inadequate ICT facilities, non-availability of current information resources, poor user education programs, and inefficient cataloguing systems.

Additional challenges identified in the literature include:

1. Lack of modern information and communication technologies.

2. Limited internet connectivity and access to electronic databases.

3. Inadequate professional staffing and specialized training.

4. Poor awareness of available library services among legislators.

5. Outdated and insufficient information resources.

6. Unconducive library environments.

Time constraints faced by legislators, which limit library use.

These challenges collectively reduce the capacity of legislative libraries to provide timely, accurate, and comprehensive information support for legislative activities and evidence-based decision-making.

Way Forward

To strengthen evidence-based legislation in Nigeria, legislative libraries must be repositioned as strategic knowledge centers that support informed policymaking and effective legislative performance. This requires a deliberate commitment by government, legislative institutions, and other stakeholders to address the challenges currently limiting the effectiveness of these libraries.

First, there is a need for increased and sustainable funding for legislative libraries at both the National Assembly and State Houses of Assembly. Adequate funding will facilitate the acquisition of current information resources, subscription to electronic databases, modernization of library facilities, and improvement of overall service delivery.

Second, legislative libraries should embrace digital transformation through the deployment of modern information and communication technologies (ICTs). The establishment of digital libraries, online catalogues, electronic repositories, and remote access platforms will enhance accessibility to information resources and enable legislators to obtain relevant information regardless of location or time constraints.

Third, continuous professional development and capacity-building programmes should be provided for legislative librarians and information professionals. Specialized training in legislative research, policy analysis, information management, digital librarianship, and emerging technologies will improve the quality of information services available to lawmakers.

Fourth, awareness and orientation programmes should be organized regularly for legislators and legislative staff to promote greater utilization of library resources and services. Such programmes should emphasize the importance of evidence-based decision-making and demonstrate how library resources can support legislative drafting, policy analysis, committee work, and oversight functions.

Furthermore, collaboration and networking among legislative libraries, academic institutions, research organizations, and international parliamentary information services should be strengthened. These partnerships can facilitate resource sharing, access to global best practices, and the exchange of research and legislative information.

There is also a need to establish clear policies and standards for legislative library development and operation across Nigeria. Such standards should address staffing requirements, resource acquisition, technological infrastructure, service delivery, and performance evaluation to ensure consistency and effectiveness.

Finally, future empirical studies should be conducted to evaluate the impact of legislative library services on legislative outcomes, policymaking processes, and governance performance in Nigeria. Evidence generated from such studies will provide a stronger basis for policy interventions and investment in legislative information systems.

By implementing these measures, legislative libraries can be transformed into vibrant centers of knowledge that support evidence-based legislation, improve the quality of laws and public policies, and contribute significantly to democratic governance and national development in Nigeria.

Conclusion

Legislative libraries remain indispensable institutions in the legislative process, serving as critical sources of information that support evidence-based lawmaking and democratic governance. This study has demonstrated that legislative libraries in Nigeria provide a wide range of information resources and services, including books, legislative documents, government publications, policy reports, journals, and electronic resources that are essential for informed legislative decision-making.

ABSTRACT

This study examines the role of Artificial Intelligence (AI) in enhancing 21st-century library and information services in Nigeria, focusing on its impact on service delivery, benefits, and adoption challenges. A descriptive survey research design was adopted, and data were collected from 165 professional librarians in selected Nigerian academic libraries using a structured questionnaire. The data were analyzed using descriptive statistics (mean and standard deviation) and inferential statistics (Pearson correlation). The findings revealed that AI technologies such as machine learning, natural language processing, chatbots, and automated cataloguing systems are applicable to library services and significantly improve efficiency, accuracy, accessibility, and user satisfaction. The study also established a strong positive relationship between AI adoption and library service delivery, as well as between librarians' digital competencies and effective AI implementation. However, AI adoption is constrained by inadequate ICT infrastructure, limited funding, insufficient technical skills, and weak policy support. The study concludes that strategic investment in infrastructure, continuous capacity building, and supportive policy frameworks are essential for sustainable AI integration and improved library service delivery in Nigeria.

Keywords: Artificial Intelligence (AI), Academic Libraries, Service Delivery, Digital Transformation, Nigeria

INTRODUCTION

Libraries have historically served as essential institutions for the preservation, organization, and dissemination of knowledge. From ancient manuscript collections to modern digital repositories, they have continuously evolved in response to changes in information production and technological development (Das & Islam, 2021). Today, libraries have transformed beyond physical spaces into dynamic digital ecosystems that support teaching, learning, research, and lifelong education. The evolution of libraries reflects major historical milestones, including early civilization knowledge preservation systems and the invention of the printing press in the 15th century, which significantly expanded access to information (Sharma & Sharma, 2022). The 20th century introduced computerization, automation of cataloguing, and the development of electronic databases, leading to the emergence of digital libraries that now provide global, remote access to information resources (Cox et al., 2022).

In recent years, libraries worldwide have increasingly adopted Information and Communication Technologies (ICTs) and Artificial Intelligence (AI) to enhance service delivery. In advanced regions, AI is being used to automate cataloguing, improve information retrieval, support virtual reference services, and personalize user experiences (Dwivedi et al., 2023). These innovations are reshaping traditional librarianship into a more intelligent, data driven service environment. AI technologies such as machine learning, natural language processing, and predictive analytics are further transforming library operations by improving efficiency, automating routine tasks, and enhancing user engagement (Liu & Briggs, 2022). However, while developed regions have made significant progress, many libraries in Africa are still at the early stages of digital transformation due to infrastructural and capacity-related challenges (Echedoma & Okuonghae, 2021).

In Nigeria, libraries remain central to education, research, and national development, yet many still rely on conventional service models that limit efficiency and innovation. The adoption of AI remains limited, resulting in challenges such as slow information retrieval, low personalization, and inefficiencies in managing digital resources (Atanda, 2024). This situation is further constrained by inadequate funding, weak ICT infrastructure, limited technical expertise, and inconsistent policy frameworks (Oton & Kolawole, 2025). Despite these challenges, there is growing recognition of AI as a transformative tool for repositioning libraries as intelligent information hubs capable of delivering faster, more accurate, and user centred services (Igbo et al., 2025). AI driven tools such as chatbots, intelligent indexing systems, and predictive search engines offer practical solutions for improving library service delivery and user satisfaction (Adewojo & Dunmade, 2024).

Against this background, this study examines the role of Artificial Intelligence in enhancing 21st-century library and information services in Nigeria, focusing on its opportunities, challenges, and sustainable adoption strategies.

Statement of the Problem

Despite the growing global adoption of Artificial Intelligence (AI) in library operations, many Nigerian libraries continue to rely on traditional and semi-automated systems that limit efficiency, responsiveness, and innovation in service delivery. While AI technologies such as machine learning, natural language processing, and intelligent search systems have demonstrated the potential to enhance information retrieval, automate routine tasks, and improve user experience, their integration into Nigerian libraries remains minimal.

This limited adoption is largely attributed to challenges such as inadequate ICT infrastructure, insufficient funding, low levels of digital and technical skills among librarians, and the absence of clear policy frameworks to guide implementation. As a result, there exists a significant gap between global advancements in AI-driven library services and the current state of library operations in Nigeria. If this gap is not addressed, Nigerian libraries risk becoming less relevant in the rapidly evolving digital information landscape. Therefore, there is a need to investigate how AI can be effectively leveraged to improve library service delivery and to identify strategies for overcoming existing adoption barriers.

Objectives of the Study

The study seeks to:

8. Identify Artificial Intelligence technologies applicable to library and information services.
9. Examine how Artificial Intelligence improves library service delivery in Nigeria.
10. Analyze the benefits of integrating AI into library operations and user services.
11. Investigate the challenges affecting AI adoption in Nigerian libraries.
12. Propose strategies for the effective implementation of Artificial Intelligence in library services.

Research Questions

The study is guided by the following research questions:

1. What Artificial Intelligence technologies are applicable to library and information services?
2. How does Artificial Intelligence improve the efficiency and quality of library services in Nigeria?
3. What benefits are associated with the adoption of AI in library and information management?
4. What challenges hinder the adoption of Artificial Intelligence in Nigerian libraries?
5. What strategies can support the effective integration of AI in library services in Nigeria?

Research Hypotheses

To guide empirical investigation, the following hypotheses are formulated:

H_{01}: There is no significant relationship between Artificial Intelligence adoption and library service delivery in Nigerian libraries.

H_{02}: There is no significant relationship between librarians' digital skills and the successful implementation of Artificial Intelligence in library services in Nigeria.

LITERATURE REVIEW

Introduction

The integration of Artificial Intelligence (AI) into library and information services has become one of the most transformative developments in contemporary librarianship. Globally, libraries are transitioning from traditional information management systems to intelligent, data driven service environments that support automation, personalization, and predictive analytics. This transformation is reshaping the role of librarians, redefining service delivery models, and enhancing user engagement. This chapter presents a critical review of relevant literature on AI and library services, structured according to the research questions of the study. It examines empirical and theoretical studies from 2021–2026 focusing on AI technologies in libraries, their impact on service delivery, and the benefits and challenges of adoption, particularly in developing countries such as Nigeria.

Artificial Intelligence Technologies Applicable to Library and Information Services

Artificial Intelligence technologies in libraries have evolved rapidly in recent years, particularly in the areas of machine learning, natural language processing (NLP), robotics, and intelligent automation systems. According to Das and Islam (2021), who conducted a systematic review of AI applications in libraries using Scopus and Web of Science databases, AI technologies are primarily deployed in cataloguing, classification, and information retrieval systems. Their study analyzed 32 peer reviewed articles and found that machine learning and NLP dominate AI implementation in library environments, although full-scale deployment remains limited.

Similarly, Ajani, Tella, Salawu and Abdullahi (2022), examined the applicability of AI tools in Nigerian academic libraries through a qualitative documentary analysis. Their study revealed that AI tools such as expert systems, robotics, and intelligent databases are relevant in acquisition, indexing, and circulation services. However, they emphasized that most Nigerian libraries are still operating at the automation stage rather than full AI integration due to infrastructural and financial constraints. In a more recent study, Lappalainen and Narayanan (2023), explored emerging AI technologies in modern libraries using conceptual synthesis and case-based evidence. Their findings indicated that generative AI systems, intelligent chatbots, and predictive analytics are becoming essential tools for modern libraries globally. The study further highlighted that these technologies improve efficiency in user interaction, automate repetitive

tasks, and support data driven decision-making. However, they stressed the need for continuous training of librarians to effectively manage AI systems.

Synthesis:

The literature clearly indicates that AI technologies relevant to libraries include machine learning, NLP, robotics, expert systems, chatbots, and predictive analytics. However, adoption in developing countries, particularly Nigeria, remains in early stages due to infrastructural and human capacity challenges.

Artificial Intelligence and Library Service Delivery in Nigeria

Artificial Intelligence has been widely recognized as a catalyst for improving efficiency, responsiveness, and personalization in library services. Wagwu et al. (2024) conducted a descriptive survey involving 37 librarians from selected Nigerian university libraries to examine the use of AI powered chatbots in reference services. Their findings revealed that chatbots significantly improved response time, enhanced user interaction, and provided 24/7 virtual assistance. The study concluded that AI-based systems increase service efficiency but require adequate ICT infrastructure and staff training. Similarly, Suleiman et al. (2023) investigated AI adoption in Nigerian academic libraries using qualitative research methods and ethical analysis. The study found that AI enhances information retrieval systems by enabling personalized search results and intelligent recommendation services. However, concerns were raised regarding data privacy, algorithmic bias, and ethical governance in AI deployment.

In another empirical study, Oton and Kolawole (2025) analyzed AI integration in library operations through literature based synthesis. Their findings indicated that AI improves cataloguing accuracy, accelerates information processing, and enhances user satisfaction. They further noted that AI transforms librarians from routine service providers into knowledge managers and data interpreters.

Synthesis:

Across the reviewed studies, AI has been shown to improve service delivery through automation, personalization, and improved response time. However, concerns around ethics, infrastructure, and professional readiness remain significant barriers in Nigeria.

Benefits of Artificial Intelligence in Library and Information Services

The benefits of Artificial Intelligence in libraries are widely documented in recent literature. Igbo et al. (2025) examined AI adoption in Nigerian academic libraries using thematic analysis of secondary data. The study identified key benefits including improved operational efficiency, automated workflows, enhanced user satisfaction, and faster information retrieval. The authors concluded that AI enables libraries to handle large datasets more effectively than traditional systems. Similarly, Idahosa and Eireyi-Edewede (2023) conducted a survey of librarians in South-South Nigeria using structured questionnaires. The study revealed that the adoption of emerging technologies significantly enhances library service delivery by improving efficiency and reducing reliance on manual processes. However, the findings also showed that limited digital literacy and inadequate technical skills among librarians hinder the effective implementation of such technologies in academic libraries. In their study, Ovie and Ekuerhare (2024) further emphasized that AI contributes to knowledge management, institutional efficiency, and improved decision-making in libraries. Their conceptual review highlighted that AI enables predictive analytics, which helps libraries anticipate user needs and improve resource allocation.

Synthesis:

The literature consistently shows that AI enhances efficiency, improves user experience, supports decision making, and reduces workload in libraries. However, these benefits are fully realized only in environments with adequate infrastructure and skilled personnel.

Challenges Affecting Artificial Intelligence Adoption in Nigerian Libraries

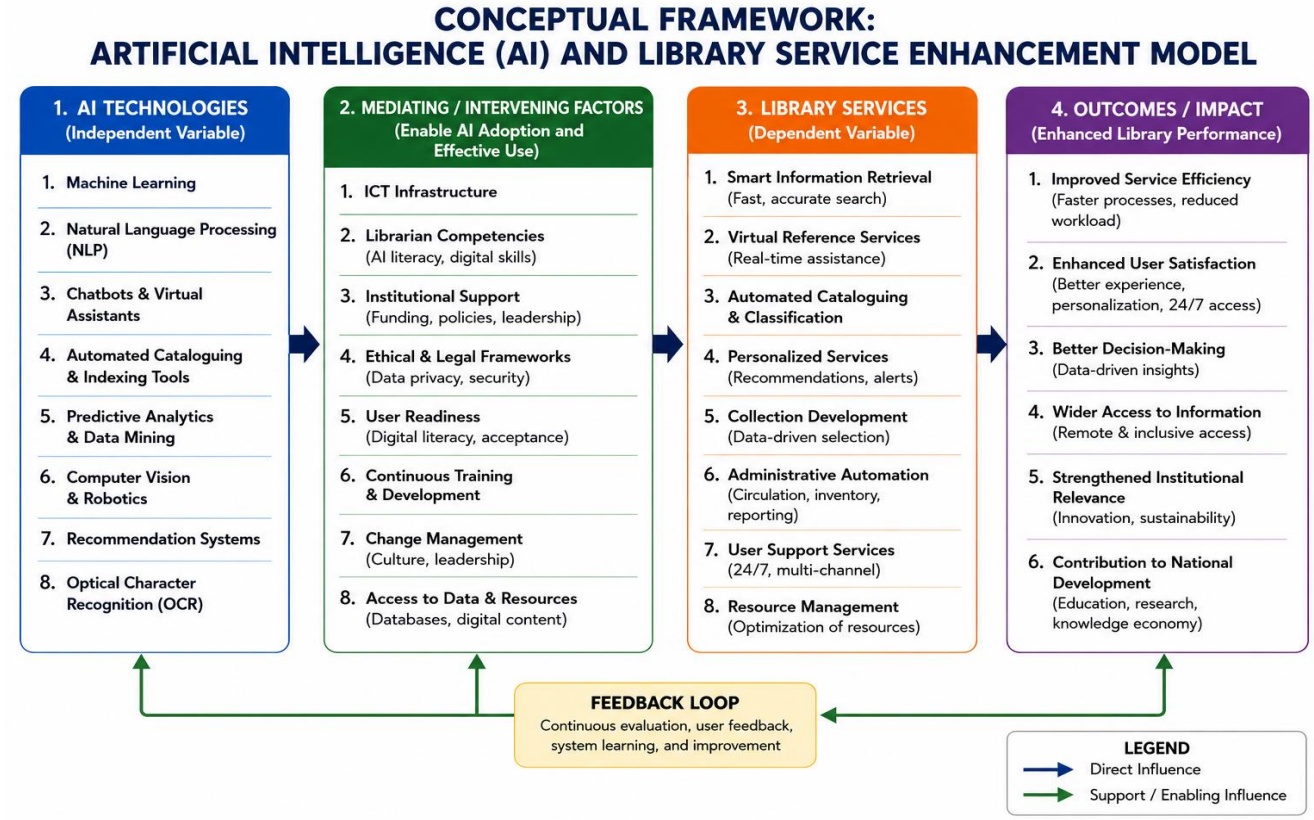
Despite its benefits, AI adoption in Nigerian libraries faces significant challenges. Igbo et al. (2025) identified infrastructural deficits, lack of policy frameworks, and insufficient funding as major barriers to AI implementation. Their study emphasized that many libraries lack stable internet connectivity and modern ICT infrastructure required for AI systems. Idahosa and Eireyi-Edewede (2023) also highlighted the problem of low AI literacy among librarians. The study found that many library professionals lack training in emerging technologies, making it difficult to effectively implement and manage AI systems.

Similarly, Ovie and Ekuerhare (2024) pointed out institutional and governmental limitations. They argued that the absence of national AI policies for libraries has slowed technological adoption. Additionally, resistance to change among library staff was identified as a sociocultural barrier. Suleiman et al. (2023) further added that ethical concerns such as data privacy, surveillance risks, and algorithmic bias also limit AI adoption in academic libraries.

Synthesis:

Key challenges include poor infrastructure, lack of funding, inadequate ICT skills, weak policy frameworks, ethical concerns, and institutional resistance to technological change.

Theoretical Perspective



This study is anchored on the Technology Acceptance Model (TAM) and the Diffusion of Innovation Theory (DOI). TAM, as proposed by Davis (1989), explains that user acceptance of technology depends on perceived usefulness and perceived ease of use. In contemporary studies, Ghimire and Edwards (2024) similarly found that in the context of

generative artificial intelligence, perceived usefulness significantly influences users' acceptance of technology, while perceived ease of use also plays an important role in shaping adoption behaviour.

The Diffusion of Innovations (DOI) theory (Rogers, 2003) explains how innovations spread within a social system over time through communication channels and social influence. Recent applications of the theory confirm its relevance in explaining technology adoption in institutional settings. For example, Al-Rahmi et al. (2023) affirm that DOI explains technology adoption through key attributes such as relative advantage, compatibility, trialability, and observability, which significantly influence users' decisions to adopt innovations. In the context of Nigerian libraries, AI adoption can therefore be understood in terms of innovation awareness, trialability, and gradual institutional acceptance, where librarians evaluate the benefits and usability of AI before full integration into library services. These theories collectively explain both individual and institutional factors affecting AI adoption in libraries.

Conceptual Synthesis

Based on the reviewed literature, AI in libraries can be conceptualized as a system that transforms traditional library services into intelligent, automated, and user centered service environments. The interaction between AI technologies, librarian competencies, institutional infrastructure, and policy frameworks determines the effectiveness of library service delivery.

Summary of Literature Review

The literature reveals that Artificial Intelligence has significant potential to transform library and information services globally and in Nigeria. AI technologies such as chatbots, machine learning, and predictive analytics improve efficiency, accuracy, and user satisfaction. However, challenges such as inadequate infrastructure, limited skills, ethical concerns, and weak policy frameworks hinder full adoption in Nigerian libraries. Overall, there is a clear research gap in empirical studies focusing on AI implementation in Nigerian library environments, particularly regarding large-scale adoption and sustainability strategies

METHODOLOGY

This study adopted a descriptive survey research design to investigate the influence of Artificial Intelligence (AI) on library service delivery in selected university libraries in Northern Nigeria. The study was conducted in federal, state, and private universities with functional library systems and evidence of ICT integration. The population comprised 180 professional librarians and library staff, including university librarians, cataloguers, reference librarians, and ICT/digital services librarians. A sample of 165 respondents was selected using a multi-stage sampling technique involving purposive, stratified, and simple random sampling methods to ensure adequate representation.

Data were collected using a structured questionnaire titled *Artificial Intelligence and Library Service Delivery Questionnaire (AILSDQ)*, which contained items on AI technologies, service delivery, benefits, and challenges of AI

adoption. Responses were measured on a five-point Likert scale ranging from Strongly Agree (5) to Strongly Disagree (1). Face and content validity of the instrument were established through expert review, while reliability was determined through a pilot study involving 20 librarians outside the study area using the Cronbach Alpha method, with a coefficient of 0.70 considered acceptable.

The questionnaire was administered through both paper-based and online platforms, including Google Forms, email, and WhatsApp. Data collected were analyzed using descriptive statistics such as frequencies, percentages, means, and standard deviations to answer the research questions, while Pearson Product Moment Correlation (PPMC) and regression analysis were used to test the hypotheses at the 0.05 level of significance. A mean score of 2.50 and above was accepted, while scores below 2.50 were rejected.

Analysis of Research Questions

Research Question 1: What AI technologies are applicable to library services?

Table 4.3: AI Technologies Used in Libraries

AI Technologies	Mean	Std. Dev.	Decision
Machine Learning	3.45	0.82	Accepted
Natural Language Processing	3.62	0.76	Accepted
Chatbots	3.80	0.70	Accepted
Automated Cataloguing	3.90	0.68	Accepted
Predictive Analytics	3.30	0.85	Accepted
Grand Mean	3.61		Accepted

(Field Survey, Source 2026)

Interpretation: The results in Table 4.3 indicate that all identified AI technologies recorded mean scores above the benchmark mean of 2.50. This implies that respondents agreed that Machine Learning (3.45), Natural Language Processing (3.62), Chatbots (3.80), Automated Cataloguing (3.90), and Predictive Analytics (3.30) are applicable to library services. The grand mean of 3.61 further confirms the general acceptance of AI technologies in library operations. Automated Cataloguing recorded the highest mean score (3.90), suggesting that it is the most commonly applied AI technology among the surveyed libraries.

Research Question 2: How does AI improve library services*?*

Table 4.4: AI and Service Improvement

Variables	Mean	Std. Dev.	Decision
Faster Information Retrieval	3.88	0.64	Accepted
Improved Accuracy	3.75	0.70	Accepted
Personalized Services	3.60	0.78	Accepted
24/7 Accessibility	3.92	0.60	Accepted
Reduced Workload	3.70	0.72	Accepted
Grand Mean	3.77		Accepted

(Field Survey, Source 2026)

Interpretation: Table 4.4 reveals that respondents agreed that AI improves library services in several ways. The highest mean score was recorded for 24/7 Accessibility (3.92), followed by Faster Information Retrieval (3.88). The grand mean score of 3.77 indicates that AI contributes significantly to improved service delivery through enhanced accessibility, efficiency, accuracy, and reduced workload for library staff.

Research Question 3: What are the benefits of AI adoption?

Table 4.5: Benefits of AI Adoption

Benefits	Mean	Std. Dev.	Decision
Efficiency Improvement	3.95	0.62	Accepted
User Satisfaction	3.85	0.65	Accepted
Time Saving	3.90	0.60	Accepted
Better Decision-Making	3.70	0.73	Accepted
Grand Mean	3.85		Accepted

(Field Survey, Source 2026)

Interpretation: The findings show that all the identified benefits of AI adoption were accepted by respondents. Efficiency Improvement recorded the highest mean score (3.95), indicating that respondents perceive AI as a tool for improving operational effectiveness. The grand mean of 3.85 suggests a strong agreement that AI adoption contributes

positively to library performance through increased efficiency, user satisfaction, time savings, and informed decision-making.

Research Question 4: What challenges affect AI adoption?

Table 4.6: Challenges Affecting AI Adoption

Challenges	Mean	Std. Dev.	Decision
Poor Infrastructure	4.10	0.55	Accepted
Lack of Funding	4.05	0.60	Accepted
Low Technical Skills	3.95	0.65	Accepted
Lack of Policy Support	3.80	0.70	Accepted
Grand Mean	3.98		Accepted

(Field Survey, Source 2026)

Interpretation: Table 4.6 indicates that respondents agreed that all the listed factors constitute major challenges to AI adoption in libraries. Poor Infrastructure recorded the highest mean score (4.10), followed closely by Lack of Funding (4.05). The grand mean score of 3.98 demonstrates a strong consensus among respondents that infrastructural deficiencies, inadequate funding, limited technical skills, and weak policy support hinder the effective implementation of AI technologies in libraries.

Test of Hypotheses

Hypothesis One

H_{01}: There is no significant relationship between AI adoption and library service delivery.

Table 4.7: Pearson Product Moment Correlation between AI Adoption and Library Service Delivery

Variables	AI Adoption	Service Delivery
AI Adoption	1.000	0.712**
Service Delivery	0.712**	1.000

$r = 0.712$, $p = 0.000$, $\alpha = 0.05$

Decision: Since the calculated p-value (0.000) is less than the level of significance (0.05), the null hypothesis is rejected.

Interpretation: The correlation coefficient ($r = 0.712$) indicates a strong positive relationship between AI adoption and library service delivery. This implies that increased adoption of AI technologies is associated with improved library services. Therefore, AI adoption significantly influences service delivery in university libraries.

Hypothesis Two

H_{02}: There is no significant relationship between librarians' digital skills and AI implementation.

Table 4.8: Pearson Product Moment Correlation between Digital Skills and AI Implementation

Variables	Digital Skills	AI Implementation
Digital Skills	1.000	0.685**
AI Implementation	0.685**	1.000

$r = 0.685$, $p = 0.000$, $\alpha = 0.05$

Decision: Since the p-value (0.000) is less than the significance level of 0.05, the null hypothesis is rejected.

Interpretation: The correlation coefficient ($r = 0.685$) indicates a strong positive relationship between librarians' digital skills and AI implementation. This suggests that higher levels of digital competence among librarians significantly enhance the successful adoption and implementation of AI technologies in library services.

SUMMARY, CONCLUSION AND RECOMMENDATIONS

Summary of the Study

This study examined the role of Artificial Intelligence (AI) in enhancing 21st-century library and information services in Nigeria. The research was guided by five objectives which focused on identifying AI technologies applicable to library services, examining their impact on service delivery, analyzing benefits, investigating challenges, and proposing strategies for effective implementation. A descriptive survey research design was adopted for the study. The population comprised professional librarians working in selected Nigerian university libraries, from which a sample of 165 respondents was obtained. Data were collected using a structured questionnaire and analyzed using descriptive statistics (mean and standard deviation) and inferential statistics (correlation analysis).

The findings revealed that AI technologies such as chatbots, natural language processing, machine learning, and automated cataloguing systems are applicable to library operations. The study also established that AI significantly improves library service delivery by enhancing speed, accuracy, accessibility, and user satisfaction.

Furthermore, the study identified key benefits of AI adoption, including improved efficiency, time-saving, better decision-making, and enhanced user experience. However, several challenges were found to hinder effective AI implementation in Nigerian libraries, notably inadequate infrastructure, insufficient funding, low technical skills among librarians, and weak institutional and policy support.

The hypotheses tested confirmed that there is a significant positive relationship between AI adoption and library service delivery, as well as between librarians' digital skills and successful AI implementation.

Discussion of Findings

The findings of this study demonstrate that Artificial Intelligence (AI) technologies are increasingly becoming important tools for improving library service delivery. The identification of machine learning, natural language processing, chatbots, and automated cataloguing systems as major AI technologies used in libraries corroborates earlier studies that highlighted the growing relevance of AI in information management and retrieval. This finding suggests that libraries are gradually transitioning from traditional service models to technology-driven systems capable of meeting the evolving information needs of users. The adoption of these technologies reflects the global trend toward digital transformation in library operations and services.

The study further revealed that AI significantly enhances service delivery through improved efficiency, accuracy, speed, and accessibility of information services. This implies that AI-powered systems can reduce the workload of library staff by automating repetitive tasks while simultaneously improving the quality of services offered to users. The finding supports previous studies that reported improvements in response time, user satisfaction, and information retrieval through AI applications. The increased accessibility provided by AI technologies is particularly important in contemporary library environments where users increasingly demand instant and remote access to information resources. Therefore, AI adoption has the potential to strengthen the role of libraries as effective information service providers in the digital age.

Another important finding of the study is the existence of a strong positive relationship between AI adoption and service delivery. This indicates that libraries that embrace AI technologies are more likely to experience improved operational performance and user satisfaction. The finding reinforces the Technology Acceptance Theory, which posits that the perceived usefulness of a technology influences its adoption and eventual impact on organizational performance. In the context of libraries, the effectiveness of AI applications appears to translate directly into better service outcomes, thereby justifying investments in AI-driven solutions.

Despite the numerous benefits associated with AI adoption, the study identified several challenges hindering its effective implementation, including inadequate infrastructure, limited funding, shortage of technical expertise, and insufficient staff training. These challenges suggest that the successful deployment of AI in libraries extends beyond the availability of technology itself and depends largely on organizational readiness and institutional support. The findings reflect the realities of many developing countries, particularly Nigeria, where financial and technological constraints continue to affect the modernization of library services. Consequently, libraries may be unable to fully exploit the benefits of AI without adequate investment in infrastructure development and capacity building.

The findings also underscore the need for continuous professional development for librarians. Since AI technologies require specialized knowledge and technical competencies, library personnel must be equipped with the necessary skills to manage, maintain, and effectively utilize these systems. Training programmes, workshops, and collaborations with technology experts could therefore play a critical role in facilitating successful AI integration in libraries. Furthermore, policymakers and institutional administrators should prioritize funding and strategic planning aimed at promoting AI adoption in library environments.

Overall, the study demonstrates that while AI offers substantial opportunities for improving library service delivery, its successful implementation requires addressing existing infrastructural, financial, and human-capacity challenges. The findings therefore provide empirical evidence that supports increased investment in AI technologies as a means of enhancing the efficiency, effectiveness, and sustainability of library services in the contemporary information society.

Conclusion

This study concludes that the adoption of Artificial Intelligence has significant potential to enhance service delivery in the academic libraries studied. The findings revealed that AI technologies such as machine learning, natural language processing, chatbots, and automated information retrieval systems are recognized as valuable tools for improving library operations and user services. The study further established that the utilization of these technologies contributes to greater efficiency, accuracy, accessibility, and responsiveness in the delivery of library services.

The study also found a significant positive relationship between AI adoption and service delivery in the academic libraries investigated, indicating that increased implementation of AI technologies is associated with improved

library performance and user satisfaction. However, the effective deployment of AI in these libraries is constrained by challenges such as inadequate technological infrastructure, insufficient funding, limited technical expertise, and inadequate staff training. Based on these findings, it can be concluded that while the academic libraries studied are aware of the benefits of AI and have begun embracing relevant technologies, the full realization of AI-driven library services will depend on sustained institutional commitment, investment in infrastructure, capacity building for library personnel, and the of supportive policies. Addressing these challenges will enable the libraries to maximize the benefits of AI and better meet the information needs of their users in an increasingly digital environment.

Recommendations

Based on the findings and conclusions of the study, the following recommendations are proposed:

1. ***Investment in ICT Infrastructure:*** Government, educational institutions, and stakeholders should invest in modern ICT infrastructure, including high-speed internet, digital platforms, and AI-compatible systems, to support the implementation of Artificial Intelligence in libraries.

2. ***Capacity Building and Training:*** Continuous professional development programs should be organized to equip librarians with relevant digital and AI skills. Training should focus on areas such as data analytics, machine learning basics, and digital information management.

3. Development of AI Policies for Libraries: There is a need for the development of clear national and institutional policies that guide the adoption and ethical use of Artificial Intelligence in library services. These policies should address issues such as data privacy, security, and responsible AI usage.

4. Increased Funding for Library Innovation: Adequate funding should be allocated to libraries to support technological innovation, research, and implementation of AI-based systems. This will enable libraries to modernize their operations and improve service delivery.

5. Collaboration and Partnerships: Libraries should collaborate with technology firms, academic institutions, and research organizations to facilitate knowledge sharing, innovation, and access to AI tools and expertise.

6. Integration of AI into Library Education: Library and Information Science (LIS) curricula in Nigerian universities should be updated to include Artificial Intelligence, data science, and emerging technologies to prepare future librarians for digital transformation.

7. Pilot Implementation of AI Systems: Libraries should begin with pilot projects such as chatbot services, automated cataloguing, and digital reference systems to gradually integrate AI into their operations.

ABSTRACT

Artificial Intelligence (AI) is increasingly transforming library and information services by enhancing operational efficiency and improving user experiences. Its growing application in service delivery has attracted considerable attention among researchers and information professionals, particularly in Colleges of Education libraries. This study explored the current state of AI adoption in Colleges of Education libraries, identified the key drivers of AI integration, examined practical applications and use cases, investigated implementation challenges, and assessed strategic approaches for effective AI adoption. The study adopted a qualitative content analysis approach and reviewed relevant literature from scholarly journals, conference proceedings, and credible reports. Data obtained from the reviewed sources were subjected to thematic analysis in line with the study objectives. Findings revealed that AI adoption in Colleges of Education libraries remains at an emerging stage, with most institutions implementing basic technologies such as automated cataloguing systems, digital reference services, and chatbots. The analysis further showed that technological advancement, increasing demand for personalized services, operational efficiency, and institutional digital transformation goals are the major drivers of AI integration. Practical applications identified include intelligent information retrieval systems, virtual reference assistants, metadata generation, recommendation systems, and predictive analytics. However, AI adoption in colleges of education librries is constrained by inadequate funding, poor infrastructure, limited technical expertise, resistance to change among library personnel, data privacy concerns, and the lack of localized AI solutions. The study concludes that AI has considerable potential to enhance service delivery, accessibility, and user engagement in Colleges of Education libraries. However, its successful integration depends on institutional readiness, adequate infrastructure, skilled personnel, and appropriate governance frameworks.

Keywords: Artificial Intelligence (AI), Challenges, Colleges of Education, Libraries, Prospects Service Delivery

INTRODUCTION

Artificial Intelligence (AI) has rapidly emerged as one of the most transformative technologies of the 21st century, influencing a broad spectrum of human activities ranging from healthcare and education to business, finance, and public administration. Its ability to mimic human cognitive functions such as learning, reasoning, problem-solving, and decision-making has opened new frontiers in how services are designed, delivered, and managed (Russell & Norvig, 2021). In the field of education, AI technologies are reshaping teaching, learning, and administrative processes, thereby creating more personalized, data-driven, and efficient systems (Rawas, 2024). Among the less frequently highlighted but equally significant domains of AI integration is the library and information science sector, particularly academic libraries.

Academic libraries, is experiencing a paradigm shift due to the integration of AI technologies. As digital natives increasingly dominate the user base, traditional library services must evolve to meet changing demands. Academic libraries have traditionally served as pivotal knowledge hubs within higher education institutions, supporting teaching, learning, and research activities. However, the rapid digitization of knowledge resources, coupled with changing user behaviors and expectations, have necessitated a profound transformation in how libraries operate. The influx of digital native students and faculty members who are technology savvy has increased demand for real-time access to information, intelligent search capabilities, and more personalized services (Tenopir et al., 2020). In this evolving context, AI presents both a challenge and an opportunity for academic libraries to redefine their roles and reimagine service delivery.

AI adoption in academic libraries spans a wide range of functions, from automated cataloging and metadata creation to intelligent recommendation systems, virtual reference services, and predictive analytics for collection development and user engagement (Luo & Ghosh, 2021). Chatbots and, while machine learning algorithms are used to enhance information retrieval and user behavior analysis. These innovations not only improve operational efficiency but also elevate user satisfaction by providing tailored and contextually relevant services (Zhang & Zhao, 2022).

Despite these promising developments, the integration of AI into academic libraries is neither uniform nor without hurdles. Institutional capacity, infrastructure readiness, staff competencies, and ethical considerations all play crucial roles in shaping how AI is adopted and implemented. These factors are particularly pronounced in Colleges of Education, where libraries perform a dual role: supporting pedagogical training and fostering academic research. The specialized nature of these institutions, which focus on training future educators, means their libraries must be particularly adaptive and responsive to the specific needs of both pre-service teachers and faculty members. Therefore,

the implementation of AI in such settings requires not just technological upgrades but also strategic alignment with educational goals and user expectations (Aina, 2020).

Artificial intelligence is increasingly being used in Colleges of Education libraries to support teaching, learning, and research. However, there is growing concern that over-reliance on AI tools may reduce students' critical thinking skills, independent reasoning, and engagement with academic resources. Despite its benefits in improving service delivery and access to information, there is limited understanding of how AI affects students' intellectual development and academic integrity within these libraries. This study therefore examines the impact of AI on students' critical thinking and academic engagement in Colleges of Education libraries.

OBJECTIVES OF THE STUDY

This study aims to explore the current state of Artificial Intelligence adoption and in Colleges of Education libraries in the globe. The specific objectives are to:

1. Explore the current state of AI adoption in Colleges of Education libraries.
2. Identify the key drivers of adoption of AI technologies in Colleges of Education libraries.
3. Investigate the practical applications, use cases of AI in Colleges of Education libraries.
4. Find out the challenges associated with the implementation of AI in Colleges of Education libraries.
5. Suggest for a strategic, inclusive, and ethical approach to AI adoption in Colleges of Education libraries.

METHODOLOGY

This study adopts a qualitative content analysis approach with a global scope, focusing on AI integration in academic libraries without regional limitation. Data were sourced from four (4) databases: Scopus, Web of Science, IEEE Xplore, and Google Scholar, selected for their high-quality, peer-reviewed, and multidisciplinary coverage of AI and library science literature. A total of 40 articles published between 2019 and 2025 were reviewed. Literature search and selection were completed within a six-week period, guided by relevance, credibility, and recency criteria. The data were analyzed using thematic analysis, enabling the identification and synthesis of key themes on AI adoption, applications, drivers, and challenges in academic libraries globally.

DATA PRESENTATION, ANALYSIS AND DISCUSSION OF FINDINGS

The analysis of the selected studies revealed five major themes corresponding to the objectives of the study. These themes include: the current state of AI adoption in Colleges of Education libraries, the drivers of AI integration, practical applications and use cases of AI, challenges associated with AI implementation, and strategic approaches for inclusive and ethical AI integration. The findings are presented and discussed under the respective themes.

Theme One: Current State of AI Adoption in Colleges of Education Libraries

The thematic analysis revealed that the adoption of Artificial Intelligence (AI) in Colleges of Education libraries remains largely at an emerging stage. Across the reviewed studies, there is growing awareness among library administrators and information professionals regarding the transformative potential of AI technologies in enhancing service delivery. The literature consistently indicates that libraries are increasingly exploring opportunities for integrating AI into their operations in response to global technological developments and changing user expectations.

The reviewed studies show that while awareness of AI is increasing, actual implementation remains limited in many Colleges of Education libraries. Most institutions are still experimenting with basic AI applications such as automated cataloguing systems, digital reference tools, and simple chatbot services. Full-scale deployment of advanced AI systems remains relatively uncommon due to infrastructural and financial limitations. The findings suggest that many institutions are currently in the exploratory and pilot implementation phases rather than the advanced adoption stage.

The analysis further indicates that the pace of adoption varies considerably among institutions. Some libraries have demonstrated greater readiness by investing in digital infrastructure and staff development, while others continue to rely heavily on traditional library practices. This uneven pattern of adoption reflects disparities in institutional capacity, technological readiness, and availability of resources. The findings therefore suggest that although AI adoption has commenced within Colleges of Education libraries, the integration process remains gradual and developmental.

The implication of this finding is that Colleges of Education libraries are increasingly recognizing the importance of AI technologies but require additional support, strategic planning, and infrastructural investment to move beyond experimental implementation toward comprehensive adoption.

Theme Two: Drivers of AI Integration in Colleges of Education Libraries

The analysis identified several factors driving the integration of AI technologies in Colleges of Education libraries. A dominant theme emerging from the literature is technological advancement. The increasing availability of affordable

digital technologies, cloud computing services, machine learning tools, and AI-powered applications has lowered entry barriers for educational institutions seeking to modernize their library services.

Another significant driver identified is the changing expectations of library users. Students and academic staff increasingly demand personalized, efficient, and real-time access to information resources. The reviewed studies reveal that contemporary users expect intelligent search capabilities, instant responses to inquiries, customized recommendations, and seamless digital experiences comparable to those available on commercial digital platforms. Consequently, libraries are adopting AI technologies to meet these evolving expectations and remain relevant within the digital information environment.

Operational efficiency also emerged as a major motivating factor. The literature demonstrates that AI technologies enable libraries to automate repetitive and time-consuming activities such as cataloguing, classification, metadata generation, circulation management, and information retrieval. Through automation, library personnel can devote more attention to strategic activities including research support, information literacy instruction, user engagement, and collection development.

Institutional support and strategic alignment constitute another important driver. The findings indicate that AI adoption is more successful when linked to broader institutional objectives such as digital transformation, academic excellence, innovation, and e-learning development. Institutions that perceive AI as a strategic tool for improving educational outcomes are more likely to invest in its implementation.

These findings suggest that AI integration is not driven by a single factor but rather by a combination of technological opportunities, user demands, operational needs, and institutional aspirations.

Theme Three: Practical Applications and Use Cases of AI in Colleges of Education Libraries

The thematic analysis revealed a wide range of practical AI applications currently being utilized or considered within academic library environments. One of the most frequently reported applications is the use of intelligent information retrieval systems. These systems employ machine learning and natural language processing technologies to improve search accuracy, understand user intent, and provide more relevant search results.

The analysis also identified AI-powered chatbots and virtual reference assistants as prominent applications. These technologies provide immediate responses to user inquiries, offer guidance on resource utilization, assist with navigation of library collections, and support users outside regular service hours. The reviewed literature suggests that chatbot implementation has significantly improved service accessibility and responsiveness while reducing the workload of library personnel.

Another major application emerging from the analysis is automated cataloguing and metadata generation. AI technologies assist libraries in organizing information resources more efficiently by automatically generating descriptive metadata, identifying subject headings, and supporting classification activities. This reduces human error and enhances consistency in bibliographic management.

The findings further reveal growing use of recommendation systems that analyze user behavior and preferences to suggest relevant information resources. Such systems support personalized learning experiences and facilitate effective information discovery. Predictive analytics also emerged as an important application area, enabling libraries to analyze usage patterns, forecast resource demands, identify collection gaps, and support evidence-based decision-making.

The analysis demonstrates that AI applications are transforming both front-end user services and back-end library operations, contributing to improved efficiency, accessibility, and user satisfaction.

Theme Four: Challenges Associated with AI Implementation in Colleges of Education Libraries

The analysis identified several significant challenges that constrain the successful implementation of AI technologies within Colleges of Education libraries. One of the most recurring themes is inadequate funding. The reviewed studies consistently indicate that the acquisition, deployment, and maintenance of AI technologies require substantial financial investment, which many institutions struggle to provide due to competing budgetary priorities.

Another major challenge identified is inadequate technological infrastructure. Effective AI implementation depends on reliable internet connectivity, robust digital systems, cloud computing capabilities, and technical support services. Many Colleges of Education, particularly those located in underserved areas, continue to face infrastructural deficiencies that limit the deployment of sophisticated AI solutions.

The findings also reveal resistance to change among library personnel. Some librarians express concerns regarding job displacement, increased technological complexity, and insufficient technical expertise. Such perceptions often create reluctance toward adopting AI technologies and may slow implementation efforts. The literature emphasizes that inadequate training and low AI literacy contribute significantly to this challenge.

Data privacy and ethical concerns emerged as another important theme. AI systems often require access to large volumes of user data to function effectively. Consequently, concerns regarding data protection, user privacy, transparency, algorithmic bias, and ethical accountability continue to generate apprehension among stakeholders.

In addition, the analysis identified the scarcity of localized AI solutions as a significant barrier. Many existing AI applications are developed outside the Nigerian educational context and may not adequately address local linguistic, cultural, and operational realities. This limitation reduces the effectiveness and relevance of some AI technologies within Colleges of Education libraries. These challenges highlight the need for comprehensive planning, investment, and stakeholder engagement to facilitate sustainable AI implementation.

Theme Five: Strategic, Inclusive and Ethical Approaches to AI Integration

The final theme emerging from the analysis emphasizes the importance of adopting strategic, inclusive, and ethical approaches to AI integration. The reviewed studies consistently advocate for institutional strategies that align AI initiatives with organizational goals, academic missions, and long-term development priorities. Strategic planning ensures that AI investments contribute meaningfully to educational outcomes and institutional performance.

The analysis further underscores the necessity of inclusiveness in AI implementation. Successful adoption requires the active participation of librarians, academic staff, students, information technology specialists, and institutional administrators. Stakeholder involvement promotes ownership, reduces resistance, and facilitates smoother implementation processes.

Capacity building emerged as another critical component of successful AI integration. The literature strongly recommends continuous professional development programmes aimed at improving AI literacy, technical competence, and digital skills among library personnel. Such initiatives enhance staff confidence and preparedness for technological change.

Ethical governance constitutes another central element of effective AI integration. The reviewed studies emphasize the need for clear policies addressing data protection, privacy, transparency, accountability, and responsible use of AI technologies. Ethical frameworks are essential for safeguarding user rights and maintaining trust in digital library services.

The findings also highlight the importance of strategic partnerships involving educational institutions, technology companies, government agencies, and international organizations. Such collaborations can provide access to technical expertise, financial support, and locally relevant AI solutions.

DISCUSSION OF FINDINGS

The findings of this study demonstrate that AI is gradually transforming service delivery within Colleges of Education libraries. Although adoption remains at an emerging stage, there is clear evidence of increasing institutional interest and growing recognition of AI's potential benefits. The study confirms that technological advancement, user expectations, operational efficiency, and strategic institutional goals are major catalysts for AI integration.

The findings further reveal that AI technologies have substantial potential to enhance information retrieval, automate routine operations, improve user engagement, and support evidence-based decision-making. However, realizing these benefits requires addressing persistent challenges related to funding, infrastructure, staff readiness, ethical governance, and localization of AI solutions.

The study therefore reinforces the need for deliberate, inclusive, and ethically grounded implementation strategies that will enable Colleges of Education libraries to harness AI effectively while minimizing associated risks. The success of AI integration will ultimately depend on institutional commitment, stakeholder collaboration, continuous capacity building, and sustainable investment in digital infrastructure.

CONCLUSION

The adoption of Artificial Intelligence (AI) in Colleges of Education libraries represents a significant step toward transforming academic service delivery. This study, through a thematic analysis of literature, has illuminated both the prospects and the multifaceted challenges associated with AI adoption in this specialized educational context. There is increasing adoption of AI in library operations, but the actual implementation remains uneven, constrained by infrastructural limitations, financial constraints, and human capital deficits. AI technologies such as intelligent search systems, chatbots, and recommendation engines offer promising avenues for enhancing user experience and operational efficiency. However, their impact is contingent upon institutional readiness, strategic alignment with educational goals, and the willingness of library personnel to adapt to new technological paradigms. The study therefore concludes that Artificial Intelligence has significant potential to reshape service delivery in Colleges of Education libraries. Nevertheless, the extent to which these libraries benefit from AI technologies depends largely on their level of

preparedness, availability of resources, technological capacity, and ability to address the institutional and operational challenges associated with AI adoption and integration.

RECOMMENDATIONS

Based on the findings of this study, the following recommendations are proposed in line with the specific objectives of the study:

1.To Enhance the Current State of AI Adoption in Colleges of Education Libraries

College administrators, library management, and policymakers should develop comprehensive AI adoption frameworks that will facilitate the gradual transition from exploratory implementation to full-scale integration of AI technologies. Institutional policies should clearly articulate the role of AI in library service delivery and provide strategic direction for its implementation. Furthermore, awareness campaigns should be intensified to promote understanding of the benefits and opportunities associated with AI adoption among stakeholders.

2. To Strengthen the Drivers of AI Integration in Colleges of Education Libraries

Institutions should capitalize on the factors driving AI adoption by aligning AI initiatives with institutional goals relating to digital transformation, teaching excellence, research support, and student engagement. Library managers should continuously assess user information needs and leverage emerging technologies to provide personalized, efficient, and user-centered services. Additionally, management should create enabling environments that encourage innovation and technology-driven service delivery.

3. To Expand the Practical Applications and Use Cases of AI in Libraries

Colleges of Education libraries should invest in the deployment of practical AI applications such as intelligent discovery systems, virtual reference assistants, chatbot services, automated cataloguing tools, metadata generation systems, and predictive analytics platforms. Libraries should also collaborate with technology providers and information professionals to identify and implement AI solutions capable of improving operational efficiency, resource management, and user satisfaction.

4. To Address the Challenges Associated with AI Implementation

Government agencies, institutional administrators, and library authorities should prioritize investment in digital infrastructure, reliable internet connectivity, and AI-related technologies. Adequate funding should be allocated for the acquisition, maintenance, and upgrading of AI systems. In addition, regular training, workshops, and capacity-building programmes should be organized to enhance librarians' competencies, reduce resistance to technological change, and improve their readiness for AI implementation. Institutions should also establish robust policies for data protection, privacy, and ethical AI usage.

5. To Promote a Strategic, Inclusive, and Ethical Approach to AI Adoption

Colleges of Education libraries should adopt a strategic and participatory approach to AI implementation by involving librarians, faculty members, students, ICT professionals, and administrators in planning and decision-making processes. Institutions should develop ethical guidelines that ensure transparency, accountability, fairness, and user privacy in AI deployment. Furthermore, efforts should be made to encourage the development of localized AI solutions through partnerships with software developers, research institutions, government agencies, and international organizations. Continuous monitoring and evaluation mechanisms should also be established to assess the effectiveness, impact, and sustainability of AI initiatives.

Abstract

This study empirically investigated the adoption of Artificial Intelligence (AI) to enhance 21st-century information services in university libraries across Kano State, Nigeria. Using a mixed-methods sequential explanatory design, data were collected from 152 librarians and 384 library users across four universities. The findings revealed that AI adoption remains at an early stage (mean = 2.14/5.00), with basic tools like plagiarism checkers and OPACs being most common. Key challenges include poor ICT infrastructure, high costs, and significant skill gaps among librarians. Despite these barriers, users expressed strong readiness for AI-enhanced services (mean = 4.21). Statistical analyses showed significant positive correlations between AI adoption and ICT infrastructure (r = 0.68), librarian AI competence (r = 0.72), and institutional policy (r = 0.59), with these three factors jointly explaining 67.4% of the variance in AI adoption. The study concludes that infrastructural, financial, and human-capacity deficits constrain AI integration, providing empirical evidence for policymakers and library administrators to prioritize targeted interventions.

Keywords: Artificial Intelligence, Academic Libraries, 21st-Century Information Services, Kano State.

1. Introduction

The global academic library landscape is undergoing a profound paradigmatic shift, driven by the imperatives of the Fourth Industrial Revolution (4IR) and the rapid maturation of Artificial Intelligence (AI) technologies (Okonkwo & Adebayo, 2025). AI, encompassing machine learning (ML), natural language processing (NLP), robotic process automation (RPA), and expert systems, is no longer a futuristic concept but a present-day catalyst for redefining core library functions—from intelligent discovery and automated cataloging to personalized recommendation systems and virtual reference services (Cox, 2021; Lund & Wang, 2023). For contemporary 21st-century information services, which demand speed, ubiquity, personalization, and seamless interoperability, AI offers transformative potential to transcend the limitations of traditional, manual, and reactive service models (Wheatley & Hervieux, 2020).

Simultaneously, higher education institutions worldwide are under mounting pressure to digitally transform their support ecosystems to meet the expectations of a digital-native student populace. Academic libraries, as the intellectual heart of universities, are expected to lead this transformation (Igwe, 2024). The COVID-19 pandemic further accelerated this need, exposing the fragility of library operations reliant on physical presence and highlighting the necessity for AI-powered, 24/7 digital services (Raphael & Nwafor, 2022).

In Nigeria, the context is more complex. While federal and state universities have made incremental progress in automating core operations via integrated library systems (ILS), the leap to AI-driven services remains nascent and fragmented (Ani & Ngulube, 2020; Okocha & Akpan, 2024). The typical Nigerian academic library still grapples with fundamental challenges: underfunding, erratic power supply, inadequate ICT infrastructure, and a shortage of librarians with advanced digital competencies (Eze & Ugwu, 2023). Kano State, a major educational and commercial hub in northern Nigeria, reflects this national reality. Its universities—Bayero University Kano (BUK, a first-generation federal university), Yusuf Maitama Sule University (YUMSUK, a state university), Kano University of Science and Technology (KUST), and a growing number of private institutions—have made uneven progress. BUK, for instance, has a functional digital repository and subscription databases, yet AI-powered discovery or chatbots are rare. YUMSUK and KUST face even greater infrastructural deficits (Sani & Bello, 2025).
